### **ABSTRACT**

*The Indian higher education system is the world's third-largest in terms of students, next to China and the United States. E-learning has brought drastic change in the educational sector especially in higher education. Integration of Information and Communication technology along with e-learning initiatives has enhanced the teaching-learning process in higher education and also helped the government to improve the higher education structure in the country. Higher education institutions are implementing various E-learning initiatives as key component to facilitate the knowledge acquisition and to withstand the fast growing competition and digital technology. The basic objective of this paper is to understand the concept of e-learning and examine e-learning initiatives in higher education institutions while making passing reference to Covid-19 effects.*

**KEYWORDS:** *E-Learning, Implementing*

### **INTRODUCTION**

Recent technological and other advancements have turned the World into a Global Village where awareness and knowledge has become the key components. In such scenario, education has become a powerful tool of the society to raise awareness of the culture, environment, social diversity and also to increase the levels of knowledge to face the competitiveness among the people besides helping them to become Global Citizens. Recently, E-learning has emerged as strong and effective means to promote education worldwide. E-learning is super spreader of

education and knowledge in the world and India is no exception. With the help of E-learning tools and technology, India can attain the goal of reaching the remote citizens of in rural areas, motivating the learners for higher education as well as empowered women through the education.<sup>1</sup>

The emergence of internet in terms of its speed and availability has broadened up the usage of e-learning in Indian higher education Institutions. E-learning is becoming a part of the internet which experiences the highest growth rate and improves the teaching and learning process. E-learning environment has been widely implemented in many schools, colleges and universities. It is not only being used for education purposes alone, but for training purposes in many corporate and government departments. However, with the on-going demand for the e-learning technology, there is one major question asked by most professionals and scholars are on the effectiveness and success of various e-learning initiatives. Therefore, it is relevant that e-learning readiness will be conducted prior to the introduction of the e-learning tools and technology in organization and institutions. It is important to apply the e-learning readiness assessment.

Integration of Information and Communication Technologies (ICTs) has completely changed the dynamics of education sector; and has undeniable impact on learning outcomes. E-learning has emerged as a vital tool to improve the teaching- learning outcome as well as expand the learning opportunities for learners. E-Learning initiatives are a procedure of using digital technology to assist learning and teaching. Enhancement in how the Internet works, has allowed websites to deliver an effective and immersive learning experience on a computer, laptop or mobile device, which is helpful for encouraging learning.<sup>2</sup>

### **Emergence of E-Learning in Covid Times**

Covid-19, a deadly pandemic struck the world in late 2019. With the outbreak of the virus operating conditions all over the world have changed rapidly and the effects of the pandemic are visible, unstoppable and uncontrollable. Many sectors of importance have been badly affected leaving the economies and systems in shatters and education sector like many other important sectors got the severe whip. Face to face learning became a thing of the past as billions of students are forced to learn while sitting home through e-learning to avoid spread of the infection. E-learning has emerged as only viable alternative in the present times to impart education to keep moving the ball of societal obligations.

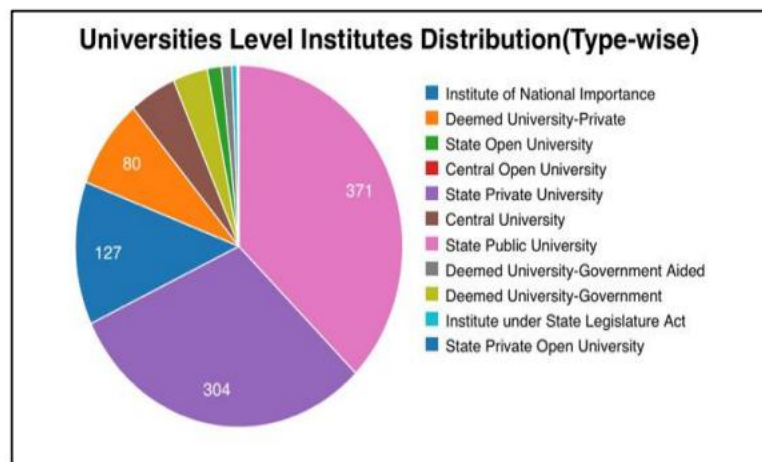

Thus, technologies and the circumstances have changed the traditional way of teaching-learning rather has replaced it with technology. To-day, all the higher education institutions and universities and even the schools are imparting online education.

### **Definition of e-learning**

There are many definitions given to e-learning (which stands for electronic learning) to enhance and support learning in higher education. E-learning is the integration of digital technology and learning, and with the use of network tools and technologies to facilitate learning anytime, anywhere. Thus, E-learning is covered under a larger term of technology-based learning through websites, learning portals, video conferencing, YouTube, mobile apps, and thousand types of free available websites for blended learning tools. Currently, E-Learning is enhancing student's knowledge, even the academic staff and professional and industry people skills through the internet.<sup>3</sup>

However, in present time, e-learning has become an important tool for enhancing the delivery, interaction, and facilitation of both teaching and learning process. The Commission on Technology and Adult Learning (2001) defined “e-learning as instructional content or learning experiences delivered or enabled by electronic technology.” With the increasing number of students in higher education institutions every year, it has become necessary to introduce e-learning initiatives and some alternative method of imparting education to all the students. Online programmes and courses through various e-learning platforms are a solution to this. However for e-learning implementation to succeed there is a need to assess the readiness of stakeholders (organizations, teachers and learners) to adopt this learning style. E-learning offers the multiple advantages of economy besides the enhancement in teaching learning outcomes. The desire for a well-educated technical workforce has driven many nations to redesign their education systems. Desire for a technical workforce is mentioned in Alvin Toffler’s declaration (in Rosenberg, 2001), that “the illiterate of the 21st century will not be those, who cannot read and write but those who cannot learn, unlearn, and relearn.” This signifies that learning institutions/universities will have to progressively change and adapt in their environments if they are not to lag behind.

### Higher Education Architecture in India

SOURCE: International Journal of Scientific and Research Publication

The Indian higher education system is the world's third-largest in terms of students, next to China and the United States. According to All India Survey of Higher Education report (2019) the Indian higher education comprises of 53,620 institutions with 37 million students. There are a total of 41,901 colleges, 10, 726 standalone institutions and 993 universities, out of which 385 Universities are private and 394 Universities, are located in rural areas. In which there are 548 General, 142 Technical, 63 Agriculture & Allied, 9 Language, 23 Law, 58 Medical, 13 Sanskrit, 13 Sanskrit, and 58 Medical Universities and rest 106 Universities belong to other subjects. A total of 26 million students study in colleges followed by 7 million students studying in universities and 2 million students studying in the standalone institutions. According to this report, Gross Enrolment Ratio GER) in higher education is 26.3. GER for the male and female population is 26.3% and 26.4% respectively

### Regulatory Framework Of Higher Education In India

### IMPORTANCE OF E-LEARNING IN HIGHER EDUCATION

The Four Rationales for Introducing E-Learning in Education (Source: Cross and Adam, 2007)	
Social	Perceived role that technology now plays in society and the need for familiarizing students with technology.
Vocational	Preparing students for jobs that require skills in technology.
Catalytic	Utility of technology to improve performance and effectiveness in teaching, management and many other social activities.
Pedagogical	To utilize technology in enhancing learning, flexibility and efficiency in curriculum delivery.

SOURCE: Cross and Adams, 2007

In higher education Institutions, the demand to create a virtual learning environment (VLE) is increasing day by day, in which all aspects of a course are handled through a consistent user interface throughout the institution. Many online courses and programmes are already initiated in our country, which are delivered online to students. In present time, several Higher Education Institution and university provide. Of a total of around 1.2 million students worldwide, 32% are from the U.S while 15% are from India. In India, especially in rural areas many colleges and universities are facing the problem of non-availability of qualified teachers, but with the help of E-learning tools and technology, they can overcome the problem of non-availability of adequately qualified teachers in their institutions. While there is no substitute for effective and organized classroom teaching, e-learning's is the best option. School dropouts and physically disabled student can be taught through e-learning study materials. Computerized Assessment of students' performance becomes easier to the teacher/professor, for the courses where the number of students is very high. However e-learning has its own limitations. People, who are oppose to the online learning and teaching saying that it is irrelevant and does not impart the education

effectively. On the other hand, some people oppose traditional school learning saying that self-learning with the help mobiles, computers and laptop etc., is always better than classroom learning as it does not encourage learners for self-learning.

Stakeholders	Benefits
<b>Students</b>	<ul style="list-style-type: none"> <li>✓ Enlarge access to education,</li> <li>✓ Global knowledge sharing</li> <li>✓ Feasibility of content delivery,</li> <li>✓ Combination of ICT and multimedia</li> <li>✓ Blending of work and education,</li> <li>✓ Learner –centric approach</li> <li>✓ Improvise-quality of education.</li> </ul>
<b>Employer's</b>	<ul style="list-style-type: none"> <li>✓ Increase training quality,</li> <li>✓ Cost effective strategy ,</li> <li>✓ Elevation of employee skills</li> <li>✓ Enlarged employee efficiency</li> <li>✓ Developing of a new learning culture,</li> <li>✓ Sharing of costs and of training time with the employees,</li> <li>✓ Increased portability of training.</li> </ul>
<b>Governments</b>	<ul style="list-style-type: none"> <li>✓ Increase the capacity and cost effectiveness of education and training systems,</li> <li>✓ To reach target groups with limited access to conventional education and training,</li> <li>✓ To support and enhance the quality and relevance of existing educational structures,</li> <li>✓ To ensure the connection of educational institutions and curricula to the emerging networks and information resources,</li> <li>✓ To promote innovation and opportunities for lifelong learning.</li> </ul>

The technological improvisation and globalization are the factors that enhance the growth of e-learning. Education plays a key role in enhancing the social and economic development of the nations all over the world. Higher education sector implements E-learning as vital component to facilitate the knowledge acquisition and to withstand the fast growing competition and technology. Along with ICT, development of multimedia has brought changes in the traditional way of teaching. E-Learning has a significant role in transforming knowledge, skill and performance improvement of the higher education. The implementation of e-learning tools have brought several drastic changes in the delivery of knowledge in higher education. Integration of Information and Communication technology along with e-learning has enriched the learning process in higher education. The role of e-learning has become imperative component of the higher education institution and universities. Education through e-learning enables access to the best tutors and the knowledge accessible worldwide (UNESCO, 2002).

**RECENT E-LEARNING INITIATIVES IN INDIA**

The learner with the use of digital tools and technology can access tremendous level of information

And it also provides world class resources of information from which the learners can benefit at their own phase of learning.<sup>4</sup> Followings are some e-learning initiatives:-

**EDUSAT:-**

This is a Geo-synchronous satellite developed on I-2K bus GSAT-3, also known as *EDUSAT is a dedicated communication satellite, launched by the Indian Space Research Organisation but exclusively serve in education sector. It was first “Educational Satellite”, meant for distant class room education from school level to higher education and also provides the country with satellite based two way communications to class room for delivering educational materials.*

**Net varsity:-**

Net varsity is the India’s first online educational enterprise also came with the private initiative. It is started by the National Institute of Information Technology (NIIT Limited) in 1996.

**NTFITSD:-**

The National Task Force on Information Technology and Software Development (NTFITSD) formed by the then Prime Minister of India in 1998, with the purpose to investigate the IT-potential of the nation. “The Task Force report presents the master plan that India has in place as a long term policy for capacity building of institutions, human resource development in IT related areas, and use of Information and Communication Technology in education sector.”<sup>5</sup>

**VCI:-**

The Indira Gandhi National Open University (IGNOU) on the recommendations of the Task Force started Virtual Campus Initiatives (VCI) in 1999. IT started in Bachelor of Information Technology and Advanced Diploma in Information Technology course.

**PDF:-**

In 2001, the School of Social Sciences at the Indira Gandhi National Open University (IGNOU) started a Post Graduate Certificate in Participatory Management of Displacement, Resettlement and Rehabilitation in 2001, with the help of the World Bank. It is a fully online programme that included both synchronous and asynchronous learning opportunities. It is a first programme, in which Participation in Discussion Forum (PDF) is used as a peer evaluation mechanism.

**OCPFS:-**

Online certificate programmes on Food Safety (OCPFS). OCPFS is an online initiatives of IGNOU, in collaboration with the Ministry of Health and Family Welfare, Government of India. It is Web-based Training Programme for the min career diplomat of the Government of India and also a web-enhanced training package on the Windows version of the UNESCOs popular database management package CDS/ISIS.

**NPTEL:-**

NPTEL (National Programme on Technology Enhanced Learning) was designed in 1999. NPTEL is funded by MHRD (Ministry of Human Resource and Development). Under the project, 7 Indian Institutes of Technology (IIT Bombay, Delhi, Guwahati, Kanpur, Kharagpur, Madras and Roorkee) and IISc (Indian Institute of Science) Bangalore have created 112 video courses and 116 web courses. All these courses are based on undergraduate engineering and science topics, and created to meet most of the requirements of an engineering undergraduate program (at any Indian university). These all programmes and courses are available to students, working professionals and colleges (both government and private) at virtually no cost or very low cost.

#### Some of the digital initiatives of UGC & MHRD for higher education are given below

- **e-gyankosh** (<http://egyankosh.ac.in/>) is a national digital Repository that preserves all the learning sources. All the digital study materials in e-gyankosh are protected by copyright, with all rights reserved by Indira Gandhi National Open University (IGNOU). It is the world's biggest repository of educational resources in higher education.
- **Gyandhara** (<http://ignouonline.ac.in/Gyandhara/>) is an internet audio counselling service offered by IGNOU, where learners can listen live discussions by teachers and experts on the topic of the day. Students can ask questions and interact with them through telephone, e-mail and also through chat mode.
- **SWAYAM** (Study Webs of Active-Learning for Young Aspiring Minds) is a programme initiated by the Government of India aimed at offering everyone, easy access to high-quality digital aids and resources. It provides Massive Open Online courses (MOOCs) with 140 universities approve credit transfer feature. Courses based on specific subjects, managed by SWAYAM are available free of cost to all the learners.
- **PG Pathshala** (<https://epgp.inflibnet.ac.in/>) is for postgraduate students. Postgraduate students can easily access this platform to get study materials, online courses and e-books..
- **Shodhganga** (<https://shodhganga.inflibnet.ac.in/>) is a platform for research students to deposit their PHD theses and make it available to the entire scholarly community in open access. It has the ability to capture, index, store, disseminate and preserve electronically thesis and dissertations submitted by the research scholar of any university in India.
- **VIDWAN** (<https://vidwan.inflibnet.ac.in/>) is a premier database and national research network which has profiles of scientists/researchers and other faculty members working at leading academic institutions and other Research & Developments organisation in India.
- **National Educational Alliance for Technology (NEAT)** (<https://neat.aicte-india.org/>) is an initiative for skilling of learners in latest technologies through a Public- Private partnership model between the Government (through its implementing agency AICTE) and the Education Technology companies of India. In education sector, it brings the best technological products on a single platform for the comfort of learners.

#### DISCUSSION

The current generations are synonymously called as “Netizens” and “digitals” as they have been born and brought up in the wraps of technology. They discover e-learning helpful and friendly as

it encourage them in pursuing their learning in their convenient space and time. In this technological age Indian government is also investing more on digital technology and tools across all the government service such as passport service, railway ticket booking, and online registration for water supply, e-bills, etc. The adaptive nature of e-learning technology imparts various intellectual capabilities to learners to utilize the best of knowledge without any time and spaces restriction.

SOURCE- India Report on Digital Education 2020

The above table elaborate upon the various steps, both online and offline, taken by States/UTs to facilitate remote learning for students. Online teaching- learning process could not completely replace traditional education and school system as they provide many other qualities other than academic knowledge, which play an important role in learner's overall personality development and In online classes, the poor network connectivity especially in rural areas of the country creates a huge problem, even in the middle of the classes; the connection gets disconnected due to network problems, system error, software updates, etc.<sup>6</sup> E-learning can also create obstacles such as chances of piracy and plagiarism, ease of copy-paste, inappropriate selection skills, lack of interaction etc.

The education sector in India is no longer limited to just school classrooms. The e-learning and teaching market in India is estimated to be around \$3 billion. The central government's e-learning initiatives to make digital learning available to all learners in every corner of the country are also aiding the sector. Currently, online training in India focuses equally on school and college-based courses as well as professional courses.<sup>7</sup> However, education institution can improve and develop their skills and standards by imparting education through online platform with the help of digital technology and tools. Many online learning platforms and e-learning initiatives provide various programmes on the same subjects with different levels of certifications, methodology and assessment parameters. So, the quality of these programmes and courses may not be the same across different online learning platforms. Therefore, establishment of quality assurance mechanisms and quality benchmark for e- learning programmes must be developed and offered by HEIs in India keeping in view of rapid growth of the online learning platforms.<sup>8</sup>

## CONCLUSION

The growth of e-learning in India shows that, circumstantially, it has become acceptable substitute to the traditional class room learning in higher education especially under the present situations. E-Learning not only plays a major role in Indian higher education institutions but also acts as an emerging trend of education for future India. The majority of the learners believe that digital technology and flexibility are the key factors behind the development of e-learning in higher education. It has also discovered a new definition and dimension in teaching learning process and all government e-learning initiatives plays a very important role to make it available to all the students. For making e-learning more effective, it is essential to improve e-learning tools and technology and make few changes in the area of online assessment, investment in technology and faculty training and in policies and governance towards e-learning. All the educational institutions should focus on the technology and services that suit them and also security of data reliability and the personal information of teachers and learners should be secured. It can be concluded that the access to internet connectivity plays a crucial factor for growth of online education. In developing countries, e-learning raises the level of literacy and more so with the help of e-learning initiatives many opportunities can be captured and speedy development of educational sector is possible. It is also expected that if developing countries work as a joint venture on the issue of e-learning, it will be beneficial for the development of knowledge reservoirs throughout the world.

## ON THE SPIRITUAL UPBRINGING OF YOUNG PEOPLE IN THE WORKS OF AJINIEZ QOSIBAY OGLU

**Taspanova J.K\***

\*Karakalpak State University,  
UZBEKISTAN

### ABSTRACT

*This article is about the spiritual upbringing of young people in the poetry of Ajiniyaz Qosibayoglu. It is said that Ajiniyaz's aesthetic participation in fiction is a realistic description of it, a description of the real world. The secrets of the work of art, the power of inspiration, which is difficult to express in words to the inner world of man, the service to ensure that people gain a deeper understanding of the beauty of life through art, and the main content of his literary and aesthetic views as part of the poet's worldview formed.*

**KEYWORDS:** *Spiritual, Life, Truth, Poetry, Thinker, Poem, Content, Thought, Creation, Work.*

### INTRODUCTION

Ajiniyaz Qosibayoglu is a poet who stood out in the history of Karakalpak literature for his philosophical ideas through sharia. His pen-shaking, nourished by the ideas of mystical teaching, was the basis for his success in literary-aesthetic considerations. The artist's mastery of poetry, his respect for the arts, his understanding of the importance of literature in society and its spiritual function among the people were the result of his mystical achievements.

The secrets of the work of art, the power of inspiration, which is difficult to express in words to the inner world of man, the service to ensure that people gain a deeper understanding of the beauty of life through art, and the main content of his literary and aesthetic views as part of the poet's worldview formed.

Therefore, the role of Ajiniyaz literature and music in society, especially its importance in giving beautiful feelings to man, its role as a tool to unite people for the benefit of the people, to call young people to fight against injustice, tyranny and ignorance, the conditions for the creation of art. In this regard, the poet's Central Asian thinkers: Navoi, Fuzuli, Makhtumkuli and many other

sages studied the richer and more meaningful aesthetic views, grew up receiving spiritual nourishment from the achievements of Khorezmian civilization in his youth. Known.

The poet's worldview of pantheism or Sufism: that everything in the world was created by God's command, that there is nothing but God's command and its execution, was also the basis for his understanding of the poetic ability of those who possessed high artistic expression. The famous Eastern thinker and sage, Ajiniez, in his literary and aesthetic views, first thought about the emergence of poetic talent in man, and considered the talent inherent in this art as a special gift given to man by God, which is not found in all.

Such aesthetic thoughts of the poet in connection with Sufism (mysticism) are vividly expressed in the poem "No":

Көңлимдеғам, дәрдиәлем,

Сөзләсәмшықардәмбәдәм

Меңасөздинбашқаигәм

Ҳешнәмәрсеберәнйокты[3-121] -

According to the author, if poets praise something unreasonably through their poetry, and write it with false images, such works will not be read by the selective people. In his time, Ajiniez also met some poets who created works in such a way. By pointing to the works of such masters of artistic expression, and by explaining that the life of superficially written lions is short, to the poets who have acquired a formalistic narrative: "I have seen with your own eyes that you're flattering words are a disgrace when they lie," he replied. [1-67] He said that only works written in real art will last a long time, and people will not forget such works from generation to generation.

Relying on his views based on mystical philosophy, Ajiniez said that masters of artistic expression will always serve the people with their talents, create new ideas and aesthetically pleasing works for the people, and will never forget that man is given the opportunity to live only once. Because he said, "There is no time to come back," so he said to himself, "Speak, my nightingale's tongue" [3-119].

Indeed, life in this world is given to every slave only once, and no matter who a person is, our way of life will come to an end in time. In the five-day world, he favored the wise use of life, the opportunity to express the people's dreams, aspirations, goals, and the desire to revive their good intentions with the help of "sweet words." These thoughts:

Зийўарайтур, саңакелүршумөлүм,

Сөзләқазанурып, содмайынғүлиң,

Сөзләмәкдиң қалур бу қызыл тилиң,

Бир күн шыбын киби жандын айрылса [3-64]

Can also be seen in the verses.

Calling the Shari'a a "sweet word," a "sweet language," Ajiniez said that the people of fiction, realizing the greatness of their service to society, encouraged them to believe in the "spiritual property" they give to the people and to seize the opportunity in time. He exemplified his

exemplary work on this subject to other masters of the art of speech, saying, "Before the poet dies his wise words" [1-66]. Through these ideas, Ajiniezh was able to further elaborate on the works that poets create during their lifetime and the services they render to the people.

The sage thinks that only the necklaces of the poetic works written by the poets are preserved by the people and passed down from generation to generation, enjoying them continuously and aesthetically. The ideas of justice, equality and humanity in these works of art have been nourishing the people for centuries.

Шийринтиладамныңтолықуаты,

Қаларкейингигесөздіңбәленті[1-66]

Indeed, a lion rich in wise thoughts, masterfully crushed, never wears out, never loses its power to influence people spiritually and aesthetically. Through these ideas, Ajiniezh explained that the value of the artistic word, the knowledge and advice contained in it, is inalienable. The reason is that poets, with their "sweet words", inspire the people to move forward. In this way, they feel happy for the rest of their lives because they have served their people, and they agree to live with the people of their creations:

Шайырлархәзметкенпалекрауана,

Шығарғаныкетернешшезамана [1-66]

Ajiniezh correctly understood the power of sharia, that it is an inexhaustible source of spiritual nourishment for man, the greatness of its power of aesthetic influence on human feelings. According to the poet, the people should not misunderstand the meaning of the content and ideas expressed in the works of art, to appreciate and enjoy the art of poetry, to understand and accept the ideas expressed in the poem, which is of great aesthetic importance.

Шайырларсөзетерелатымтыңлаң

Душпанларкүлерлер, досларымтыңлаң,

Дослар, мәнисин аўдырмай тыңлаң

Бул дүньяға шығып хәммесин көрдим[1-67]

According to the poet, only poetry that truly reflects life, depicts the goals in the hearts of the people, makes the existing life full of beauty and enjoys it. Far from aesthetics, meaningless works, first of all, undermine the reputation of the poet who created this work, lowering his value in this art, so the masters of the word believed that the events of life should be told in a realistic, fair way.

Ajiniezh believes that a person who correctly understands the content reflected in the sharia, who understands its aesthetic meaning, will never be satisfied with the spiritual pleasure that a lion gives. These sweet words were narrated by the people, especially the young ones, who listened with love and cheered and said so. To this end, in his poem "Kerak-Need" he explained:

Emphasizing the importance of art and literature in society, the role of keeping the people in high spirits, the poet reminded that without literature, especially without poetry, life would be uninteresting, depriving people of the joy of life. The word nourishes the souls of men, strengthens them spiritually, enriches the inner world of men, and helps them to understand

better than ever that the world is beautiful. In view of this, Ajiniez encourages people who are dissatisfied with a society where there is no equality and democracy, and urges them to fight for justice in society, especially in overcoming the difficulties of the times. Considered particularly large.

Зейинэйлепхэрнышанатүшмәге,

Кеўилқойыппәрўазетипушмаға,

Ғам-қайғыў, қәпестекөңлинашмаға,

Мунда, дәркаршийринсөздиңләззети [3-124]

Ajiniez's use of fiction, especially of singing lions, is a way for a person to lift his spirits, to remember the happy times in his life, to make them happy, and to use them wisely, orderly, and wisely. He wrote: "Ashyq (lyq) penenghazzelaytir, özoaqtymdykhoshetermen" [1-62]. The fact that the poets sang this love reminded them of the feelings of love in the youth, the uplifting spirit, which makes it more meaningful from an aesthetic point of view.

In his poem "Wounds", the poet vividly expresses these thoughts, explaining that the lion is an effective tool for rejuvenating the human soul and gaining strength from life: It is an effective weapon that satisfies the aesthetic needs of the people, increases their self-confidence and gives them great hope for the future.

According to the poet, the people remember and remember the influential lion, the "sweet word" together with the wise poet who created this work. This idea was reflected in the words of Ajiniez to the girl Mengesh in the language of Mengesh: It is known that Ajiniez fulfills these requirements through the services of aesthetic pleasure to the country at weddings among the people. Indeed, he showed his talent among the people: "If a poet (s) takes a pen, he (the people) will be satisfied with the word" [1-167]

The feudal Khiva regime of the Ajiniel period and the wealthy locals witnessed the humiliation and humiliation of the masters of the artistic word as they constantly condemned the atrocities committed by the officials and demanded justice. As a result, the poets who provided the people with spiritual food lived a difficult life without respect for their dignity in society, their leaders did not pay attention to the development of creative work, and he was one of such poets. az, I saw some of Shayir with my own eyes"[1- 66].

Indeed, in the poet's time, there was no time for the masters of the "sweet word" to freely write their works and give aesthetic pleasure to the people [3-39]. Dissatisfied with such a difficult situation, the poet read:

Сәнемлерқолындатилласазедим

Хәўижгекелтиррержәнәнболмады,

Туғырымдаталпынғаналғырбазедим

Қәлпе-саядларыммаманболмады. - [3-39]

He lamented the lack of opportunity in society to further develop his poetic talent, to create more of the lions that the people love to read.

The writer knew that the people knew the value of the poets who sang the life of the people, that their goal was to share their thoughts, that the people would listen to the wisdom they created, and that the task of the wise poets was to lead their people to peace. With this in mind, Ajiniez said: "My people knew my pain and I knew it, and those who heard it said what I heard. [3-138] - he reminded.

Noting that little attention is paid to the fiction loved by the people in the life of the society, Ajiniez supported the beginning of the efforts to spread the works of the poets for aesthetic enjoyment among the people. He wished that attention would be paid to introducing the achievements of artistic expression in the country for the benefit of the people, and that the importance of sharia in society would be taken into account. He lamented the fact that the sweet words, the "property of the soul" created by the poets with talent, did not move. This was stated in the above-mentioned poem "Dao'ranbolmady":

Әлипқаддимдалдекболыпбүгилди,

Көзлеримненқанлыяшымтөгілди.

Жолбойынауігенхасылйүгимди.

Базарғаелткендейкәрұанболмады. [3-39]

The poet believed that the sweet words created by the masters of artistic expression should be spread among the people, that people should be inspired by it, enjoy it, and enjoy it aesthetically. If these requirements were not met, he explained that the poet's works were aesthetically inferior, "like an old roof," if he did not use the wise words of the poet in public relations or, where necessary, to clarify the issue.

Ийемендепуллыатаққа,

Атыбелгилиелатқа,

Жайылмасасөзихалыққа

Шайыргөнетамғамегзер [3-73]

Ajiniez was well aware that in the Russian lands he visited, the Kazakh, Nogai, and Tatar peoples were publishing the works of poets in books or publishing them in newspapers and magazines. Seeing this, the writer tried to find ways to ensure that the "property of the soul" of the poets did not remain insignificant. He sent several people to Bukhara to publish his collection as a book. [5]

Ajiniez noted that the knowledge and experience of the poet played an important role in the meaningful creation of the Shari'a, the formation of wisdom in it, and considered the worldview of the masters of artistic expression to be richer. The lion was well aware that the "sweet word" arose from the intellect and learning of the poet, and was connected with the wisdom he possessed. When a master of artistic expression has a wide range of knowledge and understanding, his works will be deeply meaningful, full of wisdom and influential. Based on these experiences, he found that his poems were created in connection with the intellect, knowledge, and spiritual zeal he possessed:

He said, "My mind was raging like a river, and I was uttering words over and over again. There was no Armenian in my heart" [2-104]. At this point, Ajiniez also draws attention to the poetic

zeal associated with the art of artistic expression, implying that this quality is related to the mind, a spiritual quality that arises from the divine in man. He explained that poetic zeal, inspiration, is an important quality for a poet, that it flows like a river and that human words come out of each other in an effective, beautiful way.

Thus, Ajiniez explained the importance of fiction and music in society, as a necessary tool in the ideological armament of the people, and many issues necessary to increase the aesthetic effectiveness of art, in particular, the relationship of content and form, realistic expression of life, the participation of art in life. And b. he said. He was able to explain the great role of these arts in shaping a person's view of the world, the ideas and feelings expressed in poetry and music, the depiction of life events on the basis of a certain worldview.

### **ABSTRACT**

*The article analyses the main sources of forming financial resources of enterprises. Furthermore, it describes some ways to improve the process of forming additional resources for enterprises. Management of financial resources of an enterprise is a set of purposeful methods, operations, levers, methods of influencing various types of finance to achieve a certain result. The financial resources of the firm are a part of the cash in the form of income and external income intended for the fulfillment of financial obligations and the implementation of the costs of ensuring extended reproduction. Financial resources and capital are the main objects of research of the firm's finances.*

**KEYWORDS:** *Financial resources, Sources of funds, Share capital, Authorized capital, Pricing policy.*

## INTRODUCTION

Management of financial resources of an enterprise is a set of purposeful methods, operations, levers, methods of influencing various types of finance to achieve a certain result. The financial resources of the firm are a part of the cash in the form of income and external income intended for the fulfillment of financial obligations and the implementation of the costs of ensuring extended reproduction. Financial resources and capital are the main objects of research of the firm's finances. In a regulated market, the concept of "capital" is more often used, which is a real object for the financier and which he can constantly influence in order to generate new income for the firm. As such, capital is an objective factor of production for the practical financier. Thus, capital is a part of the financial resources involved by the firm in the turnover and generating income from this turnover. In this sense, capital acts as a transformed form of financial resources.

The main link of the economy in the market conditions of management are enterprises that act as economic entities. They use certain types of resources for carrying out economic activities, obtaining products, income and savings: material, labor, and financial, as well as monetary funds. Many economists believe that "financial resources" are the money available to businesses. However, cash is an independent economic category. In their concept, the funds of enterprises that are on accounts in bank institutions, in cash registers, etc. are invested. They are taken into account in the active accounts of the accounting of enterprises and are reflected in the asset of their balance sheet. Financial resources are the sources of funds of enterprises that are directed to the formation of their assets. These sources can be owned, borrowed, or attracted. They are reflected in the corresponding sections of the balance sheet liability. Consequently, the financial resources of enterprises are their own, borrowed and attracted monetary capital, which is used by enterprises to form their assets and carry out production and financial activities in order to obtain the corresponding income and profit.

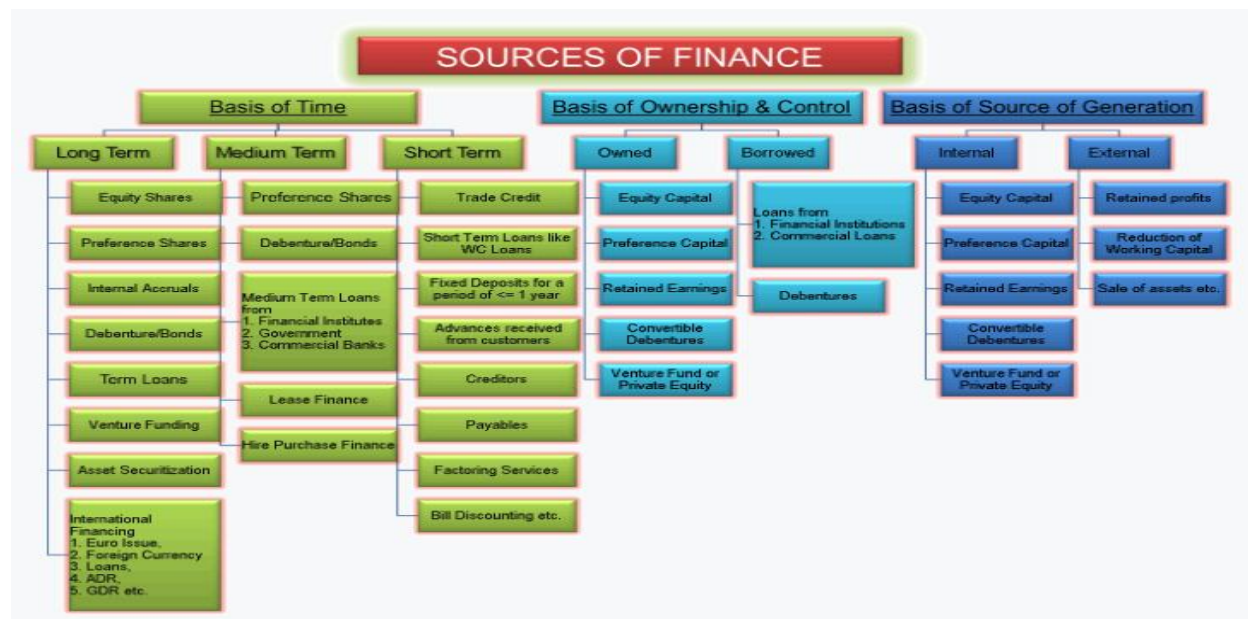

The formation of financial resources is carried out in the process of creating enterprises and implementing their financial relations in the implementation of economic and financial activities. When creating enterprises, the sources of formation of financial resources depend on the form of ownership on the basis of which the enterprise is created. Thus, when creating state-owned enterprises, financial resources are formed at the expense of the budget, funds of higher management bodies, funds of other similar enterprises during their reorganization, etc. For partnerships, this is the share capital, for limited liability companies – the authorized capital, for joint-stock companies-the share capital, for production cooperatives-the share fund, for unitary enterprises-the authorized fund. It turns out that the initial formation of financial resources occurs at the time of the establishment of the enterprise, when the authorized capital (share or stock capital) is formed.

Therefore, the authorized capital is the total value of assets fixed in the constituent documents, which are the contributions of the owners to the capital of the enterprise. The contribution to the authorized capital can be money, securities, other things or property rights that have a monetary value. The authorized capital minimally guarantees the rights of the company's creditors, so its lower limit is legally limited. The authorized capital is the main part of the company's own capital and the main source of its own financial resources. At the expense of its funds, fixed assets and current assets of enterprises are formed.

The investment attractiveness and the possibility of obtaining large loans largely depend on the size of the authorized capital of the organization. And many companies decide to increase it. When the authorized capital of the company is increased at the expense of its property, the nominal value of the shares of all participants of the company increases proportionally without changing the size of their shares. I.e., in fact, the amount by which the authorized capital increases is used to pay for additional shares placed among the participants.

The financial resources of the state and enterprises are the direct objects of financial management, that is, the management of their formation, use and flow of cash flows. The availability of sufficient financial resources, their effective use, determine the good financial position of the enterprise, solvency, financial stability, and liquidity. In this regard, the most important task of enterprises is to find reserves to increase their own financial resources and use those most effectively in order to improve the efficiency of the enterprise as a whole. Effective formation and use of financial resources ensure the financial stability of enterprises, prevents their bankruptcy.

The structure of sources of financial resources formation is important, first of all, the share of own funds in their total volume, the share of borrowed funds (over 50%) complicates the financial activities of the enterprise due to additional payments to banks (lenders), shareholders and shareholders (dividends, interest, etc.) and often makes the balance illiquid. Therefore, the financiers of enterprises are obliged to calculate the profitability of attracting borrowed funds into circulation every time. Effective financial activity of the enterprise is impossible without competent management of financial resources. So here the role of management and classification of financial resources is so much important factor in to the form the capital of enterprises. Here in Figure 2 all possible sources of formation of financial resources of the enterprise are considered in more detail:

Additional contributions may be made by the company's participants within two months from the date of the decision of the general meeting of the company's participants to increase the authorized capital, unless the company's charter or the decision of the general meeting of the

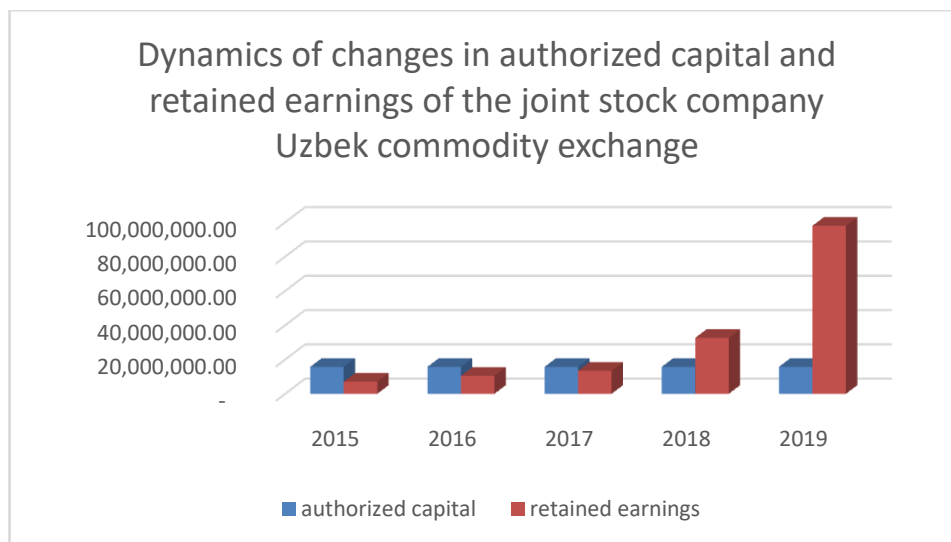

company's participants sets a different deadline. Then, no later than one month from the date of the end of this period, the general meeting of the Company must be convened, at which the results of the increase in the authorized capital are approved. In case of non-compliance with this deadline, the increase in the authorized capital of the company will be declared invalid.

The main sources of funds used to finance the economic activities of the enterprise are:

- The own funds of a commercial company (profit, depreciation, etc.) —
- Credit funds and resources of banks whose activities are based on investments;
- Allocation of budgets of various levels;
- Financial resources of various types of commercial structures (investment companies, commercial banks, insurance companies, etc.);
- Investments of foreign companies;
- Private savings of individuals;
- Other types of investments.

We can consider such trends on the example of JSC «Uzbek commodity exchange» over the past five years (Figure 1). As we can see, the authorized capital of this joint-stock company did not change, but there was a stable growth in retained earnings. This was mainly due to the reforms in the legislation of our country, as well as the introduction of innovative methods in the operation of this enterprise.

Diagram 1.

It is potentially possible to achieve a balance between the consumption of your own financial resources and those attracted from outside, between positive and negative cash flow, using the following ways:

- Sale or lease of unused or worn-out fixed assets, in order to improve the efficiency of the use of its own resources;

- Reduction of excess production stocks and non-current assets, in order to accelerate the turnover of assets;
- Establishing stricter control over the timely settlement of payments with both buyers and suppliers, in order to prevent the growth of accounts receivable;
- Use of a more effective pricing policy to promote their own products to the market in order to increase net income and increase the profitability of the enterprise;
- Forecasting of financial performance based on the actual conditions of economic activity and the availability of own financial resources.

These areas should be implemented within the framework of financial management, which is one of the most important subsystems of the overall management system of a modern enterprise and allows for more efficient formation and use of its financial resources.

Thus, the formation of the financial potential of the enterprise is one of the objects of the financial strategy, and its change is due to its effectiveness. The availability of sufficient financial resources and their effective use determine the financial viability of the organization: solvency, financial stability, and liquidity. They can arise from a wide variety of sources

## FLOWS AND DIRECTIONS IN FINE ART, ARTISTIC PERCEPTION OF WORKS

**Smaylova Gulmari Yuldashevna\***

\*Associate Professor,  
 Regional Center for Retraining of Public Educators,  
 Republic of Karakalpakstan Applied Sciences and Extracurricular Teaching Methods,  
 UZBEKISTAN

### ABSTRACT

*The article focuses on currents and trends in fine arts classes in secondary schools, such as impressionism, post-impressionism, cubism, pointilism, fascism, which have a special place in the artistic perception of works and their important place in world art and also, information on flows and directions. Freedom in creativity cannot exist outside of society; society gives its meaning to art, expressed in the language of national styles. However, national styles are not the texture of a group of artists, nor are they a guide to all events in life or a top-down guide, a code of conduct or a way of thinking, but a spiritual unity of ethnic and linguistic brotherhood and it is the result of an action that has taken place in the collaboration of historical directions.*

**KEYWORDS:** *Currents and trends, Impressionism, Post-impressionism, Cubism, Pointillism, fauvism, Avant-garde, Neo-impressionism.*

### INTRODUCTION

As in the social life of Uzbekistan, radical changes are taking place in its art. Fine art, which has a rich heritage, especially its most popular type, differs from other types of painting in its development, its ease of depicting ideas in an avant-garde way. For this reason, in the history of fine arts, works in painting, which are divided into different streams, directions and styles, and created on the basis of symbolic forms, have a special place. There are two main opposing traditions in contemporary painting. One is “retro” that is, creation based on traditional realistic rules, and the other is “avant-garde”, and that is, a combination of currents and trends that transcend the boundaries of the advanced traditions of world art is a direct result. The theoretical roots of avant-garde were not born of abstractionism and its disconnection from reality. Because even if any work does not look like real life in one way or another, it is first and foremost a

combination of events. Freedom in creativity cannot exist outside of society; society gives its meaning to art, expressed in the language of national styles. However, national styles are not the texture of a group of artists, nor are they a guide to all events in life or a top-down guide, a code of conduct or a way of thinking, but a spiritual unity of ethnic and linguistic brotherhood and it is the result of an action that has taken place in the collaboration of historical directions. There are some periods in the development of world art that the current artistic method, direction and means of depiction do not fully meet the requirements of the time. Then, as a result of the artist's desire for innovation, he creates a unique direction and style. The art of Uzbekistan has entered the XXI century with great changes. That is why in many exhibitions we see the works of artists in different styles. At the same time, there are cases of misunderstanding of such works. This is due to the fact that they do not know how to “read” works of art, analyze them, currents and directions, styles, specific schools, and do not know about them.

This is due to the fact that they do not know how to “read” works of art, analyze them, currents and directions, styles, specific schools, and do not know about them. Given that the book's audience could expand, we decided to include information about them as well. Impressionism (French: impressionism) is one of the major artistic trends of the 19th century, which emerged and developed in opposition to the rigid, dogmatic academic-salon art. In 1874, an exhibition of works by The Humiliated (as unofficial artists were called) opened in a cafe in Paris. It contained pictures that did not look like the clocks that everyone was used to, and that at first glance contradicted “real art”. A journalist called the title of his article for the exhibition “Impressers” based on Claude Monet's work “Impressions before the Sunrise”. Originally used to describe the work of a group of artists, the term was later applied to sculpture, music, literature, and other forms of art. This style is realistic in its content and enriches its possibilities. The artists tried to use color greases freely and effectively. Color has become one of the tools of general perception of existence, of its objects. From nature itself, open-air painting (in the open air) became the main creative style of the Impressionists. This enriched their palette and enhanced the impact of their work. Impressionists have emerged in the history of art as innovative artists. The peculiarity of the direction of Imperialism is manifested in the works of Claude Monet, the founder and leader of this movement, such as “Pichantarami”, “Poppy field”, when objects are wrapped in light and air, lose their appearance and will become a color balance. Although Kamil Pissarro's works, such as “The Streets of Paris” and “Montmartre Avenue”, are small in size, the composition is complete, in keeping the beauty of nature alive and vibrant, Pierre Auguste Renoir's “Mrs. Samari” and “The Naked Woman” reflected youth, physical beauty, and cheerfulness with great skill. Edgar Degas's “Dancers in Blue Dress”, “Ballet Class” and Alfred Sisley's “Little Square in Argentina” are also examples of Impressionism. Representatives of Impressionism brought light and color to the art of world painting. They paid more attention to the brilliance of the colors, the play of light and shadow, than to the outlines of the objects, to the expression of its concrete form. They created works using “pure” colors close to the colors of the spectrum, using optical interference of colors. Impressionism existed as a trend for almost 30 years, and later gave way to post-impressionism. Despite much controversy and criticism, the Impressionists were more effective. Their contribution to the further development of world art is invaluable. In particular, Impressionism has laid the foundations for many currents and trends in contemporary art. The role of the representatives of Impressionism in understanding is incomparable.

Post-Impressionism (Latin for “post” later) is a movement influenced by Impressionism, in which members of the movement work in pure colors, such as the Impressionists, in contrast to them, they sought to create generalized images through conditionality. The term is conditional and is usually used to describe the work of artists who emerged after Impressionism and marked their path in art history without its achievements. While acknowledging the achievements of the Impressionists, the movement opposed the use of etiquette as etiquette, ignoring pencil painting as the basis of fine art, and avoiding social issues. Great artists such as Vincent Van Gogh, Paul Cézanne and Paul Gauguin are great representatives of post-impressionism.

Neo-impressionism (French: neo-impressionnisme) was a movement in late 19th-century French painting. Its major representatives are J.Syora and P.Sinyak. Neoimpressionism is also widespread in Belgium (T.VanReyselberg) and Italy (J.Segantini). Its representatives worked on thematic compositions, portraits in a three-dimensional space. Neo-Impressionists developed the traditions of recent Impressionism, including optical properties, and developed methods for applying complex shades of color. In this sense, they laid the foundations of divisionism, pointillism.

The great masters of neo-impressionism overcame the randomness of impressionism, the fragmentation of compositions, and came up with a decorative solution. This style usually led to cold intellectualism, the dryness of the images. Nevertheless, the brightness and excitement of the color system of artists such as P.Sinyak, A.Kross created the basis for the emergence of fascism.

Pointillism (French “pointillisme”, “point” means “dot”) – “pointiller” - means to write, draw with dots, is one of the major trends in painting. In this style, color smears are applied in the form of small round dots with a characteristic of neo-impressionism. In some cases, this style is called divisionism (“divisionism” - French – “separation”). In the 1880s and 90s, a number of trends and trends emerged in French art. Artists such as Paul Sinyak (1863-1935), George Syora (1859-1891), and Henri Edmond Cross sought to scientifically substantiate the optical addition of colors. They tried to work their works without touching the spectral color greases in the form of small cubes or round dots. These color greases are separated, creating a new, cohesive color system through the addition of optics. This method is called point, that is, the point method. In the history of art, this style is called “pointillism” and its representatives are called “pointillists”.

George Syora's “Grant Jatt Holiday”. Paul Sinyak's “Fractions in Avignon” reveals the peculiarities of the style of pointillism. Cubism (French “cubisme”). The homeland of this movement is France, which originated in the early twentieth century, and its great representatives, such as P.Picasso, J.Brock, F.Leté, R.Belonin sought to exaggerate the informational potential of the depicted objects, to divide them into simple geometric shapes. Fauvism (derived from the French word “fauvism”, “fauve”, meaning “savages”) is a movement in French painting of the early twentieth century. This is the nickname “les fauves” (the wicked), who in 1905 year took part in the Paris show “Salon of Independence” A.Metiss, A.Marge, J.Ruo, M.Vlemink, A.Deren, R.Dyufi, J.Brek, K.It was used in relation to Van Dongen and similar artists. They sought to solve the issues of form, plasticity in a primitive (extremely simple) way, similar to medieval art, including in a way peculiar to Oriental Art.

### ABSTRACT

*The article describes the causes of HIV infection, its routes of transmission, this infection in adolescents and changes in psychological processes in adolescents under its influence, stressful situations and measures to prevent them. A person's health and life are above all. Therefore, a person should not be indifferent to his health throughout his life, otherwise he may face disappointments. Because there are different types of people in the society we live in, ming unfortunately among them the presence of people being treated for or infected with a contagious disease constantly calls us to vigilance.*

**KEYWORDS:** *HIV infection, adolescence, stress, remedy, correction, immunity, virus, mental processes, syndrome, cognitive.*

### INTRODUCTION

A person's health and life are above all. Therefore, a person should not be indifferent to his health throughout his life, otherwise he may face disappointments. Because there are different types of people in the society we live in, ming unfortunately among them the presence of people being treated for or infected with a contagious disease constantly calls us to vigilance. We want to reflect below on this very HIV infection and its classification, ways of transmission and its impact on the minds of young people. We will first consider the nature of the content of this infection.

HIV infection is a chronic infectious disease caused by the human immunodeficiency virus, which remains in the body of a sick person throughout his life. The infection is initially latent, has been shown to be transmitted vertically through breast milk.

As HIV infects a person, it attacks his or her immune system. When an organism fights a disease, it is called an "immune response," which is controlled by the human immune system. It

is a very complex system of blood cells. HIV only targets one type of white blood cell called CD4 (you can see this in the picture below). These T-helper cells play a key role in protecting the body from disease. Their main role is to direct the army of "killer cells". CD4 cells instruct these "killer cells" on what to do. Without CD4 cells, "killer cells" cannot fight, and the body's immune response becomes less effective. In addition to attacking CD4 cells, HIV can also use them as a "factory" to create its own. In this way, HIV creates billions of new cells in the body, attacking more CD4 cells in the body. In response, the body fights and produces more CD4 cells, "killer cells" and more antibodies.

Unless specific treatment for HIV infection is started, over the years, HIV will slowly destroy so many CD4 cells that our bodies will not be able to regenerate them. At this stage, the amount of CD4 cells in the blood is 200 cells / mm<sup>3</sup>. This test is called a CD4 count and is an important measure of the immune response. The normal CD4 level in an HIV-free adult is typically 800–1200 cells / mm<sup>3</sup>. Therefore, when the amount of CD4 drops to 200 cells / mm<sup>3</sup>, the immune system is actually on the trail begins to exit. After that, the person loses the ability to fight other infections that cause the disease, and AIDS develops. People living with HIV have no symptoms for a long time. You don't know if he has HIV or not. People living with HIV can look healthy and feel healthy. They can study, work and continue their daily activities. They do not show any signs for a long time. This period is called the "asymptomatic" period, ie the period without any symptoms. It can also infect other people without their knowledge. Therefore, it is important to get tested and use HIV prevention methods. In general, HIV develops slowly in the human body and symptoms appear over a long period of time. In some people, it develops rapidly, but in most adults, the AIDS stage develops in about 10 years. In people living with HIV, a number of factors, including food quality, general health, physical and mental stress, and drug use affect the developmental stages of the AIDS stage. Treatment with antiretroviral drugs may also play a role in the development of HIV infection. People with AIDS die within 1.5-2 years if left untreated. However, people living with HIV who are under medical supervision and treated with the necessary antiretroviral drugs can live a full life for many years to come. These were the reasons for the origin, and it is natural that the question arises as to how to inform the young people suffering from this disease.

What exactly to tell a child or adolescent is his age and some issues (for example, certain functions of the body and the nature of the disease).determined by understanding. It's better to be a parent. If a child has HIV, it is best to let him or her know between the ages of 7 and 11. If a child learns about the human immunodeficiency virus through the media or school, he or she may have a number of questions and comments. Therefore, the parent should inform the child in advance. This allows the child to be told that one of the family members is infected with HIV. If a parent has someone who can advise them on how to tell them what to do with their HIV infection and what words to use, it's a great light upon light. To do this, play different role-playing games with the children, during the game the children can give written or oral answers to various questions, or read a book about HIV / AIDS to them. In this regard, it is advisable to organize psychological trainings. Parents need to make sure that their children are well-informed. Young children can understand simple concepts about HIV. For example, "All people have white blood cells in their blood. They help people stay healthy. And in my blood, those cells are sick. That's why I'm often sick and tired. "Explanatory work should be carried out in the usual, simple cases, for example, when going to the doctor during the illness. The doctor

may say that the child has the ORZ virus. Parents say that they are also infected with the virus, but they are not infected with the flu in children, but with a larger virus, so the parent may feel unwell and "can't play with you" or "so for your mother or father must be hospitalized for the doctors to correct them." Can be explained. Parents should also discuss with their children that this information should be kept confidential. Children need to be made clear that this secret should not be told to anyone under any circumstances. They need to find an explanation that is appropriate for their age and explain why they should keep it a secret. For example, it can be explained that others have a negative view of HIV, which can lead to frustration. Children react differently when they find out that someone in the family is infected with HIV. Given that children's reactions can be severe for adults, it is best for parents to consult with and seek help from professionals who have been working with children and young people for a long time. In children, as well as in adults, the reaction may appear over time. They may grieve the loss of a loved one, even though he or she is still alive. It is also possible that they think that their normal family life will end. Their whole mind may be occupied with a dying loved one, they may lose their mental stability, and they may not be able to relate to their HIV-infected relative as before. Some children may be relieved if someone in the family suspects that they are infected with HIV and they hear about it from themselves. There is no need for him to torture himself with suspicions and pretend he doesn't know anything. At times, the child may appear to have no reaction to the information. In that case, you need to give him time to think about everything. If a parent or other adult provides spiritual support to the child, he or she can share his or her feelings, ask questions, and express his or her feelings. In such cases, it is very important that the child's psyche is not broken, that he does not feel like a useless person, but that he looks at life differently. Unfortunately, the psychology of all parents or children living with HIV is not always as positive as we think, it takes on a negative mood and consciousness, for which life seems to have come to a standstill. This is because it is difficult for a teenager to suddenly become aware of the disease when he is already accustomed to both psychological and physiological changes. In such a complicated situation, it is better for parents to deal with their children individually, under the supervision of a psychologist. It is important for the psychologist to talk to the child and explain with good examples that life is not over with him, that he should not be addicted, and that he can live with this disease for many years.

## STUDY OF EPIDEMIOLOGICAL FEATURES OF VISCERAL LEISHMANIASIS IN ENDEMIC AREAS OF THE REPUBLIC OF UZBEKISTAN

**Gaybullaev Fazliddin Khayriddinogli\***

\*Bukhara State Medical Institute named after Abu Ali Ibn Sino,  
 UZBEKISTAN

### ABSTRACT

*In the study of the clinical and epidemiological course of visceral leishmaniasis in the regions studied by the author, all 70 patients were children. The average age of the patients was  $5.8 \pm 0.8$ . 58.6% (41 people) were girls and 41.4% (29) were boys. In terms of regions studied, the highest rate is in Navoi region - from 3.3 to 4.1 per 100,000 population, the incidence rate increased by 1.2 times, followed by Samarkand region - by 2.2 times. In Namangan region, there was a 2-fold decrease.*

**KEYWORDS:** *Visceral leishmaniasis, sternal puncture.*

### INTRODUCTION

Leishmaniasis is a widespread disease worldwide, affecting 350 million people each year. The person is at risk of injury. Leishmaniasis is registered in 98 countries. [2] Leishmaniasis affects 700,000-1 million people a year. It is estimated that 50,000 to 90,000 cases are visceral leishmaniasis. [2]

The causative agent of visceral leishmaniasis (VL) is *L. infantum* (synonyms: Mediterranean leishmaniasis, pediatric leishmaniasis), mainly distributed in the Mediterranean, the Near and Far East, the Caucasus and Central Asia. VL is a more dangerous disease than other leishmaniasis: if the disease is not diagnosed and treated in time, it can lead to the death of the patient. The risk group includes children, especially young children. [1]

Currently, the main hearth of VL is located in Pop district of Namangan region. The first cases of the disease in Pop County have been registered since 1987. From 1987 to 2009, 95 cases of VL were observed in 9 settlements. The resurgence of BJI in the Republic of Uzbekistan requires a modern study of the spread of the disease among humans, the reservoir of infection, the clinic, the carriers. [2]

## MATERIALS AND METHODS

The study was conducted in 2016-2017 at the Samarkand Institute of Parasitology named after Isaeva, Navoi and Namangan Regional Infectious Diseases Hospitals, and during this period observed 70 patients diagnosed with visceral leishmaniasis.

All 70 patients in the follow-up group were children. The mean age of the patients was  $5.8 \pm 0.8$ . 58.6% (41 people) were girls and 41.4% (29) were boys. There was no statistically significant difference in the sex of patients in the follow-up group.

Patients were diagnosed by clinical signs and the detection of leishmaniasis on microscopic examination of the bone marrow puncture, and groups of patients were randomly selected according to their arrival at the hospital.

**TABLE (1). THE VOLUME OF RESEARCH METHODS CONDUCTED**

№	Research methods		Number of patients
1.	Clinical-laboratory	Clinical follow-up of patients	70
		Clinical analysis of blood, urine, feces when coming to the hospital and before discharge	70
		Blood biochemical analysis	70
		Sternal puncture	45
		Rk-39 test	20
2.	Statistical analysis		70

### The incidence of visceral leishmaniasis in Samarkand, Navoi and Namangan regions

The first task of the study was to analyze the data of the State Center for Sanitary Epidemiological Surveillance of the Republic of Uzbekistan for 2016-2017 in order to study the dynamics of the incidence of visceral leishmaniasis in Samarkand, Navoi and Namangan regions.

**Picture 1. The incidence of visceral leishmaniasis in the study areas (intensive)**

According to the results of the analysis, in 2017, 506 cases of visceral leishmaniasis were registered in the country. In 2016, the figure was 391. In terms of regions studied, the highest

rate is in Navoi region - from 3.3 to 4.1 per 100,000 population, ie the incidence rate increased by 1.2 times, followed by Samarkand region - by 2.2 times. In Namangan region, the number of cases decreased by 2 times.

[Picture1]

**Picture 2.** Incidence of visceral leishmaniasis among children under 14 years of age in the study areas (intensive rate)

In 2017, 44.5% (225) of patients with visceral leishmaniasis registered were children under 14 years of age. This figure is 1.2 times higher than in 2016, i.e. in 2016, the number of children under 14 years of age with visceral leishmaniasis was 188. In 2016, children accounted for 48.1% of all cases.

An analysis of children with visceral leishmaniasis in the studied regions showed that the incidence rate among children was highest in Navoi region, and in 2017 the incidence rate increased 1.5 times compared to 2016. In Samarkand and Namangan regions, the incidence among children decreased by 3.5 and 1.8 times, respectively, as in adults. [Figure 2]

## CONCLUSION

1. If you look at the cross-section of the studied regions, the highest rate is in Navoi region.
2. There was no statistically significant difference in the sex of patients in the follow-up group.
3. Samarkand region - over the years, the incidence rate decreased by 2.2 times, and in Namangan region - by 2 times.

### ABSTRACT

*The article examines new conditions demanded an immediate and essential revision of both general methodology and specific teaching methods and techniques of TFL and the main tasks of TFL in Uzbekistan at present. Furthermore, the theoretical bases of intercultural communication in teaching and learning foreign language are covered in the work. The problem of modifying the foreign language as an instrument of production combined with culture, economics, law, applied mathematics, various branches of science - with those areas that require the use of foreign languages is touched. The work presents the results of the methodological and cultural analysis of materials used to describe the process of teaching language considering intercultural communication.*

**KEYWORDS:** *Intercultural communication, Consciousness, Non-philologists, Function of a message, Informative function, Language skills.*

### INTRODUCTION

The close connection and interdependence of teaching foreign languages and intercultural communication is so obvious that they hardly need long explanations. Each foreign language lesson is a crossroads of cultures, it is a practice of intercultural communication, because every

foreign word reflects foreign world and foreign values: behind every word there is a conditioned national consciousness view of the world.

Teaching foreign languages in Uzbekistan is experiencing today, like everyone else other spheres of social life, the hardest and most difficult period of the indigenous restructuring, reassessment of values, revision of goals, tasks, methods, materials. It makes no sense to talk now about huge changes in this area, about flourishing in public interest, about an explosion of motivation, about a radical change in the attitude towards this subject for quite certain socio-historical reasons are all too obvious. New time, new conditions demanded an immediate and radical revision both general methodology and specific teaching methods and techniques foreign languages. These new conditions are the "opening" of Uzbekistan, its rapid entry into the world community, crazy leaps in politics, economics, culture, ideologies, mixing and displacement of peoples and languages, changing relations between Uzbekistan and foreigners, absolutely new goals of communication - all this cannot but to pose new problems in the theory and practice of teaching foreign languages.

An unprecedented demand needed a unique supply. Unexpectedly for myself foreign language teachers are under the attention: impatient legions of specialists in various fields of science, culture, business, technology and all other areas of human activity required immediate teaching foreign languages as a tool of production. They are not interested in any theory, nor the history of the language - foreign languages, primarily English, they need exclusively functionally, for use in various spheres of social life as a means of real communication with people from other countries.

Under the circumstances, to meet socio-historical needs of society which was previously understood completely differently and, accordingly, they did not prepare specialists. The basic principles of this directions can be formulated as follows:

- 1) Learn languages functionally, in terms of using them in different fields of social life: in science, technology, economics, culture;
- 2) summarize the vast practical and theoretical experience of teaching foreign languages for specialists;
- 3) Scientifically substantiate and develop methods of teaching language as a means of communication between professionals, as an instrument of production combined with culture, economics, law, applied mathematics, various branches of science - with those areas that require the use of foreign languages;
- 4) Study languages in a synchronous context, against a broad social, cultural background, the political life of peoples speaking these languages, that is, in close connection with the world of the language being studied;
- 5) Develop a model for the training of foreign language teachers, specialists in international and intercultural communication, and specialists in public relations.

Thus, the motives for learning the language completely changed, in connection with which it was necessary to radically restrict the teaching of foreign languages, introduce the specialty "linguistics and intercultural communication" and start training teachers staff. The main task of teaching foreign languages in Uzbekistan at present teaching language as a real and full-fledged

means of communication. The solution to this applied, practical task is possible only on a fundamental theoretical base. To create such a base, it is necessary: 1) to attach the results of theoretical works on philology to the practice of teaching foreign languages, 2) theoretically comprehend and summarize the vast practical experience of foreign teacher's languages.

Traditional teaching of foreign languages in our country was reduced to reading texts. At the same time, at the level of higher education, philologists were trained at the basis of reading fiction; non-philologists read special texts according to their future profession, and everyday communication, if there was enough time and enthusiasm for both teachers and students, was presented by the so-called everyday topics: in a hotel, in restaurant, post office, etc. Exploring these famous topics in complete isolation and absolute impossibility of real acquaintance with the world of the studied language and practical the use of the knowledge gained was at best romantic, in the worst - useless and even harmful, annoying (the topic "in a restaurant" in food shortages, topics "at the bank", "how to rent a car", "Travel agency" and the like, which have always been the main content of foreign courses of English as a foreign and domestic, written in Western patterns).

Almost exclusively one function of the language was realized - function of a message, an informative function, and even then in a much narrowed form, since from four language skills (reading, writing, speaking, listening) only one developed, passive, oriented towards "recognition" - reading. This misfortune was widespread and had quite clear reasons and deep roots: communication with other countries and their peoples was also, to put it mildly, narrowed, the country was cut off from the world of Western languages, these languages were taught as dead - Latin and Ancient Greek.

Teaching foreign languages based on written texts only reduced the communicative capabilities of the language to the passive ability to understand texts created by someone, but don't create, don't generate speech, but without it real communication is impossible. A sudden and radical change in the social life of our country, its "Discovery" and rapid entry into the world - primarily Western - the community brought languages back to life, made them a real medium of different kinds communication, the number of which is growing day by day along with the growth of scientific and technical means of communication.

Nowadays, this is why at the higher education level, teaching foreign language as a means of communication between specialists from different countries, we do not understand it as a purely applied and narrowly special problem of teaching physics language of physical texts, geologists - geological, etc. A university specialist is a well-educated person with fundamental training. Accordingly, a foreign language of a specialist of this kind is both a tool of production and part of culture, and a means of humanizing education. All this assumes fundamental and versatile language training. The level of knowledge of a foreign language by a student is determined not only direct contact with teacher. In order to teach foreign language as a means of communication, you need to create a real communicative environment, to establish a connection between teaching foreign languages and life, actively use foreign languages in living, natural situations. It can be scientific discussions in the language with the involvement of foreign specialists and without it, abstracting and discussion of foreign scientific literature, reading individual courses in foreign languages, student participation in international conferences, work as a translator, which is precisely about communication, contact, ability understand and convey information. It is necessary to develop extracurricular forms of communication: clubs, circles,

open lectures in foreign languages, scientific societies on interests, where students of different specialties can gather. So, highly specialized communication through written texts is by no means language skills are exhausted as a means of communication, a means of communication.

The maximum development of communication skills is the main one, promising, but very difficult task facing teachers of foreign languages. To solve it, it is necessary to master new teaching methods, aimed at developing all four types of language proficiency, and fundamentally new teaching materials with which you can teach people effectively communicate. In this case, of course, it would be wrong to rush from one extreme to another and abandon all the old methods: from them all the best must be carefully selected, useful, proven by teaching practice. The main answer to the question about solving the urgent problem of teaching foreign languages as a means of communication between representatives of different peoples and cultures is that languages should be studied in an indissoluble unity with the world and the culture of the peoples who speak these languages.

Teaching people to communicate (verbally and in writing), teach to produce, create, and not only understanding a foreign language is a difficult task, complicated by the fact that that communication is not just a verbal process. Its effectiveness beyond knowledge language depends on many factors: conditions and culture of communication, rules of etiquette, and knowledge of non-verbal forms of expression (facial expressions, gestures), the presence of deep background knowledge and much more. Overcoming the language barrier is not enough to be effective communication between representatives of different cultures. To do this, you need to overcome the barrier cultural. In the passage below from an interesting study by I. Yu. Markovina and Yu. A. Sorokin presented national-specific components cultures, that is, exactly what creates the problems of intercultural communication: "In situations of contact between representatives of different cultures (linguocultural communities) the language barrier is not the only obstacle to mutual understanding. Nationally specific features of the most different components of cultural communicants (features that make it possible for these components of the ethno-differentiating function) can complicate the process intercultural communication.

To the components of culture, bearing a nationally specific coloring, you can include at least the following:

- a) Traditions (or stable elements of culture), as well as customs (determined as traditions in the "socionormative" sphere of culture) and rituals (performing the function of unconscious familiarization with the dominant system in this system regulatory requirements);
- b) Everyday culture, closely related to traditions, as a result of which it is often called the traditional everyday culture;
- c) Everyday behavior (habits of representatives of a certain culture, the norms of communication accepted in some society), as well as the associated mimic and pantomimic (kinesic) codes used by carriers of some linguocultural community;
- d) "National pictures of the world", reflecting the specifics of perception the surrounding world, national peculiarities of thinking of representatives of one or another culture;
- e) Artistic culture, reflecting the cultural traditions of one or another ethnos.

The native speaker himself has specific features and culture. In intercultural communication, it is necessary to take into account the peculiarities the national character of the communicants, the specifics of their emotional makeup, and nationally definite features of thinking". In new conditions, with a new formulation of the problem of teaching foreign languages, it became obvious that a radical increase in the level of communication learning, communication between people of different nationalities can be achieved only with clear understanding and real consideration of the sociocultural factor.

Many years of practice of teaching living languages as dead has led to that the aspects of the language were in the shadow, remained unclaimed. Thus, there is a significant gap in the teaching of foreign languages. One of the most important and radical conditions for filling this gap is expanding and deepening the role of the socio-cultural component in development communication skills.

According to American linguist E. Sapir, "every cultural system and every single act of public behavior explicitly or implicitly implies communication ". Thus, we are already talking about the need for a deeper and more thorough studying the world (not the language, but the world) of native speakers, their culture in a wide ethnographic sense of the word, their way of life, national character, mentality, etc., because the real use of words in speech, real speech reproduction is largely determined by knowledge of social and the cultural life of a community speaking a given language. "The language is not existing outside the culture, i.e. outside the socially inherited totality practical skills and ideas that characterize our way of life". Linguistic structures are based on sociocultural structures. Knowing the meanings of words and grammar rules is clearly not enough to actively use language as a means of communication. You need to know how you can deeper the world of the language being studied.

In other words, in addition to the meanings of words and grammar rules, you need to know:

- 1) When to say / write, how, to whom, with whom, where; 2) as a given meaning / concept, this subject of thought lives in the reality of the world of the language being studied. How do concepts such as sociolinguistics relate to each other, linguistic and cultural studies and the world of the target language?

Sociolinguistics is a branch of linguistics that studies conditioning linguistic phenomena and linguistic units by social factors: on the one hand, communication conditions (time, place, participants, goals, etc.), on the other parties, customs, traditions, features of social and cultural life speaking collective. Linguistic and regional studies is a didactic analogue of sociolinguistics, developing the idea of the need to merge teaching a foreign language as a set of forms of expression with the study of social and cultural life native speakers.

Sh. Usmanova and G. Rixsieva, Uzbek linguists have formulated this essential aspect of language teaching as follows: "Two national cultures never completely coincide, - this follows from the fact that each is composed of national and international elements. Aggregates coinciding (international) and divergent (national) units for each pair of compared cultures will be different ... So no wonder that you have to spend time and energy on mastering not only the plan of expression some linguistic phenomenon, but also a content plan, i.e. must be developed in the consciousness of students of the concept of new objects and phenomena that do not find analogy neither in their native culture nor in their native language. Therefore, we are talking about the inclusion elements of regional studies in language teaching, but this is the inclusion of

a qualitatively different kind in comparison with general geography. Since we are talking about connection in the educational process of the language and information from the sphere of national culture, this kind teaching work is proposed to be called linguistic and cultural teaching".

The world of the target language as a discipline inextricably linked with teaching foreign languages, focuses on the study of the aggregate in non-linguistic facts (in contrast to the two previous concepts), that is, those sociocultural structures and units that underlie language structures and units and reflected in these latter. In other words, the scientific discipline "the world of the target language" is based on study of the socio-cultural picture of the world, reflected in the linguistic picture of the world.

The picture of the world surrounding native speakers is not just reflected in the language, it and forms the language and its carrier, and determines the features of speech use. Here why it is impossible to learn the language as a medium without knowing the world of the target language generally. It can be studied as a piggy bank, a way of storing and transmitting culture, then is like a dead language. A living language lives in the world of its speakers, and learning it without knowledge of this world (without what is called differently in different scientific schools: background knowledge, vertical context, etc.) turns a living language into dead, that is, deprives the student of the opportunity to use this language as a means of communication. This, apparently, explains all the failures with artificial languages. Even the most famous of them, Esperanto, does not receive spread and is doomed to die primarily because there is no life-giving soil - carrier culture Relationship between linguistic and regional studies.

"Correlation of the concepts of" cultural linguistics" and "Linguistic and cultural studies" seems to be quite difficult today, and theoretical comprehension is fundamentally important for a number of reasons, primarily because all the growing interest in the problem "Language and culture" makes it is necessary to clarify sources, parameters, research methods, concepts, included in its scope of terminological inventory. Appeal to linguoculturology is not a betrayal of the already traditional the linguistic and cultural aspect of teaching the Russian language, methodological sound the ideas of which we accept, but caused and conditioned, first of all, by the urgent needs and reassessment of some linguo-methodological values of the problem "Language and Culture".

Studying the world of native speakers aims to help understand the features speech usage, additional semantic loads, political, cultural, historical and similar connotations of units of language and speech. Special attention given to realities, since a deep knowledge of realities is necessary for the correct understanding the phenomena and facts related to the everyday reality of peoples, speaking the given language. At the basis of any communication, that is, at the basis of verbal communication as such, lies the "shared code", mutual knowledge of realities, and knowledge of the subject communication between participants in communication: speaking / writing and listening / reading. To understand the linguistic facts of this excerpt from the sketch (not fiction works with his copyright liberties and focus on the function of influence), you need knowledge of realities, socio-cultural background, otherwise understanding the text becomes difficult, and hence, communication.

To clarify the meaning of the following passage from D. H. Lawrence's story, you need to have extensive background knowledge: to know what in a given society is involved in the concept of

"feminine woman", to be able to understand literary and biblical allusions (conditioned by the culture of a given speaking group):

He imagined to himself some really feminine woman, to whom he should be only fine and strong, and not for a moment "the poor little man". Why not some simple uneducated girl, some Tess of the D'Urbervilles, some wistful Gretchen, some humble Ruth gleaning an aftermath? Why not? Surely the world was full of such (Highlighted by me. - S. T.) \*. \* It imagined a truly feminine woman for whom he would always only beautiful and strong, and not at all a "poor little man." Why not some simple, uneducated girl, some kind of Tess D'Urberwills, some languid Gretchen or humble Ruth gathering ears of corn? Why not? Surely the world is full of these. So, in linguistic phenomena, the facts of the social life of a given speaking collective is of importance of studying. Tasks of teaching a foreign language as a means of communication inseparably merge with the tasks of studying the social and cultural life of countries and peoples speaking this language.

There is no human society without culture and there is in each culture a specific capital which links together the members of a particular community. Teaching about one's own culture, like the theoretical endeavor to lift the Globe with a lever, depends critically on the choice of a starting point: if one proceeds from too close, the sweep of force is suspended; if, alternatively, the levering bar is left too far, the object escapes the tool.

### **ABSTRACT**

*As time goes on, people and their needs and requirements will change. This is an axiom that does not require proof. We can observe the same historical process in the study of foreign languages, as well as in various aspects of our lives. Thousands of years ago, the need and interest in foreign languages such as Arabic and Persian developed in our country, our great scholars organized their scientific research in these languages, and our ancestral poets and writers created masterpieces in these languages and left an immortal legacy.*

**KEYWORDS:** *Pedagogical technologies, English, Modern education system.*

### **INTRODUCTION**

All this is the need of that time, the demand of that time. So what is the state of the state's language policy today, in the first quarter of the 21st century? What is the impact of global development, new discoveries, especially the Internet, on language learning? Which foreign

languages should we pay more attention to in the 21st century, and for what purpose? By the way, the development of the period, the process of globalization taught several foreign languages to young people requires them to know. Based on these needs, the Resolution of the President of the Republic of Uzbekistan dated December 10, 2012 "On measures to further improve the system of learning foreign languages" laid the foundation for a new stage in the policy of teaching foreign languages in the Republic.

### **THE MAIN RESULTS AND FINDINGS**

The main goal of the system of continuing education is to train highly spiritual, competitive and intellectually gifted specialists. Following the implementation of this decision, the process of applying modern pedagogical technologies in the education system has become widespread. Today, scientific and technological progress requires the introduction of new modern technologies in all areas, including education. Therefore, the National Program of Personnel Training emphasizes the need to provide the educational process with advanced pedagogical technologies, and new models of education are being created. Research conducted by the authors in Uzbekistan has shown that citizens of a free, enlightened and democratic state should have the following social qualities: · Smart - able to think independently; · Politeness - has all the qualities of our nation; · Hardworking - labor has become a social need; · Knowledge - the ability to acquire a large and deep knowledge of religious, secular and cosmic knowledge and apply them in life; · Healthy - physical, mental and social health; · National pride - possessing the material and spiritual heritage of our ancestors, being proud of them and contributing to their enrichment; · Patriotic - a person who works selflessly for the Motherland, for the people, who is able to protect them and, if necessary, sacrifice his life for them; · Humane - one who wishes only good to the human race and does good deeds for them. · Brave and courageous - one who bravely enters into every task and completes it with courage. These ten social qualities stem from the needs of society are state orders and should be used by everyone working in the field of education as a common methodological framework. Achieving the goals Scientists of the Republic R.Kh. Jorayev, U.N. Nishonaliyev, A.A.Parpiyev, N.S. Saidakhmedov, MVKlarin, M.Dadahojayev, as well as Kazakh scientists MJAristanov, JSKHaydarov in their research tried to explain the essence and significance of the concept of "pedagogical technology". The introduction of advanced pedagogical technologies in the education system of the Republic of Uzbekistan will further enrich the content of the training process in the educational institutions of our country and bring it into line with world standards, as well as the ideology of independence, Uzbek folk pedagogy and national identity. Became the basis for the creation of mother-specific and appropriate pedagogical technology. The demand for learning foreign languages has become a necessity at the same time. Changes in the socio-economic spheres of the country, rapid development require the introduction of new pedagogical technologies in the educational process, the need to find and apply modern methods of language teaching in the educational process.

Research conducted by the authors in Uzbekistan has shown that citizens of a free, enlightened and democratic state should have the following social qualities: · Smart - able to think independently; · Politeness - has all the qualities of our nation; · Hardworking - labor has become a social need; · Knowledge - the ability to acquire a large and deep knowledge of religious, secular and cosmic knowledge and apply them in life; · Healthy - physical, mental and social health; · National pride - possessing the material and spiritual heritage of our ancestors,

being proud of them and contributing to their enrichment; · Patriotic - a person who works selflessly for the Motherland, for the people, who is able to protect them and, if necessary, sacrifice his life for them; · Humane - one who wishes only good to the human race and does good deeds for them. · Brave and courageous - one who bravely enters into every task and completes it with courage. These ten social qualities stem from the needs of society are state orders and should be used by everyone working in the field of education as a common methodological framework. Achieving the goals Scientists of the Republic R.Kh. Jorayev, U.N. Nishonaliyev, A.A.Parpiev, N.S. Saidakhmedov, MVKlarin, M.Dadahojayev, as well as Kazakh scientists MJAristanov, JSKhaydarov in their research tried to explain the essence and significance of the concept of "pedagogical technology". The introduction of advanced pedagogical technologies in the education system of the Republic of Uzbekistan will further enrich the content of the training process in the educational institutions of our country and bring it into line with world standards, as well as the ideology of independence, Uzbek folk pedagogy and national identity. Became the basis for the creation of mother-specific and appropriate pedagogical technology. The demand for learning foreign languages has become a necessity at the same time. Changes in the socio-economic spheres of the country, rapid development require the introduction of new pedagogical technologies in the educational process, the need to find and apply modern methods of language teaching in the educational process.

Leading scholars and methodologists have sought modern pedagogical technologies, methods and techniques of foreign language teaching.

The advantage of teaching a foreign language on the basis of pedagogical technology over previous methods is, firstly, that it considers the educational process as a whole, the purpose of education, its content, methods and means of teaching, design the stages of education, control the educational process and in the design of its project, bringing its components, such as the evaluation of learning outcomes, into an interdependent system. Second, it is not about students memorizing the knowledge they have been given, but about doing practical work at the end of the teaching and learning process. Pedagogical technology is the system that, based on the needs of society, effectively defines the social qualities of a predetermined person and sees it as a system of goal-oriented learning process. Is a technology-based educational activity that monitors the impact of a teacher (educator) on students in a particular sequence in a given setting and evaluates learning outcomes using teaching aids. Technology is derived from the Greek word "techne", which means skill, art and "logos" - the word, the meaning of education, and an ambiguous translation of the English word "an education technology". It should actually be translated as "Educational Technology". The introduction of technology into education has been going on for centuries. Until the late 50s, pedagogical technology was associated with the creation of a technical environment for traditional education, the construction of a set of automated tools. Today, educational technology is considered as a field of pedagogical sciences. Human psychology plays an important role in the development of technology. Historically, educational technology has operated and evolved tactically. Technology is a set of knowledge about the methods and means of implementation of processes, as well as the qualitative changes that occur at the facility. Educational technology is a set of concepts that includes: - Have an idea of the planned results; - A diagnostic tool to help learners determine their current status; - A set of training models; - Criteria for selecting the optimal model for specific conditions. Pedagogical methods do not depend on the tools used. Even the method, which is considered the best

technology, if it does not give a positive result, it is not a good way. Conversely, a simple question-and-answer method can significantly increase the effectiveness of education. There are specific aspects of the teaching process in the education system, and the guarantee of effective results is mainly based on pedagogical technologies.

In order to shed light on the essence of pedagogical technology, we consider it expedient to dwell on the definitions given by pedagogical didactics. "Pedagogical technology is a consistent method of creating, implementing and defining all processes of teaching and learning in technical and human factors and through their joint efforts, aimed at accelerating the forms of education" (UNESCO). "Pedagogical technology is the process by which a teacher (educator) influences students through the use of teaching (educational) tools under certain conditions, and as a product of this activity, the intensive formation of pre-defined personality traits in them." "Pedagogical technology is a social phenomenon that intensively shapes the pre-defined social qualities that are necessary for society as a result of the systematic influence of the teacher on students in certain conditions with the help of teaching aids." "Pedagogical technology as a factor in managing the pedagogical process has the following meaning: PT - organization of the educational process on the basis of design, features that guarantee its effective results, (pedagogical skills, pedagogical tact, pedagogical style, pedagogical accuracy) innovative features of pedagogical activity, high professionalism-acmeology, analytical and critical approach-reflection) is a systematic category that fully determines the creation and implementation of new forms and methods of education. Methodological qualities of pedagogical technology include: - Technological scheme; - Scientific basis; - Systematic; - Management; - Efficiency; - Repetition.

A new modern approach to the application of new technological processes and new modern methods of teaching in the educational process. The purpose of foreign language teaching is not only to educate students and develop certain, speaking skills, but also to development, increasing interest in the foreign language they are learning, activating the internal capacity of their memory, and building students' confidence in their own power. As you know, the educational process is complicated. Foreign language lessons include the stages of developing relevant speaking skills through the presentation of new learning material, its practice through a variety of exercises, and its application to a variety of speech situations. A number of interactive methods can be used to increase student engagement in the classroom. The term interactive method is derived from the English word "interactive", which means to increase students' internal activity. There are a number of types of this method, some of which are currently widely used interactive methods such as "brainstorming", "business games", "pinboard", "cluster", "sinkway", "cubic technology", role-playing games. Appearances are aimed at increasing the activity of students in the educational process. In interactive teaching, group teaching, small groups of 3-5 people are effective. Summarizing the above, it can be called "INNOVATIVE TECHNOLOGY". Innovative technology is a way to improve knowledge through the use of factors that increase the effectiveness of education, the design and implementation of various pedagogical processes. Its main purpose is to make innovations and changes in the activities of teachers and students in the educational process, which requires the use of interactive methods. Interactive methods are based on the active, free and independent thinking of each learner involved in the learning process. Using these methods, learning becomes a fun activity. When using interactive methods, the ability to work independently develops.

It is known that today there are more than a hundred types of interactive methods, most of which have been tested and given good results. The main conditions for the introduction of educational technologies in the educational process are: - The development of free communication of each student in the acquisition of knowledge in the teaching process; - The main focus in the educational process is to increase the activity of the learner and the use of methods and modern teaching aids that increase the activity in the classroom. Classes conducted on the basis of pedagogical technology nurture the desire of young people to express their attitudes to important life achievements and problems, give them the opportunity to think, to justify their views. Pedagogical technologies are innovations and changes in the pedagogical process and the activities of teachers and students, in the implementation of which mainly interactive methods are used. In interactive lessons, the teacher directs the activities of students to the purpose of the lesson. The peculiarity of these methods is that they are carried out only through the joint work of teachers and students. The process of such pedagogical cooperation has its own characteristics, such as ensuring that the student is not indifferent during the lesson, independent thinking, involvement in creativity and research, and the continuity of interest in science in the educational process, the teacher and ensures that student collaborative activities are organized on a regular basis. The main basis of pedagogical technology is the joint achievement of the teacher and the student from the set goal to the guaranteed result. Each lesson, topic, subject has its own technology. Pedagogical technology in the learning process is an integrated process in a clear sequence, which is focused on a single goal, carefully designed and guaranteed results, based on the needs and interests of the student. Pedagogical technology, in general, is based on reproductive (copying) teaching, in which the learning process allows students to master the actions of typical situations directed. A distinctive feature of pedagogical technology is that it designs and implements the learning process that ensures the achievement of learning objectives. The technological approach is primarily expressed in a practical instructional structure that allows the implementation of the designed results, rather than a description. The main way to understand pedagogical technology is to focus on clearly defined goals, to establish regular interaction with the learner, to teach through the learner's behavior, which is the philosophical basis of pedagogical technology.

## CONCLUSION

Interaction should form the basis of pedagogical technology and fully cover the learning process. In the process of reproductive education in pedagogical technology, the lesson is divided into specific sections, each of which shows the results that students need to know. Modern pedagogical technology cannot be considered as a separate branch of pedagogical science or as a system aimed only at optimizing educational practice. Pedagogical technology reflects the activities within the framework of combining theoretical and practical research in this area. Today, with the development of science and technology, the boundaries of human activity are expanding exponentially, new technologies are entering. Qualitative changes indicate that there are new technical, informational, audiovisual, audio tools that require new methods and introduce a certain feature of it, which is becoming an integral part of the educational process. Becomes a reality.

**ABSTRACT**

*Extensive work is being done in our country on the use of pedagogical and information technologies in the educational process. The scientific and theoretical basis of this problem, the specifics of each pedagogical technology have been developed and sufficient experience has been accumulated. Relevant organizations of foreign countries are closely assisting in the introduction of pedagogical and information technologies in the educational process. It is known that in the implementation of this direction was focused on the study of the first foreign language.*

**KEYWORDS:** *E-learning resources, foreign language lessons, requirements.*

**INTRODUCTION**

The use of the media in the study of a foreign language, especially English, and the development of programs in it also give results in the implementation of the requirements. Of course, all this is a modern program with a set of facilities that can be used in the learning process. An analysis of modern educational e-publications has shown that they have a complex structure and need to be classified. The classification of e-learning publications is based on the general methods of classification of both educational and electronic and software tools. The main type of learning process is the lecture. A lecture is a form of organization of the educational process, which forms the knowledge that is the guiding basis for the learning material to be mastered by students.

---

## THE MAIN RESULTS AND FINDINGS

There are three main types of lectures: introductory lectures, informational lectures and review lectures. Depending on the subject and didactic purposes, the following forms of lectures can be used: problem lectures, visual lectures, press-conference lectures, etc. Electronic educational publications used in lectures should enrich the narrated material with videos, audio animations, help the speaker to demonstrate complex processes. The following types of electronic textbooks can be used to organize the study of theoretical material:

- Video lecture. The lecture is recorded with the help of a video camera. The advantage of this type of lecture is that it can be heard over and over again and can be stopped in difficult places.
- Multimedia lectures. Interactive educational programs can be created for independent learning. When using such textbooks, each student can learn a trajectory that is convenient for him, the optimal pace of learning. And can choose the method. The mastery rate can also be increased in many ways by means of controls.
- Traditional publications: electronic lecture texts, basic abstracts, manuals for studying theoretical material, etc. Students' independent education based on information technology includes: work with electronic textbooks, watching video collections, listening to audiocassettes, working on computer simulators, computer testing, etc. [2, 21]. At present, all types of knowledge control can be carried out on the basis of specially developed computer programs with the help of e-learning publications. In particular, the use of e-learning publications in the current and intermediate control system is highly effective. Computer test programs are not only a means of self-monitoring for learners, but also take on the role of current and intermediate control. Such a test program can be an independent program that cannot be changed, or it can also be a modified shell program supplemented by an anthill. Teaching practice is important in history education. The computer serves as a tool for simulation models, simulators. With the help of computer programs can be organized trainings on archeological excavations, collection of ethnographic materials, reconstruction of monuments, and acquaintance with archival documents. Computerization of archives and museums Educational-methodical complexes play an important role among the electronic means of education. OUMs contain theoretical material as well as practical tasks, tests, applications, etc. OUMs can be presented as digital and analog multimedia courses consisting of structured and logically connected didactic elements. Modern educational multimedia course - video and not only text-based interactive material enriched with audio materials, but also educational materials should be placed in different forms and on different media. The multimedia course is a means of complex interaction with the learner through illustrative, informative, simulative and control parts. The basis of OUM is its interactive part. This part is realized only on the computer. It includes: -electronic textbook; - electronic reference book; - training complex; - a set of examples and problems; - electronic laboratory practicum; - computer test system. The e-textbook is designed for independent study of theoretical material, and its hypertext structure allows you to work with an individual educational trajectory. An electronic chrestomathy is a collection of texts that complements a textbook. The chrestomathy may include documents, works of art, and excerpts from them. The methodical instructions, which explain the features of the texts included in the chrestomathy, are important for the reader. These guidelines provide a link between the text and the study material and guide students in preparing for the workshop. The e-reference allows the user to quickly receive the necessary information in a compact form at any time. Typically, an e-reference consists of a list

of terms, and each element of the list is hyperactive, ie as a result of its activation, a hyperlink with the content, translation or interpretation of the term is referenced. Is a necessary condition. Internet resources in history education. The number of Internet resources on the Internet is growing among e-learning publications. The number of Internet resources on historical topics is also increasing. Gradually, databases of historical resources, special directories and search engines have emerged. Working with network scientific and educational resources has its own characteristics and requires skills in working with the network, browsers, and knowledge of how to search, process and store information on the Internet. A historian who wants to work on the Internet the first problem is the problem of information retrieval. The next challenge is to determine if the resources found are suitable for educational use. There are many historical resources that cannot be tested for compliance with state education standards. In the process of studying a voluntary course, there may be a problem that the textbook obtained from the Internet does not correspond to the curriculum of the educational institution. The information obtained from the Internet is very diverse in nature, the software needed to process it and there are many formats of text, graphics, and audio-video information. We will consider some ways to solve these problems. What to look for? - In answering this question, the historian in his educational activity refers to the curriculum.

## CONCLUSION

It is also useful to identify the nature of information that differs in structure, type of presentation, purpose, and form of presentation. How do I search? - To find the necessary information on the Internet, you need to search for resources that contain this information. Such information can be found in the databases of search engines, search directories. The main Russian search engines include rambler, yandex, apart, google. In such systems, the search is based on queries expressed in the form of text. In practice, it is advisable to use more than one search engine, because the databases of search engines are different from each other. Special historical directories can exist as part of a search, information or research resource, or as an independent resource. Unlike search engines, directories are more likely to live up to the expectations of users because the search is done within materials on a pre-selected topic. The role of basic multimedia devices in foreign language teaching is significant. In the implementation of these processes, visual materials and audio devices further strengthen the activation of the learning process. Although the development of technology in the teaching of multimedia means, that is, the beginning of the twentieth century, we can see that the effectiveness of its results is satisfactory.

**ABSTRACT**

*The article analyzes the results of a study of the adaptive systems of the body on the example of the physical development of children under the influence of environmental factors in the South Aral Sea region. The data obtained on the state and growth dynamics of girls make it possible to conclude that they do not have noticeable differences depending on the area of residence. A general regularity was revealed - some lag in the growth of the body of children living in different regions of the Aral Sea region.*

**KEYWORDS:** *Children's population, Physical development, Pesticide load, Environment.*

**INTRODUCTION**

In the world, the problem of environmental protection in the interests of preserving human health, in particular, reducing the influence of the negative consequences of exposure to harmful factors, remains a fundamental task of environmental research. In recent decades, the state of the air environment, water sources, and soil has become the most ecologically unstable. The quality of human health primarily depends on the quality of the environment in which he lives. The most urgent problems of environmental pollution in industrial centers, where more than 50% of environmentally hazardous areas are concentrated. The most serious consequences of the Aral

Sea catastrophe can be considered as the pollution of the natural environment under the influence of anthropogenic factors, which has led to widespread salinization of soils used in agriculture.

The main factors that transform the natural environment are a decrease in water supply to the territory, an increase in land salinity and a general aridization of conditions. The reason for the activation of these processes over the past 30 years was the coincidence of poor regulation of the water use system and the rapid increase in the scale of land use.

The drying up of the Aral Sea has changed the climatic situation in the region. Initially, the Aral Sea was a kind of temperature and humidity regulator [4, 5]. The main elements of the climate that determine the intensity of physical evaporation, transpiration, the degree of moisture, the recurrence of droughts, and the deflation of sandy loamy-sandy substances are air and soil temperature, precipitation, air humidity, drought, and wind. The dried-up bottom of the Aral Sea now extends over 4.5 million hectares. Two thirds of this area is salt marshes, saline sands and soils. According to experts, the drained bottom of the Aral Sea has turned into a powerful source of salt and dust removal. From this area, in all directions from the Aral Sea, annually up to 75 million tons of sand and dust are carried out. In recent years, there has been an increase in dust storms in the region by 4-10 times [2, 10]. At the same time, a significant part of aerosols of marine origin is contained in the atmosphere layer up to 1000 m; above 2500 m, such particles are practically absent. As you know, the smallest particles of salt and dust at low speeds can be transported over long distances, and larger particles fall out at a short distance from the source of removal [2].

### **THE MAIN FINDINGS AND RESULTS**

In the soils of Karakalpakstan, organochlorine pesticides are detected mainly hexachlorocyclohexane (HCH). From a soil sample contaminated with pesticides, 10 indigenous cultures of microorganisms - active destructors of HCH were isolated and a series of experimental works was carried out to identify the ratio of the isolated crops to various concentrations of lindane (250, 500, 750, and 1000 mg / l). It was found that the maximum amount of pesticides (by assortment) was used in 1990 (41 items), the lowest amount in 1992 (13 items in total). The most intensive use of pesticides in Karakalpakstan was observed in 1987. Then more than 3 thousand tons of 100% of the active ingredient were introduced into the external environment [6, 9].

As you know, physical development is one of the indicators of the health of the child population. Growth and body weight indicators are an important indicator of the physical development of children and adolescents [3, 8]. They are used to assess and interpret the health status of the child population. The growth and development of children remain the main indicators of their health status. Changes in growth processes, the ratio of the child's body weight and length, growth arrest are the main or even the only manifestations of chronic diseases [3]. At the same time, the physical development of children serves as the basis for predicting pathology.

Despite numerous studies on the problems of studying the adaptive systems of modern children, however, a number of issues were not discussed, or were not considered comprehensively, in a narrow range of ontogenesis. In recent years, most of the works of modern researchers are devoted to the physical development of children [1, 8], and the results of complex functional studies are much less represented.

The physical development of children and adolescents is currently being studied in various directions, and one of the topical problems continues to be the study of its features in unfavorable environmental conditions of residence, for example, in the Southern Aral Sea region. The least studied are the issues of individual variability of growth processes. At the same time, the study of the physiology of growth seems to be very important, especially in the case of deviations from the average indicators of body length, since lagging, and sometimes acceleration of growth rates can be the only symptoms of a fairly wide range of diseases [7].

The term “physical development” is usually understood as a complex of functional indicators, which determines the stock of physical strength of the body and its functional reserves [1, 3]. With regard to children, the concept of physical development should be expanded by assessing the processes of growth and development of the body, therefore, physical development in this case is understood as a complex of morphological and functional signs that characterize the age level of a child's biological development. There are two known periods of increasing growth rate: the first falls on the period from 4 to 7 years, the second - at a later period: for girls 10-11.5 years old, and for boys 13-15 years old. The first increase in the growth rate is called the half-growth jump the second is called the pubertal jump [3, 8].

A significant increase in body weight in boys and girls is noted during puberty. During this period (from 10 to 15 years old), the body weight of girls is greater than the body weight of boys, and from 15 years old, the rate of weight gain in boys is higher. Boys experience the most intense weight gain between 4-5 and 12-15 years of age. In girls, the most intense weight gain is observed between 4-5 and 10-11 years. The data of official statistics and scientific research indicate that negative trends in the change in demographic indicators in the Republic of Uzbekistan, including the health status of the child population, persist.

The least studied is the nature of the manifestation of the morphological and functional characteristics of the development of children with different growth rates living in different regions of the South Aral Sea region (by the example of the Republic of Karakalpakstan), which is characterized by a peculiar ecological background. Knowledge of the individual capabilities of a child and predicting his ontogenesis is a necessary prerequisite for successful education and upbringing without prejudice to health.

It is known that linear, volumetric and other parameters of an organism are closely related to its functional characteristics. Parameters such as height, body weight, age and gender are the argument, and the basal metabolic rate is their function [1]. Therefore, it is very important to know the dynamics of height and weight - the main indicators of a child's development.

When analyzing the annual anthropometric indicators, we came to the following results. At the age of 6, regardless of where they live, girls are slightly lower than the standard values (Fig. 1). As can be seen from the diagram, the growth of girls 6-8 years old from the southern regions slightly exceeds the growth of girls from the northern regions. The trend line is also similar for the two groups of indicators. The normative data are 111-120 cm, and in relation to them, the growth of girls is less by 4 and 6%, respectively, in the indicated areas. The increase in body length by the age of 7 was 7.3 cm, which, although it is within the limits of the existing norms, in spite of this, the growth of the body still remains closer to the lower limit of the physiological norm. The indicated dynamics persists annually throughout the analyzed period of the growth of

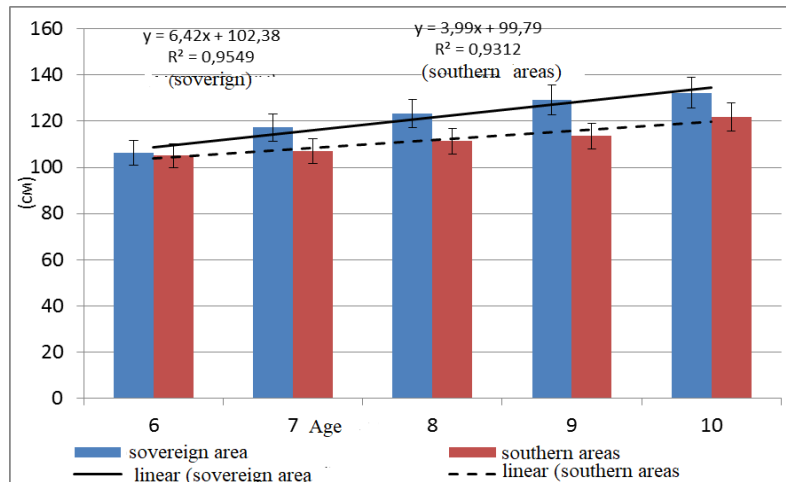

children, i.e. all years up to 10 years. By this age, the lag in body length in relation to the standard values was 4 and 6%, respectively, in the two surveyed groups.

The data obtained on the state and growth dynamics of girls make it possible to conclude that they do not have noticeable differences depending on the area of residence. There is a general pattern - some lag in the growth of the body. The body length values of girls correspond to the minimum standard age indicators (Fig. 1). The annual increase in body length also corresponds to the lower limit of the norm. Probably, in this regard, attention should be paid to the height values of girls at 6 years of age. With normative values from 111 to 120 cm, the indicators for the southern regions are lower by 4%, and for the northern regions - by 6%.

**Fig. 1 Growth rates of girls (cm) living in different areas South Priaralie ( $M \pm m$ )**

The obtained values of the height of boys from 6 to 10 years old are presented in Fig. 2, from which it follows that they are somewhat lower than the existing normative ones. As can be seen from the diagram, the most pronounced lag is traced among children born and living in the southern regions (group 2). As for boys from group 1 (northern regions), there are no noticeable differences in years between them. Growth retardation is traced as a general pattern and ranges from 5 to 8% (respectively). As for the value of the annual increase in body length, it is for children from the northern regions within the existing age norms, and for boys from the southern regions, it is mainly below it. By the age of 10, the body length of boys from the southern regions is below the standard by 13% and less than the minimum value - 141.8 cm (norm 155-170 cm).

**Fig. 2. Growth rates of boys (cm) living in various regions of the Southern Aral Sea region ( $M \pm m$ )**

Attention is drawn to the initial inconsistency of the body length in boys with the existing norms, that is, by the age of 6. The gap was 13% in the southern regions and 7% in the northern regions, respectively.

## CONCLUSION

Summarizing the data obtained on the anthropometric indicators of children from different regions of the Southern Aral Sea region, which differ in the degree of environmental pollution, it can be noted that there are no significant differences in gender in the development of body length between children from the northern regions of Karakalpakstan. Boys from the southern regions are an exception. They have deviations in growth, which is below the average values of the norm by 13-16% (from other regions by 4-9%). A possible reason for this is the fact that the value of the annual body gain at the age of 7, 8 and 9 years is less than the existing normative ones.

The very dynamics of the processes of growth and development of children from different regions of the Aral Sea region differs little from each other and from the normative indicators, corresponding to their low values. The existing differences in age values from the normative ones are related, in all likelihood, to the peculiarities of the early period of ontogenesis, which lead to the above characteristics of the growth and body weight indicators of children and adolescents born and living in the Aral Sea region. When developing modern problems of adaptation and solving problems in the field of preserving the health of the younger generation, at least a three-dimensional assessment system is needed, which should include medical and biological, environmental and social criteria.

### ABSTRACT

*In this article customs and ceremonies of population of Jizzakh oasis associated with the birth of child comparatively analyzed by field ethnographic researches, personal experiences, sociological questionnaires and scientific publications on the subject. As well as, ethnocultural features of customs and ceremonies of population of Jizzakh oasis associated with the birth of child were pointed.*

**KEYWORDS:** *Tradition, Custom, Ceremony, Chilla, Chilla dress, Belly hair, Navel, Umbilical cord, Omai mother, Cradle wedding.*

### INTRODUCTION

Practical works are being done for restoring ancient history and rich cultural heritage of people during the years of Independence in Uzbekistan and delivering them to the world. In this regard, with another historical ethnographic regions of Uzbekistan Jizzakh has also an important role, geographical and natural advantages had been reasons to forming of different cultures and traditions during thousand years. Furthermore, spiritual and material culture of population of the region has some local exceptions which are the product of historical and ethnocultural processes that have taken place in the region over many years.

Variety family and community ceremonies which are held in Uzbekistan distinguish with common and private features. When analyzing comparatively on a Republican scale, although

ceremonies and customs which are held in all regions look similar, there are some specific situations where this process is based on the peculiarities of the population's way of life, daily activities, aspirations and attitudes related to local traditions. This is because the emergence of traditions, customs and rituals and their important place in the social and religious life of the people is a complex process and is influenced by several factors. That is, national identity is based on socio-economic, political processes, natural and geographical location, mutual ethnocultural relations, religious affiliations of a long historical period, and it is on the basis of the spiritual and psychological views of the people, ancient traditions and customs [Ashirov A. 2014. 189 p].

Family ceremonies organized by the people of the Jizzakh oasis have both common Uzbek and private aspects.

While all activities from birth to death are called lifelong rites, in social anthropology they are called passage rites.

According to French ethnologist A. VanGennep, passage rites divided into two groups:

- a) Rituals related to the time of birth, puberty, engagement, marriage and death, which the transition to a certain stage of life.
- b) Seasonal ceremonies marked by changes in the Moon, the Sun and seasons [Arnold van Gennep. 1999. - C. 12.].

Category "B" seasonal ceremonies are, in fact, a distinctive product of the agrarian community, whose main job is farming. For this reason, these rituals have undergone significant changes in modern post-industrial societies, some of them have even disappeared. Category "A" ceremonies, regardless of the lifestyle and conditions of the population, the normal course of life and are a product of historical development. Therefore, for many centuries it has been passed from generation to generation and is used as an important source in the study of ancient culture and ethnic history of each nation [Arifkhonova Z. H. 2002. 173 p]. These ceremonies are also called family ceremonies, mainly because they are performed in the family circle.

One of the most important activities of the family in the historical development of mankind is growing children. For this reason, one of the most precious qualities of a woman is considered to be her childbearing. Loving the child, respecting large families, wishing the family to have many children are the expression of the Uzbek national spirit, and from ancient times the happiness of having children is the highest happiness among the people.

As a result, many proverbs, songs, fairy tales and stories have been created, which express the infinite joy and great spiritual strength of the child [Mirtursunov Z. 1973. 54 p]. For example, proverbs such as "A person with a child is energetic, without a child person's waist will be broken", "Home with a child is market, without a child is cemetery.", "10 children have their role, 40 children have their action" expresses the relationship, love and kindness to children.

If we observe the traditional ceremonies associated with the birth of the peoples of the Jizzakh oasis, we can see that in this series of ceremonies not only the navel of the child, but also his umbilical cord is protected [Toshboev F. 2016. pp. 383-385]. For instance, in the regions of Gallaorol, Bakhmal, Zaamin the baby's umbilical cord was not reported until it fell. Because if others knew about it, it would be difficult for the umbilical cord to fall.

In turn, it should be noted that in the peoples of the oasis, the baby's umbilical cord was considered a living being, and the child's brother, sister or protector of the child was considered to be in him [AkchaevF.Sh. 2020. 67 p].

Population of the Jizzakh oasis like the Uzbeks and Tajiks living in other regions also have a tradition of holding special ceremonies for babies in shrines.

Such ceremonies include the Aqeedah, the Sacrifice, the taking and burying braids, the bleeding, and mushkulkushod.

Holding such ceremonies in shrines is the idea and intention of the saint or patron saint of the shrine, named after the sacred step protects the child from various ins-jins.

In the oasis of Jizzakh, seven days after the birth of the child (after falling the umbilical cord), a special water was prepared for the first bathe of the child, which salt and soil were added to the water in the heat of the house. The baby was laid to a basin, where specially prepared water was first poured from the right side and then from the left side. As for the properties of the items in water, the salt hygienically tightens the skin of the baby, and prevent various diseases and ailments, it was a symbol of abundance, plenty and nourishment. The soil prevents the growth of various wisp and hairs on the body. After the baby was bathed in a ceremonial way, even the water used to wash the baby was spilled not underfoot, but under a fruit tree. It should be noted that the first ceremonial bathe of a child meant not only his hygienic purification, but also his symbolic transition from one world to another, that is, from the "natural" world to the human world.

The child was considered an official member of the family only after the ceremonial bathe. In the Jizzakh oasis, among relations and in the mahalla and in the village, respectable, uvali-juvali, and unmarried women were chosen to carry the child in the cradle. In the process of putting the child in the cradle, the intention is stated: "Be a fearless hero, grow up healthy, and live long!" In this way, after the child was tied to the cradle and his hands and feet were tied, people strew sweets, apricot, pistachio, almond, raisins, oleasters on the cradle. These bouquets were collected by the participants of the ceremony and distributed to their children with good intentions [field notes. 5.].

Getting the baby's first "Korin Sochi" was a big ceremony. Our ancestors imagined that "human life and power are in the hair". They were afraid to take the child's belly hair and our rich, old fathers, who had many children took it, and they carefully buried it under a fruit tree. It should also be noted that the removal of a baby's early belly hair is a pre-Islamic tradition and it meant symbolic transition from one world to another, that is, from the "natural" world to the human world.

It is known that the custom of giving flour soup - "Atala" a new-born woman is widespread among all Uzbeks and has survived to this day, but the method of preparation of it differs depending on the ingredients added to it. For example, in some places it is fried in oil, in other places it is prepared without oil. In Surkhandarya, milky flour pour is made, and in Tashkent, it is made with minced meat. In Jizzakh, flour pour with a buttermilk or a sheep oil is prepared for a woman who gives birth [field records 6.].

Children are raised in cradles until they are one and a half to two years old. According to the tradition of the Jizzakh oasis, when the first child is placed in the cradle for the first time, 5 or 6

close relatives gather and clap, and a long-lived, large-scale "grandmother" place child in the cradle.

In short, since the birth and upbringing of children is one of the basic behaviors of mankind, the decline in the birth rate today does not mean that people are less concerned about children. On the contrary, the current economic prosperity is increasing the attention of the population for the upbringing of the younger generation. In other words, the role and place of the community among the people is shrinking over time, but the birth of a new generation and the preservation of the nation's gene pool is considered one of the most important tasks.

This means that despite the fact that the customs and traditions of the Uzbek people are changing in line with modern requirements, the birth and upbringing of the younger generation is always in the focus of the entire population.

### ABSTRACT

*The article is devoted to the research of the historico-philosophical works of Beruni coming out as one of the important components of the rich and polyhedral heritage of Abu Raikhan Beruni and his contribution to studying history of philosophy of peoples in many regions including the Central Asia as well. In the article analyses of the little studied objective and subjective factors of developing the historico-philosophical traditions in the early medieval countries of islam region, especially, in the Central Asia, to the study of the the historico-philosophical heritage of Beruni, his conceptual-methodological bases. As shown in the article, the historico-philosophical investigations of Beruni are differed not only by its rich, concrete, factual data but by developing many conceptual problems of analysis of history of philosophy.*

**KEYWORDS:** *Beruni, spirituality, spiritual and moral formation, history of science, objectivity and truthfulness, conceptual and methodological conclusions, moral perfection, social and philosophical views, philosophical and methodological questions, geodesy, spiritual and religious needs, unity of the historical and scientific process, "Pharmacognosy", "India", "Monuments of the past generations."*

### INTRODUCTION

Spirituality is inherently a very complex and multifaceted phenomenon, and in the process of its formation and development, factors related to the whole society and the human personality have played an important role. One of them is science, natural sciences and sociology, technical knowledge. Of course, their position in this process was not somewhat simple or one-sided,

because they are a factor of development in relation to spirituality, and on the other hand, in a sense, an important component of spirituality.

### **The main results and findings**

This issue is especially relevant in modern times, as some scholars tend to interpret the results of scientific research, the consequences of their application in practice, without being related to their spiritual and moral positions. However, the development of science today has reached such a level that the great achievements of scientists have the potential to have a direct impact on nature, the environment, the spiritual world of man. This effect can be both positive and negative. Therefore, the problem of the inextricable link between the sciences and the spiritual formation and development of man has attracted the attention of thinkers not only today but also since ancient times. One of the first to pay serious attention to this issue in the early Middle Ages was our compatriot, the great encyclopedic scientist Abu Rayhan Beruni, who made a great contribution to world science. From this broad and multifaceted problem, the scholar sought to shed deep light on the importance of studying the history of science and identifying its spiritual aspects. Beruni's foresight in this direction, his scientific predictions are surprisingly close to our time, and their importance is growing.

First of all, it should be noted that the name of this great scientist, his contribution to science is already recognized in the history of world science and finds its worthy value. About Beruni the American historian of science Sarton calls the 11th century the "Beruni age". Such a high and justified assessment is explained, first of all, by the invaluable contribution of our great compatriot, the owner of encyclopedic thinking, to the development of science. It should be noted that Beruni was very objective and truthful both in scientific matters and in the assessment of historical events and contemporaries. That is why he suffered so much in life, even at the end of his life, but in spite of all the difficult circumstances, he did not give up his faith, which shows how faithful he was to his own spiritual ideals.

Uzbek scholars, who have made a significant contribution to the study of Beruni's scientific heritage and the publication of his works, have repeatedly mentioned his contribution to the history of science. Well-known Uzbek philosopher I.M Muminov wrote on this issue: "Beruni's scientific interests were very wide and varied. He studied the history of science in ancient Greece and the Arab Caliphate, the history of ancient and early medieval science in Central Asia, as well as the science of his time. P.G Bulgakov, one of the great researchers of Beruni's legacy, also noted his services in the field of history of science: has preserved valuable information. "

Continuing Beruni's above-mentioned merits in the study of the history of science, we have come to new conclusions, which, in our view, are known as a result of a special study of this aspect of the great scientist's work. First of all, it should be noted that in the study of the history of science, Beruni, while collecting accurate and valuable information in this area, tried to approach it from a theoretical and methodological point of view, and achieved very interesting and important results. Interestingly, Beruni's conceptual and methodological conclusions and generalizations about the history of science do not lose their significance over time, but again show their true value to the present day. The second important aspect of Beruni's scientific-historical heritage is that it defines the spiritual significance of the restoration of the history of science, interprets it as an important tool, factor in the formation and development of society, personality, spiritual, moral and intellectual, and should be approached from this perspective.

According to Beruni, the spiritual significance of the history of science, first of all, comes from its spiritual content. As the scholar wrote, "There is more benefit and more benefit in anything other than knowledge, and only those who know science can refrain from doing good deeds and harming them, both for religion and for the world. Without knowledge, there would be no belief that what we attract is not evil and that what we avoid is not good."

Thus, in Beruni's view, science, including its history, while providing clear and accurate information about human existence, should be defined as an important tool and moral norm for the purification of the spiritual world, moral perfection, and the separation of good and evil. This spiritual nature and significance of science is also reflected in the history of science, as these sciences are tested over time, enriched and improved scientifically and methodologically.

One of Beruni's great contributions to the study of the history of science, and history in general, is that he was one of the first to try to develop a special method for studying them. At the same time, it should be noted that this method puts before the researcher not only pure scientific-theoretical, but also spiritual-ethical requirements, and they are described as an integral part of this method. Beruni explains the spiritual side of this style as follows: "It is then known by comparing the words and beliefs they cite for proof, after purifying themselves of the bad morals that degrade the nature of most people, the factors that prevent them from seeing the truth. This is the best way to get to the real goal I mentioned and the most powerful helper to wash away the doubt that tarnishes it. No matter how hard we try, no matter how hard we try, we can't achieve the goal in any other way."

From this it is clear that before embarking on the study of the history of science, and history in general, a scientist must purify his language spiritually, get rid of all feelings of prejudice and envy, and achieve a certain spiritual maturity. Interestingly, the scholar also referred to the dirty interests associated with political struggles and to the detriment of an objective approach. Beruni's above claims are still relevant today, as some researchers in the study of the history of science ignore and discriminate the services of certain peoples in the history of science on the basis of ideological, racial, and erroneous scientific positions. This has been particularly evident in the recent past in the context of a totalitarian administrative system. For example, the socio-philosophical views of Muslim people were negatively assessed by most representatives of history, accused of mysticism, idealism. This, in turn, has led to the existence of many unexplored, generally unrecognized pages in our history.

Beruni puts these requirements before the researcher who studies the history of science not only of his own people, but also of other nations, and urges him to adhere strictly.

It is a science that, unites all people and serves as a universal value, which is reflected in the history of science, because the differences between the sciences of different peoples, whether methodological or factual, gradually lead to the development of science, the search for truth to some extent agreed and adapted to each other.

The unity or ever-increasing closeness of the sciences in different nations, based on the means of reason and experience, is the unity of mankind, and its unity is determined by reason. The difference from the animal is also in the mind. When Beruni speaks of ignorant people who do not understand the essence of some science and what is the superiority of man over animals, he concludes: "... That superiority is the absolute science itself, without which the existence of man

becomes doubtful." Man is characterized by his ability to master science as well as his spiritual approach to it.

A researcher who deals with the problems of the history of science, who focuses on philosophical and methodological issues, first of all confronts the question of the origin of the sciences. Therefore, Beruni also puts this issue in a special way and describes the reasons for their general emergence as follows: "This is the state of the sciences. They are the result of essential needs in human life, so they are divided into networks. The need for them is in their interest, but not in the silver and gold they find. " These needs can of course be material and spiritual. But Beruni specifically points out that the origin of the true sciences should not in fact be associated with greed and greed. That is, the origin of any science is based on certain spiritual values in man.

The scientist specifically examines the causes of the origin of several sciences and distinguishes between them directly aimed at improving human spirituality. From these he can show maturity, poetics, logic. For example, he describes puberty as follows: "If one is asked about its benefits, it is a virtue in itself. The Prophet (peace and blessings of Allah be upon him) said: "Indeed, there is magic in speech."

Beruni even tries to show that it is related to spiritual needs and to reveal their interrelationships when analyzing the needs that this or that science brings. A vivid example of this is geodesy. The main reason for its emergence is, on the one hand, the determination of azimuth and other dimensions, and, on the other hand, the satisfaction of religious and spiritual needs. "Since we have a strong need to determine the azimuth of the Qibla and the Qibla is the pillar and pole of Islam, let us explain what we need to know about it. Allaah says (interpretation of the meaning): "Wherever you come from, turn your face towards the Sacred Mosque, and wherever you are, turn your face to the right."

In general, whatever the need for the formation and development of the sciences is, they depend on the human desire to know. "After all, humanity," writes Beruni, "was not created with a strong desire to learn things that are hidden and unknown to it?" You can see that even children, despite their bad habits and misbehavior, rejoice in all kinds of news. "

When showing the reasons for the origin of the sciences, Beruni reveals another important aspect of the problem. It is also determined by the fact that this process is related to human needs, but also to the performance of certain duties and services before nature, society and other people. "As for the sciences, since man is by nature capable of accepting them, the questions of service during his reign in the universe have compelled him to turn to them." These services, regardless of their material and vital nature, also have spiritual qualities.

One of the most important aspects of Beruni's method of studying the history of science is to approach them from the point of view of the inseparable unity of humanity. The integrity and integrity of the historical-scientific process is determined, first of all, by the fact that mankind has a common origin.

"People," writes Beruni, "are all children of the same father and each one goes by his own appearance. " This determines the integrity and close connection of human civilization, including the history of science. But there is another reason for the unity of the sciences on a human scale, which is that the goals, methods, and means, no matter what nation they belong to, are close to

one another, and in many cases, one. For example, the goal of every science is to know a particular aspect of being. Scientific methods and tools will be developed for this purpose. Of course, the styles and tools of the sciences that are developing in different peoples and regions differ to some extent, but they will come closer to each other once it is determined in practice how successfully they can be used.

When Beruni emphasizes the global unity of science, he notes that each nation has its own characteristics of this process. Bright examples of this can be found in many of Beruni's works. In his book Pharmacognosy, he writes that each nation differs in the development of a particular science.

But the thinker does not draw this conclusion to show the incompatible differences of peoples, but rather emphasizes that they can and must learn from each other's scientific achievements and use them, and more deeply and vividly express the integrity and integrity of the history of science. This means that nations need each other in order to master the achievements of science. "When something is generalized on earth, every nation seeks to contribute to it."

Therefore, when Beruni analyzes the services of each nation in this or that science, he often compares them to the situation in other nations and serves as the main criterion in their evaluation to determine which one is more accurate. In general, the foundations and status of the sciences are determined by how effective and useful these international relations are. Summarizing the history of science from this point of view theoretically and conceptually, he concludes: "... Most knowledge is acquired simultaneously and in several places, and they are transferred from one place to another through language and gesture, which are the means of general expression. Due to the length of time and the breadth of places, the basics of science and sciences, knowledge for a person are concentrated. In addition to the general foundations of these collected and formed sciences, the development of science in each nation is determined by its special features.

Some of these may be more scientific, some socio-historical, or even spiritual. For example, in his book India, Beruni describes the sciences of the Indians and Romans, along with their general features, but also their differences in scientific content. These are primarily related to the methods and tools used in the relevant sciences. For example, in these nations, the goals of astronomy and mathematics are common, but the methods and tools used and the resulting results are somewhat different.

As mentioned above, the factors that determine the characteristics of the history of science in nations can take on a socio-historical character. These include wars, conflicts, social situations, and more. In his book India, Beruni speaks of the consequences of the marches were made to India by Mahmud Ghaznavi, first and foremost, of their negative impact on the development of science. In particular, he describes the marches of the Ghaznavid rulers to India and how much massacre they inflicted on the Indian people, which in turn led some Indians to have a misconception about Muslims and to distance themselves from them to some extent. As for the sciences, he concludes: "Perhaps these events led to the disappearance of science from the occupied countries and their flight to places we still do not have access to, such as Kashmir, Banoras and the like. At the same time, because of politics and religion, there is a lot of disconnection with foreigners. " Condemning such a policy of looting and exposing the damage it does to Islam, Beruni emphasizes that it hinders the development of science and the

establishment of mutual scientific relations. This, in turn, can cause certain damage to the scientific and spiritual development of other nations.

Beruni repeatedly notes that the characteristics of the authority established in the country for the effective development of the history of science depend on how much they sponsor scientists, and gives historical examples. At the same time, such a policy leads not only to the scientific development of society, but also to its spiritual perfection. For example, when it comes to some scholars, Beruni writes: "They exalt themselves, act foolishly, and become arrogant and ignorant. They are greedy for what they have learned and are not taught to be ignorant, even of their own gender. How can they teach others after that! Because they do not believe that there is a country other than their own, that there are peoples living in those countries, and that there is knowledge in nations other than themselves. " It is these unfortunate actions that prevent scientists from establishing scientific ties and may even cease altogether. The detrimental and negative effects of this can lead to certain material and spiritual losses not only for less developed countries, but also for people with rich traditions related to science.

In Beruni's view, the various factors and processes that are of great importance to the sciences determine their uneven development. Summarizing this idea, the scientist comes to the following conclusion: "A person who thinks seriously notes that they are in a state where the knowledge is unknowable, that is, the possibilities are not open, and in time, the knowledge is unknowable."

Therefore, ensuring the development of scientific relations will further increase and strengthen the spiritual potential of nations, as it leads to the development of science, says Beruni. This is due, firstly, to the elimination of conflicts and wars, albeit to a certain extent, and, secondly, to the growing respect and interest of peoples, scholars, in each other, regardless of nationality or religion. Beruni's great contribution to the spiritual upliftment of mankind in this regard, that is, his contribution to the study of the scientific and spiritual achievements of other peoples, their mastery and correct interpretation in terms of the history of science, is invaluable. The scholar supported and noted with satisfaction the efforts of scholars representing other nations in this direction. For example, Beruni emphasizes the words of the great Indian scholars on the need to study and respect Greek science, regardless of religion or other differences, that is, people should be "glorified because they can reveal science and rise above others." Beruni's approach to the history of science from this point of view has not only great scientific historical, but also broad spiritual and universal significance, as his understanding of the universal nature of science reinforces the idea that humanity is one of the most important universal spiritual values.

Emphasizing the need to follow the path of objectivity, truth in the study of the history or culture of other peoples, the history of science, spirituality in general, Beruni himself strictly adheres to this requirement. Commenting on his book *India*, he said: "This book is not a book of evaluation and gravity, so in this book I will not cite the proof of the enemies and I will not oppose those who deviate from the truth. It's just a narrative book. "

Enlightenment, which is inherent in Beruni's worldview in general, and the desire to spread science, finds its bright expression in the history of science. Because Beruni's approach to the above-mentioned history of science from the point of view of universal unity, the need to acquaint scientists of other nations with the achievements of science, takes on a fundamental theoretical character and has become one of the most important conditions. He writes that while translating for the Indians, he was "interested in spreading knowledge and having the knowledge

they did not have," and elsewhere he continued, "I remember all my thoughts, my heart is devoted to the propagation of knowledge, because I have enjoyed the pleasure of gaining knowledge." I consider it the greatest happiness for me".

## CONCLUSION

Summarizing the history of science, the state of sciences and their connection with the spirituality of scientists, Beruni concludes: "There is a lot of science. They are the epitome of time and multiply as different thoughts and memories join them. The fact that people are interested in science and respect the sciences and the people of knowledge is a sign of this success."

**ABSTRACT**

*Among the comprehensive reforms being carried out in Uzbekistan, measures to increase the role of women in the life of the state and society reflect the current image of a renewed Uzbekistan. As a clear proof of this, the attention paid to women confirms that one of the noble features of our people, historical work of state importance is being carried out to strengthen the role and status of women in society. After all, paying attention to women, respecting them in society is one of the noble features of the Uzbek people. There is a deep historical basis for the fact that Uzbekistan is carrying out historic work of national importance to strengthen the role and status of women in society. It is no coincidence that the stability and development of the political, socio-spiritual environment in society has always been determined in many respects by the attitude to women and the family. It should be noted that the Women's Committee of Uzbekistan, a self-governing non-profit organization, was established on a voluntary basis on December 27, 1991 at a conference of women of Uzbekistan in Termez to protect the rights and interests of women has been carrying out large-scale activities. Also, the Decree of the President of the Republic of Uzbekistan dated February 3, 2018 "On measures to radically improve the activities in the field of support of women and strengthening the institution of the family" served to fully support the role of women.*

**KEYWORDS:** *Uzbekistan, women, reform, society, spiritual environment, family, neighborhood, employment, management, entrepreneurship, tradition, national mentality, socio-political activity, youth, ideology.*

## INTRODUCTION

The Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 identifies comprehensive measures to increase the socio-political activity of women and strengthen their role in government and society. Nowadays, when rapid socio-economic reforms are being carried out in all spheres, great attention has been paid to the further development of the primary organization of society, that is, the activities of women and the expansion of their powers. In particular, the proclamation of 1998 as the Year of the Family in Uzbekistan, 2012 as the Year of the Family, and 2014 as the Year of the Healthy Child has once again increased the prestige and prestige of women in society. Because in the national mentality of the Uzbek people, the principles of mutual cohesion, respect for the elder, respect for the younger have always prevailed in the family, family ceremonies, public events have always been held with the participation of neighbors, relatives. The role of women in it is great. It was during the years of independence that the prestige of Uzbek women increased. This plays an important role in further improving social relations between people, restoring historical traditions, forming in the minds of citizens the spiritual and moral qualities of our national mentality, such as respect and kindness to the family, parents and children.

**Methods:** The article is based on the methods of objectivity, consistency, historical-comparative analysis, study of historical and social events and phenomena in chronological order, reliance on sources and evidence and their validity. It was based on the definition of indicators for assessing the effectiveness of state policy on women's protection, the existing problems based on the development strategy of the sector and some methodological criteria for identifying priorities for their solution.

**CONCLUSIONS:** Article 18 of the Constitution of the Republic of Uzbekistan recognizes the equal rights of women with men in all spheres [1. 2019 y]. It should be noted that all legislation aimed at protecting the rights and interests of women is based on international legal norms. It is gratifying to note that the living standards of the population in Uzbekistan have significantly improved, resulting in a 2-fold decrease in maternal mortality and a 3-fold decrease in infant mortality, an average life expectancy of 67 to 73 years, including 75 years for women.

If we look at the historical figures, in the early days of Uzbekistan's independence, in 1991, women's employment in heavy labor was 47%, but by 2000 this figure had dropped to 42.5% [2. 52 b]. That is, women have moved from manual labor to services, management, entrepreneurship, farming, agriculture. That is, they have expanded their activities and increased their prestige in various fields.

Speaking about the role of women in the development of various spheres, President Shavkat Mirziyoyev noted that the heroes of Uzbekistan, such as Khalkhahon Mirzaeva, Patilakhon Ergasheva, Siyosatkhon Abdullaeva, Muyassar Temirova, Martiya Rakhmatova, set an example for all. Especially in recent years, the role of women in public administration, entrepreneurship, agriculture and manufacturing is growing. Well-known academicians Mashhura Mavloniy, Rano Ubaydullaeva, Sayyora Rashidova, Anna Glushenkova, Mukhabbat Abidova, People's Poets of Uzbekistan Aydin Hojjeva, Halima Khudoiberdieva, Enahon Siddikova, People's Artists of Uzbekistan Yayra Abdullaeva, Tuti Yusupova, Galina Melnikova, Munojat Yulchieva are known and popular [3. 2017. March 8. №19].

In recent years, the country has achieved significant growth in the activities of women in government and society, especially in terms of increasing economic and political activity. For example, today the share of women in local representative bodies is 16%, in the Legislative Chamber - 17.5%, and in the Senate - 15%. The fact that 3.4% in the executive, 22.7% in the judiciary, and production has doubled compared to previous periods [4. p. 506] alone confirms the growing role of women in the life of the state and society.

Another important aspect of the issue is that in Uzbekistan there has always been an association of self-government called "Makhalla", in which the role of women in the organization of spiritual and ideological education and the development of measures for ideological prevention among young people. has In this regard, by 2020, women's activities have entered a new stage of development. The Decree of the President of the Republic of Uzbekistan dated February 20, 2020 "On measures to improve the socio-spiritual environment in society, further support the institution of the community and bring the system of working with families and women to a new level" played an important role [5. February 20, 2020, №37]. On the basis of this decree, the President of the Republic of Uzbekistan adopted a resolution "On the organization of the Ministry of Makhalla(Neighbourhood) and Family Support of the Republic of Uzbekistan" [6. February 20, 2020, No. №37]. The resolution also sets tasks to increase the role of women in the life of the state and society.

In particular, according to the decision of the Cabinet of Ministers of the Republic of Uzbekistan, religious extremism and fanaticism, aimed at disrupting the peaceful life and socio-political stability of the country, the fight against the spread of inhuman, harmful ideas in society "[7. 5-6 b].

On the basis of this decision, "Advisers on religious enlightenment and spiritual and moral issues of the mahalla citizens' assembly" were appointed. It is planned to appoint women to this position, who will be able to work closely with the population, have a good reputation among the population, have extensive experience in national and religious traditions and customs, and can be a role model.

In other words, the purpose of the position of advisor to the chairman of the mahalla was as follows:

- Decision of a healthy lifestyle in the minds of the population of the neighborhood, especially young people;
- Preservation and development of exemplary, national, religious traditions and customs;
- The stability of the spiritual environment in society and the systematic implementation of the work of interethnic friendship and solidarity [8. Tashkent., 2005].

In Uzbekistan, as one of the noble features of our people, attention and respect for women, historical work of national importance is being carried out to strengthen the role and status of women in the community. As a proof of this, in accordance with the requirements of the new Charter, the position of adviser on religious-enlightenment and spiritual-moral issues in the mahalla is established in settlements with at least 500 families, as well as in towns, villages and auls. Women with extensive life experience, able to instill in the minds of the population the requirements of a healthy lifestyle, who can have a positive impact on the preservation and development of national and religious traditions and customs, will be appointed to this position.

According to the recommendations of the charter, the appointed women must be over 40 years of age and must reside in the same neighborhood.

The Madad Insurance Agency (June 26, 1995), the Chamber of Commodity Producers and Entrepreneurs of Uzbekistan (March 1996) and their regional branches were established in the country to promote the development of small business and private entrepreneurship, the Association of Peasants and Farmers, the Association of Craftsmen. , "Businesswoman" Business Association was established. For example, until 2018, the Business Association of Uzbekistan "Tadbirkor Ayol" had more than 24,000 women [9. "People's Word". January 7, 2017].

But in recent years, the lack of involvement of women in small business and entrepreneurship remains one of the main problems. Of course, Uzbekistan is a rapidly growing labor force. The peculiarity of the republic is that the growth of labor resources in the country averages 2.2% per year [10. 2019]. It is natural that this situation will cause serious employment problems in the field. One of the key solutions to this is to involve women in small business and entrepreneurship.

According to a survey of women conducted by women, when asked "Do you want to do business and entrepreneurship in the future?", Almost half of them, or 43.8%, answered "yes", while 15.7% said, "I am currently engaged." He replied. Among the respondents, it was confirmed that the majority of those wishing to engage in business and entrepreneurship are middle-aged women. Overall, the study found that this figure was 39.1% among men and 39.9% among women [11. 236 b].

When asked "What type of business do you want to do in the future?", 46.4% of respondents chose trade, services, 26.8% - construction, light industry, food production, 16.4% - fruit and vegetables. with the type of business in the vegetable processing industry, 7.9% responded with an intellectual business. In this regard, special attention is paid to increasing the role and prestige of women in production, business and entrepreneurship in the country, ensuring their employment.

However, in Uzbekistan, an agro-industrial country, women's participation in agriculture is still insufficient. Company farms, farmers' associations, agricultural cooperatives and agribusinesses play an important role in this. However, the role of women in them (in particular, their involvement in the management system, employment) is still not enough. After all, in the mentality of our people there is still an old view that the agricultural sector is not a specific field for women.

According to public opinion polls among graduates of vocational colleges in the country, some girls want to graduate and work in this field, that is, to become a farmer, that is, the share of those who aspire to this type of work is small. This figure is 16.9% for men and 6.4% for girls. In other words, rural youth are losing interest in the agricultural type of labor. Among the students who wanted to continue their studies, a total of 33 boys (5.4%) who wanted to become agronomists said that none of the girls had aspirations for such a profession. This is one of the problems that needs to be solved [pp. 12. 72-73].

As a result of the high attention paid to women in the society of Uzbekistan today, it is necessary not only to provide them with social protection, but also to ensure their more effective

participation in the life of the state and society, including active involvement in production, especially agriculture.

**CONCLUSION:** From the first days of independence of Uzbekistan, we have witnessed an increase in attention, respect for women in various sectors of the economy, the role of women in public administration. However, in our country there are many problems in further enhancing the role and status of women in entrepreneurship, agriculture, and life itself requires a lot of work in this direction. In general, it is important to identify measures to increase the knowledge of women in Uzbekistan in the field of management, entrepreneurship, business, agriculture, the formation of economic culture. It is important to perform the following tasks in this direction:

1. Wider involvement of women in entrepreneurship;
2. Increase the establishment of credit unions to expand women's economic opportunities;
3. Further expansion of their activities in public administration through the implementation of various national programs in cooperation with non-governmental and international organizations;
4. Strengthening labor protection of women in entrepreneurship and agriculture, creating safe working conditions for them, etc.
5. Providing women with certain benefits in the allocation of loans, microcredits in terms of further expansion of entrepreneurial activity;
6. Further expansion of research in this area to clearly define the prospects for further development of the industry;
7. To achieve the development and modernization of women's activities in the field of public administration and the wider promotion of their participation in public administration and the prospects for the development of the sector in the media;
8. New directions in the system of training for the industry, the expansion of specialties for training women in management, entrepreneurship and agriculture in the relevant higher education institutions to reform the system of training women.

## THE PLACE OF DRUM INSTRUMENTS AND SONGS IN THE ART OF BAKHSHIL

**Zafar Hayitov\***

Senior Lecturer at the Institute,  
 Uzbek national music art, named after Yunus Rajabi,  
 UZBEKISTAN

### ABSTRACT

*This article discusses the role of nagma melodies in the performance of the bakhshi and the dombira, its role in the life of the bakhshi, the secrets of its making. The opinion expressed in the study of scientific sources is based on the comments and scientific conclusions on the definitions of noma and nagma.*

**KEYWORDS:** *Epic, Syncretic, Dombira, Nagma, Noma, Religious, Improvization.*

### INTRODUCTION

Today, Uzbek epic poetry is showing itself in a new form. It is no secret that the attention paid to the art of baxshi is paving the way for the further development of this rare art and the revival of its schools. Academician Tora Mirzaev devoted his life to the study of variants of the epics "Alpomish", their comparative analysis. As we study Master's research, we see that there are still many unexplored aspects of the Alpomish epic. It is no secret that the epic "Alpomish" is of interest in many areas. Alpomish provides a platform for research in all areas. As we teach students about the idea of the epic, its plot, its motives, we do not know that we are getting more and more immersed in its magical world. Whether it is a master bakhshis or a bakhshis who sings epic ideas today, we are amazed at its uniqueness and charm. Each version of the epic "Alpomish" can give us a school of science with the worldview, art, eloquence, description of the plot in its own way.

As Bakhshi sings a saga, he cannot imagine his saga without a drum. Accompaniment of the drummer. That's why we see that bakhshis have created so many terms about their drums.

My drum made of spruce,

My drum pistachio,

My drum across the rivers,  
I bought a drum for six sheep.

According to one of the legends quoted by folklorist M. Murodov, God gave a whip to the hand of Adam, whom he created, and called it a chal. But no matter how hard Adam tried, there was no sound from the drum. Then when the devil put a donkey out of the straw on the drum, he began to laugh. "That's probably why," says the scholar, "in all the legends, myths and legends about the drum, it is said that the drum was inherited from Adam, and that the devil added the donkey."

Adam's drum,

I am a drummer with a donkey added by the devil "[1.42].

A. Ergashev writes about the abundance of drum melodies in the epics of South Uzbekistan, the myriad of myths and legends about the drum. Interestingly, here each drum melody has a vital basis or mythical interpretation according to its origin. Husan Bobo from Shurchi district confirmed that some drums make a great sound during the day, others after sunset, and still others after midnight [2.80].

Now let's look at the details of how the drum is made. My teacher Safar BakhshiShaydulov, the People's Bakhshi of Uzbekistan, gives the following information about the drum.

"The drum is a key element in the performance of the bakhshi. The drum is a simple-looking word consisting of two strings. Bakhshis describe it as "chase", that is, bare wood. There are three elements that ensure the quality of the drum melody:

1. Drum bowl. The bowl is a skirt board that covers the drum, which is mainly made by cutting the hard fiber into a very skirt. The tree from which the bowl is made, i.e. the willow, grows in different areas of different quality. This causes the drummer to play the nagmaas a result of that quality of the bowl.

2. The drum string. Previously, until the eighties of the last century, the strings of the drum were made from the stalks of dried hay (mainly goat). This fact alone suggests that the intestines of goats living in different climates make different sounds. For example, in the climate of Samarkand, it is natural for a goat to grow up to be different from a goat raised on a narrow Sherabad mountain.

3. The body of the drum, i.e. the main part. This is also a big factor in how the drum beats sound. "In Surkhandarya and Kashkadarya regions, the drum is made of apricot, mulberry and walnut trees. The sound of a drum made of pears sounds good. Until the middle of the last century, more apricots were made, and later in mountainous areas the transition to walnut trees was made. After the mass planting of mulberries in Pakhtakor districts, the transition from mulberry trunks to making drums was made. The heaviness and lightness of the drum have a great influence on the bakhshi's melody. "[3.]

Now listen to the words of master NormuradShoydilov about the drum: "The drum has such a mysterious melody, it is an ancient national word of the Uzbek people. The dombra has long been made by masters in Surkhandarya, Kashkadarya and Samarkand regions. The bakhshis developed the art of bakhshi with these drums. " Normurad master Shoydilov did not take the

word for drum (Olmurid tree grows in the mountains, mainly in Sangardak in Sudkhandarya region, the fruit looks like pears), he makes apricots, walnuts and mulberries. These trees are pruned in late November or early December after 5-10 years of life.

“Every craftsman has his own style of making drums. I also have my own style of making drums. Because I created my style of making drums by asking old grandparents, shepherds who play the drums. After cutting the tree, I dig it deep for 1-1.5 years and bury the cut tree about a meter deep with water. From time to time I put water on a buried tree. Then the sap in the tree will come out as needed. I send one drum a month. I started making drums in 1989. I turned the drum to the drum of OlloyorovTaji bobo in Muzrabot district, which he turned to ShoberdibakhshiBoltaev. I consider OlloyorovToji Bobo as my absent teacher. Because I made a drum from the drum made by this man, ”said Master NormuradShoydilov.

From the above data we can see that the first and most important factor that demonstrates the unique performance skills of the art of baxshi is the drum. Through the drum, the bakhshis sing a saga through their own unique melodies. Today, there are reports that there are more than 32 epic songs by bakhshis.

Umir poet Safar oglu, one of the founders of the Sherabadschool of poetry, became a student of ShernaBakhshi of Surkhandarya, where he learned epics, terms, and drums from his teacher [4.8.]. The number of letters of the Qamayschool in the performance of the Umir poet Safar oglu is given:

“O my drummer,  
You have thirty-two names.  
All charming,  
If I play one, I have one.

that is, the number of letters is recorded. According to the son of the poet Umir, the People's Bakhshi of Uzbekistan Kara BakhshiUmirov, the number of these letters was increased by KadyrBakhshiRakhimov to sixty-four”[5.40.].

According to B. Matyokubov, in the traditions of epics it is noted that "Noma" and "Nagma" underwent alliterative changes and were generalized in content. In fact, noma (Persian) and nagma (Arabic) are both lexically and terminologically different, separate and independent concepts, differing in meaning [5.41.].

Based on these ideas, we preferred to consider the words noma and nagma lexically.

In the explanatory dictionary of the Uzbek language the word "noma" (Persian) - the meaning of official correspondence, letter, letter, "nagma" (Arabic) - melody, melody, melody; it has been shown that the sound of music signifies meanings [6.30,53.].

"Due to the predominance of words in such legends and epics, it is possible that it was called a letter, not a nagma," said B. Matyokubov. The scholar's opinion may be well-founded in its place, but we have chosen to use the drumming melodies of the drum in its proper place as a nagma, in the lexical sense.

Even among the bakhshis who play the nagma in their performances, there are unique melodies, and each of them has its own history of creation. For example, the People's Bakhshi of

Uzbekistan ShoberdiBoltaev tells the following legend about the history of the song "Ogajonim" in his repertoire. "A good young man is killed by the invaders. Seeing this, the young man's sister entered the house, grabbed the drum that her brother was playing, cried, "Uncle," and sang the same tune.

The bakhshi gives the following information about the creation of the song "Karakoz" in the epic "Yusuf and Ahmad" in the repertoire of the People's Bakhshi of Uzbekistan AbdumurodRakhimov. "While Ahmad is in prison, a maid named Karakoz carries food for him. Ahmad fell in love with this maid,

I love you Black Eyed Peas,

Who did you love, Karakoz?

- he said, creating this tune.

From the above information, it can be seen that each nagma performed by bakhshis has its own history of creation. We can say that it would be expedient not only to write epic texts performed by bakhshis, to study it scientifically, but also to study epic poems along with the history of their creation scientifically and to take them into musical notes.

The Alpomish epic (version by FozilYuldoshogli, compiler and preparer for publication: Tora Mirzaev, translation and commentary by MaqsadAbdurahimov) is published in Uzbek and Russian (1999). Features of the Epic "(in Russian) and "Note Applications" were also given. The Karakalpak version of the epic "Alpomish" - the text of the version and the note (written on paper by Suren Gabrielyan) performed by QiyasJirovKairatdinov accompanied by a kobyz, was published in 1999 by T. Mirzaev and F. Karomatli. BotirMatyokubov and SeydatTamay in Turkey The text of the epic "Temur and Boyazid" (in Turkish and Uzbek), composed and performed by the People's Bakhshi of Uzbekistan QahhorRakhimov (2019), multi-volume "Monuments of Uzbek folk art" has published 20 volumes of his book to date. It should be noted that in volumes 1-16 of the monument, along with the publication of the rarest samples of folk epics, notes were also given. It is obvious that along with the epics performed by Uzbek bakhshis, we want to continue the study of their melodies in such a syncretic way.

In conclusion, on September 2, 2020, the Resolution of the Cabinet of Ministers No. 536 "On the organization of the Uzbek National Institute of Musical Arts named after YunusRajabi" was adopted.

The resolution sets out a number of tasks for the training of qualified teachers in the education system. In addition to teaching our young creative students to perform epics, it is necessary to teach them about the history of songs, the place of performance. It takes a lot of work to preserve the melodies that come in the repertoire of bakhshis and pass them on to the next generation. This, in turn, requires studying the melodies that have come to the forefront of oblivion and taking notes. The preservation of nagmals in the notes can serve as an auxiliary function in their preservation.

Le substitute to the traditional class room learning in higher education especially under the present situations. E-Learning not only plays a major role in Indian higher education institutions but also acts as an emerging trend of education for future India. The majority of the learners believe that digital technology and flexibility are the key factors behind the development of e-learning in higher education. It has also discovered a new definition and dimension in teaching learning process and all government e-learning initiatives plays a very important role to make it available to all the students. For making e-learning more effective, it is essential to improve e-learning tools and technology and make few changes in the area of online assessment, investment in technology and faculty training and in policies and governance towards e-learning. All the educational institutions should focus on the technology and services that suit them and also security of data reliability and the personal information of teachers and learners should be secured. It can be concluded that the access to internet connectivity plays a crucial factor for growth of online education. In developing countries, e-learning raises the level of literacy and more so with the help of e-learning initiatives many opportunities can be captured and speedy development of educational sector is possible. It is also expected that if developing countries work as a joint venture on the issue of e-learning, it will be beneficial for the development of knowledge reservoirs throughout the world.

**ABSTRACT**

*The measurement of Subjective Well-being (SWB) has advanced rapidly over the last two decades with the several segments. Subjective well being is defined as sum of three components- life satisfaction, presence of positive affect and absence of negative affect together called “happiness”. However studies based on working women’s well-being still is scarce. In this paper a attempt has made to measure the social determinants of subjective well-being for working women while identifying the variation among social determinants and subjective well-being for the selected area is the supplementary objective. Selected sample consisted with 187 married, employed women in the age group of 19-60, from 3 GN Divisions in Balangoda DS Division, through cluster sampling and convenience sampling methods, using a structured questionnaire. Weighted Principal Components Analysis (WPCA) is performed on variables for the indicators of Subjective Well-Being. Under this method, the loading from the first component of PCA are used as weights for the respective indicators. Finally the constructed social determinants of subjective well-being are classified into three categories as happy moderately happy and unhappy using cluster analysis. Indicators for community relationships, contribution of family members, social validity, organizing events and nature of the job lead to high satisfaction while working hours per week, working environment and trade union participation make less happiness among working women*

**KEYWORDS:** *Social, Subjective Well-Being, Employed Women, WPCA*

---

## INTRODUCTION AND RESEARCH PROBLEM/ISSUE

Subjective well-being (SWB) is widely considered to be an essential ingredient of the good life and represents a hedonic well-being concept with roots in the mid-seventies when Andrews and Whitey (1976) introduced a well-being structure consisting of three factors such as cognitive evaluation, negative effect and positive effect. According to Diener (1984), subjective well-being covers two main components such as one affective including negative and positive emotions and one cognitive namely life satisfaction. Negative emotions and life satisfaction are distinct measures and although positive emotions are related to life satisfaction (Diener et al, 1999). Therefore, subjective well-being can be defined in terms of high levels of positive emotion and life satisfaction and low levels of negative emotions.

When people describe what they most want out of life, happiness is almost always on the list. Scientists rely primarily on surveys to assess the happiness only for the individuals, but some important point should in to consideration that people's levels of subjective well-being are influenced by both internal factors, such as personality and outlook, and external factors, such as the society in which they live. In recent years, cultural differences in subjective well-being have been explored, with a realization that there are profound differences in what makes people happy (Diener & Suh, 2000).

A growing numbers of scholars have attempted to study the subjective well-being of women, because role of the women in the society and their contribution for the family and economy is very important and significant. A woman can be considered as a pre dominant character in any society. She plays an important role in the family by encouraging the husband, children and other family members. And also women provide a greater service to strengthen the household economic activities and make her full effort to enhance the welfare of the family members.

Main objective of this study is to measure the social determinants of subjective well-being for the selected group. Identifying the variation among social determinants and subjective well-being for the selected area is the supplementary objective.

## RESEARCH METHODOLOGY

The study is based on a sample of 187 married, employed women in the age group of 19-60, selected from 3 GN Divisions in Balangoda DS Division which represent urban (Balangoda Town), rural (Rassagala) and estate sector (Pettigala estate) through cluster sampling and convenience sampling methods, using a structured questionnaire. Weighted Principal Components Analysis (WPCA) is performed on variables for the indicators of Subjective Well-Being under three varieties as community contribution, family and working place. Under this method, the loading from the first component of PCA are used as weights for the respective indicators. Finally the constructed social determinants of subjective well-being are classified into three categories as happy moderately happy and unhappy using cluster analysis.

## RESULTS AND FINDINGS

### PCA on Community Contribution

One component solution is chosen as component in community contribution dimension. This suggested that just less than 61 per cent of the variance in the five variables is represented in the first component.

**TABLE 01: PCA ON COMMUNITY CONTRIBUTION**

	Component
	1
Spend time for social activities	0.998
Relationship with friends	0.003
Relationship with neighbors	-0.077
Organizing social activities	-0.029
Participation for recreational activities	0.603
% of total variance	60.9

Source: Sample Survey, 2015

*PCA on family*

PCA applied to the five family measures suggested one component solution with the component representing around 98 per cent of the variance in the five indicators.

**TABLE 02: PCA ON FAMILY**

	Component
	1
Contribution of family members	0.114
Attention of family members	0.164
Decision making within the family	-0.008
Time spend with family members	13.6258
Structure of the family	-0.038
% of total variance	97.7

Source: Sample Survey, 2015

*PCA on working place*

Working place categorized under one of the social relations which determine the satisfaction of the workers. Contribution to trade union, thrift societies, attaining and organizing some events and the nature of the job are identified as the variables under this section. PCA generated one component with Eigen values greater than 1.0. These components accounted for 98% of the variance in the dataset.

**TABLE 03: PCA ON WORKING PLACE**

	Component
	1
Working environment	-1.193
Working hours per week	-12.313
Social validity	0.397
Organizing events	0.15
Trade union participation	-0.35
Nature of the job	0.237
% of total variance	98.2

Source: Sample Survey, 2015

#### *Final index*

First principal component of the social dimensions of subjective well-being are the linear compound;

$$SWB = 0.107 \text{ Social} - 185.009 \text{ family} + 28.311 \text{ working}$$

And results from the first principal component for SWB is recorded as their associated Eigen value is 1.489, accounting for 61%, of the variation in the original data. Social and working variables are weighted as positively on SWB.

K-means clustering classified 187 individuals as 65 low, 80 moderate and 42 high satisfied group. Cluster 2 is the largest grouping with just half the cases while the smallest group is cluster 3.

### **CONCLUSIONS, IMPLICATIONS AND SIGNIFICANCE**

Indicators for the community relationships are especially with association and the amount is given to the society by a group in many ways have high positive weights on happiness while having neighbors association makes less happiness among women in the selected area.

Family and the family members are important social determinants of subjective well-being since family is identified as the small cluster. When the decision are making with more special occasion, it makes more complex with the group.

Working hours per week, working environment and trade union participation lead to less satisfaction while social validity, organizing events and nature of the job lead to high satisfaction.

Greater the social working environment increase subjective well-being but lack of family assistance limits well-being.

**IMPLICATIONS**

Women should encourage to participate in community societies or the volunteer works and should conduct awareness programmers to give an idea about the importance of those societies. Concerning the working status of the women, working places or the organizations should give the priority for the women and should provide needed leaves for women based on their requirements. Further, should be offered suitable duties in line with their skills and education level.

### ABSTRACT

*In the context of the digitalization of a socially-oriented market economy, the main tasks of the state are to solve socio-economic problems, ensure the implementation of existing government programs, reduce poverty and improve living standards. It is known from the best practices in the world that public administration reform, raising democratic reforms to a new level does not happen by itself. This is a matter of many factors. One of them is to take into account the interests and aspirations of different segments of society, to pave the way for their realization. In this article, the socio-economic structure of villages and the socio-economic significance of changes in them in the context of a digitally oriented market economy are determined on the basis of analysis.*

**KEYWORDS:** *Socio-Economic Structure Of Villages, The Market Economy, Prosperous Rural Areas, Entrepreneurship, Poverty Reduction.*

### INTRODUCTION

The great creative work of recent years is the basis for the development of the socio-economic structure of the country's villages. New industrial enterprises, social facilities, housing, roads and bridges are being built in cities and villages. Entrepreneurship, trade and consumer services are developing rapidly, and living standards are rising [1-5].

It is known that the decrees of the head of state in 2018 adopted the programs "Obod Qishloq" and "Obod Mahalla". Within the framework of these programs, the conditions in 1,200 mahallas and villages inhabited by about 5 million people have been improved. But work on the issue was suspended last year due to a coronavirus pandemic. Today, there are 188 mahallas in 796 villages and cities with difficult conditions in the country. The electricity supply to more than 4,000 neighbourhoods is unsatisfactory. Only when the infrastructure goes to the villages, the quality of life will change, entrepreneurship will develop. Therefore, the programs "Obod

Qishloq" and "Obod Mahalla" were formed on the basis of new approaches. Along with beautification, the issues of job creation and lifting the population out of poverty are also envisaged. This year, a total of 21 trillion soums have been allocated for these programs. It was noted that from now on, local councils will determine which mahallas or villages will be included in the "Obod Qishloq" and "Obod Mahalla" programs. The deputy mayors of districts and cities on economics, construction and mahalla issues, together with the chairman of the mahalla, defend the necessary funds and the work to be done in the regional councils.

Particular attention is paid to the complex development of 325 villages and 71 mahallas with the difficult socio-economic situation. They have allocated 3 trillion 300 billion soums for the construction and repair of drinking water and electricity networks, internal roads and social facilities. Also, 2 trillion soums were allocated for the repair of more than 10,000 kilometres of internal roads in 2,721 mahallas, and 1 trillion soums for the construction of more than 4,000 kilometres of drinking water networks in 500 mahallas. Life itself shows that improving the power supply is urgent. Therefore, it is planned to upgrade 15,000 kilometres of power transmission lines and more than 4,000 transformers in 5,377 mahallas. This means 60% of the mahallas in our country. About 2 trillion 100 billion soums will be allocated for these measures. Also, together with the World Bank and the Asian Infrastructure Investment Bank, the Rural Infrastructure Development Project has launched projects worth 485 billion soums in 21 districts and 60 villages in Fergana, Andijan, Namangan, Syrdarya and Jizzakh regions [6-9]. Officials are tasked to complete all the planned work by November 1, using the funds effectively [10-12]. The government is taking comprehensive measures to provide employment and create new jobs in rural areas, including targeted sectoral and regional programs, and is introducing clusters and cooperation systems in agricultural production. Therefore, in 2019 alone, a total of 370047 new jobs were created in the country [7-9]. 64.3% of this figure is in rural areas. The goal is to link entrepreneurship and employment programs to the community, provide employment to 500,000 young people and 200,000 women, and lift 300,000 people out of poverty. For this purpose, 9 trillion soums will be allocated for Family Entrepreneurship programs this year, as well as small industrial zones will be established in 128 mahallas for 1 trillion soums.

379 schools, 171 preschools and 161 medical institutions will be built and repaired under the "Obod Qishloq" program, 57 schools, 37 kindergartens and 15 medical facilities will be built and repaired within the "Obod Mahalla" program. The Ministry of Health has been tasked to create a "medical map" of the settlements included in the "Obod Qishloq" and "Obod Mahalla" programs. Several measures are being taken to ensure the implementation of the Decree of the President of the Republic of Uzbekistan dated March 26, 2020 No PF-5975 "On measures to radically update the state policy on economic development and poverty reduction." Also, the Ministry of Economic Development and Poverty Reduction of the Republic of Uzbekistan and its affiliated organizations are effectively organizing the work in this area and fulfilling the tasks set.

## CONCLUSION

Creation of new jobs in key sectors of the rural economy, such as agriculture, processing industry, construction and building materials industry, services, based on the introduction of effective mechanisms, training of professionals and professions with the necessary demand and supply, as well as improvement of labour market infrastructure and labour migration, and the development of strategic directions for the development of organized surplus labour exports and

the forecast parameters of their achievement in the near future and their implementation will lead to the development of socio-economic structures in rural areas.

**ABSTRACT**

*The article studied the reaction of obtaining high-molecular hydrocarbons from the synthesis gas and the physicochemical characteristics of the catalyst containing Co-Fe-Ni-ZrO<sub>2</sub>/HSZ used in this process. The reason for the increase in selectivity in methane formation is, firstly, the acceleration of the hydrogenation reaction of CO in the methane formation centers with increasing synthesis temperature and secondly, the diffusion of CO and H<sub>2</sub> at different speeds through zeolite pores. In all fractions of hydrocarbons synthesized in the presence of hybrid catalysts, secondary changes: isoparaffins and olefins are formed due to cracking and isomerization. A large amount of isoparaffins is recorded for the composite catalyst - the iso/n parameter is 0.6, which indicates an increase in its activity relative to the catalysts absorbed in the hydrogenation reactions. For catalysts with low cobalt content, the concentrations of olefins will be high, which is due to their low hydrogenation ability compared to unsaturated hydrocarbons. In absorption catalysts, the hydrocarbon synthesis centers and the zeolite acid sites are in close contact with each other, which contributes to the intensification of secondary processes. However, the content of liquid hydrocarbons (C<sub>5</sub>-C<sub>18</sub>) in C<sub>5</sub>+ hydrocarbons is about 83%, which is 12% less than in the composite catalyst. No oxide-oxide interaction was found for the composite catalyst prepared by mixing the components, the pores of the zeolite are not blocked by cobalt, which allows the reagents to be efficiently delivered to the active part of the hydrocarbon synthesis.*

## INTRODUCTION

One of the most promising methods of obtaining motor fuel from carbon-containing sources, which is an alternative to oil, is GTL technology. Unlike petroleum products, synthetic fuels in practice do not contain aromatic mono and polycyclic compounds, organic sulfur and nitrogen compounds, and are environmentally friendly and high-quality consumer fuels [1-5]. In nature, the raw material base of synthetic fuels is widespread, consisting of carbon-containing materials - natural, petroleum gases, coal, biomass, etc. [6-11]. GTL technology involves the following steps: production of synthesis gas (a mixture of CO<sub>2</sub> and H<sub>2</sub>); catalytic conversion of synthesis gas to hydrocarbons by the Fisher-Tropsh method; separation of products into fractions of gasoline (C<sub>5</sub>-C<sub>10</sub>), diesel (C<sub>11</sub>-C<sub>18</sub>), wax (C<sub>19+</sub>) [12-16].

The main stage of GTL technology is the catalytic conversion of synthesis gas to hydrocarbons by the Fisher-Tropsh method (FT-synthesis). In the catalytic conversion of synthesis gas to hydrocarbons, cobalt, nickel, ruthenium, iron, etc., from group VIII metals with variable valence, exhibit catalytic activity.

Cr, Mo, W from group VI metals, Mb, Te, Re from group VII metals and Cu, Ag, Au from group IV metals increase the activity level of the catalyst to some extent [17-21]. In practice, two types of FT-synthesis are used in industry: low-temperature and high-temperature variants [22-23].

Low-temperature synthesis (LTFT) is carried out in cobalt or iron catalysts at temperatures below 300 °C. It forms mainly high-molecular-weight n-paraffins, n-olfinins and oxygen-containing components. High-temperature synthesis (NTFT) is carried out in an iron catalyst at temperatures above 300 °C. The product is mainly a mixture of hydrocarbons with a high content of olifin, which are used as the main raw material for many chemical processes. FT is characterized by a relative lack of isoparaffins for synthesis products, so the hydrocarbons being synthesized have a low octane number. The turbidity temperature and filtration norm of the diesel fraction are not very high, which makes it difficult to use these components as fuel.

Therefore, in both options it is necessary to change the composition of raw materials obtained in the production of motor fuel, which are hydrolysed by combining processes and cracking, isomerization and other processes according to the technological scheme [19-23]. It is advisable to intensify each stage of the process in order to demonstrate the workability of the GTL technologist in obtaining the motor fuel in the traditional way. One solution to this problem is to implement a single reactor by combining hydrocarbonar synthesized hydrolysis steps. This requires the development of new Effective Hybrid Catalysts. In the process of GTL technologist, blockchain-enabled mobile technology allows simple equipment to process petroleum gases and pastes pressurized gases of used gas cones in mining conditions. developed [15-22].

The aim of the work is to obtain high molecular weight hydrocarbon from synthesis-gas and to organize the physicist-chemical characteristic of catalysing.

## EXPERIMENTAL PART

In the synthesis of hydrocarbons from CO and H<sub>2</sub>, the catalytic properties of the catalysts were tested under the following optimal conditions in a flow isothermal reactor filled with 30 cm<sup>3</sup> of

quartz (catalyst layer 10 cm<sup>3</sup>): temperature range 280-300 °C, 0.5 MPa and volumetric velocity of gas flow (GHT) 1000 h<sup>-1</sup>. Balanced experiments were performed for at least 150 h, the incoming and outgoing gas composition was analyzed, and the amount of hydrocarbons and reaction water obtained was recorded. The activity of hydrocarbon synthesis catalysts was evaluated on the following indicators: CO conversion, selectivity and productivity for hydrocarbons. The calculation error did not exceed 2.5%.

CO conversion was calculated according to the following formula:

$$X_{CO} = \frac{V_{in} \cdot c(CO)_{in} - c(CO)_{out}}{V_{in} \cdot c(CO)_{in}} \cdot 100\%$$

where  $V_{in}$ ,  $V_{out}$  - gas consumption at the inlet and outlet of the reactor, dm<sup>3</sup>/h;

$c(CO)_{in}$ ,  $c(CO)_{out}$  - Co concentration at the inlet and outlet of the reactor, unit fraction. Methane selectivity was calculated according to the following formula:

$$S_{CH_4} = \frac{V(CO)_{CH_4}}{V(CO)_{np}} \cdot 100\%$$

where  $V(CO)_{CH_4}$  is the volume of CO used to produce methane, dm<sup>3</sup>;  $V(CO)_{conv}$  is the volume of CO converted to methane, dm<sup>3</sup>. Selectivity for C<sub>5</sub> + hydrocarbons was calculated using the formula:

$$S_{C_{5+}} = \frac{V(CO)_{C_{5+}}}{V(CO)_{conv}} \cdot 100\%$$

bu erda  $V(CO)_{C_{5+}}$  - C<sub>5+</sub> uglevodorodlarni hosil qilish uchun sarflangan CO hajmi, dm<sup>3</sup>.

C<sub>5+</sub> uglevodorodlari uchun unumdorlik quyidagi formula bo'yicha hisoblab chiqildi:

$$G_{C_{5+}} = \frac{m_{C_{5+}}}{V_{cat} \cdot \tau}$$

where  $m_{C_{5+}}$  - C<sub>5+</sub> - mass of hydrocarbons, kg;  $V_{cat}$  - catalyst volume, m<sup>3</sup>;  $\tau$  - time, hour.

Determination of the composition of synthesis products. The composition of gaseous synthesis products was analyzed on a chromatograph "Crystal 5000" (Chromatek, Russia) equipped with a thermal conductivity detector with gas adsorption chromatography and two columns with active Haysep R phase and NaX molecular sieves. Analysis mode The temperature can be programmed with a heating rate of 8 °C/min. The composition of C<sub>5+</sub> hydrocarbons was determined by capillary gas-liquid chroma-mass spectrometry on a gas chromatograph (Agilent, USA) equipped with a mass-selective detector MSD 5975C.

## RESULTS AND DISCUSSION

The study of the catalytic properties of the samples during the synthesis of hydrocarbons from CO and H<sub>2</sub> was carried out at a temperature of 290 °C, a pressure of 0.5 MPa, a volumetric velocity of the gas at 1000 h<sup>-1</sup> and a ratio of H<sub>2</sub>/CO=2. High-silicon zeolite derived from Navbahor bentonite was used as the catalyst holding agent [24-28].

The experimental data obtained are presented in Table 1. Analysis of the dependence of the conversion rate of CO on the synthesis temperature shows that the composite catalyst exhibits higher activity than the absorption catalysts in FT-synthesis. Despite a 3-fold decrease in cobalt

concentration, an increase in FT-synthesis temperature to 290 °C in the presence of a composite catalyst allows CO conversion rates to be increased by 74.2% and hydrocarbon C<sub>5</sub> + by 91.7 kg/m<sup>3</sup><sub>cat</sub>-hour. The FT-synthesis catalyst is comparable to similar values for Co-Fe-Ni-ZrO<sub>2</sub>/HSZ (Table 1).

**TABLE 1. CATALYST TEST RESULTS**

Catalyst	C <sub>CO</sub> , %	T, °C	X <sub>CO</sub> , %	selectivity, %				G <sub>C5+</sub> , kg/m <sup>3</sup> <sub>cat</sub> h
				CH <sub>4</sub>	C <sub>2</sub> -C <sub>4</sub>	CO <sub>2</sub>	C <sub>5+</sub>	
Co-Fe-Ni-ZrO <sub>2</sub> /HSZ	20,8	225	76,2	16,1	10,4	1,4	72,1	115,0

Note: X<sub>CO</sub> is the conversion rate of CO; Productivity for G<sub>C5+</sub> - C<sub>5+</sub> hydrocarbons.

Samples of hybrid catalysts are characterized by a decrease in the selectivity of C<sub>5+</sub> hydrocarbon formation to 58-66% relative to the Co-Fe-Ni-ZrO<sub>2</sub>/HSZ catalyst. The intensification of these intermediate processes - the formation of methane and hydrocarbons C<sub>2</sub>-C<sub>4</sub>, is associated with the reaction of water gas. The increase in selectivity in methane formation is due, on the one hand, to the acceleration of the hydrogenation reaction of CO at the methane formation centers and the diffusion of CO and H<sub>2</sub> at different rates through zeolite pores due to the increase in synthesis temperature. As mentioned above, a Co-Fe-Ni-ZrO<sub>2</sub>/HSZ catalyst of FT synthesis has been developed for the synthesis of high molecular weight hydrocarbons (C<sub>19+</sub>). Therefore, their content in C<sub>5+</sub> hydrocarbons reaches 46.7% (Table 2). The group composition of C<sub>5+</sub> hydrocarbons is characterized by paraffins of normal content, the content of isoparaffins and olefins does not exceed 3%. The molecular mass distribution of hydrocarbons is shown in Figure 1 below. In the diagram showing the distribution of the amount of hydrocarbons obtained according to the number of carbon atoms in the molecule, the main part of the obtained hydrocarbons includes up to 25 carbon atoms, a significant part - 25-35. The fractional composition of C<sub>5+</sub> hydrocarbons obtained in the presence of hybrid catalysts is mainly represented by liquid hydrocarbons (C<sub>5</sub>-C<sub>18</sub>), their content is 83% for absorbing catalysts and 95% for composite catalysts. This is mainly due to the cracking of C<sub>19+</sub> hydrocarbons in the acid center of the zeolite. Against the background of a decrease in the content of hydrocarbons C<sub>19+</sub> and partly C<sub>11</sub>-C<sub>18</sub>, an increase of C<sub>5</sub>-C<sub>10</sub> hydrocarbons by 24-34%, redistribution of products of synthesis of products obtained in the presence of FT-synthesis catalyst Co-Fe-Ni-ZrO<sub>2</sub>/HSZ compared to their content.

**TABLE 2. THE COMPOSITION OF THE OBTAINED S5 + HYDROCARBONS**

Catalyst	Hydrocarbons	Content, %			Total	iso/n
		C <sub>5</sub> -C <sub>10</sub>	C <sub>11</sub> -C <sub>18</sub>	C <sub>19+</sub>		
Co-Fe-Ni-ZrO <sub>2</sub> /HSZ	n-paraffins	17,2	34,7	45,5	97,4	0,02
	isoparaffins	0,4	0,6	0,8	1,8	
	olefins	0,1	0,3	0,4	0,8	
	Total	17,7	35,6	46,7	100	

Note: iso/n - isoparaffins: paraffin ratio

In all fractions of hydrocarbons synthesized in the presence of hybrid catalysts, a large amount of products of secondary transformations (cracking, isomerization) - isoparaffins and olefins were found. A large amount of isoparaffins is recorded for the composite catalyst - the iso/n parameter is 0.6, which indicates an increase in its activity relative to the catalysts absorbed in the hydro-

improvement reactions. High concentrations of olefins have been found for catalysts with low cobalt content, which is due to their low hydrogenation ability compared to unsaturated hydrocarbons.

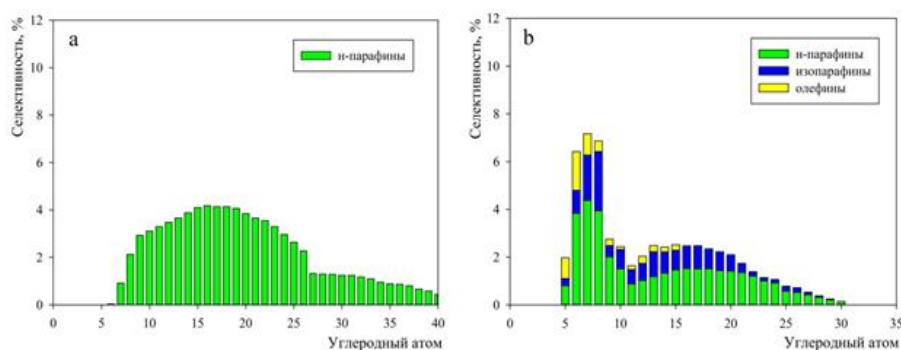

Figure 1. Molecular-mass distribution of  $C_{5+}$  hydrocarbons obtained in the presence of catalysts: a - Co-Fe-Ni-ZrO<sub>2</sub>/HSZ; b - absorbent, containing 6.5% cobalt.

The use of zeolite in hybrid catalysts allows the production of  $C_{5+}$  hydrocarbons whose molecular-mass distribution does not obey the AShF equation. Maximum MMD corresponds to  $C_5$ - $C_{10}$  hydrocarbons. The products mainly consist of liquid hydrocarbons. For selective catalysts, the selectivity in the formation of  $C_5$ - $C_{18}$  hydrocarbons is 46–49%, and for the composition, 62.6% (Fig. 1). Thus, the use of cobalt mixing and cobalt precipitation methods by absorption into the resulting carrier was found to have a significant effect on the physicochemical and catalytic properties of hybrid catalysts. The use of the absorption method to obtain hybrid catalysts creates a system that exhibits lower catalytic properties than a composite catalyst during the synthesis of hydrocarbons. This is probably due to both diffusion factors, the blockage of pores by sedimentary cobalt, and the formation of compounds of cobalt and aluminum oxides that are difficult to recover from the oxide-oxide interaction. In absorber catalysts, the hydrocarbon synthesis centers and the zeolite acid sites are in close contact with each other, which should contribute to the intensification of secondary processes.

However, the content of liquid hydrocarbons ( $C_5$ - $C_{18}$ ) in  $C_{5+}$  hydrocarbons is about 83%, which is 12% less than in the composite catalyst. No oxide-oxide interaction was found for the composite catalyst prepared by mixing the components, the pores of the zeolite are not blocked by cobalt, which allows the reagents to be efficiently delivered to the active part of the hydrocarbon synthesis. Such a catalyst has a high activity in the synthesis of hydrocarbons - the conversion rate of CO is 74.2%, the yield and selectivity for  $C_{5+}$  hydrocarbons is  $91.7 \text{ kg/m}^3_{\text{cat}} \cdot \text{h}$  and 66.5%. In a composite catalyst localized in silicon oxide, the acid center is not blocked by cobalt located above the silicon oxide in the Co-Fe-Ni-ZrO<sub>2</sub>/HSZ catalyst. There are both external and internal centers for hydrocarbons, as a result of which the composite catalyst increases the activity in hydrolysis reactions - the amount of liquid hydrocarbons reaches 95%. In this regard, the preferred method of preparation of hybrid catalysts is to mix the active components using a binder. Structure and phase composition of catalysts. The phase composition and structure of the catalysts were studied using RFA and IR spectroscopy. The radiographic image is the same for all samples (Figure 2)

Figure 2. Diffractograms of catalysts containing different amounts of cobalt, %: a - 4.2; b - 6,3; c - 7,4; d - 8.4

The size of the  $\text{Co}_3\text{O}_4$  particles varies in the range of 10–12 nm, with no deviations recorded at the elemental cell parameter 8.088 Å in the  $\text{Co}_3\text{O}_4$  structure associated with the change in the components in the catalyst. According to IR spectroscopy data, no interaction of cobalt oxide with the catalyst components was observed (Fig. 3).

Figure 3 - IR spectra of catalysts of different cobalt content, %: a - 4.2; b - 6,3; c - 7,4; d - 8.4

By increasing the cobalt content in the catalysts, the intensity of the absorption bands corresponding to the  $\text{Co}^{2+}$  vs  $\text{Co}^{3+}$  oscillations increases. Between 3000-3700  $\text{cm}^{-1}$ , 1600-1650  $\text{cm}^{-1}$  and 750-850  $\text{cm}^{-1}$  the intensity of the absorbing bands varies with respect to the vibrations of the surface hydroxyl groups, the crystallization water and the Al-O bond, which is the aluminum content of the composite catalysts. associated with a decrease in the amount of oxide.

## CONCLUSION

Thus, the reaction of obtaining high-molecular hydrocarbons from the synthesis gas and the physicochemical characteristics of the catalyst containing Co-Fe-Ni-ZrO<sub>2</sub>/HSZ used in this process were studied. The reason for the increase in selectivity in methane formation is, firstly, the acceleration of the hydrogenation reaction of CO in the methane formation centres with increasing synthesis temperature and secondly, the diffusion of CO and H<sub>2</sub> at different speeds through zeolite pores. Secondary changes in all fractions of hydrocarbons synthesized in the presence of hybrid catalysts: isoparaffins and olefins are formed due to cracking and isomerization. A large amount of isoparaffins is recorded for the composite catalyst - the iso/n parameter is 0.6, which indicates an increase in its activity relative to the catalysts absorbed in the hydrogenation reactions. For catalysts with low cobalt content, the concentrations of olefins will be high, which is due to their low hydrogenation ability compared to unsaturated hydrocarbons. In the absorption catalysts, the hydrocarbon synthesis centres and the zeolite acid sites are in close contact with each other, which contributes to the intensification of secondary processes. However, the content of liquid hydrocarbons (C<sub>5</sub>-C<sub>18</sub>) in C<sub>5+</sub> hydrocarbons is about 83%, which is 12% less than in the composite catalyst. No oxide-oxide interaction was found for the composite catalyst prepared by mixing the components, the pores of the zeolite are not blocked by cobalt, which allows the reagents to be efficiently delivered to the active part of the hydrocarbon synthesis.

### ABSTRACT

*This article investigated and examined the change in the quality properties of cotton fiber and degree of purification. In the technological process of blowing, cleaning and carding. The basic purpose of this study determine the optimizing the technological parameters of blowing, cleaning and carding process for normal yarns by using fiber which is estimated as the average quality by the USTER®. Short fiber cotton was used to produce normal counts, i.e Ne 30 OE yarn spun on Autoconer 9 spinning frame. Yarn produced by spinning process from semi-finished products collected at different type technological parameters of spinning process shows variable yarn properties. The study of all these parameters plays important role to achieve better quality output of the spinning process.*

**KEYWORDS:** *Fiber Properties, Blowing, Cleaning, Carding, Neps, Optimization*

### I. INTRODUCTION

Cotton-spinning production has a number of features, which include the continuity of processes; a large number of interrelated and interdependent factors that determine the process; the presence of external and internal uncontrolled disturbing influences affecting the quality of raw materials, produced semi-finished products and yarn.

Depending on the degree of influence of each of these factors on the quality of raw materials, semi-finished products and yarn, and their interactions, deviations of the parameters of technological processes occur in time, which leads to fluctuations in their quality indicators.

Modern blowing and cleaning units blown cotton more finely, mix the components of the mixture better, more completely clean cotton from minor pollution, and create continuity of the production flow from a bale of cotton to the formation of a sliver on a carding machine.

Blowing and cleaning of fibrous material from trash impurities should be considered as two continuously connected and influencing processes, including several successive stages. A prerequisite for effective cleaning of raw materials with minimal damage to fibers is to ensure a high degree of blowing before entering the cleaners, since the latter can effectively remove only those minor pollutions and hard impurities that are on the surface of cotton shreds.

Blowing and cleaning of fibrous material is carried out on all machines of the production line, from the bale ripper directly to the carding machine. Many engineering firms in various versions produce modern blowing units. In the process of spinning, the technological systems for blowing, cleaning and carding of fibers are very diverse and the correct choice of maintaining the properties of the fiber in technological processes and maintaining the specified properties of the yarn is of great importance. In order to produce an even, clean yarn, the fibers must be completely separated from each other, sufficiently cleaned and evenly spaced in the product. In the production of textiles, the carding process is considered the most optimal and only technology for preparing fibers in the above form.

The carding process is carried out as a result of the interaction of a set of carding machines that cover the surfaces of the working parts.

The card clothing separates the fiber bundles into individual fibers, combing out small and tenacious impurities, as well as short fibers to waste, and in partial fiber orientation.

Therefore, the carding process plays an important role in determining the characteristics and properties of cotton yarns.

As a result of the fact that the rotational speed of the current carding machines has increased more than three times than that of the previous carding machines, that is, the main drum from  $200 \text{ min}^{-1}$  to  $900 \text{ min}^{-1}$ , the liker-in drum from  $700 \text{ min}^{-1}$  to  $2700 \text{ min}^{-1}$ , the speed of movement of the flats increased from  $0.1 \text{ m / min}$  to  $0.4 \text{ m / min}$ , respectively, in the technological transitions of the spinning process, changes in the qualitative properties of the fiber occur and, accordingly, the structure of the yarn also changes.

Therefore, the effective use of raw materials in the production of yarn and a thorough study of the effect of changes in the structural indicators of fibers on the structural indicators of the yarn during technological transitions has become an urgent problem.

In addition, optimization of technological processes based on the study of factors that affect the structure and properties of the yarn is essential in improving the spinning efficiency.

Despite the fact that the performance of spinning mills significantly grow, some key problems still await solution in the process of yarn production, including:

Identifying the cause of defects (IPI) on the yarn and ways to eliminate them;

An increase in the yield of yarn from fiber with an increase in production productivity;

In achieving, in terms of the quality of cotton yarn, a state of competitive high quality, corresponding to the demand of the world market.

As a solution to these problems, the need to identify the optimal parameters of the working parts of machines in the technological process of spinning is mentioned.

To date, there are no universal methods and recommendations for improving the quality of products manufactured by enterprises operating on modern equipment.

To accomplish these tasks, it will be necessary to determine the optimal parameters of the working parts of technological machines.

To ensure the rational use of raw materials, to ensure quality products and semi-finished products, it is necessary to conduct more and more scientific research, based on which to optimize the technological parameters of refueling equipment, to design new solutions that will effectively solve the tasks set for the cotton spinning industry. Today, the issues of studying the dependence of yarn properties on the raw materials used and technological parameters of machines are very relevant and in demand.

The study of changes in the properties of fibers and semi-finished products during production passing through the sequence of technological processes is the main direction of increasing the efficiency of not only spinning production, but also the production of finished textile products. Because the performance of subsequent transitions depends on the preservation of the natural properties of the fibers and the unevenness of semi-finished products, from blowing the bale to the production of finished fabric.

Cotton fiber, from the process of its collection to the production of finished products, passes through many processes, where it is constantly exposed to humidity, temperature, working parts of machines, which leads to damage to the cotton fiber [1].

Mechanical and biological damage to fibers ultimately leads to a decrease in the natural properties of the fiber, such as fiber length, strength, elongation index, elongation at break, an increase in the content of trash impurities, short fibers, which directly affects the quality of the yarn produced. A change in the structure of a fiber under biological action leads to a decrease in its strength characteristics, and under the action of the working parts of machines installed in the technological process; it increases the damage to the fibers. If we take into account that the fiber passes through several technological processes, where it is subjected to mechanical stress, then by the end of these processes it loses its original properties. Based on this, it can be concluded that in order to preserve the natural properties of the fiber, it is necessary to reduce the processes of exposure of the working parts to it in each technological process, and also the processes must be carried out in the optimal technological mode [2], [3].

The analysis of the research work carried out showed that with mechanical damage to the fiber, fine fractures appear on its surface the formation of these fractures on their surface leads to a decrease in the quality indicators of the fiber, such as strength and elongation at break.

As a result of our research, it was found that endless mechanical stress on the fiber leads to its damage. To determine the level of influence of the mechanical action of the working parts of machines on the properties of the fiber, we carried out experiments, as a result of which the degree of mechanical damage was determined by the transitions of the spinning industry.

## II. MATERIAL AND METHOD:

During the experiment, we used medium-staple cotton of type 4, grade I, selection C 6524, which was processed in a Blowroom for blowing and cleaning and subsequent feeding for carding. The experiments were carried out using technological equipment from TRUTZSCHLER® (Blowroom line and Card TC-19i) [4].

## III. TECHNOLOGICAL PART:

During the experiments, fiber samples were taken from each transition machine by random sampling. Cotton samples were tested on laboratory equipment AFIS [5]. The investigated properties of a cotton fiber sample are shown in Table 1.

**TABLE 1 FIBER PROPERTIES BY TRANSITIONS, TESTING IN AFIS EQUIPMENT**

ITEM of process	Tot Nep Cnt [cnt/g]	SC Nep Cnt [cnt/g]	SFC(w) % < 12,7 mm	Maturity [mat1]	Fineness [mteks]	UQL(w) [mm]	Trash Cnt [Cnt/g]

TwinToprear	1 095	202	37,8	0,79	149,0	22,6	467
Top flat	703	343	8,3	0,91	177,0	27,7	277
Twin top	549	60	46,0	0,79	156,0	20,8	63
TC -19i CARD sliver	103	12	5,7	0,95	176,0	29,4	1

Table 1 shows the results of changes in the properties of fibers obtained in the process of opening, cleaning and carding. Qualitative indicators such as the number of Neps in the initial stages of processing increase, the content of short fibers varies unevenly after each transition of cotton fiber processing. This can be explained by the influence of the dynamic and mechanical effects of the working parts of the machines in the process of blowing, cleaning and carding the fibers.

An increase in Neps can lead to problems in the finished yarn, and affects an increase in the IPI value [5].

Which directly requires even more attention to research in these transitions of the spinning process.

To facilitate the analysis of the results obtained, histograms were drawn up on the change in the properties of the processed fiber in each transition.

**Fig-1.** Change the q of Neps by transitions

Where is,

- 1- neps count after BLENDOMAT BO-A
- 2- neps count after the SP-MF separator
- 3- neps count after pre-cleaner CL-P
- 4- neps count after the MX-I mixer
- 5- neps count after the CL-C3 cleaner
- 6- neps count after the SP-PX separator
- 7- neps count to the receiving hopper of the carding machine
- 8- neps count after CNUFT
- 9- neps count after CARD CHUTE receiving hopper

- 11- neps count after the back segment of the card
- 12- neps count after the carding machine
- 13- neps count after the front segment of the carding machine
- 14- neps count in the carding sliver

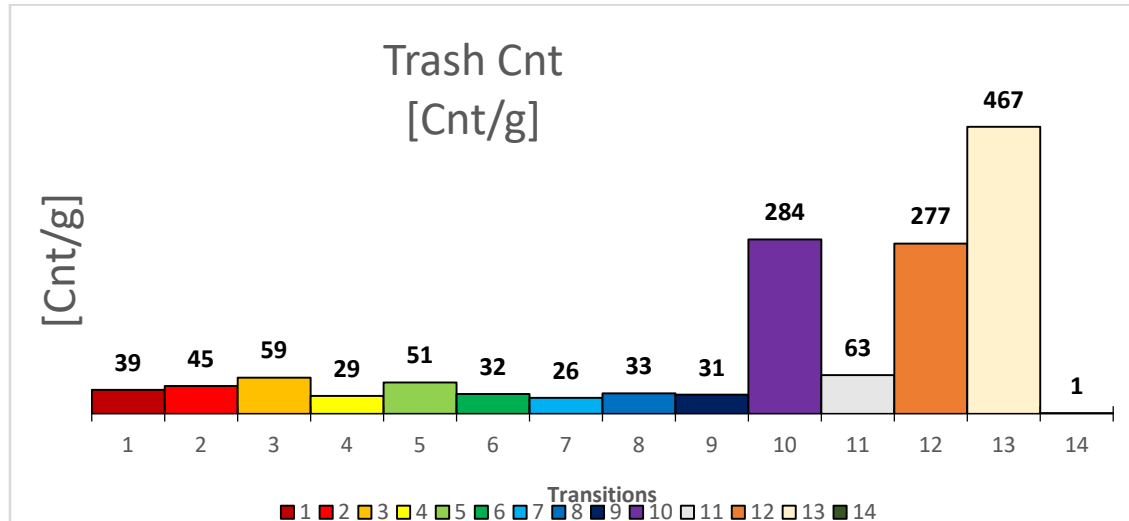

**TABLE 2 TECHNOLOGICAL PARAMETERS OF TC 19I CARDING MACHINES**

Item of parameter	Parameters
Feed speed	500-600
Taker-in speed	1250
Cylinder speed	520
Flat speed	320
Delivery speed	200
Total number of flats in rotation	99
Cylinder to flat distance (in five different positions from back to front)	Position 1: 0,250 position 2: 0,250 position 3: 0,220 position 4: 0,220 position 5: 0,200

From the Pic 1. on histogram, you can determine what, the number of neps after cleaning processes on the CL-P machines. CL-C3, the take-up drum of the carding machine, where the serrated sets act on the fiber sharply, increases. Towards the end of the carding process, the number of neps decreases under the influence of fixed flat segments and a flat blade. From the constructed histograms, one can come to the following understandings: during the process of blowing, cleaning and carding, it is necessary to optimize the operating parameters of the working parts of the machines, such as distribution and speed, as well as the pressure of the air suction [6].

**Fig-2.** Change in the number of short fibers by transition.

As can be seen from the histogram in Fig-2, the number of short fibers increases in the process of carding the fibers on the back and front carding segments, since after the carding segments the proportion of short fibers should have decreased, but in our version the opposite happened, which leads to the idea that the fibers have places of mechanical damage and the card itself can become an object of improvement or decrease in the quality characteristics of fibers. That requires special attention to the establishment of the operating parameters of technological machines.

**Fig-3.** Change in the count of trash by passages

The results obtained show that each machine, depending on the type of set of working parts, affects the degree of cleaning of the processed material. It can be seen from the histograms in Fig-3 that the Blowing - cleaning unit has the greatest cleaning effect, while on these units, defects, neps, cotton waste, dust and fiber fluff, cotton leaves and non-spinning fibers are removed.

The final in-depth cleaning of the fiber is applied by carding machines. It was found that an increase in the speed of preliminary carding with the receiving drum leads to intensive separation of fibers and the impact of the teeth of the card clothing leading to grinding (in micron sizes) trash impurities. As our analyzes show, after the receiving drum (liker-in), the proportion of trash impurities increased. There is also an increase in fiber breakage and neps removal efficiency. The result is an increase in the IPI and hairiness of the yarn and also a decrease in the strength in a single yarn.

#### IV. CONCOLUTION:

1. In the course of the study, the influence of the settings of technological machines in Blow room and carding machines on the change in the main quality properties of cotton fiber, improving the indicators of neps and uneven quality indicators of the carding sliver was studied.
2. It has been determined that the carding process has a significant effect on the quality properties of cotton fibers and plays an important role in improving them.

3. The optimal technological parameters for the production of ribbons for yarn produced for weaving and knitting purposes have been developed, which allows increasing the productivity of carding machines up to 80-100 kg / hour.
4. The results of theoretical and experimental studies on increasing the efficiency of carding machines, improving the quality of combed fibers and optimizing the technological parameters of the fiber processing process are considered.

## V. ACKNOWLEDGMENT

The authors is also highly grateful to staff of Tashkent institute of light and textile industry to prof. K. Gofurov for their support and guidance.

## VI. DECLARATION OF CONFLICTING INTERESTS

The author(s) declared no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

### ABSTRACT

*The article analyzes the originality of literary interpretation in poetry, the contradiction of words and spirit in the formation of poetic perception, the combination of expression and description in methodological research on the example of AlisherNazar, one of the representatives of modern Uzbek lyric poetry. It examines the status of form and content in the evolution of the poet's narrative technique, the use of metaphors and semantic shifts, the ways in which emotional perception and philosophical observation intertwine, and the degree to which artistic speech and interpretation skills are appropriate. The human psyche is, in fact, inherent in the creative skill of grasping the mysteries of the subtleties and feeling the delicate image of the situation and reviving the feeling in a vivid imagination. The concentration of tone, music, and analysis in a poem that combines concept-symbol-image-idea determines aesthetic value.*

**KEYWORDS:** *Poetry, Literary interpretation, Creative worldview, analytical skills, artistic speech, image bubble, depth of expression, aesthetic ideal, situation, formal conciseness, philosophical generalization, evaluation criteria, methodological research, psychological analysis, artistic skills, emotional perception.*

### INTRODUCTION

Poetic speech, figurative thinking and creative inclination always strive for a level of originality. It is natural that the creative nature of the poem is detached from the spirit of the nation, which is colored by the unique potential of art! The metaphor used by the poet and the symbol he created actually summarize certain aspects of the character. In writing, the natural flow of image bubbles

and expression independence is welded to artistic mastery. It is the technique of narration to direct the disturbed mood to the depths of philosophical observation, to connect the vital need with the poetic passion. In this sense, given that the logical development of each poet's artistic concept tends to originality, it becomes clear that there are scientific gaps in science. At the same time, each creative worldview is markedly differentiated by aesthetic choice, perception, and renewal of imagination. An analysis of the extent of the conflict of words and spirit in poetry on the example of AlisherNazar's poetry determines the relevance of the topic.

Poetic speech, figurative thinking and creative inclination always strive for a level of originality. It is natural that the creative nature of the poem is detached from the spirit of the nation, which is colored by the unique potential of art! The metaphor used by the poet and the symbol he created actually summarize certain aspects of the character. In writing, the natural flow of image bubbles and expression independence is welded to artistic mastery. It is the technique of narration to direct the disturbed mood to the depths of philosophical observation, to connect the vital need with the poetic passion. In this sense, given that the logical development of each poet's artistic concept tends to originality, it becomes clear that there are scientific gaps in science. At the same time, each creative worldview is markedly differentiated by aesthetic choice, perception, and renewal of imagination. An analysis of the extent of the conflict of words and spirit in poetry on the example of AlisherNazar's poetry determines the relevance of the topic.

### LITERATURE REVIEW

Usually, in the poet's poetry, the conflict of words and spirit creates an artistic unity. More precisely, the synthesis of consciousness and worldview is a key factor in determining the separation of artistic speech, in which emotion complements observation, in which the power of expression in observation is determined. At the level of lyric theory, there is some experience in analyzing the creative worldview in terms of the integrity of words, imagination, and images. In particular, B. Nazarov's "Life is a benign criterion" (Tashkent, 1985), I. Gafurov's "Heart of lyrics" (Tashkent, 1982), K. Yuldashev's "Burning word" (Tashkent, 2006), N. Rakhimjanov's "Period and Uzbek lyrics" (Tashkent, 1979), N. Jabborov's "Time, criteria, poetry" (Tashkent, 2015), A. Sabirdinov's "Words and images in Oybek's poetry" (Tashkent, 1993), B. Akramov's "Problem of poetic image in modern Uzbek lyric" (Tashkent, 1991), J. Jumaboyeva's "Psychological image skills in XX century Uzbek poetry" (Tashkent, 1999), B. Norbaev's "Poetic life Principles of Interpretation and Problems of Mastery" (Tashkent, 1996). The study of a certain stage of period poetry in historical terms, the study of the laws of literary development in relation to the creative worldview, reveals the poet's individual skills. In fact, the subject of the lyrical image differs from the emotional perception in the style of expression that creates the philosophical observation. The mix of aesthetic choice and creative worldview individualizes artistic speech. The current situation is welded by the use of metaphors, the effective use of the image calendar, the determination of the poetic harmony of words and moods. The breadth of natural imagination depends on the concept of artistic mastery! The sense of meaning that combines constant change and continuous action is nourished by the creative nature. AlisherNazar's work, although creating a unique artistic discourse, has not yet been analyzed as a holistic problem as an object of special research.

## RESEARCH METHODOLOGY

The analysis of the creative worldview of each artist as a whole poetic structure provides a basis for evaluating the word-image-idea relationship at the level of the historical principle. In the present case, the sequence of life logic is replaced by artistic conditionality. Perception, formed by the influence of real reality, centralizes the situation. There are three main centers that define AlisherNazar's lyrics: word shift, artistic speech development, and text poetic system! The possibility of interpretation and analysis organizes the trinity in the system. In subtle observation and vivid observation, the poet's style of expression is characterized by a deepening of the imaginative perception of the way of the image, in which the state of the scene governs the emotional thinking, in which the narrative technique describes the creative nature. In the author's writings, an attractive temperature, inner harmony and aesthetic energy define the expression. The path of the image, moving from the perceived reality to the unexplained essence, formalizes the reality of the senses in a way that transfers meaning. The poet's tendency to form a solid psychedelic analysis of the reality of a changing being adorns his methodological pursuits, in which a high and intense observation, an attractive and impressive emotional upheaval, a gentle and elegant tone predominate. The transition from emotional to emotional states requires a sense of urgency. At the heart of the integrity of sign-concept-imagination-word-idea is the gradual evolution of the spiritual experience of the creative nature.

## ANALYSIS AND RESULTS

Poetic discourse, a mixture of words and ideas, always seeks to renew the literary essence. In the perception restored in the sense of perception, the philosophical perfection manifests itself in the uniqueness of the expression. In fact, the combination of subtle observation and live observation is a leading factor in shaping the philosophy of poetry, and the narrative technique puts the creative worldview into a specific system. In a poetic way that confronts the synthesis of imagination and imagination in relation to each other, relationship management plays a crucial role. A metaphor from nature, an analysis of the psyche, and a sense of emotion are the subtle qualities of true talent, the scale of the imagination in the line of the state that emerges from the emotions. The collection of form and content in expression depends on a particular poetic talent, in which the perception of melody and music integrates the delicate landscape. The desire to penetrate the deepest layers of the human senses and the desire to materialize the image define the nature of magical art. It includes the right to spiritual inviolability, the product of spiritual need, and the logical change of meaning:

U tunnisiqorar – qismatmayini,

Ko'zlaridabedormunglixotira.

Osmoneshiklarinochadiasta,

Quyoshchiqibkellar...

Tongotmassira [2, 29].

AlisherNazar's work has a significant place in the history of Uzbek poetry during the period of national independence. In magical art, which strangely combines the harmony of emotion and observation, the depiction of the state of mind evokes a sense of poetic perception. The unique style of expression created by the poet, the level of specificity of artistic speech deepens the

imagination, brightens the image, and most importantly, the natural flow of thoughts rapidly occupies the human mind. The ability to analyze the situation in the mood, which is formed with the help of artistic expression, is polished. The regular exchange of emotions and observations is a key factor in determining the philosophy of poetry, in which the power of meaning and the power of form complement each other, in which the psyche of image and the independence of expression are combined, in which the paradoxical relationship serves to distinguish the lyrical image. . In the author's writings there is a tendency to organize mood-action-mood during imagination. The bubble image and the dark rhythm of expression are vividly reflected in the poet's collections of poems "Mornings for Us" (1999) and "Vola" (2014). The desire to portray the human psyche in a philosophical tone defines the creative nature. "Alisher's poems can be said to consist of confessions about him. He is a creator who believes that the way to the world and humanity passes only through himself, his heart and deeds. In many poems, either emotion or thought predominates. A. Nazar's lyrics are the result of the combination of thoughts with feelings and emotions with thoughts. Nor does he want y to be left behind by emotions" [3, 401]. The balance between emotion and observation is, in fact, the discipline of poetic logic. The artistic goal achieves aesthetic power in the sense of perception, the rhythm in the perfection of thought. The natural tone of the word is rounded to the brim. Every impression in a person's emotional thinking reflects a creative essence. The practice of perception, perception, and comprehension creates in the poetic worldview the originality of expression — the uniqueness of the image — the spiritual experience.

The poet enlivens the image of suffering in elegant lines. The "trembling of the night to the heart" is a heavy pain, sealed with "a sad memory in his eyes"! "Stars in the sky," "crazy winds," and "moon's sickle" - comparisons from nature - are specialized in expressing mood. The bright expression (the evening slowly pours into the heart, the stone begins to shoot, the stars in the sky) and the bubble image (the night shakes, fills, waves) provide an aesthetic impression of the thought. Philosophical emphasis (when the sun rises) strengthens the student's confidence in the future. The phrase "never wake up" embodies the weight of the riot in the heart of the lyrical hero. The state of a person, which is roasted in the embrace of anxiety and imagination, is strained by attractive metaphors. "Suffering" is a general term that focuses on confession and hope, hope and desire, confidence and opportunity, imagination and impression:

Shu so'zgao'xshaydiaslitiriklik,  
Aslsaodat ham shundanboshlanar.  
Bu so'znishunchakiaytako'rmagil,  
Ortidanqontuflayolmasang, agar [2, 36].

In the five-line poem "Liberty", the author focuses on the analysis of "the feeling of the blood of the ancestors." The poet's relational speech lays the groundwork for the maintenance of mental tension in the artistic cells of the whole text. In the feeling of rising to the level of "the greatest joy, the greatest cry" in the life of the nation, "there is a spirit of evil heroes!" In the eyes of the Creator, freedom has the status of "the root word of faith", freedom "the word that awakened so many martyrs", spiritual inviolability "the great word that leads to the truth"! It contains the essence of the "real life", in which "the real happiness begins", in which the ancient history is "aware of the distant past!" The blessing of Allah is not easily achieved, it is as dear and dear to the Uzbeks as the "holy word"! It is as if the "sound of swords" is a sign of great tragedy ... The

more difficult it is to achieve freedom, the more difficult it is to protect it, based on the lyrical hero's appeal "Carefully embrace him, hide him in the depths of your heart forever." There is a reference to "The art of the artist is that he strives to capture every word, the meaning of the situation, in a bus-whole, to penetrate into the essence of the word" [4, 149]. The weight of the word depends on the strength of the poetic idea, which is equated to it, and the logical emphasis of meaning harmonizes the tone and rhythm. The truthfulness of the feeling and the perfection of the observation are in fact derived from the grasp of the vital beliefs:

Yarimkecha.

Yarim dil...

Shamollarboshlarxonish.

Orzugatilaboqyo'l,

Mudrabyotaditashvish [2, 61].

In a poetic scene, nature comes to life: a subtle life analogy (midnight-half-tongue) controls the movement of emotions. The poem is dedicated to the "mystery of existence" - the beginning and end of life. In a strange way, "a white path to a dream, a drowsy anxiety", in the world of "forty years of mourning, the head of dreams is bowed". The hardships of the "white horse - life" do not allow dreams to be "filled" all the time. And yet, "The blue thermals giryon, wrinkle the world!" In the author's literary interpretation, reality serves as a determinant of state and mood. "Singing the heads of the winds" - a symbol of hope and confidence, the white horse - describes the symbol of happiness. In the present case, the reality of perception takes precedence over the reality of life. The "coming of the white horse" in the dream contrasts desire and opportunity. An alternative image allows the poet to brighten the image. Indeed, "there is a proper understanding of the ingenuity of inspiration in the senses, the greatness of the art of speech, and those who can feel it are very subtle. I do not experience the whims of meaning and logic without a clear definition of purpose. It is impossible to achieve the right result without striving for pleasant eloquence and innovation" [5, 45]. The quote draws attention to several aspects: first, the creative potential of word art is reflected in the sense of perception, secondly, the poetic structure of the poem is determined by purposeful clarity, thirdly, the conflict of meaning and logic determines the philosophy of creation, fourth, the choice of aesthetic taste and the combination of methodological research is a key factor in ensuring the uniqueness of the narrative technique.

## CONCLUSIONS AND RECOMMENDATIONS

In AlisherNazar's poetry, the word art seeks to become a deep analysis of the human psyche and an examination of the mysteries. As the author paints a picture of the situation in emotional perception, he subtly connects subtle observation and vivid observation. The poet usually derives the logic of life from the expression of mood. While magical works of art born of a creative worldview sometimes feature creative independence of visual aids such as pitching, cutting, and satire, some literary interpretations tend to materialize emotion and depict the flow of emotion. "NasrullaErgah" - the poet's talent for analyzing the growth and transformation of spiritual landscapes is a testament to his talent. In it, research and experience complement each other, in which the lyrical subject and the object of the poetic image are combined. In the author's writings, which stabilize the burden of meaning on the poetic idea, the temperature of feeling, the power of content is reflected. The allegories used in the poet's poems are full of vividness, vivid

imagination, and a desire to deepen philosophical observation. The desire to expand the scope of the imagination, the meticulousness in the analysis and examination of the psyche, the desire to keep the scale of life's contradictions tense characterize the effectiveness of the poetic possibilities achieved by the creator. There is a tremendous potential in the creative nature that directs the capacity of words to the understanding of poetic meaning!

**ABSTRACT**

*The article examines role of motivation in teaching foreign language. Having effective methods are not enough to increase learners' acquisition. Different factors influenced by nature and formed by nurture. The following paper studies how motivation has impact on learners' foreign language acquisition, the relationship of motivation, cognition, and emotion, and analyzes the role of motivation in teaching foreign language.*

**KEYWORDS:** *Motivation, Integrative motivation, Instrumental motivation, Cognition.*

---

## INTRODUCTION

Teaching second language entails not only good methodological skills but also touches the factor individual differences of FL learners. Proficient teacher knows that FL learners vary regarding their learning styles. Some learners regardless of their age possess skills that help them acquire a language. For example, some learners are kinesthetic and show better results when they touch or see. Others are visual and remember a language when they see it. Nevertheless, the most important factor that pushes them to learn a language is Motivation.

Motivation in a second language acquisition is a tough object. Dornyei (1998) marked that there is a connection between motivation and success in second language learning. In fact, "... without sufficient motivation, even individuals with the most remarkable abilities cannot accomplish long-term goals, and neither are appropriate curricula and good teaching enough on their own to ensure student achievement" (Dornyei, 1998, p. 117).

What Is Motivation? Motivation Is Willingness Of Action Specifically In Behavior. These Days, The Word Motivation Is Widely Used Among Teachers And Learners. Foreign Language Teachers Struggle To Find Various Ways On How To Awake Or Increase Learners Motivation.

Gardner And Lambert (1972) Divided Motivation Into Two Types: Integrative And Instrumental.

Integrative Motivation Pushes Learners To Acquire Foreign Language In Order To Become A Part Of A Target Culture Or Community. In This Type Of Motivation, Learners Have Great Willingness To Behave And Resemble Like The Aimed Community.

In Case Of Instrumental Motivation, Individuals Find Incentive In Learning Foreign Language In Order To Get Benefits, Such As Working, Travelling, Or Studying Abroad. Not Regarding Its Type Both Can Lead To Success. However, The Domination Of One Of These Types Is Influenced By Social Factors. That Is, Individuals That Belong To Well-Off Society In Common Cases Have Integrative Motivation. Yet, Individuals That Belong To Subordinate Group Of Society Can Possess Instrumental Motivation.

Dornyei (1994) Noted That Instructors Should "Develop Learners' Instrumental Motivation By Discussing The Role L2 Plays In The World And Its Potential Both For Themselves And Their Community" (P.281).

The Complex Relationship Of Motivation, Cognition, And Emotion.

Cultivating Motivation Is Essential To A Language Learners And Their Success In Study. As It Was Mentioned Above, Motivation Is Something That Learners Form In Their Mind. Still, According To Dornyei (1998) There Is A Fundamental Issue With Conceptualizing Of Motivation As The Foundation Of Human Behavior. Motivation Is Abstract Term, It Is Untouchable, But Its Results Are Visible. Individuals Who Pushed By Integrative Motivation Commonly Feel Happiness And Emotionally Stable. They Have A Tendency Not To Give Up When Face With Problems. In Terms Of Teaching Integrative Motivated Learners, Teachers Do Not Have Difficulties And At The Same Time Feel Joy While Conducting The Lesson. Such Learners Do Not Hurry Language Acquisition Time, Instead They Fully Into Learning Society With Its Customs, Traditions, Culture, And So On. Individuals Who Pushed By Instrumental Motivation Are More Practical And Need Quick Results.

## Motivation And Teaching

Both For Teachers And Students Will Be Big Issues If The Last Have Neither Integrative Nor Instrumental Motivation. Such Cases Appear At Schools, When Children Do Have Any Idea Why They Are Learning Foreign Language. Usually, Elementary School Teachers Do Not Know How To Teach Demotivated Pupils And Become Strict If A Particular Pupil Is Not Ready To The Lesson Or Distract Others. Schoolchildren Are Not Interested In Target Language Community Or Culture; They Do Not Have Particular Contacts With Job Prospects, Neither With Educational Institutions. According To Noel's Theory On Adaptation Of Self-Determination Theory Of Language Learning Theory

For Elementary School Children The Great Motivation Is Their Marks. If They Get An Excellent Mark From Language Lesson, They Are Happy, If Not They Are Sad. It Is Too Simple. However, Apprising Only With Marks Are Not An Effective Teaching Method. The Possible Solution In Such Situation Is Well Picked Coursebook. The Course-Book Should Contain Authentic Dialogues By Using Language In Elementary Level. Situational Dialogues Induce Young Learners To Them In Their Daily Life And Become Interested In A Language. Syllabus Should Be Developed Accordingly. The Course-Book Published By Cook (1983) Living With People Described England, Specifically Oxford And Showed Real Supermarkets, Hospitals, Trade Centers, Cafes, And So On. For Children It Is Good Chance To Practice Their Language Not Only In The Classroom But Out Of It, As Well. The Feeling Of Motivation Appear In Middle School Or In Higher Classes, When Pupils Have Already Set Their Goal Or Trying To Find Their Place In Society.

Dornyei And Otto (1998) Suggested A Framework For Motivational Strategies, Which Is Presented In The Form Of Process (See Figure 1). The Key Points In This Process-Oriented Structure Consist Of The Following:

Creating The Basic Motivational Conditions, That Is Developing A Good Scenario For The Effective Utilization Of Motivational Strategies;

Generating Student Motivation, Developing Students' Goal-Orientedness; Preactional Phase

Maintaining And Protecting Motivation, Creating Motivational Atmosphere And Maintaining It; Actional Phase

Encouraging Positive Self-Evaluation, Providing Motivative-Cosntructive Feedback; Postactional Phase

Creating Basic Motivational Conditions Are Fundamentals Of Successful Lesson. In This Phase, It Is Crucial For Teachers To Behave Appropriately And Consider Learner's Individual Characters. Classroom Environment Should Be Supportive And Positive. This Is Very Important Level; The Result Of The Lesson Will Be Depend On This Condition.

Generating Student Motivation If The Above-Mentioned Condition Directly Influenced By External Features, The Following Is Closely Related To Lesson Process. In A Perfect World, Leaners Are Eager To Learner A Language And Are Always Hurry To The Lesson, Regardless Their Age And Incentive. In Reality, It Is Far From That. School Administration Pays More Attention On Students' Attendance And "Lesson Papers".

**In Conclusion,** To Promote Motivation In The Foreign Language Classroom, Teachers Should Face With Some Motivational Strategies. To Carry Out The Classroom Participation, The First Thing The Teacher Should Do Is To Take Into Account The Students Attitudes And Interests. Moreover, Teacher Should Have A Good Relationship With The Students. It Is Obvious That Having A Good Relationship With The Students Is Also Essential To Keep Them Motivated For That Reason During Teaching Period Having A Positive Attitude And Positive Relationship With The Students Not Only Academically But Also Personally Providing Students Useful And Real Materials Dynamic Tasks And Suitable Learning Atmosphere Are Aspects That Can Be Used To Maximize Students Motivation In The Classroom.

**ABSTRACT**

*The article deals with the theoretical and methodological aspects of the development of intellectual and creative abilities of children based on media education technologies. The main approaches that have developed in the world of science to this issue are studied, and the differences between them are outlined. Media literacy is, in general, a set of skills and abilities that enable people to analyze, evaluate, and generate information in different forms, genres, and types of different media. It is based on a model that encourages a person to ask questions about what they see, read, and hear. Through media literacy, a person acquires the ability to analyze media texts and distinguish the true from the false, the important from the insignificant, the narrow approach from the broad approach*

**KEYWORDS:** *Media, media education, media literacy, media laws.*

**INTRODUCTION**

The concept of media and its impact on society has been of interest to researchers since the 1950s and 1960s. Issues related to the impact of the media on the individual and society, the role of the individual in communication processes G.Lassuel, U.Shramm, G.Gerbner, G. Innis was widely covered in the works of Anglo-Saxon scholars such as M. McLuhan. It was in the Anglo-Saxon school that extensive, comprehensive research on the phenomenon of "media" was conducted. In the 60s of the twentieth century, a new scientific direction was opened on the basis of the University of Toronto, which was devoted to the impact of new technologies on human consciousness and activity. The first group, led by Professor G. Innis, studied communication technologies, while Professor M. McLuhan studied the phenomena of mass communication,

media education. This field of study was later renamed the Toronto School of Communication Theory.

Professor M. McLuhan is the scientist who introduced the concept of "media" to the world of science. Originally in Latin, the word "media", which is a plural form of the word "medium", meaning "in the middle", was accepted in scientific consumption as a means of communication, a method of receiving information.

In his monograph "Media Laws", McLuhan outlined four basic principles of media activity: [1]

1. Any technology enhances the capabilities of a particular organ or user's specific abilities.
2. As one area of sensation intensifies or intensifies, the other weakens or becomes under pressure.
3. Any being brought to the limit of its possibilities changes its properties.
4. Under any new media lies the old.

As a result of his research, M. McLuhan developed the thesis "Medium is the Message". According to him, the media has a huge impact on both its content and its perception. Therefore, the transmission of the same information through different communication channels (e.g. radio and television) leads to an absolutely different solution. Based on this view, the Canadian scientist concludes that the means of transmitting information is more important than the information itself. Based on this, the researcher develops a "Marshall Plan" to introduce students to the world of media. The plan is as follows:

*"Not analyzing. Do not explain. The classroom should be filled with movies, TV, plates, flashing lights, and the student should be able to move. "* [2]

*Continuing the scientific legacy of M. McLuhan, H. Pros and H. Bonfadelli analyzed the content and typology of the concept of "media" in their works. The impact of the media on the individual has also been reflected in the work of scholars such as D. Baake, D. Winter, M. Castels, V. Kolomiets, L. Mikos, U. Sander, R. Hoffman, R. Folbrecht.*

Since the 1960s, the United Nations Educational, Scientific and Cultural Organization (UNESCO) has supported and promoted the concept of "media education" around the world. In the modern world, media education is defined as the development of a person in the materials of the media and with their help, the purpose of which is to form a culture of communication with the media, critical thinking, creative, communicative skills, full acceptance, interpretation and analysis of media texts. is the introduction of various forms of revelation through. [3] The end result of this process is media literacy, which allows a person to actively and fully use the opportunities of the information space - television, radio, cinema, the press, the Internet.

In 1978, under the auspices of UNESCO, the General Curricular Model for Mass Media Education was developed. To date, UNESCO has hosted major international conferences in Grunwald (1982), Toulouse (1990), Paris (1997), Vienna (1999), Seville (2002) and other cities. In particular, the final document of the international conference held in Vienna in 1999 states that "Media education is inextricably linked with the types of media (print, graphics, audio, screen, etc.) and various technologies.

It allows people to understand how mass communication is used in societies and to learn to use the media. Through media education, a person acquires the following knowledge:

- Analyze, critically understand and create [their own media texts];
- Identify the sources of media texts, their political, social, commercial and / or cultural interests and content;
- Interpretation of media texts and values disseminated by the media;
- To create and distribute their own media texts, to select the appropriate media in order to find an audience interested in them
- Access to and production of media through free access. [4]

The term "media literacy" also has a strong place in the international scientific community. Scholars such as Walter Benjamin, Lorentz Engel (Germany), Nicholas Negroponte, Noam Chomsky (USA), Alexander Fedorov (Russia), Stuart Hall (UK) have reflected on this concept in their works.

Media literacy is, in general, a set of skills and abilities that enable people to analyze, evaluate, and generate information in different forms, genres, and types of different media. It is based on a model that encourages a person to ask questions about what they see, read, and hear. Through media literacy, a person acquires the ability to analyze media texts and distinguish the true from the false, the important from the insignificant, the narrow approach from the broad approach. The main mission of media literacy is to transform media consumption into an active and critical process.

By the end of the twentieth century, the concept of "media competence" entered Western pedagogy. In this regard, German scientists in particular have made great strides. In particular, D.Bake, S.Blumek, I.Pottinger widely used the concept of "media competence" in German in their works. [5] G. Tulojeski suggested that "media competence" means "the ability to act competently, independently, creatively and socially responsibly in relation to the media." [6] For his part, Rutgers University Professor R. Cuby (USA) summarized the concepts of media competence and media literacy, describing it as "the ability to use, analyze, evaluate, and convey information in various forms." gave. [7]

The concept of "media educated" is also common in a number of scientific works. The Russian scientist N. Zmanovskaya defines this term as "a systematized media knowledge, a set of skills, a valuable approach to media education, the degree of implementation of media education in practice in the pedagogical process." [8]

According to American scientist J. Potter, media education based on three components:

- Experience - The greater a person's experience in communicating with the media and the real world, the higher their media competence.
- Ability to apply knowledge in the field of media in practice.
- Readiness for independent study. [9]

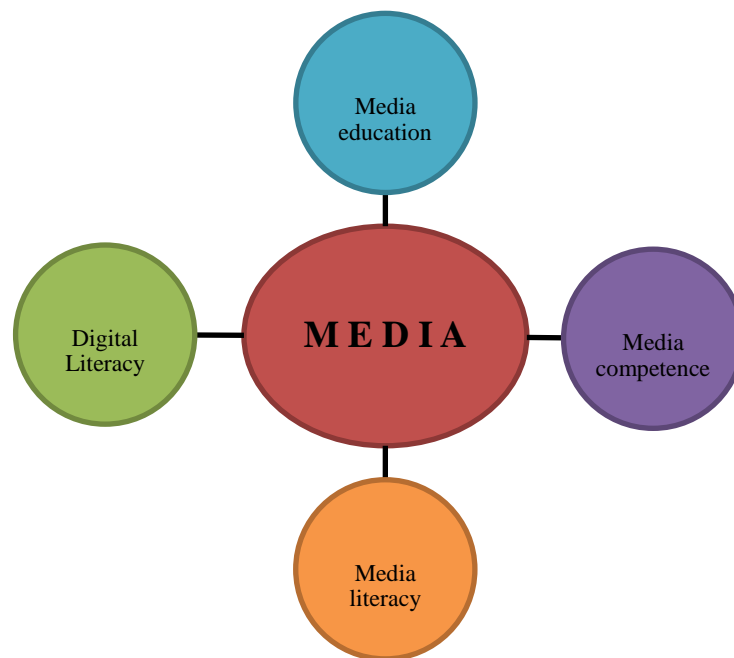

In turn, media educator S.Beeren highlights the following important skills in improving a person's knowledge and skills through the media:

- Willingness and ability to understand the content of the media without being distracted by excessive "noise".
- Understand and respect the impact of the power of media texts.
- To be able to distinguish between emotional and reasoned reaction in the reception of the delivered information by the audience and to act accordingly.
- Development of competent assumptions about the content of media texts.
- Understand the diversity of genres, go to their differences.
- Critical thinking about media texts, regardless of their source.
- To understand the "language" of different media, to study their influence. [10]

The German educator W. Weber developed a structure of knowledge in the field of media consisting of five main skills:

In terms of form:

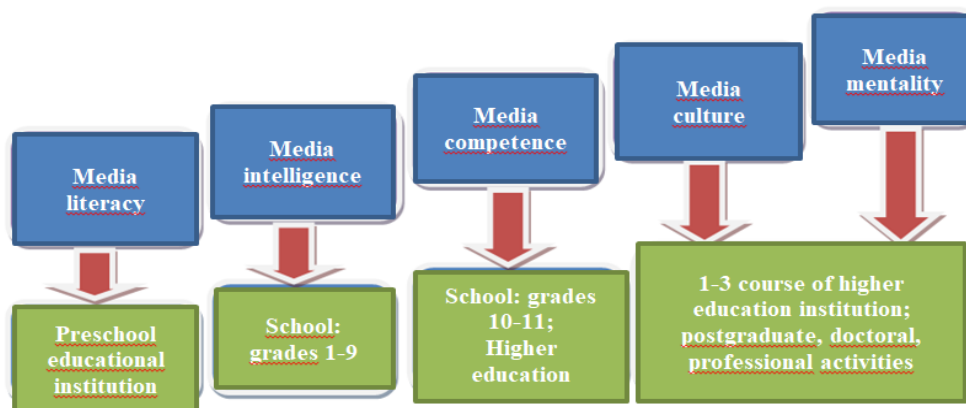

- Selection and use of opportunities that the media can provide.
- Create your own media product.
- Knowledge and analytical skills required in terms of content:
- Use a variety of media-based creative opportunities.
- Creating conditions for effective use of the media.
- Economic, social, technical, political conditions related to the production and distribution of media products. [11]

**PICTURE 1. The structure of the media in modern practice.**

According to Russian scientists O.Davidova [12], L.Ivanova [13], V.Protopopova [14], O.Surova [15], E.Ushakova [16], the following knowledge for modern pedagogical students (children) and must have the skills:

- use of information and communication technologies directly related to their specialization in their professional activities;
- to have an idea about educational resources in the media and the Internet, to know how to use them;
- be able to assess the pedagogical aspects of e-learning resources;
- access to telecommunications;
- Ability to work in the form of forums, conferences, video conferencing;
- use of ready-made multimedia objects, development of such objects;
- Knowledge of the basic means of information protection.

**PICTURE 2. The generally accepted step-by-step scheme of media education.**

According to I. Donina and A. Gopkina, in order to educate and bring up older children through the media, comprehensive preparation is required, and this process consists of three stages [17]:

**Technical stage** - the formation of basic computer skills;

**Methodical stage** - the study of the didactic features of e-learning resources, training teachers to use new technologies in the learning process;

**The philosophical-worldview stage** is a change in the educator's attitude towards media information technology, overcoming existing fears and feelings of rejection of news.

In general, in order to teach students or pupils using modern media, teachers and educators need to formulate the following factors:

№	Indicator	Basic criteria
1.	Motivation	Striving to improve their knowledge and skills in the field of media education

2.	Information	The level of information that the educator has about media education and media
3.	Methodology	Methodical ability of the teacher, pedagogical skills
4.	Practice	Quality of education in different forms of learning processes
5.	Creativity	The educator's creative approach to his work and the learning process

Thus, the analysis shows that the current work on the theoretical research on the development of children's intellectual and creative abilities on the basis of media education technologies is scarce and unsystematic, and at the same time relevant.

Research of theoretical and scientific sources aimed at studying the development of intellectual and creative abilities of preschool children on the basis of media education technologies as a pedagogical problem. allows for more detailed observations on the development of creative, creative abilities. This opportunity contributes to the revitalization of the work of purposeful formation of creative resources and potentials in children.

Foreign research has scientifically substantiated the possibility of developing creative skills such as creativity, critical thinking, interpretation and analysis, evaluation, inference, decision making, judgment in preschool older children on the basis of media education. Media education allows children to analyze, evaluate and create such information on the basis of different forms and genres. In doing so, the child acquires the ability to analyze the media texts and distinguish the true from the false, the important from the insignificant, the narrow approach from the broad approach.

### ABSTRACT

*Chronic generalized periodontitis is a serious medical, social and economic problem, and its complex therapy should affect all pathogenetic mechanisms of the development of this disease. In this regard, the local use of the therapeutic properties of the active components of herbal preparations as an alternative is relevant and affordable from an economic point of view.*

**KEYWORDS:** *Periodontal diseases, Phytopreparations, chronic generalized periodontitis, Chlorhexidine, Metronidazole, Aloe vera, Gum inflammation.*

### INTRODUCTION

Today in the structure of dental diseases one of the leading places is occupied by inflammatory periodontal diseases. This is due to their high prevalence among the population, an increase in the severity and intensity of the process, the formation of a chronic odontogenic focus of infection, and its adverse effect on the body [4, 12, 22]. According to the WHO, more than 95% of the population over 45 years old suffers from inflammatory periodontal tissue diseases.

Research conducted by Y. G. Tarasova et al. (2010) in the epidemiological study has shown that the prevalence of symptoms of periodontal tissue lesions CPITN index is high and ranges on average from 54.04% to 99.33%. With increasing age of those surveyed regularly increases the percentage of patients with inflammatory periodontal diseases. At a young age (15-34 years) is mainly dominated by the initial signs of periodontal tissue inflammation in the form of bleeding gums (32.06%) and tartar (21.15%). A periodontal pocket is detected in 5.58% of cases. With age, the number of persons with identified periodontal pockets increases: at 35-44 years - up to 28.37%; at 45-64 years old - up to 44.28%; at 65-74 years - up to 73.68%. The percentage of people in need of periodontal care, according to the CPITN index, averages 69.43%.

Among the inflammatory periodontal disease is given a special place of chronic generalized periodontitis (CGP), which is a serious medical, social, and economic problem and its complex therapy should affect all the pathogenetic mechanisms of the disease. Complex therapy of CGP should contribute to the elimination of clinical manifestations, which implies, among other things, the use of various medications and their combinations to achieve a positive result and increase the duration of remission [1, 14, and 25].

It is well known that the most effective methods of preventing periodontal disease are individual. The most effective program is to conduct professional oral hygiene, including the removal of dental plaque, if necessary, the use of local therapeutic agents, training in individual oral hygiene, and monitoring the quality of its implementation [1, 8, and 19]. In addition to this, local and systemic medications are also used in treatment: antiseptic drugs, antibiotics [12], non-steroidal and antimicrobial drugs, and others [5, 9].

Orthopedic and surgical interventions are performed after the removal of acute inflammation. Speaking about the complexity of the treatment of the disease, we also mean a multidisciplinary approach with the inclusion in the treatment plan of therapeutic, orthodontic, surgical, orthopedic interventions, if necessary, treatment of patients by specialists of related specialties.

The main and most numerous group of topical agents is the group of antiseptics. The number of representatives is quite large, however, the most often noted use of representatives of the groups of cationic detergents, halogens, phenols, herbal preparations [6, 16].

One of them is Chlorhexidine, the so-called "gold standard" among other medications used to eradicate periodontal infection. Chlorhexidine has a broad spectrum of action against gram-positive and gram-negative bacteria, yeast, dermatophytes, and lipophilic viruses, and is considered a stable and effective agent for reducing plaque and inflammation. [2, 6, 7, 24].

Some antibacterial agents such as triclosan, essential oils are used in commercial products for oral care to control plaque formation and halitosis [3, 6, and 18].

Today, all the more common methods antimicrobial effects that can reduce the side effects of the drug on the body, minimize the occurrence of side effects from the organs and systems can create and maintain the desired local concentration without increasing the content of pharmacological agents to the general circulation. One of these methods is the use of a method of local delivery of the drug with prolonged release, which will allow maintaining higher concentrations of the active substance at the injection site. [13, 23].

However, some inherent parodontopatogeny with high virulence and the ability to form biofilm is capable of exhibiting drug resistance to chemotherapeutic agents used in their uncontrolled and prolonged use. The development of drug resistance in periodontopathogens creates additional difficulties in the implementation of a full complex therapy CGP, reducing the effectiveness of both local and general therapeutic measures.

Due to the fact that antimicrobial therapy using drugs of synthetic origin can lead to a number of such adverse consequences as: disruption of the normal symbiosis of microorganisms, an increase in the development of allergic reactions, the ability to have hepatotoxic and immunosuppressive effects, suppression of the immunobiological resistance of the body, a possible inhibitory effect on tissues periodontal disease and defense mechanisms, the risk of developing oral dysbiosis, impaired taste sensitivity [1,10,15,23].

Based on the foregoing, today widely used phytopreparation have a great demand at the local and general treatment of CGP. When creating an effective herbal remedy, it is necessary to take into account the experience of using medicinal plants in dentistry; analysis of the structure and structure of medicinal plants; chemical, physical properties, and biological effects of natural healing substances; knowledge and use of the latest methods and technologies of extraction, allowing to isolate biologically active substances from plants while maintaining their high natural activity in small doses.

The concept of "phytopreparations" has long been somewhat arbitrary, since plants were the main, if not the only, remedy. Since the 19th century, phytopreparations based on the analysis of the chemical composition of plants have been used in dental practice. This took into account not only the qualitative (vitamins, flavonoids, alkaloids, glycosides, etc.) but also the quantitative composition [15, 17, 20].

In the 20th century, an integrated approach to the study of medicinal plants began to be used, taking into account not only the content of biologically active substances in them but also the optimal methods for their extraction.

The literature has accumulated extensive material on the effects of plants and their preparations on the clinical course, local and general immunity, microflora, metabolism, and function of periodontal tissues.

At this time, herbal medicine is widely used in dentistry, both in our country and abroad in connection with the identification of its positive properties. Namely: the presence of a whole set of therapeutic properties, minimally toxic and side effects, no restrictions on the intake of other medications, the minimum likelihood of developing resistant strains, the availability, and ease of use of drugs [2,19,21].

Herbal preparations are characterized by complex chemical composition and, accordingly, the spectrum of biological action will be quite wide [5, 11, 17]. No wonder the same plant-based remedy can have a pathogenetic, immunomodulatory effect, and phytotherapy can also be considered as an adaptive therapy [4, 17, and 20].

Especially worth mentioning is phytopreparations property as recovery and normalization of tissue metabolism along with increased efficiency of treatment of underlying disease, which is particularly valuable in the treatment of pathologies periodontal tissues [4,16].

The homeopathic method is recognized as one of the areas of herbal medicine. The drugs of this group do not serve to destroy microorganisms, are not used for substitution therapy or to stop a certain pathological process, they help to restore the body's self-regulation. The homeopathic preparation consists of dozens of components of plant and mineral origin is widely used in the treatment of inflammatory phenomena in periodontal tissues in the form of ointments, tablets, or injections. It is noted that it has an analgesic, anti-inflammatory effect with the ability to improve microcirculation in the focus of irritation and stimulate healing processes [8, 14, 20, and 22].

The results of domestic and foreign scientific works prove the advisability of using herbal antioxidant drugs in the complex therapy of dental diseases. The range of complex preparations from medicinal herbal raw materials, which is used in the treatment of diseases of the oral cavity, is small, therefore, the expansion of the arsenal of medicinal preparations based on herbal raw materials and their standardization is an urgent task. As the object of study to use ready raw

aerial parts of the four species of medicinal plants: rough hypericum, chamomile flowers, leaves, sage, and calendula flowers drug. To investigate the antioxidant activity (AOA) of water-soluble substances prepared aqueous plant extracts of plants. 1 g of milled plant raw material was placed into a flask filled with 100 ml of distilled water at room temperature and a boiling water bath with occasional stirring for 15 min [3, 14, and 23].

AOA preparation "Parodontfit", which is a liquid extract of medicinal plants: rough hypericum, chamomile flowers, leaves, and flowers of *Salvia officinalis* calendula dosage in a ratio of 1: 1: 1: 1 and the ethanol to 60.0% (obtained by extraction and percolation 70.0% ethyl alcohol) was studied in dilutions of 1:10; 1:20 and 1:40 [3,19,21].

Green tea is a popular nutraceutical and has strong antioxidant properties. It contains polyphenols, which include flavonols, flavonoids, and phenolic acids. Antioxidants protect body cells from the destructive effects of reactive oxygen species such as singlet oxygen, superoxide, and peroxy radicals. An imbalance between antioxidants and reactive oxygen species leads to oxidative stress, which ultimately leads to cell damage [5, 22].

Several studies have proven the efficacy of turmeric extract as a gel and as part of a periodontal chip for application to periodontal pockets.

A study conducted by foreign authors included a comparative clinical and microbiological assessment of the effectiveness of using the Neem chip in conjunction with basic conservative therapy in comparison with conservative therapy without the use of any additional drugs in the treatment of periodontitis and found that long-term drug release systems prevent recolonization pathogens over a long period; determined a significant improvement in all clinical parameters in the study group compared with the control group, the quantitative presence of *P. gingivalis* significantly decreased in response to local drug delivery. It was revealed that Neem extract has a powerful immunostimulating activity, as evidenced by the state of both humoral and cellular immunity [10, 22].

Proven effectiveness in the prevention and treatment of inflammatory processes in the periodontium - dental adhesive based horsetail(*equisetum*), which has drainage properties and pronounced antimicrobial activity against strains of the four test cultures staphylococci [12,23].

To reduce the degree of inflammation of the periodontal tissues, oils of rosemary, eucalyptus, clove, mint have proven themselves well, used both in isolation and included in the composition of various combined drugs [2, 17].

The researchers found that the alkaloids present in barberry were more effective against bacteria such as *A. Actinomycetemcomitans* and *P. gingivalis* than against lactobacilli and streptococci. Berberine has also been shown to inhibit collagenase of these two species [3, 9, and 19].

Ahuja S. et al. (2011) used chamomile and pomegranate extracts in mouthwash in patients with periodontal tissue inflammation. It has been proven that this medicine has a pronounced anti-inflammatory and antimicrobial effect, and can be used as an additional therapeutic agent for the restoration and maintenance of periodontal health.

An experimental study using the method of automatic cultivation made it possible to reveal that phytopreparations "Tonsinal" and modified plate "CM-1" characterized sided impact on the key stages in the development of bacterial populations. The average optical density of samples with

the addition of phytopreparations of various concentrations is lower than in control samples - during the cultivation of *A.actinomycetemcomitans* and *P.intermedia* by 83% and 60%, respectively, during the cultivation of *F.nucleatum* - by 35%, *S. constellatus* - by 23%, *C. Albicans* - by 22%. The optimal concentration of active substances of phytopreparations for providing antimicrobial action on *A. actinomycetemcomitans*, *P. gingivalis*, *P. intermedia*, *F. nucleatum*, *S. constellatus*, *C. Albicans* is: for Phytopreparation "Tonsinal" - 0, 125 mg/ml, for plates "CM-1" - 5 times higher than the concentration in the original sample. Clinical evaluation of the effectiveness of the treatment in the comparison groups revealed a significant improvement in the state of periodontal tissues based on the values of hygienic and periodontal indexes. Evaluating the level of hygiene of patients, the degree of bleeding of the gingival sulcus, significantly lower values were obtained in patients of the group for whom phytopreparations "Tonsinal" [9, 18, 20].

In the last 10 years, scientific research in periodontology has revealed the positive properties of Aloe vera, which have a direct effect on the links in the pathogenesis of inflammatory phenomena in the periodontium. This is the ability to provide anti-inflammatory, analgesic, antibacterial action when included in the composition of kinds of toothpaste, elixirs for rinsing in the complex treatment of CGP. As a local delivery system, Aloe vera gel was used in combination with SRP (scaling and root planning), which ultimately led to a decrease in clinical parameters such as plaque index, probing depth, and an increase in the level of clinical attachment. The anti-inflammatory effect of Aloe vera is associated with inhibition of cyclooxygenase and a decrease in the production of prostaglandin E2 [5, 15, and 24].

Based on all the above can be argued that the main etiological factor in the onset and development of periodontal diseases is subgingival microbial biofilm. The widespread prevalence of this pathology, its rejuvenation in recent years, the insufficient effectiveness of the preventive measures carried out justify the need to study the etiopathogenesis of this pathology and the search for new effective means and their combinations to achieve a positive therapeutic result. Despite the desire for comparison of means and methods to the established conventional standards and creating new combined means which have in their composition, as a plant component and a chemical antimicrobial agent of antiseptics groups and other pharmacological groups.

The search for alternative means to increase the effectiveness of treatment of periodontal diseases of inflammatory genesis is still an urgent task. In this regard, the local use of the therapeutic properties of the active components of herbal preparations as an alternative is relevant and affordable from an economic point of view.

**ABSTRACT**

*The article is designed to create favorable conditions and opportunities for businesses by improving tax administration without taking measures to mitigate the negative impact on the economy of Uzbekistan and the implementation of fiscal policy to support taxpayers. Improving the tax administration of the country is mainly aimed at improving the efficiency and quality of tax relations between taxpayers and the state, which is one of the main directions of our tax policy.*

**KEYWORDS:** *Budget policy, Crisis, budget, Tax benefits, Tax administration, Business entities, Tax reporting, Tax revenues, Tax benefits, Taxes, Tax rates, Taxes.*

**INTRODUCTION**

Today, a number of laws at the government level are being adopted to support business entities. At the same time, the tax authorities are working to ensure the implementation of these laws and provide tax legislation and business entities with practical assistance in the export of manufactured goods and the further development of the electrical industry.

Improving the tax administration of the country is mainly aimed at improving the efficiency and quality of tax relations between taxpayers and the state, which is one of the main directions of our tax policy.

For this reason, the President considers the increase in the level of tax administration as an important direction of tax policy by reducing the tax burden, ensuring equal competition between honest taxpayers and reducing the costs associated with the operation of the tax system.

The Tax Code of the Republic of Uzbekistan provides benefits to exporting businesses:

- 1) in Article 284, the sale of excisable goods for export (under customs procedures for export) is not subject to taxation;
- 2) in Article 260, the value-added tax with a zero rate shall be applied to the sale of goods exported from the territory of the Republic of Uzbekistan under the export customs procedure;
- 3) in Article 337, the income tax from the sale of goods (works) for export is applied at "0" percent;
- 4) In Article 464, income from the export of goods (services) is not included in the tax base for turnover tax.

First, from 2020, not only exporting enterprises but also all business entities that have a negative difference in the calculation of the amount of VAT will have the right to a refund (refund) of value added tax. This exemption was established by the new Tax Code and came into force on July 1 this year.

In particular, 9,014.6 billion soums of taxes were returned in 5,847 cases this year, which is 5 times more than in 2019 (1,697.7 billion soums were returned to exporters in 739 cases).

Due to these funds, opportunities have been created for the development of entrepreneurial activity and expansion of the production base.

Second, in order to improve the system of taxpayer services, the task of VAT reimbursement was transferred to each regional state tax administration, and VAT administration departments were established in the tax system.

Third, an accelerated procedure for VAT reimbursement (7 days) was introduced, and in August-December this year, a total of 2,788.0 billion soums were reimbursed in 1,168 cases.

Also, by the Resolution of the President of the Republic of Uzbekistan dated March 2, 2021 "On additional measures to further develop the electrical industry and increase the competitiveness of domestic products" PR-5011, the development of the electrical industry and the creation of new types of modern electrical and household appliances, was adopted in order to increase export potential.

Paragraph 4 of this resolution provides for the introduction of the following measures to support the enterprises of the electrical industry by the Export Promotion Agency. Until January 1, 2024, the export of electrical and electrical products to all countries, including neighboring countries, will not exceed 50% of the cost of transportation by road, rail and air, but not more than 15% of the export value (excluding transportation costs) by road and 20% by rail. as collateral for providing subsidies for reimbursement and making advance payments (refunds) in the framework of tenders, regardless of the source of funding, compliance with the terms of the contract in foreign currency and guarantees from local commercial banks for goods (works, services) up to 50 percent of the guarantee amount, but not more than \$ 3 million.

In addition, paragraph 5 of the resolution provides tax benefits to enterprises of the electrical industry for the period from April 1, 2021 to January 1, 2024 at a rate of not less than 80% of total revenue from sales of electrical products at the end of the reporting period in the form of income tax and property tax rates funds released in connection with the granting of tax benefits provided for in this paragraph:

not distributed by enterprises in the form of dividends;

the creation of new production facilities and the modernization of existing facilities.

Also, in paragraph 6, when placing a copper cathode produced by JSC "Almalyk MMC" on the exchange, its starting price is reduced by 8% from April 1, 2021, 6% in 2022 and 4% in 2023 from the price of the London Metal Exchange without VAT. , From January 1, 2024 at the London Metal Exchange price (export price), and from April 1, 2021, 25% of the payment will be made in advance and the remaining 75% will be paid by industry enterprises that have introduced high-tech production processes in the purchase of copper raw materials through exchange trading. introduced the procedure of implementation in equal shares every month within 90 working days after the receipt of copper raw materials.

### **CONCLUSIONS AND SUGGESTIONS**

The level of utilization of its potential and resources in the development of industry, including its processing industries, remains low, the tax burden on the economy remains relatively high, which reduces the competitiveness of industrial products sold in domestic and foreign markets.

It is necessary to improve the existing mechanisms in the form of tax reductions and exemptions, depending on the priorities of socio-economic development of the country, the acceptability of the results of the assessment of their direct and indirect impact on the economy, social sphere.

## INTRODUCTION

Education today is based on the active transfer of knowledge, the modernization of the national school system, the humanization of education, literacy, initiative, the development of creativity.

The most pressing problem in the education system of Karakalpakstan is the proper organization of education, the introduction of inclusive education based on state educational standards, the organization of English language teaching in secondary and higher education in other specialties.

As a solution to this problem, new pedagogical technologies of teaching English in other specialties, along with information technologies, are being implemented. Thus, programmatic learning is a type of education that provides reproductive acceptance of knowledge. In program education, the educator states the purpose of the new topic, resources, the purpose of the topic, and the interest of the learners is lower. This is especially noticeable when teaching is limited to lingophone technology.

The organization of education on the basis of language technology in specialties other than English creates difficulties for students to learn a foreign language other than their native language. The goal of the new lesson topic is for the learner to adapt to the artificial reception when the English phrase is repeated.

The modern educator should not only teach the educator, but also stimulate the learners, motivate them to a new topic, direct them to independent learning.

In order to teach English in other specialties and achieve effective results, it is good that we use adoption-oriented technologies of education. For example, a learning technology based on a non-adaptive lingophone. In order to avoid inconsistency with G.Palmer's established table idea, in the organization of education on the basis of new pedagogical technologies, first unfamiliar phrases are introduced into the presentation to be read aloud, then new terms and word and phrase structures are introduced in sequence. It can be seen that the vowel is read at the beginning of an unfamiliar phrase in a foreign language, and then, based on G.Palmer's table, new words and word structures are shown in sequence [1, 3, 5, and 6]. When organizing such training, the learner develops exoic memory along with audio-visual perception, i.e. short-term auditory memory [1, 3, 5, and 6].

When teaching English in other specialties, you will witness a text that is initially unfamiliar to learners, when you read the text over audio, and then when learners read the text themselves, you become interested in learning new phrases. You will also witness the development of long-term memory in learners when the meaning of new words in their native language, the text is relevant to their specialization, and then the grammar rules are briefly given.

The technology of development of figurative-associative thinking in students is an integral part of the integration of foreign languages in the genres of literature, drama, music in their native language in the teaching of English in other specialties [2,4].

In order to put this technology into practice, we must first adapt the topic identified in the curriculum to the ethnic language. For example, to teach English in the field of psychology, taking into account the ethnic aspects of this given group, the English meaning of national phrases associated with the brain, or the representation of mental processes on an intellectual map, and so on. As you know, the main idea at the center of the intellectual map is, for example,

the brain (the English translation of the brain is the brain), then the four large horns clockwise, for example the brain-connected brain, spinal cord, midbrain, cerebellum in English and so on. ideas are given in sequence. It is clear that teaching English in the field of psychology with the help of such a card will be highly effective.

Also, when we use this technology in teaching English in the field of music, you will witness a great interest of students in learning a foreign language when a plate from the works of famous Karakalpak poets is performed in English or a text from a famous work in the national language is given.

The use of case study technology in English teaching is also important. "Case-stage" is an English word ("case" - a specific situation, event, "stage" - learning, analysis) is a method of learning based on the study, analysis of specific situations. In a case, open information or a specific event can be used for analysis as a situation. Keys actions include: Who (Who), When (When), Where (Where), Why (Why), How (How), What result (What). In order to teach English in other language groups and specialties using case technology, the English text and solutions of real situations that adapt to the national environment are created first. Education organized using such technology will certainly achieve its goal [1,2,4].

One of the most effective pedagogical technologies for teaching English in other language groups and specialties is project technology.

Project technology is the individual or learning of learners to collect information, conduct research, and carry out research on a given topic for a specified period of time in groups. Using this technology, learners are involved in the planning, decision-making, implementation, verification and inference and evaluation of results of independent work in English. Project development can be individual or group, but each project is a coordinated result of the collaborative work of the study group.

The project should be able to serve learning, apply theoretical knowledge in practice, and enable learners to independently plan, organize, and implement [4].

Undoubtedly, the use of Venn diagrams - graphic organizers for teaching English in other specialties is also effective. Venn diagram - a graphic organizer in the organization of education. used in making and learning.

The diagram is formed from the intersection of two or more circles will be. In this case, a graphic image is a form of organization of teaching, which is represented by the image of two intersecting circles. Using a Venn diagram, it is possible to consider different concepts, principles, analysis and synthesis of ideas on a given topic in English through two aspects, to identify and compare their commonalities and differences.

In short, in order to effectively teach English in other language groups, we must not forget about the use of new pedagogical technologies in students, the organization of education with graphic organizers, as well as logarithmics, rhythm therapy, folk art therapy to relieve nervous and emotional stress.

**ABSTRACT**

*The article deals with the social protection of the population. The article describes the specifics of social protection, which is relevant today. There is also a systematic analysis of the legal framework for improving the social protection system. The law pays special attention to the areas of social partnership, including social protection, support and social activism, employment, development of small business and private entrepreneurship, farming, protection of the environment, public health and healthy lifestyles. Today, our views on issues in the social sphere are gradually changing, and previous concepts and approaches are gaining new meaning.*

**KEYWORDS:** *Social Protection, Social Policy, Social Partnership, Social Mechanism, Legal Framework.*

**INTRODUCTION**

At the present time, the Republic of Uzbekistan is on the path of new socio-economic development. Because of independence, our people have the opportunity to live freely in their country, and most importantly, to build their future, their lives in accordance with national interests and eternal values, universally recognized democratic principles. At the initial stage of the transition to market relations, effective measures were taken to develop social protection mechanisms, social support and protection of the population.

Of course, the essence of the fact that social issues and their solution is a priority set by our state is human it is manifested in the fact that the principle of the supreme value of human rights and freedoms and interests is aimed at the realization.

At the same time, the work on social protection of the population in need of social protection, the state programs that reflect the comprehensive measures being taken are particularly noteworthy.

In this regard, President Sh.M.Mirziyoev In the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, paying special attention to the priorities of the social sphere, in which he puts forward such issues as "... consistent increase in employment and real incomes, improvement of social protection and health care, increase of women's social and political activity, implementation of targeted programs for the construction of affordable housing, development and modernization of road transport, engineering and communications and social infrastructure to improve the living conditions of the population, development of education and science, improvement of state youth policy"<sup>1</sup>

The Constitution of the Republic of Uzbekistan is our main encyclopedia, which embodies a completely new material, legal and methodological approach to the definition and guarantee of socio-economic rights of the individual in the social sphere. In particular, Article 2 of the Constitution stipulates that "the state represents the will of the people and serves their interests." and Article 7 states that the people are the sole source of state power, and that the interests of the people take precedence over everything else in the norms. In particular, the Constitution of the Republic of Uzbekistan stipulates that "Everyone has the right to social protection in old age, loss of ability to work, as well as in the event of loss of a breadwinner and in other cases provided by law."<sup>2</sup>

Indeed, from the first days of its independence, the Republic of Uzbekistan has been operating in accordance with international rules and universal principles in the social sphere. Examples are the Universal Declaration of Human Rights, the International Covenant on Economic, Social and Cultural Rights, and the International Covenant on Civil and Political Rights<sup>3</sup>.

Social protection, as one of the human rights, is based on international legal norms and standards, and therefore its main principles are derived from universal values. First of all, the Universal Declaration of Human Rights, which is one of the international legal instruments, states that everyone has the right to adequate social security in order to live independently in difficult financial circumstances.

In particular, according to the Declaration, a person is included in the list of social risks that are the basis for obtaining social assistance in any case where he is in need of assistance for objective reasons beyond his control.

Today, a number of reforms have been carried out in the country on the social issues of the rule of law, its relationship with the rule of law, social protection and theoretical and legal issues of its implementation, modern requirements for social protection, improving legislation in the field of social protection. In particular, the Law of the Republic of Uzbekistan "On Social Partnership"<sup>4</sup>, adopted by the Oliy Majlis of the Republic of Uzbekistan on September 25, 2014, is a continuation of these reforms.

The law pays special attention to the areas of social partnership, including social protection, support and social activism, employment, development of small business and private entrepreneurship, farming, protection of the environment, public health and healthy lifestyles. formation of a comprehensively developed and healthy young generation, education of young people, their spiritual and moral upbringing and vocational guidance, protection of motherhood

and childhood, as well as women's rights, their full participation in the socio-political, socio-economic and cultural life of the country Ensuring the development of science, education, information, culture and sports, raising legal awareness, legal awareness and legal culture of the population, strengthening the foundations of civil society and democratic rule of law, strengthening the ideas of interethnic, intercultural harmony and civil harmony issues such as the restoration and preservation of centuries-old, traditional spiritual-moral and historical-cultural values, protection of consumer rights.

Today, our views on issues in the social sphere are gradually changing, and previous concepts and approaches are gaining new meaning. Concepts such as "social policy", "social protection", "social partnership" differ from the previous ones and more and more reflect the changes taking place in our lives. Therefore, social policy is not only an activity aimed at solving the material problems of citizens, especially young people, but also a major part of the domestic policy of the state. The social protection policy includes not only the provision of material assistance to the needy, but also the maintenance of the normal functioning of the country's social infrastructure, the implementation of effective state and social governance in this area, providing all-round favorable conditions for citizens.

In the past, social protection consisted only of helping the needy, but today this concept includes increasing the level of employment of citizens, payment of wages according to the quantity and quality of work, social security, realization of the right to education, high quality medical care and covers all aspects of ensuring a decent life for a person.

Social protection of the population in need of social assistance has been carried out in different ways, at the expense of different sources, by different entities. In particular, it recognizes that the expansion of non-governmental forms of social protection is a priority in the process of building the rule of law and civil society. This is due to the fact that socialization, which is carried out by the state, remains a priority, as the state has assumed the main responsibility for reform during the transition period, and strong social protection of the population is one of the main tasks.

The goal of social policy is achieved by the state through the provision of social guarantees, tax regulation of lifestyle, encouragement of charitable and entrepreneurial initiatives. Social policy should focus on solving priority problems, developing social mechanisms, coordinating government commitments with real funding opportunities. In turn, the problem of supporting vulnerable groups of the population is directly related to the state's participation in the management of the country's economy. The truth is that the modern state is a market state. The essence of a market economy is the free exchange of goods, the inviolability of private property and the recognition of the legitimate interests of the owner, the freedom of labor and private enterprise.

Despite the fact that our country has adopted many normative documents aimed at establishing the legal framework for social protection of citizens, we can not say that the basic laws defining the main principles of regulation of relations in this area have not yet been fully developed. The study of the experience of many developed countries shows that they have adopted laws that define the basic principles of social protection, on the basis of which the right of citizens to social protection is ensured.

In this regard, the role of the state in social protection of the population in the process of building civil society and the rule of law requires addressing the problems of the role of its bodies, the

---

improvement of government agencies in the implementation of social protection, with the transition to civil society, this function of the state will evolve, gradually becoming the responsibility of society, cooperation with public associations, NGOs, citizens' self-government.

### ABSTRACT

*In the article, the interpretations of the theory of Sufism, the terminology of Sufism, the views on the place and time of its origin are interpreted in comparison with the opinions of Eastern and Western scholars. If there was science, it would be learned through education. Sufism is morality with the qualities of divine morality<sup>9</sup>. Here the Sufi observes Sufism in a comparative way, because even if a Sufi is knowledgeable and feels a lack of morality, he cannot be a true Sufi. The term of Sufism was debated with different opinions about the place and time of its emergence. Some opinions of foreign scholars on this subject were found to be relevant.*

**KEYWORDS:** *Hard Wool Fabric, "Suf", Sufism, Sufi, Interpretations, Asceticism, Quran, Hadith, Messenger (PBUH), Terminology Of Sufism, Eastern And Western Scholars, Different Views And Theories, Christian Mysticism.*

### INTRODUCTION

The teachings of Sufism are among the scientific problems that have attracted the attention of many scholars not only in the countries of the East, but also in the world. Therefore, there are different views about it, and the concept of Sufism is also given different definitions. In particular, the research of well-known foreign scientists R.Nicholson, A.Arberry, L.Massignon, J.Trimingham, A.Shimmel and F.Mayer, aimed at shedding light on the concept of Sufism, is known to scientists. A.Arberry, who lived and worked on the threshold of the last century, left a number of great works on the teachings of Sufism. Explaining the meaning of the word mysticism, A.Arberry says that it is derived from "hard wool cloth", ie "suf", and that those who wear it are among those who voluntarily renounce this world<sup>1</sup>. At this point, A.Arberry calls them "Sufis" and points out that this dress was made in competition with Christianity. It can be

seen here that the scholar is referring to Islamic Sufis as imitators of some secular Christians. However, in the East, they knew very well that mysticism was gaining attention as the Sunnah of the Prophet (s.a.v.). J. Trimmingham also explains the meaning of the word mysticism in a way closer to A. Arberry's interpretation, and says that the clothes worn by Muslim ascetics in the early Islamic period were mainly "suf" and therefore they were called "Sufis". According to the scholar, the word "suf" gave rise to the mystical doctrine of Sufism<sup>2</sup>.

## MATERIALS AND METHODS

A. Arberry's "Mysticism" also deals with Islamic mysticism and expresses its attitude to mysticism through the views of several Western scholars<sup>3</sup>. The first page of the article begins with an idea from U. Inge's "Christian Mysticism". This idea is about the existence of the Creator and his eternity, determined by religious mysticism, and A. Arberry shows that the following opinion of Professor R. Zeiner is precisely related to Islamic mysticism. According to R. Zeiner, Islamic mysticism is a doctrine that is difficult to imagine. A. Arberry points out that some of the definitions of mysticism have been revised and clarified through R. Zeiner's "Mysticism is sacred and secular." A. Arberry supports the opinion of R. Zeiner and informs about the work of Professor R. A. Nicholson on the doctrine of mysticism<sup>4</sup>.

Hence, the teachings of mysticism and the definitions given to it have been sufficiently studied by foreign scholars since the beginning of the last century.

It can be seen that A. Arberry and J. Trimmingham's views and descriptions of mysticism and Sufism are limited to a single, apparent meaning. That is, the purpose of the Sufis from wearing that "suf" is described in a very superficial way. However, mysticism is a very broad concept, and the goals and ideas of those who hold these teachings are large enough.

Sheikh Ali ibn Sheikh Uthman al-Jullabi al-Hujwiri, in his book *Kashfu-l-mahjub* (The Opening of the Barrier), states that in addition to the ideas of A. Arberry and J. Trimmingham, mysticism also has inner meanings and "purity is clarity, clarity, transparency." He explains that it is derived from the word "suf" - "sof" (pure). This proves that the word can also mean purity, open volunteering<sup>5</sup>.

Some scholars in the West and the East say that mysticism is derived from the word "suffa," meaning that the "companions of the suffa" are pious people who have passed away during the lifetime of the Prophet (saas), and Sufis come close to them. Abu Rayhan al-Biruni, in his *Osar-u-l-Baqiya*, states that the word is derived from the Greek word "suf," meaning doctrine<sup>6</sup>. It is clear from the above definitions that different definitions are used in defining the concept of mysticism. In A. Arberry's article "Mysticism" and in J. Trimmingham's "Sects of Islamic Sufism" only the most proven and correct is that "suf" means "hard woolen cloth". It is possible that these two scholars were aware of other meanings of mysticism, but this fact is not reflected in the works known to us. We can say that the descriptions given by Sufis, especially in the early days, are important for mysticism. Many scholars can be attributed to the Sufis who lived and worked in the first period. But only a few of them are limited to describing mysticism in their works. It is expedient to include in the scientific circulation the works of Abu Nasr Sarraj "Al-Lum'a" ("Shu'la"), Khujviri's "Kashfu-l-mahjub", Abulkarim Qushayri's "Risolai Qushayri", Suhrawardi's "Avorifu-l-ma'arif". The following are the descriptions of mysticism in these works. Ma'rufi Karhi: "Sufism embraces the truth and turns away from the hands of the creatures."<sup>7</sup>

Abu Hafs al-Haddad said: “Sufism consists of manners. Each time has its own literature. There is literature in every case. They have the rank of a perfect man who pays attention to the manners of the time ...”<sup>8</sup>

While the first definition is seen as a concept (science) that calls for distance from greed, the second states how important the issue of time is to mysticism. The description in Gal gives it clarity.

Abu Husayn al-Nuri said, “Sufism is neither a tradition nor knowledge, but morality. If Sufism was a ritual, it would be achieved with difficulty. If there was science, it would be learned through education. Sufism is morality with the qualities of divine morality”<sup>9</sup>. Here the Sufi observes Sufism in a comparative way, because even if a Sufi is knowledgeable and feels a lack of morality, he cannot be a true Sufi. Of course, morality should not be equated with simple, worldly morality. Scholars who have studied the teachings of Sufism seriously for many years abroad have succeeded in presenting this teaching - the great works of Sufism that we have not yet studied properly.

Turkey is one of the most studied regions in the West on Sufism. There are special "Theology" faculties in the existing scientific institutions. From this it can be understood that the views on Sufism, its terminology, essence, place, spread and time of origin are being studied in all aspects, in-depth research is being conducted. The fact that large-scale research has been done in this regard is recognized by today's scholars on Sufism. Scientific, popular, religious and moral works containing scientific, philosophical, socio-political views on Sufism and its history are being translated into Uzbek with great skill by scholars and translators on Sufism in our country<sup>10</sup>. Although the descriptions of Sufism in the works of this translation take different forms, the content, the sequence of views, the complementarity of ideas, in a sense, make one aware of what the essence of Sufism is. Of course, we are far from saying that we have found the perfect answer to Sufism with the opinions of Turkish scholars. Therefore, if Sufism is an ocean, those who describe it have not yet discovered the meanings that lie at the bottom of that ocean. However, we will focus on the definitions given in some translated works.

Professor Mahmoud A'sad Joshan, a theologian who had been active in spreading the teachings of Naqshbandi in Australia and had risen to the rank of Murshid (Master), describes Sufism in his works as follows: “Sufism is a way of life in religion. Sufism is a doctrine based on the Qur'an, the Hadiths, the words and deeds of the Prophet (PBUH) and the source of his main idea.”<sup>11</sup>

Professor Usman Turar gives a general definition of Sufism as a branch of science and states the following: “Sufism teaches how to get rid of bad qualities in the human heart, shows the good qualities in the heart and ways to achieve them, and is the highest “perfect person”. It is the science that teaches the rules of attaining status and, finally, explains the secrets of monotheism (*Tavhid*).”<sup>12</sup>

Muhammad Nurullah Sayido Jazari, a well-known Sufi and an active follower of the Naqshbandi sect in Turkey, also describes Sufism as follows: “Sufism deals with man and humanity. It conveys the essence of Islam by teaching a person the most important information about his self (*nafs*), the most important social etiquette in his relations with other people, and the things that benefit and harm him in the relationship between a slave and his God.” Shaykh 'Umar Faruq Sayyid al-Jazari continued this definition: “Sufism is the religion of Islam, the command of

Allah, the dignity of the Messenger of Allah (PBUH), and the priceless *sunnah*. He teaches us true love, sincerity, respect and dignity.”<sup>13</sup>

It is not fair to ignore the opinions of Shari'ah scholars when describing Sufism. Because the Sufism and the attitude towards the followers of Islam, which originated from Islam, must be carried out through the science of *Shari'ah*, we have found it possible to cite some of the definitions in the book "The Imagination of Sufism"<sup>14</sup> by late Sheikh Muhammad Sadiq Muhammad Yusuf. Although the same work of the Sheikh is not seen as a source that can give a perfect description of Sufism, it is given brief, succinct ideas from the Islamic point of view, citing examples from the Qur'an and Hadiths. It briefly dwells on the issue of *Murshid*(Master) and *Murid* (disciple)and some of the representatives of the sect.

The scholar scientifically substantiates the ideas of Sufism related to the words"suffa", "saf", "safa" and "suf", and also notes that there are opinions related to the name of that person because he attributed many worshipers in ancient times to SufaibnUddibnTlobiha. However, denying anything other than their word "suf", many say that the word "Sufi" is derived from the Arabic word suf-jun. First of all,in terms of vocabulary, this name is very accurate. In addition, those who weredeveloped to many prayers also wore very simple clothes. They usually wear onlywool, they say.”<sup>15</sup>

According to ShahidaBilqies<sup>16</sup> the etymology of the Word Sufi has been analyzed with 7 meanings of the word “*suf*”.

1. Safaa-which means cleanliness, particularly the purity of heart, soul and actions of a man.
2. AhleSuffa-During the life time of Holy Prophet (saw) there were certain ascetics (Zahids and Abids) whose sole occupation in life was nothing but continuous study and recitation of the Holy Qur'an, meditation, prayers and absolute devotion to God in the Prophet's historical mosque at Medina.
3. Suff-means row [Those Muslims who always tried to offer their Namaz (prayers) in the coveted first row of the 'five daily' congregations during the Prophet's (saw) time].
4. Soofa-It is the name of an old Arab tribe who were dedicated to the service of Kaaba (Mecca).
5. Safoot-ul-Qafa-The hair that grows at the back of the neck.
6. SiyuSoofia-It is a Greek word which means Divine knowledge.
7. Sufana-A kind of Plant.
8. Soof-means Wool.

Sufism is deep and wide in terms of time and space, and has been gaining status for centuries. It is therefore not possible to describe Sufism in a complete sense based on its appearance in certain regions. In our opinion, it should be studied in regions by separating them into territories. Because the views of Sufism in North Africa are different from the views of Sufism in Central Asia, the views in Turkey are different from the definitions of Sufism in Iraq and Egypt, and the views in America and Europe are completely different.

Various, truthful and correct views on the history of mysticism have been expressed by many Western and Eastern scholars. A.E.Krimski in his "Development of Sufism until the end of the third century AH" sees two factors in the emergence and formation of mysticism: one is the

traces of Christianity in the West, which spread to Christian countries before the conversion to Islam, and the other to Buddhist-oriented countries in the East."<sup>17</sup>

P.Tsvetkov's "Islamism", A.Kazanski's "Islamic mysticism" and I.Goldtsier's "Lectures on Islam" are seen as superstitious approach to Sufism.

F.A.Toluk writes that Sufism originated from the "generation of priests". He later rejected this unproven hypothesis and became convinced that Sufism was an Islamic teaching<sup>18</sup>. Foreign scholars supporting this view are A. Nicholson, L.Massignon, A. Arberry, J.Trimingham, A.Simmel, and others.

According to Ed.Brown, O.V.Macdonald, A.Venzink, Sufism originated from asceticism in Eastern Christianity and was developed by Syrian monks belonging to the Neo-Platonism form of Christianity. R. Dozi, referring to Iranian sources, writes that Sufism is a doctrine contrary to the Arabs and Islam<sup>19</sup>. Sufi scholars Richard Hartman, Max Horten, and others say that this doctrine originated from or was influenced by Hinduism, Buddhism, and the early Vedantas<sup>20</sup>.

## RESULT AND DISCUSSION

Apparently, these ideas are primitive views, and attitudes to them are new today. That is, Sufism is being studied as a science based on Islam, the Qur'an, and the Hadith, and this, of course, has come at the cost of a great deal of evidence.

As a result of our thinking, we can cite the attitude of Western scholars Louis Massignon and Reynold Nicholson to Sufism, who were engaged in this doctrine in the first half of the twentieth century. They set aside various alien ideas and tried to prove that Sufism is based on Islam<sup>21</sup>. When we study J. Trimmingham's "Progress of Islamic Sufism", we realize that the scholar saw the basis of Sufism in Islam in his description: "Sufism derives its experience from asceticism and Eastern Christian philosophy, the basis of which depends on the Qur'an."<sup>22</sup> Here it is difficult to agree with the scholar's phrase "Eastern Christianity."

To understand the origin of Sufism, which is considered to be very complex in the Muslim world, we must first have a clear idea of the state of the Islamic society in which it arose. It is not enough to state the existence of elements of knowledge, Neo-Platonism, monism and other similarities in Sufism, it is necessary to try to explain what conditions allowed these elements to flourish. Only then can we correctly understand the historical role of Sufism and its future destiny<sup>23</sup>.

J.Trimingham emphasizes that the attainment of enlightenment (*ma'rifa-gnosis*) through a sense of pleasure is a feeling of Sufism and an open doctrine<sup>24</sup>. It is known that Sufism consists of four statuses, and enlightenment (*ma'rifa*) is one of its statuses. They are concepts that are inextricably linked to the Islamic law (*Shari'a*), the Divine Way (*Tariqa*), the enlightenment (*Ma'rifa*), and the higher status of The Truth (*Haqiqat*). Whether enlightenment is left out of the view of some scholars or for some other reason, it falls within these four statuses, i.e., it is recorded as *Shari'ah*, *Tariqah*, and *Haqiqat*. A similar idea can be found in an article by Western orientalist J.A.Gross<sup>25</sup>. In it, J.A.Gross identifies the state of Sufism during the Soviet Period and expresses it through the thoughts of the Russian scholar O.Sukhareva. According to the article, O.Sukhareva describes Sufism as a syncretic aspect of Islam and an easily adaptable "divine inclination." At the same time, he gives a brief commentary on the three statutes, interpreting the *Shari'ah* as the means by which a Murid (disciple) must follow the "official" rules of Islam,

understand the essence of all things, and finally achieve the Truth through divine knowledge and ecstasy<sup>26</sup>. But according to ancient Sufi scholars, enlightenment is recognized as one of the statuses.

## CONCLUSION

The term of Sufism was debated with different opinions about the place and time of its emergence. Some opinions of foreign scholars on this subject were found to be relevant. The essence of Sufism has been explained by many examples, but finding a perfect answer that provides complete content remains a challenge. However, in view of the above, we have come to the conclusion that Sufism can be defined as follows: Sufism is the religion of Islam, that is, the teachings based on the Qur'an and Hadith, and the Sunnah of the Prophet (saas) is followed by the Sufis. It is basically an inner science, and the person who enters it is called a Sufi. It is derived from the Arabic word "suvf-jun". The scientific proof of the other definitions given to it is scarce or questionable. We remain of the same opinion.

 UZBEKISTAN

Email id: muazzamxon93@gmail.com

### ABSTRACT

*This article examines the aspects of exemption from liability juveniles in the theory of criminal law of the Republic of Uzbekistan and other countries. Explains the concept of exemption from criminal liability of juveniles. In this article, the author recommends a clear definition of his mental and physical development in juvenile delinquency and the influence of adults on him. She argued that the release of juveniles was a right, not a duty, of the courts and law enforcement agencies. Exemption of juveniles from liability is divided into general and special types. In the Republic of Kazakhstan, the Russian Federation, the Republic of Moldova and the Republic of Belarus, the grounds for the imposition of coercive measures on juveniles are different. It offers new coercive measures on the experience of other countries. She concludes, based on this, social organizations (institutions) and families of juveniles who have committed crimes should help to monitor, correct their mistakes, promote healthy development and become a full member of society. The concept of the basis for the release of juveniles from liability highlights the problems and provides new suggestions for its solution.*

### I. INTRODUCTION

Approved by the Decree of the President of the Republic of Uzbekistan dated February 7, 2017 "On the Strategy for further development of the Republic of Uzbekistan", strategy of actions on five priority directions of development of the Republic of Uzbekistan for 2017-2021 Priority II is called "Ensuring the rule of law and reforming the judiciary", Paragraph 2.3 sets out the priorities for "Improving administrative, criminal, civil and economic legislation".[1]

Section 6 of the Criminal Code of the Republic of Uzbekistan is called the Features of juvenile liability, and chapter XVI is entitled "Exemption from Liability or Punishment". Under paragraph 1 of the decision which adopted September 15, 2000 year, Plenum of the Supreme Court of the Republic of Uzbekistan on Juvenile Delinquency in the case of juvenile delinquency, carefully examine the facts to be proved, thorough and objective examination, a correct assessment of the set of facts and evidence, taking into account the degree of social danger of the act and the identity of the defendant to make full use of the features and privileges provided by law in accordance with the principles of justice and humanity.

Article 9 of the law of the Republic of Uzbekistan which adopted on 29<sup>th</sup> September 2010 year "On prevention of juvenile lack of control and offenses" information on interdepartmental commissions on juvenile affairs. Interdepartmental commissions on juvenile affairs within their competence: implements measures to prevent juvenile delinquency and offenses, ensures the protection of their rights, freedoms and legitimate interests.[2];

## II.METHODOLOGY

As components of the methodology, the author used general scientific methods, which involve the study of all phenomena and processes in their development, interconnection and interdependence, as well as special methods. In particular, the methods of dialectical materialism, system analysis, analysis and synthesis, logical, historical, comparative-legal, formal-legal used.

## III.DISCUSSION

A juvenile is a person who has reached the age of 14 but has not reached the age of 18 at the time of the commission of a socially dangerous act.[3]

Personality traits of juvenile offenders, characteristics of their criminal behavior taking into account the specifics of the legal status of juveniles, the current criminal law stems from the possibility of achieving the objectives of criminal liability primarily through the use of special services. The institute of exemption from criminal liability provides for less severe criminal measures, which have a special place for juveniles. Exemption of juveniles from criminal liability embodies the principles of humanity, justice, reduction of criminal repression.

Use of the institute of release from criminal liability for juveniles, in particular, to influence them without the use of criminal investigations. (not to drastically change the living conditions of juveniles when there is a possibility of while maintaining a positive family, study, work, and environment that has a positive impact on the juvenile).[4]The commission of a crime by a juvenile indicates shortcomings in his upbringing, moral and legal development. This crime can negatively affect the future of the juvenile and determine the nature of his relationship with the criminal law. Juvenile delinquency is greatly influenced by negative social processes and events in society. Juveniles are more susceptible to external factors than adults.

According to Y.N. Ermolovich, the features of criminal liability of juveniles can be distinguished as follows:

- 1) juvenile delinquency is recognized as a mitigating circumstance;

2) in sentencing juveniles, in addition to general circumstances, life and upbringing, level of mental development, other characteristics, as well as the influence of adults are taken into account;

3) The possibility of applying special grounds for exemption from criminal liability for juveniles who have committed low-risk and less serious crimes;

In determining the age of a juvenile, the last day of the year in which the crime was committed is considered. When determining the age, it is necessary to choose the minimum age given by the experts. According to I. Mukhacheva, "In determining the age of onset of criminal liability, the legislature should take into account all juveniles between the ages of 14 and 18, the importance of their actions (inaction), their ability to understand and manage social risks. However, juveniles of the same age in the document often have different physical and mental development. At the same time, physical and psychological indicators, legal consciousness (understanding and think of the prohibitions in criminal law) may not correspond to the generally accepted characteristics of juveniles. At the same age, the development of brain structures, the formation of functional systems, the formation of ethical guidelines and the system of legal consciousness may be different in different juveniles.[5]

The Criminal Code provides for coercive measures. The Criminal Code stipulates that a juvenile who has committed less serious crime may be released from criminal liability if it is recognized that its correction may be carried out through coercive measures.

The issue of the possibility of exemption of a juvenile from criminal liability with the use of coercive measures shall be considered only if there are no grounds for exemption from criminal liability under Articles 64, 65, 66, 66<sup>1</sup>, 67 of the Criminal Code of the Republic of Uzbekistan is used. In fact, when deciding whether to release a juvenile from criminal liability on general or special grounds, general grounds are given priority.

In general, this rule is consistent with the principles of differentiation and individualization of criminal liability and this rule applies to juveniles who, for the first time after the commission of a crime, have committed a low-risk or less serious crime and have shown themselves to be positive.(Articles 64, 65, 66, 66<sup>1</sup>, 67, 68 of the Criminal Code).[6]

The main differences between the general and specific grounds for the release of juveniles from criminal liability are as follows. First, the general grounds for exemption from criminal liability are unconditional, exemption from criminal liability with the use of coercive measures is conditional. Current criminal law and criminal procedural law clearly defines the status and binding nature of the measures under consideration.

However, the exemption of juveniles from criminal liability or punishment through the use of coercive measures in the literature, even if all the necessary conditions are in place, is not an obligation for law enforcement, but a right of law enforcement agencies. The conclusion that coercive measures can be used to rehabilitate a juvenile is prognostic, but based on factual data. Determining this possibility depends on assessing the juvenile's subsequent behavior. It is important to legally release juveniles from criminal liability.

First, the release of a juvenile who has committed a crime from criminal liability, expresses his condemnation of his criminal conduct by the state and the state's humanitarian policy in the fight against juvenile delinquency.

Second, exemption applies to juveniles (criminal coercion, punishment, and sentencing).Based on this, the social organizations (institutions) that committed the crime and the families of the juveniles were involved in the monitoring, to help her correct her mistakes, grow up healthy, and become a full member of society.[7]

Wider protection of the rights of juveniles, their age, their specific physiological and intellectual development, their ability to understand the nature of their behavior, their age, their specific physiological and intellectual development, their ability to understand the nature of their behavior the ability to understand the nature of one's actions, to re-educate young people who have committed crimes in light of their place in society, wider application of the principle of humanity to them, increase the effectiveness of sanctions, prosecution of adults and consideration of the reduction of criminal liability and impunity in connection with the expiration of the term of imprisonment, it is worthwhile to study foreign experience in this area, including the criminal law of the Commonwealth of Independent States.[8]

Article 87 of the Criminal Code of the Republic of Uzbekistan is called exemption from liability or punishment "It's the first time a juvenile has committed a low-risk crime, if the characteristics of the act committed taking into account the identity of the perpetrator and other circumstances of the case, and concluding that it can be corrected without penalty may be released from liability and the case may be referred to the Interdepartmental Commission on Juvenile Affairs".

On this basis, only the coexistence of each of these conditions can release a juvenile from criminal liability.

The provisions of Article 87 of the Criminal Code apply only in such cases, not at the time of the crime but may be applied even if the person under the age of 18 at the time the relevant decision is made or the decision (ruling) on release from liability is issued. In the same case, Article 87 of the Criminal Code when there are grounds for exemption from liability specified in Part 1 but if the defendant turns 18 at the time of the decision (ruling), the issue of release of such person from liability shall be resolved on general grounds in accordance with Articles 64-68 of the Criminal Code. Submitting the materials to the Interagency Commission on Juvenile Affairs for consideration exemption from liability for a crime committed only on one condition that is, the act is committed for the first time by a juvenile and is allowed only if it does not pose a threat to society.

If a person's previous conviction for a previous crime has been completed or removed in the prescribed manner or if the person has been released from criminal liability or punishment in accordance with Articles 64, 65, 66, 66<sup>1</sup>, 68, 69, 70, 71, 76, 87 of the Criminal Code the crime is found to have been committed for the first time. The issue of the expediency of releasing a juvenile who has committed a crime of low social risk can be resolved on the basis of a comprehensive study of the circumstances of the case and the identity of the accused. When referring to the features of the act committed in the content of part 1 of Article 87 of the Criminal Code characteristics of socially dangerous acts, aimed at harming this or that public relationship protected by criminal law and an understanding of how to obtain criminal intent (with or without the use of force).However, there are other types of coercive measures in the criminal codes of some Commonwealth of Independent States: placement in an educational institution with a special regime of detention, an obligation to apologize to the victim(Article 84 of the Criminal Code of Kazakhstan); install test control(Article 84 of the Criminal Code of Kazakhstan), referral

to special education and enlightenment programs (Article 105 of the Criminal Code of Ukraine) or medical and educational institution, forcing a juvenile to undergo a course of medical and psychological rehabilitation (Article 104 of the Moldovan Criminal Code). Belarusian criminal law is a general measure of educational impact on juveniles provides for the transfer of custody of the parents or their surrogates at their request, subject to the payment of a deposit in exchange for funds.(Article 118 of the Criminal Code of Belarus).

In accordance with the provisions of the Criminal Procedure Code of Moldova (Article 344-1) in respect of a person accused of committing a juvenile or less serious crime and a felony, prior to the appointment of a court hearing in respect of a juvenile; decides on the appointment of mediation or reconciliation of the parties sets a reasonable time to implement it. If reconciliation has taken place, hence, a mediation agreement is signed and the criminal investigation is terminated, otherwise the mediator draws a reasonable conclusion and submits it to the court.[9]

Terms and conditions of stay of juveniles in special educational institutions are determined by the legislation of the Republic of Uzbekistan. Terms and conditions of stay of juveniles in special educational institutions are determined by the legislation of the Republic of Uzbekistan. Compensation in the form of monetary compensation should be used with extreme caution to avoid committing a new property crime as a result of the juvenile's financial difficulties. Compensation for damages is made voluntarily through a bailiff.[10]

Article 83 of the Criminal Code of the Republic of Kazakhstan, adopted on July 3, 2014, is entitled "Exemption from liability and punishment." According to him, a juvenile who has committed a criminal offense or a less serious crime, or who has committed a moderate crime for the first time, can be prosecuted by a court if it is determined that it cannot be corrected without criminal prosecution, can be released. However, he may be subject to coercive measures.[11]

Article 89 of the Criminal Code of the Republic of Tajikistan, adopted on May 21, 1998, provides for exemption from liability through coercive measures. According to him, a juvenile who has committed a juvenile or moderate crime for the first time can be released from criminal liability if it is recognized that its correction can be carried out through the use of coercive measures.[12]

According to Article 118 of the Criminal Code of the Republic of Belarus of July 9, 1999 "A person under the age of eighteen who has committed a crime for the first time that does not pose a serious threat to the community or is less serious with the transfer of criminal liability under the supervision of parents or persons, their substitutes, at their request, if, on the specific nature of the crime committed, personal data and other circumstances of the case, the juvenile may be prosecuted may be released from liability if correction is possible without prosecution. A juvenile who has committed a crime may be placed under the supervision of his or her parents or guardians, subject to bail. The amount of the deposit is determined in the amount of ten to fifty times the basic amount, taking into account the financial situation of the parents. For crimes of low social risk and less serious, bail for crimes ranging from fifty to one hundred times the base value is set on the day of announcement. If the the person under surveillance has committed a new intentional crime within a year, the amount of the bail shall be transferred to the state.

**IV. CONCLUSION:**

The bases of exemption from criminal liability is now important in law enforcement practice. This is because the exemption is in line with the principle of humanity, which, through its application, frees the judiciary and the investigative bodies from excessive processes and excessive expenditures of the state budget. Prevents individuals from hiding from the courts and law enforcement for the rest of their lives. Based on the above, I would like to suggest the following. First, based on the experience of many CIS countries, Part 1 of Article 87 of the Criminal Code of the Republic of Uzbekistan should be amended as follows: A juvenile who has committed a crime of low social risk for the first time shall be released from liability if, taking into account the nature of the act committed, the identity of the perpetrator and other circumstances of the case, it can be corrected without penalty. However, coercive measures may be applied to him.

Article 88 of the Criminal Code of the Republic of Uzbekistan should be worded as follows. The following coercive measures are applied to juveniles:

- (a) an obligation to apologize to the victim in the form prescribed by the court
- (b) the obligation of a person who has reached the age of sixteen to pay or compensate for the damage caused at his own expense or by his own labor. This measure is applied if the damage does not exceed ten times the established basic calculation amount. In other cases, the damage is recovered in civil law
- (c) Placement of a juvenile in a special educational institution
- (g) Placement in an educational institution with a special regime of detention
- (d) Installation of test control
- (j) Medical and educational institution, forcing a juvenile to undergo a course of medical and psychological rehabilitation
- (f) The transfer of a single measure of educational effect to juveniles - the supervision of parents or guardians at their request, subject to the payment of a cash deposit.

### ABSTRACT

*In the second experimental group, rabbits reported a worsening of their general condition from the 27th day of the experiment, as well as changes in their attitude to food and water, changes in the condition of the mucous membranes and skin, and an increase in the size of the pupil.*

**KEYWORDS:** *Ferula-Assafoetida, Coumarin, Terpenes, Pulse, Respiratory Rate, Body Temperature, Body Weight.*

### INTRODUCTION

The new edition of the Law of the Republic of Uzbekistan "On Veterinary Medicine" in the normative legal acts of the President of the Republic of Uzbekistan dated March 20, 2018 No PP-3617 "On measures to establish the Republican kovrak plantations and increase the volume of processing and export of their raw materials" this research serves to a certain extent in the performance of the assigned tasks.

Galban (galban, Iraniangalbani) from *Ferula L.* family is a part of heating, greases (plasters). Abu AlibnSino [1]. In the book "Laws of Medicine" it is noted that their sins of the genus *Ferula L.* are used for joint pain, to strengthen the digestive process, to drive worms, to abort the fetus.

In Turkmenistan, young branches of the *Ferula L.* genus are used in the treatment of colds, lung and intestinal diseases, to strengthen immunity [6]. There sin obtained from the plant is used in the treatment of asthma, nervous diseases, superficial wounds, various wounds and tumors in the form of tinctures, emulsions, plasters, as well as in the prevention of miscarriage. It is also used in the preparation of canned food as a flavoring agent.

The use of Tajik ferulain Tajik folkmedicine has a long history. *F. tadshikorumis* used as analgesic in arthritis, the plant-based substances have expectorant properties and are used in the treatment of pulmonary tuberculosis, otitis and lymphadenitis. Many sources say that mixing this plant with milk is so effective in treating some dangerous allergies [2].

Subsequent pharmacological and biological studies of scientists have information that these plant substances have antioxidant, antiviral, anti-diabetic, anti-influenza properties, they can be used as anti-tumormolluscids, hypotensive agents [3,4,5].

### **The relevance of the topic**

The new version of the Law of the Republic of Uzbekistan "On Veterinary Medicine", the Law of the Republic of Uzbekistan dated March 20, 2018 "On measures to increase the volume of processing and export of raw materials and their export" This research to some extent serves in the implementation of the assigned tasks. Galula (galban, Iranian galbani) obtained from *Ferula L.* species is a component of heating and lubricants (plasters). Abu Ali ibn Sina [1]. In the book "Laws of Medicine" *Ferula L.* states that the resins of the genus are used in joint pain, to enhance the process of digestion, to expel worms, to abort the fetus. In Turkmenistan, young shoots of *Ferula L.* are used to treat pneumonia, lung and intestinal diseases, and to strengthen the immune system. The plant-derived resin is used in the treatment of tinctures, emulsions, plasters, asthma, neurological diseases, external wounds, various wounds and tumors, as well as in the prevention of miscarriage. The series is also used as a flavoring agent in the preparation of canned food. The use of Tajik ferula in folk medicine in Tajikistan has a long history. *F. tadshikorum* is used as a painkiller in arthritis, the plant-derived substances have expectorant properties and are used in the treatment of pulmonary tuberculosis, otitis and lymphadenitis. Many sources say that mixing this plant with milk is effective in the treatment of some dangerous diseases [2]. Subsequent pharmacological and biological studies have shown that these plant substances have antioxidant, anti-viral, anti-diabetic, anti-influenza properties, can be used as anti-tumor molluscids, antihypertensive agents [3,4,5].

### **Research methodology**

Considering the fact that alcohol extract from the juice extracted from the ferula-assafoetida plant has estrogenic properties when ingested to ovarioectomy rats, taking into account the consumption of coumarin, terpenes and other biologically active substances in ferula assafoetida grains by sheep and other animals, Scientific laboratory experiments were conducted to study the effect of the grain of the plant *Ferula-assafoetida* on the clinical and physiological parameters of rabbits in rabbits of individual entrepreneurs living. A total of 15 female rabbits with an average live weight of 3-3.5 kg and a total of 9 male rabbits with an average live weight of 3.5-4 kg were used for the experiments based on the principle of similar pairs.

Rabbits of the first experimental group were given 5% of the seeds of the plant in *Ferula assafoetida* daily to the mixed feed, and rabbits of the second experimental group were added 10%. The third group of rabbits served as a control group and they were fed only the mixed feed itself. The experiments lasted 30 days. During this period, each of the rabbits in the control group received a total of 4.5 kg of mixed feed. The first experimental group of rabbits consumed 4,275 kg of mixed feed and 7.5 grams per head, a total of 225 grams of 3% coumarin, terpene and other biologically active substances containing *Ferula assafoetida* plant seeds, ie 64 mg / kg per rabbit body per day. a total of 6.75 grams of coumarin, terpene and other biologically active substances were recorded. The second experimental group of rabbits consumed 4.05 kg of mixed feed and a total of 450 grams of 15 grams per person, 3% coumarin, terpene and other biologically active substances containing *Ferula assafoetida* plant seeds, ie 128 mg / kg per rabbit body per day. A

total of 13.5 grams of coumarin, terpene and other biologically active substances were recorded from

Research results and their analysis. Prior to and during the experiment, daily experimental rabbits were monitored through clinical examinations, their general condition, response to food intake and external environmental influences, pulse, respiratory rate, body temperature.

Clinical manifestations and changes in body weight of the mother rabbits in the experiment The first experimental group in which 5% of the plant grain *Ferula-assafoetida* was added to the mixture, showed the general condition of the animal, body temperature, pulse, respiration, attitude to food and water, weight, mucous membranes and skin. the condition indicators of the coating did not differ from those of the control group rabbits.

In the second experimental group of rabbits, in which *Ferula-assafoetida* was added 10% of the plant grain to the mixture, in the first days of the experiment, their general condition, body temperature, pulse, respiration, food and water, weight, mucous membranes, and skin condition did not differ from those in the control group. , from the 27th day of the experiment, they reported a worsening of their general condition, as well as changes in their attitude to food and water, changes in the condition of mucous membranes and skin, enlarged pupils, increased heart rate and respiration.

Analysis of live weight and daily growth of rabbits in the experiment showed that the average daily growth in mother rabbits in the first experimental group was 24 grams at the end of the experiment and the total growth was 720 grams, in the second experimental group the daily growth was 19 grams and the total growth was 570 grams. in the mother rabbits in the control group, the daily gain was 21 grams and the total gain was 620 grams.

The daily growth in male rabbits in the first experimental group was 28 grams and the total increase was 840 grams at the end of the experiment, in male rabbits in the second experimental group the daily growth was 20 grams and the total increase was 600 grams at the end of the experiment. 24 grams and 710 grams, respectively.

Thus, in experiments, 5% of *Ferula-assafoetida* plant grains were added to the compound feed, ie 4,275 kg of compound feed and 225 grams of 3% coumarin, terpene and other biologically active substances were fed to *Ferula assafoetida* plant grains. in rabbits, which increased by 3 and 100 grams, respectively, and in the second experimental group by 5 and 150 grams, respectively, in male rabbits consuming 5% *Ferula-assafoetida* plant seeds in compound feeds, compared with those in the daily and total growth control groups, respectively. and 130 grams, compared with 8 and 240 grams, respectively, for the second experimental group of male rabbits.

Analysis of the results showed that each head of rabbits in the experiment fed *Ferula-assafoetida* 5% of the plant grain, ie

He consumed 4,275 kg of mixed feed and 7.5 grams per head of animal, a total of 225 grams of 3% coumarin, terpene and other biologically active substances containing *Ferula-assafoetida* plant seeds, which contained 6.75 grams per rabbit (64 mg / day). kg) The general condition of rabbits exposed to coumarin, terpene and other biologically active substances, body temperature, pulse and respiration rate, attitude to food and water, weight, condition of mucous membranes and skin, as well as indicators and productivity did not change negatively for 30 days. However, in the experimental rabbit diet, the mixed feed was supplemented with *Ferula assafoetida*

containing 10% of plant seeds, ie 4.05 kg of mixed feed, and *Ferula-assafoetida* containing 3% coumarin, terpene, and other biologically active substances at a total of 450 grams per 15 head. When consuming *assafoetida* plant seeds, rabbits receiving 13.5 grams (128 mg / kg per day) of coumarin, terpene, and other biologically active substances per animal did not show signs of poisoning for a long time, ie 30 days, but lost live weight and total a decrease in growth was observed.

## CONCLUSION

The second experimental group of rabbits reported a worsening of their general condition from day 27 of the experiment, as well as changes in their response to food and water, changes in the condition of mucous membranes and skin, enlarged pupils, and increased heart rate and respiration.

*Ferula-assafoetida* is explained by the ferulin alkaloid in the plant, especially ethyl ether - acetic acid 4-oxycoumarin, and the cumulative effect of umbeliferons on organs and tissues.

### ABSTRACT

*In this article, it is argued that at all stages of educational development, teaching should be linked to production practices. At present, the need for training in the field of science, mathematics, general and special disciplines in connection with the practice of production is defined in the qualification requirements for graduates of higher education institutions.*

**KEYWORDS:** *Engineer, Professional, Methodology, Referral, System, Production, Practice, Training.*

### INTRODUCTION

In recent years, great attention has been paid in the field of science and technology in our country. This attention requires qualified specialists in modern techniques and technologies. The training of such a specialist is the responsibility of higher education. Therefore, graduates of higher education must have serious training in natural sciences, mathematics, general and special sciences in order to master and manage modern techniques and technologies. Therefore, in this article we present the methods, forms and tools for the training of engineers in higher education in the natural sciences, mathematics, general and special disciplines.

### Main part

The presence of the oretical knowledge of students studying in higher education institutions does not mean that they have knowledge focused on industrial practice. Only when students are able to apply the knowledge they have acquired in a variety of situations does it indicate that they have some knowledge, skill, and competence. This focused ability can only be formed in the learning process, which provides a broad understanding of the relationships of all subject blocks in the curriculum. The possibility of these connections dependson:

- In the use of technology is widely used many methods mastered in the disciplines taught in higher education;
- At present, it is impossible to conduct the educational process without relying on the knowledge acquired in higher education;
- Modern techniques require users to have a deep theoretical knowledge, as well as an understanding of the theoretical laws and principles of action that form the basis of the creation and operation of this technique.

One of the means of applying the acquired knowledge to production practice is to teach students to solve practical problems related to production practice. At present, the theoretical basis of the methodology of using practical issues in the teaching of special subjects has become relevant.

We will consider the solution of practical problems as a basis for the implementation of practical training of the engineer, as well as the connection with the production practice. If we focus on the implementation of didactic functions, it is to prepare students for the acquisition of new knowledge, to strengthen the subject, to develop skills and abilities to use the subject, to describe the practical application of the subject. This, in turn, indicates the need to clarify the classification of issues according to their didactic functions. After a clear study of problem-based teaching methods, we identified two types of preparation tasks, with the help of which different methods of preparing students to learn a new topic were implemented. The first method is based on activating students' knowledge (traditional in higher education methodology), the second involves the use of problem-based research methods and requires problem identification and formulation. In the learning process, great attention will be paid to the independence of students, and it will be necessary to differentiate tasks related to research and creative approach.

Thus, to summarize the views expressed, the clear classification of problem groups is as follows:

1. Preparatory issues - preparing students to study a new topic.
2. Reinforcement issues are issues that combine the materials studied, i.e. definitions, concepts, formulas, proof methods, and so on.
3. Trainings - issues aimed at the formation of skills and competencies. In solving these types of problems, students must use a specific algorithm, a common method, and a traditional solution.
4. Research-related issues are issues that contribute to the consolidation and in-depth study of a topic, requiring students to use non-standard solutions, a combination of several traditional methods, and the use of certain algorithms in non-standard situations.
5. Creative issues - issues that contribute to the formation and development of research skills. In these types of issues, the goal may be defined. Identifying them is done in the process of solving the problem. The set of conditions, methods and tools required to achieve this goal should be determined independently by the students.
6. Supervision tasks are issues needed to determine the level of mastery of the material studied by students. These types of issues are provided for control, independent work.

At present, in the process of training future engineers, it is observed that science and mathematics courses are separated from technical sciences. This separation is so profound that learners cannot see objects known to them in a real situation, so they cannot use the mastered

natural-scientific and mathematical knowledge to describe the situation. Issues related to internships are rarely addressed in practical training, so graduates do not develop the skills to address such issues. Here are a few that hinder the active use of issues related to manufacturing practices:

- Insufficient space for them in textbooks and manuals;
- lack of time to address them in the learning process;
- Insufficient preparation of students for the school mathematics course;
- We can point out the reasons why the current stereotype of teaching mathematics does not always allow teachers to adapt to changing requirements and to include practical issues in the learning process.

## CONCLUSION

Summarizing all of the above, we can draw the following conclusions:

1. The analysis of the main stages of the development of education has shown that the purpose of education is a category of social significance, because it depends on social conditions. The history of higher education testifies to the fact that at different stages of development, educational goals have changed and supplemented in accordance with the prevailing social goals and worldview.
2. Many researchers have raised the issue of the need to use the most advanced ideas at all stages of the development of education, including the practice of teaching mathematics. At present, the problem of linking mathematical training with production practice has reached a high level, which is defined in the State Education Standards in the qualification requirements for graduates of higher education institutions.
3. Based on the principle of directing education to production practice, the main ways to implement the transfer of mathematical training of an engineer to production practice have been identified.
4. It has been found that a combination of methods, forms, and tools at different stages of teaching mathematics contribute to the practical orientation of an engineer's mathematical training.
5. One of the means of linking mathematical training with the practice of production in higher education is the use of interdisciplinary links of mathematics with general and special disciplines.
6. The use of practical issues related to all types of production practices in the context of mathematical training of an engineer helps to apply them systematically and purposefully in the learning process.

We consider it important to create a system of applied issues related to production practice and justify its use in various audiences and extracurricular activities.

**LEADERSHIP STYLE AND ITS IMPACT ON EMPLOYEE'S JOB RELATED STRESS  
A STUDY BASED ON JAFFNA DISTRICT SECRETARIAT IN JAFFNA DISTRICT,  
SRI LANKA**

**Miss. Sorubini Murugiah\***

Tutor Mentor, BBM Online Degree Programme,  
University of Jaffna, Sri Lanka  
E-mail- Sorubini06@gmail.com

**ABSTRACT**

*This research is carried out to find out whether there is a relationship between leadership style and its impact on employees job related stress. Researcher considered Transformational leadership style & Transactional leadership style. This study was conducted at Jaffna District Secretariat office where 100 employees were selected through random sampling method out of two hundred. The data were collected from selected sample. Then these data were presented and analyzed by using statistical techniques (SPSS). These analysis was used to find out (a) Transformational leadership has negative impact on employees job related stress (b) Transactional leadership has positive impact on employees job related stress.*

*Analysis showed negative correlation between transformational leadership & employees job related stress. The positive correlation between transactional leadership & employees job related stress. Further F test, ensured that there is a relationship between two variables. This result is true with 95%. Therefore, it was identified that job related stress of employees has negative impact on their transformational leadership style. That is job related stress; transformational leadership and transactional leadership lead to enhancement of employees' job related stress. T test proved that there is negative relationship between transformational leadership and employees' job related stress at 5% significant.*

**KEYWORDS:** *Transformational Leadership Style, Transactional Leadership, Job Related Stress.*

## **BACKGROUND OF THE STUDY**

Leadership is a social influence process in which the leader seeks the voluntary participation of subordinates in an effort to reach organization goals (Omolayo, 2000), a process whereby one person exerts social influence over other members of the group (Bamigboye, 2000). Leadership style is the manner and approach of providing direction, implementing plans & Motivating people. As seen by the employees, it includes the total pattern of explicit and implicit action of their leaders (Newstrom, Davis, 1993). Work stress is the harmful physical and emotional responses that occur when the requirements of a job do not match the capabilities, resources or needs of the work (United States National Institute for Occupational Safety and Health, 1999). Stress has its impact on the general & work life of the employees. It had often been said “A happy employee is a productive employee”.

People in Jaffna experience high level of stress due to prevailing political, economic & cultural problems. I have been heard many times people saying “Very difficult to work in Government offices because in most time have to work more than one boss namely Head of the Department, Political Party & the Government Circular”. Actually the leadership is the issue. An effective leader must make sure the employee to whom he/she is responsible, he never allows for role conflict which leads to job stress. Effective leader leads to several benefits such as, reducing moral stress; create new thinking and innovation which lead them to high level, fresh mind, good relationship, with co-workers, supervisor and employees etc. Leaders have an impact on the stress levels and work life balance of those they lead and, depending on the style of leadership, that impact can be either positive or negative.

This study attempts to identify whether leadership style of the leader affects their employee’s stress. Findings of this study could enable, leaders lead their employees well. Through the findings of leadership style and the reduced employee’s stress can improve both employees’ job satisfaction and performance. This study will attempt to analyze the relationship between leader’s leadership style and job related stress. Effective employee depends on many factors. The main factor is favorable leadership style. So the leaders first understand that, their behavior towards employee will have an impact not only their performance but also mental health

## **OBJECTIVES OF THE STUDY**

This study aims to achieve the following objectives.

1. To examine job stress of the employees in District Secretariat of Jaffna.
2. To examine the stress level of employees.
3. To recommend alternatives to reduce the job stress of the employees.
4. To identify relationship between Leadership style and Job stress of employees.

## **LITERATURE REVIEW**

Umer, P *et al* (2012) conducted study to examine the impact of leadership style (Transformational & Transactional) on employee performance & mediating rate of job satisfaction . Result shows transactional leadership was more significant than transformational in creating job satisfaction & Performance.

Amarjit, G *et al* (2010) conducted a study to examine the impact of Transformational leadership & employee empowerment on employee stress. The results found that the improvement in the level of perceived transformational leadership used by managers and employee empowerment mitigate the job stress of customer contact service employees in the Indian hospital industry.

Jens, R and Wolff S, (2009) tested relationships between transformational, transactional and non leadership styles and facets of chronic stress (i.e., excessive work and social demands, dissatisfaction with work and social recognition, performance pressure, and social conflicts), while controlling for subordinates' demographics and hierarchical level. It was found that one of the transformational leadership scales (i.e., individualized consideration) was negatively related to dissatisfaction. In contrast, the transactional subscale of management by- exception passive was positively related to four indicators of chronic stress, while controlling for all other transformational and transactional leadership styles. Future research should include objective indicators of stress. They recommend Managers in governmental organizations should avoid utilizing the transactional leadership style of management-by-exception passive in order to foster employees' health. The results allow for a more thorough and detailed understanding of leadership behavior, stress prevention, and occupational health.

Work stress is the feeling of tension, discomfort, uncertainty, indecisiveness and distress that a worker experiences as a result of the social and physical circumstances of the work setting. Leaders can reduce these stressors by providing direction and support for their employees (Kreitner & Kinicki, 1998), and this makes style of leadership very important in organizations.

Sosik and Godshalk (2000) reported negative associations between transformational leadership and job related stress, while contingent reward showed no associations.

Work stress is the feeling of tension, discomfort, uncertainty, indecisiveness and distress that a worker experiences as a result of the social and physical circumstances of the work setting. Leaders can reduce these stressors by providing direction and support for their employees (Kreitner & Kinicki, 1998), and this makes style of leadership very important in organizations.

Transformational leadership behaviors are highly active and influence subordinates in a positive way (Bass, 1985). The focus on long term vision, the communication of a sense of purpose and value-based leadership of transformational leaders helps subordinates to reframe stress-related events, i.e. to understand the underlying reasons for stress-related incidents.

Transactional leadership style (Avolio, 2002). We propose that this leadership style helps followers to internalize the expectations of their leader. Thus, contingent reward reduces uncertainty in a complex and potentially stressful work environment. Therefore, contingent reward should be negatively associated with chronic stress.

Transformational Leadership, as one such strategy, has been found to encourage open communication with followers, which in turn, reduces employee job stress. Gill *et al.* and Dhaliwal found a negative relationship between transformational leadership and job stress; that is, transformational leadership reduces employee job stress in the hospitality services industry.

## **METHODOLOGY**

This study based on primary data. Questionnaire is used as a tool for data collection. For the purpose of measuring leadership style the questionnaire developed by Bernard, M. Bass & Brupe

& A. Volio is used. This has two variables, such as Transactional leadership & Transformational leadership. For the purpose of measuring stress level the questionnaire developed by Parker & Decotiis (1993) is used. The questionnaire was translated in to Tamil to make the respondent understand well.

For the purpose of data collection, the researcher travelled to the respondent's location (Jaffna District secretariat office) and under the authorization of the administrators the questionnaire was handed out by the researcher to staff administrators (Administrative officer) at each unit. This method allowed the researcher to meet directly with staff administrators and staff to clarify any questions regarding the study and give explanations. 200 questionnaires were issued. Returned is 130. 100 Questionnaires were taken as sample.

### **HYPOTHESES OF THE RESEARCH**

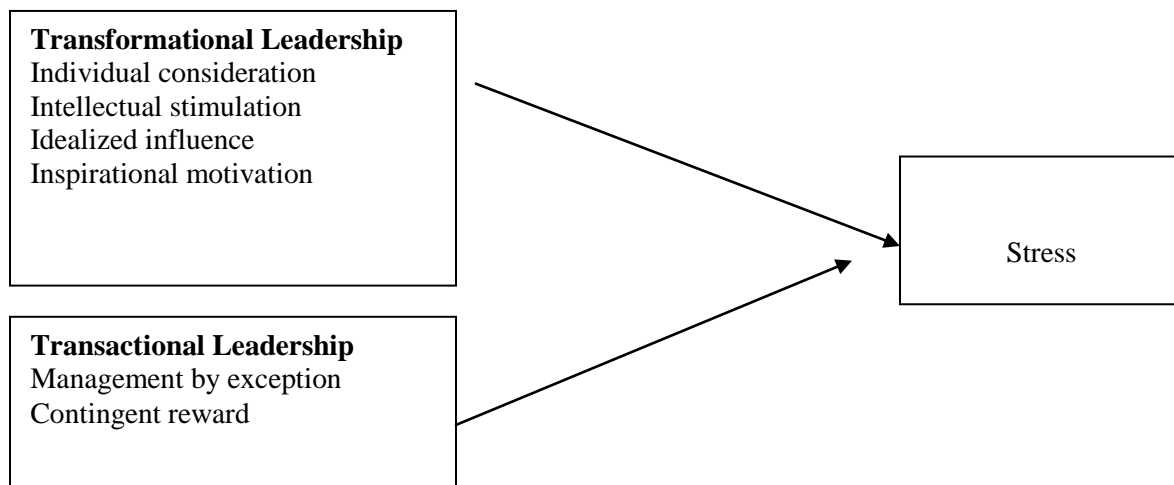

The following hypotheses are formed by the researcher.

H1: Transformational leadership has negative impact on employee's job related stress.

H2: Transactional leadership has positive impact on employee's job related stress.

### **CONCEPTUALIZATION**

The pattern of relationship between the key concepts or variables is shown in a conceptual model

## METHOD OF ANALYSIS

### Correlations of Transformational leadership and Transactional Leadership factor and Job

When the employees' stress is correlated with transformational leadership, correlation is -

		Transformational leader	Transactional leader	Stress
Transformational leader	Pearson Correlation	1	.119	-.233(*)
	Sig. (2-tailed)		.291	.038
Transactional leader	Pearson Correlation	.119	1	.028
	Sig. (2-tailed)	.291		.803
Stress	Pearson Correlation	-.233(*)	.028	1
	Sig. (2-tailed)	.038	.803	

0.233. As correlation is negative, it can be said that there is a negative relationship between two variables. Therefore, hypotheses ( $H_1$ ) is accepted, that is handling high level of good transformational leadership will lead to lower level of stress to employees.

The relationship between transactional leadership and employee's job related stress correlation is 0.028. So there is not any significant relationship between transactional leadership and employee's job related stress. Therefore hypothesis ( $H_2$ ) is rejected.

## CORRELATIONS OF TRANSACTIONAL LEADERSHIP FACTOR AND JOB STRESS

Transactional Leadership factor	Pearson Correlation	Sig. (2-tailed)
Contingent reward	- 0.063	0.579
Management by expectation (active)	0.158	0.160
Management by expectation (passive)	0.132	0.244
Laissez faire leader ship	- 0.018	0.872

The relationship between Contingent reward and employee's job related stress correlation is - 0.063. So there is not any significant between Contingent reward and employee's job related stress. The relationship between Management by expectation (active) and employee's job related stress correlation is 0.158. So there is significant between Management by expectation (active) and employee's job related stress. The relationship Management by expectation (passive) between and employee's job related stress correlation is 0.132. So there is significant between Management by expectation (passive) and employee's job related stress. The relationship between Laissez faire leader ship and employee's job related stress correlation is - 0.018. So there is not any significant between Laissez faire leader ship and employee's job related stress.

### CORRELATIONS OF TRANSFORMATIONAL LEADERSHIP FACTOR AND JOB STRESS

Transformational Leadership factor	Pearson Correlation	Sig
Idealized influence attributes	- 0.034	0.728
Idealized influence behavior	- 0.189	0.682
charisma	- 0.219	0.110
Inspirational motivation	- 0.059	0.140
Intellectual stimulation	- 0.435(**)	0.000

The relationship Idealized influence attributes between and employee's job related stress correlation is  $- 0.034$ . So there is not any significant between Idealized influence attributes and employee's job related stress. The relationship between Idealized influence behavior and employee's job related stress correlation is  $- 0.189$ . So there is not any significant between Idealized influence behavior and employee's job related stress. The relationship between charisma and employee's job related stress correlation is  $- 0.219$ . So there is significant between charisma and employee's job related stress. The relationship between Inspirational motivation and employee's job related stress correlation is  $- 0.059$ . So there is significant between Inspirational motivation and employee's job related stress. The relationship between Intellectual stimulation and employee's job related stress correlation is  $- 0.435$ . So there is significant relationship between Intellectual stimulation and employee's job related stress.

### REGRESSION ANALYSIS

Transformational Leadership and Transactional Leadership are denoted by "X". The dependent variable employees' job related stress is denoted by "Y". It is also used to estimate value of y while x is increased by one.

### RELATIONSHIPS BETWEEN TRANSACTIONAL LEADERSHIP, TRANSFORMATIONAL LEADERSHIP & STRESS

model	Un standardized Coefficients(B)	t	Sig.
(Constant)	43.828	6.743	.000
Transformational leader	-.210	-2.171	.033
Transactional leader	.064	.589	.557

#### Coefficients (a)

The regression equation  $y = -0.210x + 43.828$  exhibits that the relationship between Transformational Leadership style & job related stress of employees. If the Transformational Leadership style is  $x=0$ , the average employees' job related stress is to be 43.828. Further, Transformational Leadership is increased by one; the employees' job related stress will be

decreased by 0.210. Therefore it can be said that there is a negative relationship between two variables.

Transformational leadership significance value is higher than significance level of 0.05(significance value 0.033), so **H1** hypothesis is accepted.

The regression equation  $y=0.064x+43.828$  exhibits that the relationship between Transactional Leadership style & job related stress of employees. If the Transactional Leadership style is  $x=0$ , the average employees' job related stress is to be 43.828. Further, Transactional Leadership is increased by one; the employees' job related stress will be increased by 0.064. Therefore it can be said that there is a positive relationship between two variables.

Transactional leadership significance value is higher than significance level of 0.05(significance value 0.557), so **H2** hypothesis is rejected.

Job related stress of employees is correlated with

Independent variable	Correlation	R - Square
Transformational leadership and Transactional Leadership	0.242	0.058

R- Square ( $R^2$ ) 0.058 explains that only 5.8% variable of stress is accounted for by transformational leadership and transactional leadership. In other words, 94.2% variable of employees' stress is accounted by other variable.

### RELATIONSHIPS BETWEEN TRANSACTIONAL LEADERSHIP STYLE & STRESS

Model	Un standardized Coefficients B	Sig.
Constant	33.766	.000
contingent reward	-.300	.621
Management by expectation (active)	.520	.177
Management by expectation (passive)	.620	.295
Laissez faire leader ship	-.215	.633

The contingent reward regression equation  $y= -0.300x+33.766$  exhibits that the relationship between contingent reward & job related stress of employees. If the contingent reward is  $x=0$ , the average employees' job related stress is to be 33.766. Further, contingent reward is increased by one; the employees' job related stress will be decreased by 0.300. Therefore it can be said that there is a negative relationship between two variables.

Contingent reward significance value is 0.621.

The Management by expectation (active) regression equation  $y = 0.520x + 33.766$  exhibits that the relationship between management by expectation (active) & job related stress of employees. If the management by expectation (active) is  $x=0$ , the average employees' job related stress is to be 33.766. Further, management by expectation (active) is increased by one; the employees' job related stress will be increased by 0.520. Therefore it can be said that there is a positive relationship between two variables. Management by expectation (active) significance value is 0.177.

The Management by expectation (passive) regression equation  $y = 0.620x + 33.766$  exhibits that the relationship between management by expectation (passive) & job related stress of employees. If the management by expectation (passive) is  $x=0$ , the average employees' job related stress is to be 33.766. Further, management by expectation (passive) is increased by one; the employees' job related stress will be increased by 0.620. Therefore it can be said that there is a positive relationship between two variables. Management by expectation (passive) significance value is 0.295.

The Laissez faire leader ship regression equation  $y = -0.215x + 33.766$  exhibits that the relationship between Laissez faire leader ship & job related stress of employees. If the Laissez faire leader ship is  $x=0$ , the average employees' job related stress is to be 33.766. Further, Laissez faire leader ship is increased by one; the employees' job related stress will be decreased by 0.215. Therefore it can be said that there is a negative relationship between two variables. Laissez faire leader ship significance value is 0.633.

### RELATIONSHIPS BETWEEN TRANSFORMATIONAL LEADERSHIP STYLE & STRESS

Model	Un standardized Coefficients B	Sig.
(Constant)	51.630	.000
Idealized influence Attributes	.523	.405
Idealized influence behavior	-.527	.377
Charisma	-.524	.497
Inspirational motivation	.660	.348
Intellectual stimulation	-2.380	.001

The Idealized influence attributes regression equation  $y = 0.523x + 51.630$  exhibits that the relationship between Idealized influence attributes & job related stress of employees. If the Idealized influence attributes is  $x=0$ , the average employees' job related stress is to be 51.630. Further, Idealized influence attributes is increased by one; the employees' job related stress will be increased by 0.523. Therefore it can be said that there is a positive relationship between two variables. Idealized influence attributes significance value is 0.405.

The Idealized influence behavior regression equation  $y = -0.527x + 51.630$  exhibits that the relationship between Idealized influence behavior & job related stress of employees. If the Idealized influence behavior is  $x=0$ , the average employees' job related stress is to be 51.630. Further, Idealized influence behavior is increased by one; the employees' job related stress will be decreased by 0.527. Therefore it can be said that there is a negative relationship between two variables. Idealized influence behavior significance value is 0.377.

The Charisma regression equation  $y = -0.523x + 51.630$  exhibits that the relationship between Charisma & job related stress of employees. If the Charisma is  $x=0$ , the average employees' job related stress is to be 51.630. Further, charisma is increased by one; the employees' job related stress will be decreased by 0.523. Therefore it can be said that there is a negative relationship between two variables. Charisma significance value is 0.497.

The Inspirational motivation regression equation  $y = 0.660x + 51.630$  exhibits that the relationship between Inspirational motivation & job related stress of employees. If the Inspirational motivation is  $x=0$ , the average employees' job related stress is to be 51.630. Further, Inspirational motivation is increased by one; the employees' job related stress will be increased by 0.660. Therefore it can be said that there is a positive relationship between two variables. Inspirational motivation significance value is 0.348.

The Intellectual stimulation regression equation  $y = -2.380x + 51.630$  exhibits that the relationship between Intellectual stimulation & job related stress of employees. If the Intellectual stimulation is  $x=0$ , the average employees' job related stress is to be 51.630. Further, Intellectual stimulation is increased by one; the employees' job related stress will be decreased by 2.380. Therefore it can be said that there is a negative relationship between two variables. Intellectual stimulation significance value is 0.001.

## CONCLUSION

In this research it is found that there is a negative relationship between transformational leadership style and employees job related stress. While, there is a positive relationship between transactional leadership style and employees job related stress. Fair leadership style, promotion, reasonable pay system appropriate work itself and good working condition leads to low level of employees' job related stress. In other words, reducing employee's job related stress has positive impact on their performance

## SUGGESTIONS AND RECOMMENDATION

Even Though there are several factor affecting employees' job related stress, this research only consider two variables: Transformational leadership and Transactional leadership. Therefore in future conducting a research including all the leadership styles will be valuable. This research is bound to 100 samples only. More samples from different parts of Sri Lanka should be gained to attribute the results to whole population.

## SIGNIFICANCE OF MULTIMEDIA TUTORIAL ON LEARNING IN DISTANCE EDUCATION

**Raximova Gulchexra Obidjonovna\***

\*English teacher,  
 Uzbekistan state World Languages University,  
 Tashkent city, UZBEKISTAN

### ABSTRACT

*The purpose of the article is to learn the advantages of multimedia tutorial on learning in distance education programs. As we know, distance education is related to self-study and self-confidence on improving language skills. Also, in order to analyze the basic importance of multimedia tutorial, fifty graduate students were chosen as a sample for the research work. The researcher separated this sample into two groups, experimental group and control group. Both groups' students utilized traditional printed learning material of the university during their study. Despite this, the experimental group, along with print material, helped from multimedia tutorial of psychology in education. Results illustrated that students in the experimental group presented better than the students in the control group. The researcher knew that multimedia tutorial rose learning. This study suggested that multimedia tutorial techniques may be utilized face- to- face tutorial meeting between distance learners and teachers in distance learning programs to improve learning of students.*

**KEYWORDS:** *Multimedia Tutorial, Distance Education, Information And Communication Technologies, Synchronous And Asynchronous Delivery Methods, Conventional And Technical Devices*

### I. INTRODUCTION

Distance education is a teaching method that is based on informing students off-campus, at a distance and with a special, standard time-table. The distance education is an extremely wide learning period and covers all the conventional and technical devices to give more information about education to the masses. Distance education systems utilize correspondence, audio or

videotapes, or both, telecommunication and compressed video and audio systems for instructional goals [3].

The early distance education (DE) systems used print material for requirements and correspondence courses was the most ordinary delivery method of course material to learner that is interested in distance learning. Actually, at the present time, the DE systems utilize information and communication technologies (ICT) along with the above given method for instructional aim. The ICT consists of web based instruction, online (chat) communication, offline (e-mail) communication, video conferencing, and computer assisted instruction. The multimedia software available on CD-ROM has a great importance in labs, lectures, tutorial, and project works [15].

Koehler and Blair [8] have divided methods of distance education into two groups: Synchronous and Asynchronous delivery methods. In synchronous method, instructor and learners interact with each other in same time. A traditional classroom, two way closed circuit TV, and video conferencing are examples of synchronous methods of learning. Secondly, in Asynchronous method creation and delivery of instruction and the consumption of instruction occur at different times and usually at different places. Correspondence courses, audio video tapes, and courseware packages placed on CD-ROM or offered through a website are examples of asynchronous method of giving information on delivery. There are many popular universities in the world. Now, one of the most famous universities is the World languages university which is the largest one in Tashkent that challenges a diversity of distance learning degree programs at undergraduate and graduate levels. The university utilizes various devices to bring the gap between its teachers and students and to develop learning of. In AllamaIqbal Open University case, usually, method of instruction is print material which is sent to the learners through mail. Learning is also supported by TV/Radio programs and optional face to face meetings with the instructor. Besides these methods, OLIVE (open learning institute of virtual education) has been established since 2000. It has three models for delivery of instructions. In model A online assignment submission/checking, online special/guest lecture, and multimedia course streaming are provided. The second delivery model (model B) focuses on the students who have access to the internet. Internet based live sessions with teacher through OLIVE LMS is the main feature of this model. While in model C, students are provided self-learning multimedia courseware and reference material on CDs. Students can study material at home, office or any place of their choice. Moreover model B and model C can be combined to make a hybrid model for instruction delivery [15].

“Multimedia is defined as an interactive, computer mediated presentation that includes at least two of these elements Text, sound, still graphics images, motion graphics images and animation.” These tutorials consist of a user-friendly interface which provides control of navigation to learners [22]. Kruse and Kiel [9] has defined multimedia slightly different from that of Tannenbaum. They defined multimedia as CD-ROM. They say “CD-ROM provide a more engaging learning experience with text, audio, video, and animations all used to give information the set of multiple media means that learning is optimized.”

The generation of twenty first century has some distinct characteristics that set them apart from the previous generation. Technology has changed the lives of people of this generation. Most of the people of this generation have access to computers, video games, digital music players, video cams, cell phones, and all the other toys and tools of this digital age. This technology rich culture

has influenced the skills and interests of the people of the digital age. The students of this age are dependent on communication technologies for accessing information and for interacting with others [2].

Personal computers and laptops and other digital devices have changed today's learning style. Personal computers, laptops, cell phones, and other digital devices could be networked together. They are getting cheaper and are becoming smaller and more portable [4]. The use of this technology has created a new term of Ubiquitous Learning. Use of computer and internet in education is very common. It has generated many new terms like e-learning, online learning, Ubiquitous learning etc. Now it is possible to deliver computer based tutorial to a large number of students through systems distance learning [5]. Computer can be used to access information on CD- ROM, can be used to prepare material for teaching. It provides access to large amount of resources for teachers.

## II. METHODOLOGY

There are basic different learning methods in educational spheres by dividing into four groups. Each of them has got its own power, importance and limitations.

### a) VOICE

In this method the gap between the learner and teacher is formed by simple telephone calls, audio conferencing, audio tapes and audio CD-ROM

### b) VIDEO

Video tools with instructions include slides, films, video tape, and interactive video,

### c) DATA OR COMPUTER-BASED SYSTEMS.

Computer is a dynamic device which has more abilities of storing, processing, and communication of data, so the learner can use computer for chatting, blog, e-mail, or for watching video clips. The basic programs of Multimedia have a lot of good sides over traditional book version materials. Teaching with the help of computers results in active learning by interaction with computer based material, self-paced and individualized instruction, and presentation of multiple real time simulations [16].

Majority of teachers or scientists have been conducted research to determine effective sides of multimedia tutorials. One such research was conducted by Asan in Karadeniz Technical University, in Turkey in 2000-2001 [1]. In this research two groups of teachers were separately taught with traditional lecture method and multimedia. The results of the research work illustrated that the appropriate score in multimedia group was higher in terms of depth of comprehension, accuracy, rich supporting detail, organization, scope and reflection [1].

Advantages of the multimedia tutorials are concluded in the following points.

1. Allow self-paced instruction.
2. May incorporate text, graphics, video, and audio.
3. Allow high level of interactivity
4. Provide written record of discussion and instruction

5. Are cost effective
6. flexible in format and distribution
7. World wide access

The first and mostly utilized distance learning methods is print in. It is the cheapest source of communication used for correspondence courses. Print formats contain textbooks, study guides, workbooks.

Interactive multimedia learning is a new paradigm of learning. Multi-media tutorials deliver requirements to learners in a combination of several forms like, text, audio, video, animations and simulations. Multimedia express a computer based instruction which includes text, audio, moving pictures, and still pictures.

### **III. ANALYSIS AND RESULTS**

The computer mediated instruction is emerging as new way to add interactivity to the distance education. A lot of text as well as audio and video data can be stored on a CD-ROM. Students may utilize it in learning anywhere, any time. The multimedia software available and possible on CD-ROM has a great a role in labs, lectures, tutorial, and project works [13].

In this digital era teaching learning activities are now not limited to a class room. Technology has changed the lives of people of this generation. The people of this generation have access to computers, video games, digital music players, video cams, cell phones, and all the other toys and tools of this digital age. This technology rich culture has influenced the skills and interests of the people of the digital age. The students of this age most of the time use communication technologies for accessing information and for interacting with others. Desktop computers, laptops and other digital devices have changed today's learning style. Personal computers, laptops, cell phones, and other digital

Multimedia based instruction provides significant opportunities to improve the quality of teaching profoundly and cost effectively. There is 50% increase in the retention, a significant improvement in the learning rate, an increase in course completion, and a decrease in the overall cost of education [6]. Multimedia based education requires transformation of paper based contents to digital format. This new paradigm provides new learning environment. The conventional paper based contents may not fit to this environment. In the development of multimedia tutorial efforts are made to design and develop such contents for the new learning environment. For this paradigm shift transformation of education, especially distance education is necessary. The distance educational institutions (open universities) prepare interactive multimedia programs to overcome the shortcomings of the print material. Bork [2] suggested that natural way, to deliver multimedia tutorial, is through distance education. The tutorial can be used by distance learner anywhere and at any time. These tutorials motivate learners which is essential for successful distance teaching. In CD ROM a distant teacher can pack all the learning material (text, graphs, sound, videos, models and pictures), he wants to present learners for learning.

In AllamaIqbal Open University case, the usual method of instruction is print material which is sent to the learners through mail. Learning is also supported by TV/Radio programs and face to face meetings. Besides these methods, OLIVE (Open Learning Institute of Virtual Education)

has been established since 2001. It has three models for delivery of instructions. In model A - online assignment submission/checking, online special/guest lecture, and multimedia course streaming are provided. The second delivery model (model B) focuses on the students who have access to the internet. Internet based live sessions with teacher through OLIVE LMS is the main feature of this model. While in model C students are provided self-learning multimedia courseware and reference material on CDs. Students may study material at home. Moreover, model B and model C can be combined to make a hybrid model for instruction delivery [13].

It was an experimental research in which difference between two methods of instruction was studied. As  $n=60$   $n > 30$  ( $n$  is the size of experimental or control group) therefore for testing of hypothesis t-test was used. It has been stated in the proceeding section that the final examination held by the university was used as base. Therefore, grades in the examination were used as data which were collected from the controller of examinations AIOU and analyzed using Student's t-distribution.

#### IV.DISCUSSION

The role of ICT in education has been investigated by some organizations. According to a report of UNESCO [21] "A various computer-based technologies have been utilized including the distribution of sample lesson plans on CD-ROMS, setting up exchanges by computer conference between teachers' colleges, supporting the interactive usage of computer-based learning materials, encouraging the use of web-based materials, and using computer conferencing to encourage discussion among learners". Computer based instruction provide high-interest drill and practice programs to support learning, especially for students demanding skill remediation. Student evaluation is related that the new media of conferencing, e-mail, Web sites and electronic resources via library databases and the Internet are helpful in effective learning. An annual survey (conducted by UNECO) of different courses shows that Open University (OU) students in different faculties use these media in their courses. According to the survey findings [18]: over 40 per cent of their students rated such materials as very helpful. Science students, however, gave very low helpfulness ratings to audio CD, 60 per cent of language students rated audio CD as very useful, 40 per cent in health and social care, arts and education rated audio CD as very fruitful.

Computer based instruction supports crucial opportunities to enhance the teaching quality profoundly and cost efficiently. There is 50% increase in the retention, a significant improvement in the learning rate, an increase in course completion, and a decrease in the overall cost of education [7]. Some authors use the term e-learning which covers all forms of leaning in which computer is an essential component. Bandon Hall defines e-learning as instruction delivered electronically wholly by a web browser, through internet or intranet, or through CD-ROM or DVD multimedia platforms. When contents are delivered via CD-ROM or DVD it is referred to as computer based training. The use of WWW, CD-ROM, and computer based learning resources in the process of learning, anywhere, are various forms of e-learning.

The following beneficial ways of e-learning were defined by Choy in 2007:

1. Enhances learning
2. Improves engagement

3. Extends experiences in empowers the learner to take responsibility for scheduling and managing learning journey.

What is the role of multimedia tutorial in education and especially in distance education? Is its role effective? Before moving forward let's find answers to these questions. Multimedia tutorials have many advantages. While learning through multimedia students actively interact with learning material. It enables students to learn at their own pace. Individualized instructions and presentation of multiple real time simulations are the main features of these tutorials [10].

Multimedia programs have a great importance and efficacy in the process of learning. Teachers conducted a research to compare two methods of instructions, multimedia and lecture. The findings of the research related that average score in multimedia group was higher. They were better than the lecture group in depth of understanding, accuracy, rich supporting detail, organization, scope, and reflection.

Every Learning theory dictates some new changes in teaching/learning styles, situations, media, and methods. Developmental psychologists argue that important learning happens only in purposeful context and through active learning. Such type of learning is called situated learning. It is creation of an environment where students are actively participating in the exploration and analysis. Multimedia tutorial provide such environment where situated learning takes place [1].

Multimedia based instructions, like other teaching learning methods need support of a theory. Cognitive theory of multimedia learning supports and explains multimedia learning. According to this theory human information system consists of two separate channels, auditory channel and visual channel. Auditory channel is for the processing of auditory input and verbal representations. Visual channel is for the processing of visual input and pictorial representations. The theory further explains that the meaningful learning occurs after a cognitive process in auditory and visual channels. The cognitive process contains drawing attention to the presented material, organizing the presented material into a coherent structure, and integrating the presented material with existing knowledge [10]. After discussing the multimedia tutorial and its providing learning theory now let's discuss role of multimedia tutorial in distance education. Multimedia tutorial enhances effectiveness of distance education. It has the ability to be delivered to the distance students over a CD-ROM or a DVD, or through internet.

This study has used a post-test only control group design. Two groups (control group and experimental group) were formed. For an experimental study 30 numbers of subjects in each group is considered enough. However, in distance education usually the dropout rate is high and also by increasing size of a sample generalizability of a research can be increased.

## **V. CONCLUSION**

Computer based instruction (multimedia tutorial) techniques are more helpful than face to face tutorial. Performance of the students in the experimental group was better than the control group. The study recommended that the tutorial should be used as a supplement to the printed material in distance education. Multimedia tutorial techniques may be used along with face to face tutorial. To sum up, the main purposes of the article is to assess effectiveness of multimedia tutorial in learning and to explore the role of multimedia tutorial in distance education. The term distance education indicates that there is a distance between learner and teacher. In distance education a significant proportion of the teaching is conducted by someone removed in space

and/or time from the learner [20]. Distance education is a deliberate process and it consists of all types of formal instruction that are conducted when teachers and learners are not located at the same place [6]. Unlike learner of formal education distance learners use some means to overcome the distance between them and distant teacher. The face-to face meetings are used to overcome many of the flaws of print material. It provides a two-way real time interaction. But increase in face-to-face tutorial meetings may decrease the benefits of distance education. It also violates the principle of flexibility of distance education.

## DEVELOPING ENGLISH SPEAKING SKILL THROUGH ONLINE INTERACTIVE AND COMMUNICATIVE LESSONS

**Rasulova Dilnoza Boiskhanovna\***

\*English teacher,  
 Uzbekistan state World Languages University,  
 Tashkent city, UZBEKISTAN

### ABSTRACT

*The basic aim of this article is to enhance communicative English skill of secondary students that have difficulties on speaking. It is intended to address these questions: a) Are the employment of online communicative lessons helpful to develop learners' conversation skills compared to face-to-face classroom that is offline class with English speakers; b) Do we have any differences in the performance enhancements contributed with the help of the two learning approaches?; c) What learning approach improves the learners' communicative performance very well?; and d) What are the advantages and disadvantages of each learning approach in improving oral speech? There are 50 participants in this paper. They were basically sampled and classified into two groups: on learning through online conversation lessons and the other by classroom interaction with an English speaker. They were individually interviewed to evaluate and check their spoken English performance before the attitudes and after finishing the lessons. Video-recorded was done by students with their interviews and conversations practices for close analysis following Conversation Analysis (CA) principles and rated in the following peculiarities: accuracy, complexity, fluency, vocabulary, appropriacy, pronunciation, and grammar. The main tools of research employed in this work were spoken communication tasks for pre- and post-tests. The research findings based on statistical and CA analysis indicates that the students' oral English speaking remarkably enhanced by the usage of online lessons and interactive classroom with. The learners engaged in classroom interaction, however, became basically more fluent and had a broader variety of vocabulary than those learning through online conversations, even though their performance in pronunciation were similar. Thus, it was recommended that teachers utilize online lessons not as the sole language learning activity but as an addition to classroom interaction to focus on main speech features.*

**KEYWORDS:** *Online Communicative Lessons, Interactive Classroom, Speech Features, Oral English Performance, Conversation Skills*

---

## I. INTRODUCTION

This article is to compare the communication enhancement of learners using online communicative classes and those learning by offline interactive lessons, to make whether there are communication differences between learners learning speaking with the help of online lessons and those by face-to-face interaction with English speakers, and to discover how each learning approach can differently benefit learners' development of their conversation skills. The research questions are:

- 1) Are the employment of online communicative lessons helpful to develop learners' conversation skills compared to face-to-face classroom that is offline class with English speakers;
- 2) Do we have any differences in the performance enhancements contributed with the help of the two learning approaches? What learning approach improves the learners' communicative performance very well?;
- 3) Which aspect of the learners' communicative skill can be more useful strengthened by each approach?

English has long been utilized as a world language for global communication. Its importance as a global language has been even focused greatly particularly in the educational system. The Basic Education Core Curriculum B.E. 2551 (A.D. 2008) as a prominent for primary and secondary levels, which challenges learning English as a foreign language from Grades 1-11. The intention has been conducted on improving learners' good approaches and attitudes to learning the language and capability to effectively speak in English and use it as a medium for life-long autonomous learning (Ministry of Education, 2008).

Paying no attention of the level of learners, the purpose is to make them to share opinions, ideas, involve in English speaking on different themes, and find information significant for the choices of higher studies and future career. According to the current curriculum, young learners especially at the lower secondary level are expected to be aware and know 2,100 to 2,250 words and can speak about daily topics such as oneself and family, environment, food and drink, health, weather and climate (Ministry of Education, 2008). Nevertheless, according to Prapphal (2003), even though Thai students learn English from primary or even kindergarten level, many still fail to utilize the language with confidence in real-world speech events or when required to talk about everyday topics. Regardless of the established curriculum, it is apparently insufficient for second language learners to spend only a few hours a week learning English in classes that basically intention very little on conversation (Brooks, 2009; Wei & Zhou, 2002). Outside the classroom they also have no chances to interact in English and failure to persist the speech act (SalmaniNodoushan, 2014). Actually, these hindrances can be overcome if we as teachers attempt hard not only to create classroom environments which attract them in more intense English communicative activities, but also to motivate them to use in autonomous learning afterwards. Fujii (2012) noted that as teachers permit students to express their ideas with one another and possibly generate some new vocabulary words, the adaptation to features of natural

conversation will follow and can be strengthened addition as the learners are inspired to take duty for their language learning by attracting in after-class tasks of their choice (Nunan, 1996).

Apart from developing classroom spoken interaction, learners are therefore inspired to get positive features of bountiful computer-mediated language learning (CMLL) materials. Through the Internet learners of different groups can access a wide range of target web-based English learning materials with much ease. The availability of online resources has made language practice even more comfortable basically for EFL learners, most of whom have stopped chance to take exposed to English outside the classroom. Nowadays, a lot of websites give online English conversation lessons, giving the learners the chance to enhance their speaking skills in appropriate way, at their fingertips. Factually, there are many various websites supporting English speaking classes for EFL learners' self-study free of charge.

According to Barrs (2012), computer-mediated language lessons can actually complement offline classroom-based learning. While face-to-face learning of EFL learners remains mostly in the classroom setting and relies much on teachers' instruction, online learning can be done particularly from inside and outside the classroom through available technology applications and language training websites with little reliance on teachers. Mayer (2003) suggests that CMLL can in fact facilitate learners in developing vocabulary skills better than face-to-face learning. Audiovisual texts supported online would allow for recurring practice and assist accurate learners' misconception of the target language whereas in face-to-face teaching the learners are often deprived of such opportunity and have to draw attention to teachers.

As the goals of interaction in second language classrooms have been shifted from solely improving students' correct production of linguistic forms to containing the active production of meaningful speech with the goal of improving their L2 fluency, it becomes especially significant for teachers to comprehend the organization of the learners' speech and learning experiences in the classroom. Conversation analysis (CA), as theorized and practiced by Harvey Sacks and Emanuel Schegloff, has particularly started to have a great significance in an L2 classroom as it challenges useful devices for recording and transcribing the nature of talk in interaction (Seedhouse, 2004). CA is the study of recorded, naturally occurring talk-in-interaction to discover how participants understand and respond to one another in their turns at talk, with a central emphasize on how sequences of action are generated. Thus, CA popular focuses enabling teachers to recognize the patterns of communication that develop and maintain second language classroom interactions and provide learners to complete their conversation in the interactions. The language teaching material design of CA in particular shows dialogues in audio or video clips together with transcription permitting learners to experience their authenticity while learning linguistic expressions (Wong 2002 cited in Seedhouse 2004: 228). With the application of CA, teachers can also select authentic online speaking classes to suite learners' needs in an appropriate and make the best usage of bountiful online resources as additional learning materials for learners' autonomous learning. Given the many of online language learning resources at present, there has however been a dearth of studies particularly evaluating their efficiency, specifically in facilitating learners' improvement of conversation skills, compared to traditional face-to-face classroom-based teaching. Therefore, this study is intended to determine whether the employment of online conversation lessons can really be helpful to improve learners' speaking skills compared to face-to-face classroom interactions with English speakers, and in

what ways, if it can. It also tries to unveil how each learning approach can lend itself to the improvement in different aspects of the learners' communicative skills.

## II. METHODS

The participants of this study were fifty class 8 students from Rajchaprachanukroh 43 Songkhla province school under the Bureau of Special Education, Office of the Basic Education Commission. They were taking English as a core course of a foreign language demanded for secondary level students. The ages of students ranged from 13-15. They were selected by the purposive sampling method for the quasi-experimental treatment. The students were divided into two groups of twenty-five. One group was assigned to learn speaking through face-to-face interaction with English speakers and the other via online conversation lessons.

In educational process, instruments have a great role to conduct the class with interactive methods, techniques and approaches that are really important for students. The instruments utilized in this paper were lesson plans and oral speaking tasks. There were 6 lesson plan prepared by the researcher. Each lesson plan had duration of 150 minutes including the topic of introducing oneself and others, interview, food and family. The oral speaking exercises and tasks were pre-test and post-test. In the pre-test conversation, the participants were asked about their personal information and the conversations were recorded for subsequent assessment. After the treatment students were involved in post-test to see individual improvement.

The data was collected from the fifty student samples. In the beginning, the pre-test was conducted as all of the students were asked to converse with an English speaker to determine their conversation performance. The performance was assessed by the English speaker and videotaped for subsequent scoring by the researcher in the following features: frequency (speech flow), vocabulary (use of words and accuracy), appropriacy (turn responding), pronunciation (segmental sounds), grammar (range of structures used). The scoring rubric had been adapted from Barraja-Rohan (2011), O'Loughlin (2001), Luoma (2004), and Tsang & Wong (2002) (See Appendix). After the pre-test conversation, the students were engaged in weekly conversation lessons on the following topics: introduction and leave taking, likes and dislikes, family, and community. The training was take place three hours a week over the course of four consecutive weeks. One group of students was practice English conversation online in a computer lab with guide books containing specific instructions, conversation scripts, and exercises prepared by the researcher. At the beginning of the first session, the researcher as teacher was oriented them towards the training goal. The teacher was available during their practice only to help them with technical problems, allowing them to maneuver freely through the lesson until they master the target conversation. The students in the other group learnt conversation on the same topics through classroom face-to-face interaction with an English speaker and they were provided only with the scripts and exercises.

There were 6 lessons prepared by the researcher for both groups. In week 5, after the students complete their training, they were engaged in a post-test conversation with the same English speaker as in the pre-test. The test was measured by the English speaker and videotaped by the researcher. The score was analyzed by the two raters through the use of the same rubric, as in the pre-test. The videotaped conversations from both, the pre- and the post-test interviews were recorded and transcribed for subsequent comparative analysis. The comparative analysis threw

light on the strong and weak areas of the students and difficulties they faced during these sessions.

### III. ANALYSIS AND RESULTS

Learners' performance improvement via online conversation lessons and classroom interaction with English speakers. The videotaped oral interactive activities and the pre- and post-tests scores obtained from face-to-face interactions between participants later showed that classroom interaction learners have developed the participants' oral speaking over participants who had engaged in online lessons. However, both groups of learners have improved their oral performance.

As shown in Table 1, regarding the first research question which compared the enhancement of classroom interaction with English speaker and online communicative classes, the results analyzed by the t-test showed that both groups have same score from the pre-test which showed that the students have the same proficiency of English speaking skills.

**TABLE1 COMPARISON BETWEEN THE PRE-TEST OF GROUP 1 LEARNERS WHO PARTICIPATED IN CLASSROOM INTERACTION AND GROUP 2 PARTICIPANTS IN ONLINE CONVERSATION LESSONS**

Features	GROUP				t	df	Sig. (2-tailed)
	1 (n=25)		2 (n=25)				
	Mean	SD.	Mean	SD.			
Fluency	1.20	0.41	1.16	0.37	0.36	48	0.72
Vocabulary	1.16	0.37	1.24	0.44	-0.70	48	0.49
Appropriacy	1.24	0.44	1.24	0.44	0.00	48	1.00
Pronunciation	1.56	0.58	1.52	0.71	0.22	48	0.83
Grammar	1.08	0.28	1.16	0.37	-0.86	48	0.39
Total 25	6.24	1.64	6.32	2.15	-0.15	48	0.88
Total 100	24.96	6.56	25.28	8.62	-0.15	48	0.88

After the treatment the students who were assigned classroom interaction performed better in all speech features except in pronunciation where both groups were equal (2.32 for Group1 and 2.36 for Group2). However, there was only frequency that sig. at 0.05 (0.02) which indicated the differences in the classroom interaction, which has developed more than the learners who attained online conversation lessons.

However, indicated by the pre- and post-test score differences, the degree of improvement varied among the features; fluency appeared to be the most improved, whereas pronunciation appropriacy of turn responding, grammar and vocabulary were readily developed through face-to-face interaction with English speakers. Segalowitz & Freed (2004) suggested that for young learners, the fluency or speech flow is easier to improve and the more frequently learners occupied in meaningful conversation practice, the better their language performance and interaction will become.

#### **IV. DISCUSSION**

As we know, there are basic ways of improving speaking skill through online classes. However, online lessons can enhance self-education skill of students at the same time. Also, students can learn all types of competences by online classes. The most used and significant competence is Communicative one. The term “Communicative Competence” has been developed for many years. Hymes, (1972) stated that communicative competence is the ability to use language or interpreted language correctly in the process of interaction with the social environment such as the use of language in the proper regulation of social practices.

Moreover, Canale and Swain, (1980) and Celce-Murcia, (2007) also support Hymes’ idea that communicative competence is the ability to use language correctly, appropriate to situations and express suitable behavior in cultural context of communication. Therefore, communicative competence in this present study refer to the ability to use English language and interpreted language correctly and appropriate to situations and express suitable behavior in cultural context of communication. After reviewing many researches about component of communicative competence, it can conclude component of communicative competence as this following table.

#### **V. CONCLUSION**

This article is based on the enhancement of classroom interaction with English speaker and online communicative lessons to improve oral communication by the assessment of rubric, including five distinct features; namely, fluency, vocabulary, appropriacy, pronunciation, and grammar. The result of this work concludes that the online conversation lessons and classroom interaction with English speakers were flexible and practical styles to use, for the aim of improving good speaking skill. A teacher and learners can better use it by the application and sharing of real life experiences and situations within a healthy learning atmosphere. Thus, the roles of a teacher is a facilitator and a lider, inspiring learners with the help of linguistic interaction with others and using technology as an aid of educational and language learning activities as it permits for a lot of of chances and good environment to speakin the target language. Additional studies examining the online speaking classes and classroom interaction, should consider learners with various levels of proficiency and close-supervised training may be necessary for specific group of students. The rubric utilized for assessment in student’s communication should be made more suitable to naturally occurring conversations.

## DEVELOPING STUDENTS' UNDERSTANDING ON THE USAGE OF BLOG IN LINGUISTICS COURSE

**Aliyeva Dilorom Kholmatovna\***

\*English Teacher,  
 Uzbekistan state World Languages University,  
 Tashkent city, UZBEKISTAN

### ABSTRACT

*The basic aim of this article is to analyze the notion of students' blog use in a Linguistics course that is extremely important in an English Language Teaching program at universities. A lot of students participated in this course. The students were asked to answer to different blog questions on the linguistics lectures over the course of a term. They were also involved to share their answers and opinions with one another. The lectures related topics such as language acquisition, bilingualism and sociolinguistics. In the end of the term, the researcher regulated several tasks consisting of several questions about the usage of the blog and its contribution to their learning. The results of the study showed that the usage of the blog helped the students with their self-learning process and learning others' ideas, notions, helped them express themselves better than in class as well as understand the linguistic topics better.*

**KEYWORDS:** *Blog; Evaluation, Linguistics, Teaching And Learning, Self-Learning Process, Technologies, Cooperative Learning, Linguistic Course*

### I. INTRODUCTION

At present, the usage of Web 2.0 technologies, such as wiki, blog, podcast, instant messenger, online social communities (eg., Facebook), online video sharing (eg., YouTube), and online video and audio conferencing tools and their effect on teaching and learning have become one of the most investigated topics. This work checks the effective sides of using blogs on the learning of a different of topics in a college level Linguistics course. Blogs are defined as "personal or organizational web pages organized by dated entries, with newer items posted to the top of the site, usually consisting of links, media, ideas, perceptions, commentaries, personal thoughts, essays, papers and ongoing discussions" (Blood 2003, p.12). The efficiency of utilizing blogs for educational aims has been investigated and used by many researchers from various perspectives

(Armstrong et al., 2004; Boling, et al., 2008; Chan & Ridgway, 2003; Downes, 2004; Edbauer et al., 2005; Glass & Spiegelman, 2008; Glogoff, 2005; Haramiak, Boulton, & Irwin, 2009; Kajder & Bull, 2004; Martindale & Wiley, 2005; Quible, 2005; Ray, 2006; Wassell & Crouch, 2008). The studies presented that instructors who used blogs in their courses could support students with different kinds of activities that engaged students in discussions and give feedback to students regarding their comments. Through the usage of blogs, instructors also helped students expand their knowledge of a variety of topics, inspired them to focus deeply on the information that they acquired and write on their peers' blogs.

In addition, the studies also found that blogs enhanced literacy and motivated social and peer interaction. What makes blogs different from traditional classrooms is that blog users have more chances to present on each other's opinions and engage in discussions. One of the reasons that this study was conducted was to determine whether blogging would have a positive effect on the students' participation in discussions. Students in the present study, due to their low English proficiency levels, usually feel embarrassed or intimidated when they have to speak up in the classroom and this prevents them from expressing themselves. In addition, the fact that Linguistics involves many unfamiliar terms and concepts adds a new difficulty. It was hoped that blogging would motivate students to express themselves more frequently about the problems raised in class. In addition, a significant factor related to students' participation in the blog has to do with time. Since the students in the present study are not very fluent English speakers, they cannot express themselves in the classroom discussions and share their opinions with their classmates in a very short time. However, blogging can give students the opportunity to take sufficient time to reflect on others' opinions as much as they need to and also respond to them. Further, blogging is also perceived as an activity that can play an important role in improving writing. Through expressing themselves by the use of blogs, students can improve their writing skills. Some courses do not demand students to do much writing in the classroom and therefore, blogging can be an effective tool for students to express their views and thoughts in writing.

The main aim of the authors is to check the hypothesis that using a course blog develops and improves the quality of learning. It is expected that students will communicate with each other to discuss certain topics raised in class. The following section presents a brief review of the literature followed by the methodology used for the present study. Then the data analysis and results are reported and finally a general discussion is provided.

Cooperative learning (Slavin, 1996) suggests that motivation is maintained by social ties formed in collaborative or individual works, but shared works and blogs are also ideal for publishing material for critical feedback and seeing examples of others' work. Blogs offer a chance for students to reflect, rewrite, comment and perfect their work which do not exist or take too much time in class. Further, the chance to learn individually via blogs gives students an online personality where they can criticize others' work and communicate with other online communities for the advancement of their writing skills. Most tacit knowledge is gained through participation in such communities and emancipation of learners in this kind of media forms the basis of learning. Moreover, blogs do not restrict curricula. When the process of blogging is considered, most of the content of the blogs are prepared by students and thus it is the learner's choice to seek and find what to learn either through reading or writing. However, in order for blogs to be effective like any other self/collaborative learning environment, they must be built with guidance and structure, otherwise they will be nothing more than archives. For example,

excessive time spent on blogging activities caused lack of motivation among language learners to use and challenge in blogging activities. Thus, it is really significant that instructors train learners regarding writing critical feedback and give information them that blogs are more about substantiality, fluency and expression rather than accuracy.

The advantages of blogs on the teaching and learning process was examined from different perspectives. In Fessakis et al. (2008), when learners were asked to form an artefact together by using a blog, they stated that the online zone gave them chances that they could not otherwise utilize in class environment in such depth. The authors also focused the significance of communication and controlling but saw the absence of a notification system in blog as a bad side since some posted questions were left unanswered. The authors thought a study with higher number of participants and developed time for analyzing the usage of blogs because they thought that it would increase participation, especially if there is a larger body of material and different ideas. In another study, Park et al. (2011) found that blogging can be used to gather knowledge and information, express opinions, views and become more active in certain areas of interest. In the study, learners perceived blogging mostly as an acquisition and reflection oriented process. The majority of them also thought that blogging changed their personal ways of thinking and social relationships and helped them increase themselves. Further, they also gave information that blogs helped them deal with information differently. In Fessakis et al. (2008) participants reported that they could spend less time on tasks, monitor the work of others and directly communicate with one another by the help of blogs. They also expressed satisfactory learning outcomes, feelings of collaboration, and responsibility. Avcı and Aşkar (2011) compared factors that affect blogs and wikis as constructive tools in computer courses. The results presented that perceived useless was the highest determinant factor in using blogs in the teaching-learning process. In addition, blogs made it easier to access and reflect on information, inspired peer and social interaction and ensured feedback and equal access to information. Similar results were obtained from Yang (2009).

## II. METHODOLOGY

The aim of the study was to investigate the perceptions of the learners about the usage of the blog, more specifically, whether blogs would help them comprehend content better and as well as express themselves better than they do in class sessions. Participants were 2nd year students enrolled in three sections of a Linguistics course. Linguistics course is a required course which is taught over two semesters. The curriculum emphasized on core areas such as syntax, semantics, and phonetics in the Fall term and first and second language acquisition, bilingualism and sociolinguistics in the second term. The study was conducted over the Spring term. All three sections were taught by the same instructor. The sections met once a week for three hours. There were approximately 50 students in each section and students were predominantly female. Students were between the ages of 18 and 20. Convenience sampling was used in the study. Seventy-one second-year students (52 females, 16 males, 3 students did not report their gender) volunteered to participate in the study.

First, the researchers created a blog for use as a discussion forum for students. Then during the semester, they asked the students to answer to several blog questions about the linguistics lectures. The lectures used topics such as language acquisition, bilingualism and sociolinguistics. The course was conducted over a 10-week period. Students were required to focus upon the issues each week and post their views on the questions; as well as post comments on their

---

friends' answers. They were also motivated to debate their responses with each other. Students were given a choice on whether to be anonymous or identified when blogging. In addition, the participation in the study was voluntary. The effect for this is that students using blogs as part of the fulfillment of their courses did not necessarily present enthusiasm in personalizing or maintaining their blogs (Williams & Jacobs 2004). In addition, according to Instone (2005), Kuzu (2007), and Salen (2007), students saw blogging as a waste of time activity and they used it because it was required to pass the course.

At the end of the term, the researchers administered a questionnaire including of 16 statements about the usage of the blog and its contribution to students' learning. The questionnaire was adapted from Yoo and Huang (2011) and used a 5-point Likert scale in terms of 1 (strongly disagree), 2 (disagree), 3 (neutral), 4 (agree), and 5 (strongly agree). While the questionnaire items used themes such as collaborative learning, self-directed learning, online identity, writing skills and treatment to technology usage, the main aim was to investigate the benefits of using the blog in learning. It was expected that the students would write more critically and carefully since the blog was public and they would be evaluated by their friends and others as compared to writing in the classroom. Since the study is limited to the students taking the Linguistics course, it is a case study in a quantitative paradigm.

### III. ANALYSIS AND RESULTS

Several researchers compared formal learning in classrooms and informal learning through the use of blogs to determine the effectiveness of blogging. Heo et al. (2012) investigated the effects of blogging on informal learning. According to the authors, blogs have the potential for informal learning because of the flexibility that allow people to learn with encouragement from their instructors. The authors defined learning in three dimensions (see figure below) which also apply to learning with blogs. For example, through the use of blogs learners can make self-reflection and meaning-making through writing and reading one another's comments. In addition, there is social interaction that does not often happen in a traditional class.

Figure taken from Heo et al. (2013, p.142)

Novakovic et al. (2013) conducted a study to determine the differences between traditional writing methods and using social media in terms of learning benefits. The authors found that feedback played a crucial role on developed engagement and time spent on tasks. In another

study, Park et al. (2011) analyzed the differences between informal learning with blogs and formal learning in school. As it can be seen from the table below, learning through blogs cannot be limited or restricted. While it may not be useful to give learners such freedom, learning in schools can be formed to have more independence or interdependence on other learners. The authors think that it is best to keep a concrete degree of freedom through projects while offering proper topics for homework and such. At least some parts of the lessons should be voluntarily based or there should be more choices for assessment. The idea of self-regulation and self-determination in learning should be the ultimate goal of education so that learners can make their own decisions and become autonomous in their learning, which can take the boredom out of learning.

Table 6. Difference of characteristics between informal learning through blogging and formal education at schools

Themes	Learning through blogging	Learning in school
Learner's role	Self-directed Self-meaning making Self-motivated Active Voluntary	Passive Non voluntary
Characteristics of learning contents	Practical and tacit knowledge Social and everyday life Situating Subjective Unlimited Multiple directions	Theoretical knowledge Structured and organized Curriculum-based Disciplinary Non-practical Fixed
Learning process	Self-regulated Open Flexible Process-oriented	Guided Structured and organized Fixed Outcome-oriented

Figure taken from Park et al (2011, p.158)

Researchers also paid attention to the role of anonymity in the usage of blogs and found that students present themselves better when they are anonymous. In a study conducted by Lu and Bol (2007), the effect of identifiable and anonymous comments given by 92 undergraduate students in general English writing classes in college are compared in an e-mode. Students were randomly classified into identifiable and anonymous groups and met for regular classes in separate way. The results showed that the students in the anonymity group was better than the identifiable group with respect to their writing and giving more critical peer feedback. In addition, anonymity in a writing course increased student participation (Miyazoe et al., 2011) as well as made it possible for students to make critical reflections with the guidance of teachers (Yang, 2009). However, instructors and students have to get more information about the fact that anonymity may lead to irresponsibility (Miyazoe & Anderson, 2011).

#### IV. DISCUSSION

This paper is intended to give basic information on the learning advantages of utilizing blogs in a Linguistics course. Although the study is conducted in the context of a special course with students only, the findings, nevertheless, let us to support different tentative insights of students' notions of the learning incomes of blogging. In examining the useful sides of blogging, the most of participants gave the main information and positive opinions about their own experiences as bloggers, and reported that using a blog made it easier for them to learn about the Linguistics

subjects, enhance their internet skills, finish their assignments quickly, and learn on their own. They also considered that blogging developed their motivation to learn about the Linguistics subjects. It is crucial to acknowledge that students of today are equipped with the essential skills to search for and exchange information on various platforms and already have motivation to do so. That is why, the result that students showed positive thoughts to utilizing the blog is expected. It can also be said that 'time' may have played a great importance on the good ideas and suggestions of the students to using the blog. Since the students in the present study are not very good, experienced English speakers, they cannot show themselves in the classroom discussions and share their opinions with their classmates in a very short time. However, blogging can give students the chance to take enough time to reflect on others' thoughts as much as they have to and also answer to them.

More significantly, 45 % of the participants agreed with the fact that they showed themselves better when blogging than they presented themselves in the classroom. As given in section 1, participants in the present study feel very anxious when they have to participate in the discussions that take place in the classroom. Most of the time they do not speak up for fear of being embarrassed due to their limited English language proficiency and their unfamiliarity with the Linguistic terms. For this reason, students agreed with the fact that blogging was an activity for them to express their thoughts and opinions freely without any fear or embarrassment. In addition, as mentioned in section 1, blogging is also perceived as an activity that can play an important role in improving writing. Through expressing themselves by the use of blogs, students can enhance their writing skills. The Linguistics course does not require students to do much writing in the classroom and therefore, blogging can be a useful device for students to give their view points and understandings in writing. In addition, the quality of students' entries gets better as they utilize blogs. According to Fernheimer and Nelson (2005) when students use blogs, they make their blogs their own and thus are more likely to write entries that are good opinion and idea.

The findings of this study shows that using blogs as part of a course assisted students learn the subject-matter more efficiently and played an important role in encouraging students to learn from one another as well as from other resources. In addition, the students acknowledged that blogging changed their learning process in a positive way. Therefore, it is important that instructors understand the potential effects of blogging and efficiently integrate it in their own courses. Glogoff (2005) suggests a number of ways in which blogging can be used in classrooms. Blogging, for instance, can be used in a knowledge-centered instructional environment where the instructor involves students in research activities and engages them in discussions to help them learn the necessary knowledge that the subject-matter requires. Learner-centered blogging is another efficient way which emphasizes the importance of giving positive feedback to students and making comments about their work. Moreover, blogging can be used as a receptive learning tool through which students can acquire, reflect and assess information. They can also be used as a directive learning tool by which students can have equal access to information, and other additional materials which can widen their knowledge about a certain subject.

Finally, blogs can be helpful devices to motivate guided discovery and knowledge construction. For example, after students do research about a given subject, they can connect with other students to form knowledge and prepare a common report together. Given the fact that there can

be different methods concerning the ways blogs can be used in the classrooms, students' learning styles should also be taken into consideration (Lin, et al., 2013). Given the fact that students of today are highly dependent on the Internet and getting sophisticated each day at searching for and exchanging information, educators should acknowledge the good sides of blogging in learning and inspiring students to utilize blogs in their classrooms to increase learning.

## V. CONCLUSION

To sum up, the findings of the study reveal that using a course blog can have a positive effect on the learning outcomes and suggest that instructors incorporate blogs into their classes to give opportunities for students to learn the subject matter. When the appropriate pedagogical approach is used, blogs can enhance the quality of learning. The results indicated that students' notion of blogging is consistent with those discussed in existing literature (Novakovich and Long, 2013; Avcı and Askar 2012; Park, MiHeo and Lee 2011; Yang, 2009; Huang, Jeng and Huang, 2009). The present study is not without its limitations. Future research can address a few areas.

First of all, this work contains learners. Additional studies should focus on various cultural groups of students and their learning experiences with blogs as cultural differences may go with various understandings and ideas about the usage of blogs. For instance, Yoo and Wen-hao (2011) compared the use and acceptance of Web 2.0 applications between American and Korean college students. The authors found that although Korean students indicated good relations and attitudes towards using blogs, they had high anxiety levels. American students, on the other hand, were more likely to participate in online social communities such as Facebook than using Web 2.0 applications, such as social virtual environment tools.

Second, a further study could also encourage students to continue their communication using blogs with the same group students and investigate their learning experiences; thus continuing the 'community of learners' (Park, Gyeong, & Romee, 2011). "Blogging is a significant factor in making informal learning more enriching and completing for adults. Adults learn more significantly if learning can be self-directed, practical, and reflection-oriented" (Park, Gyeong, & Romee, 2011, p.159).

### ABSTRACT

*One of the pressing issues of modern social and political life and social and humanitarian sciences are the problems of building a civil society. Today, in the Republic of Uzbekistan, interest in this problem and issues of political education has significantly increased. Uzbekistan pays special attention to political education issues, based on the ultimate goal of creative development - building a civil society.*

**KEYWORDS:** *Legal Education, Civil Society, Rule Of Law, Legal Consciousness, Law, Democracy, Legal Entity.*

### INTRODUCTION

As you know, most of the emerging states are set by the strategic goal of building a civil society. Since the rule of law as a legal form of organization and functioning of public political power is an institution of civil society, this goal is not feasible without an appropriate legal culture and legal education.

### MATERIAL AND METHODS

In connection with the research, the article used methods such as historical and methods of comparative analysis.

## Results

What should be understood by legal education? This issue, it seems, requires a special and multi-stage study, since the approach to the management of the educational process depends on its solution.

Preliminary legal upbringing can be defined as the state in which a person is at every given moment, and therefore at the time of making a decision about how to act in certain circumstances. This, of course, is the state of his legal consciousness, and the level of legal culture, and, consequently, his readiness for lawful or illegal behavior. "A person's life is determined by objective economic and social factors, but one should not forget about subjective circumstances, about socio-psychological factors, because both positive and unfavorable social conditions do not fatally affect a person. Their impact goes through their minds. Previous social experience and behavioral skills affect his subsequent actions and are manifested in other life conditions. Purely personal traits are also of great importance" [1.63]

In the sociological aspect, a person is a set of social relations. These relations, although they are stable in type, but at the same time are absolutely changeable, they are in a constant process, like the individual himself. Therefore, the subject of law is the totality of all relations that influenced his consciousness, character, habits, aspiration, and will. And what is he and his actions: legitimate or illegal (under certain conditions). At the same time, the actions of the subject of law form him - such is the dialectic.

The question may arise whether the state of legal education does not coincide with the legal attitude of the individual, if the attitude is an integral state of the subject preceding the manifestation of his activity; attitude is the synthesizing principle of many personality traits, including relationships. It seems that the legal attitude is a kind of result of legal education, concentrated in the form of a specific program of behavior in certain conditions, a program formed from all the legal (and illegal) knowledge, assessments, opinions, attitudes, habits, habits, aspirations, attitudes towards which - or something that passes into interests and aspirations. Interests can merge or compete, which inevitably affects the state of readiness for lawful or illegal behavior.

In our opinion, the level of legal education is not only knowledge and understanding of the need to comply with legal regulations. It is determined by the degree of formation of the attitude towards the law as a value that is beyond competition in a democratic society.

One of the sources of internal struggle is the interpretation, mastering by the subject of external circumstances that are significant for him, and sometimes are of a certain value. What value the subject of law prefers, what interest will be the "winner", whether the legal mechanism for suppressing the unlawful motivation will work - all this will be a manifestation of the legal education of the subject. In this regard, we can say that legal education is the soil from which the grain of the attitude grows into an act. That is, we can say with conviction that legal education is directly related to the spiritual world and social environment.

Thus, legal education can be defined as the state of any subject of law, which is constantly changing, so it cannot be characterized exactly the same way twice, "just as you cannot enter the same river twice." Undesirable stages in the development of a subject can be a low level of legal education and even legal bad manners, which also has a different degree. The problem of legal

education is complex and multifaceted. For this reason, legal science pays a lot of attention to finding ways and preventing and overcoming such conditions of subjects of law.

An irrefutable fact is that the surrounding social environment directly affects the formation of a person. Oftentimes, many relationships develop unexpectedly and can be unfavorable.

Legal education, deliberately organized by society, is obliged to prevent the harm that in some cases is caused by accident or deliberately. In the social system of upbringing, disregard for humanistic principles and violation of the relevant requirements of the law under the guidance of an educator, entails the acquisition of the skills of selfishness and delinquency. Human energy through regulation can be directed both to creation and to violation of the law.

The subject of law, who has a sense of justice, measures his own dissatisfaction with his dignity and self-sacrifice. At the same time, he finds an acceptable way for others to achieve the desired - often high - result or get something that is of value to him. Desires and aspirations to take possession of the value by means of aggression, slander and injustice certainly pose a danger to society.

In the context of social transformations, a necessary requirement is to change not only the rational attitude, but also the mood, building feelings. Accordingly, in the process of legal education, it is advisable to focus efforts not only and not so much on increasing the legal awareness of the subjects of law, but on trying to penetrate into the inner world of a person, to try to understand the merits and mistakes introduced by education and manifested in illegal behavior. Of course, this will allow us to analyze the flaws that are allowed in social practice and scientifically approach these solutions.

In our opinion, legal education cannot be perceived in a narrow understanding, limited to legal education. It is necessary to understand that legal education is a multifaceted phenomenon, taking into account the influence on the subject of law of the entire complex of social conditions, the entire objective basis of legal education. Only by recognizing and realizing the importance of the influence of objectively existing factors, can one consider effective and purposeful activity on legal education.

The delimitation of the educational process - be it political, moral, aesthetic, labor, etc. - has a conditional meaning. All areas of the educational process are interconnected. Not taking into account this universal interconnection means leaving uncontrollable elements, sometimes dark ones, of behavior, relationships, actions interwoven into the social environment surrounding each subject. The inner world of a person is to a certain extent a reflection of the surrounding spiritual atmosphere, which also needs purity and care. Accordingly, this social environment should have a certain level of spiritual culture.

The upbringing of the inner spiritual sphere is carried out to a greater extent by means of influence from the outside: providing a favorable atmosphere with the help of a different level of communication, purposeful adjustment in finding ways to overcome internal obstacles, to cause the desired and necessary self-movement - self-restructuring of the personality, without which the legal educational efforts from the outside will perish, without reaching the goal.

## DISCUSSION

An important point in the legal educational process is taking into account the needs, which is characteristic of both the subject and the human society as a whole.

The questions of needs are studied by many sciences. The theory of legal education is interested in the problem of needs from the point of view of sociology and psychology, since among the carriers of needs, legal educational activity selects only subjects of law, from social groups to an individual. Based on the need for humanization and practical goals, it is important to note that the needs of social actors must be taken into account and cannot be ignored, since legal education is designed to provide behavior consistent with the needs, interests and values of a humane society, which must be embodied in the legal system. At the same time, in order to ensure an expedient legal regulation that creates the true prerequisites for orderly social relations, it is necessary to take into account many phenomena associated with the life of society.

It should be noted that the very attitude of a person to legal institutions can be moral or nihilistic. "Law is weak without morals" so they said in ancient Rome. In our opinion, for re-education it is necessary to develop the ability to penetrate into the inner world of a person, to influence his feelings, moods, and his spiritual world as a whole. This will enable the development of the legal sense, deliberately organizing a cumulative process, which will help to strengthen the legal sense. Legal education requires special attention to the development of legal feelings, and this is possible only on the basis of and in conjunction with other high social feelings.

## CONCLUSION

So, in order to get a real result, it takes a lot. It must be recognized that legal education is a comprehensive, long-term social process. And of course, all citizens participate in this process in various capacities, both as educators and as educated. The state of legal education should be planned as a strategy, revitalization, attraction of the positive from all spheres of social reality.

## Acknowledgement

We would especially like to express my gratitude to my friend, Candidate of Philosophical Sciences, Associate Professor Djurayev Avaz Akhmedjanovich for valuable advice in planning the research and recommendations for the design of the article. I would also like to express my gratitude to the translator Djurayeva Nigora Avazovna, who assisted in preparing the manuscript before sending it to the editorial office. The authors are grateful to their families and colleagues for friendly support and to all those who made their work easier and helped them to achieve success!

 UZBEKISTAN

### ABSTRACT

*The article examines the causes and factors of the emergence of contradictions, the wide spread of contradictions in society, contradiction-conflict-collision, views on the main and minor conflicts. Moreover, if there are no conflicts in the family, at work or in the state, it means that this is where the growth and development of a peaceful life stops. Therefore, it is necessary to study these contradictions and try to eliminate them when they occur, and to try not to have a negative impact on the development of our lives.*

**KEYWORDS:** *Opposites, Spiritual Opposites, Social Contradictions, Struggle, Relations, Internal And External Contradictionsp*

### INTRODUCTION

It is clear that any social conflict in the world will affect the fate of millions of people. This shows that social conflict plays an important role in the life of the individual, society and humanity in general. The present period shows the need to look at the problem of social conflict from the point of view of social philosophy. The practice of resolving non-violent social conflicts, which is one of the important factors of social life, is gaining urgency today.

The socio-historical changes taking place in the world are radically different from all stages of historical development in the past, as they are very intense, complex and contradictory in nature. Research by the World Bank and the United Nations has shown that timely prevention of social conflict can save lives and save an average of \$ 70 billion a year in social protection. Research institutes (USA, Canada, France, England, Japan, Russia) dealing with the analysis of social conflicts and their solutions are focusing on the scientific study of the causes of violence and social conflicts, as well as their prevention based on a scientific analysis of the issues of social equality, gender equality, equality of political relations.

Therefore, the problem of creating a scientifically sound concept of studying and resolving social conflicts remains. The aim of the research is to study the history of the origin of social conflicts and to find ways to solve them.

The word "ziddiyat" (contradiction) is originally Arabic and means contradiction, intellectual contradiction, contradiction, "irreconcilable contradiction, hostility, enmity," in discussion, in the text, in theory and in the subject in general, "the existence of two contradictory considerations in events and the relationship between them".<sup>1</sup> It is possible to live without using the word contradiction, but it is impossible to live without entering into conflict. Perhaps it is not surprising that the word is used in order to generalize all of the words disagreement, conflict, struggle. There can be no one among us who has not been in conflict at least once. That's why the phrase "check your pulse if there's no conflict in your life" is used. The bottom line is that conflict is as simple as an event in our lives. Moreover, if there are no conflicts in the family, at work or in the state, it means that this is where the growth and development of a peaceful life stops. Therefore, it is necessary to study these contradictions and try to eliminate them when they occur, and to try not to have a negative impact on the development of our lives. Determining the nature of the conflict is a matter of scientific research. Because conflict is complex in its forms and levels. For example, a conflict between specific individuals. In defining the concept of conflict, we are forced to consider its content in the context of interpersonal relationships. But in this way it does not reflect the whole essence of the concept of 'contradiction' that we are exploring. Because conflict is complex in its forms and levels. For example, a conflict between specific individuals. In defining the concept of conflict, we are forced to consider its content in the context of interpersonal relationships. But in this way it does not reflect the whole essence of the concept of 'contradiction' that we are exploring.

Analysis of conflicts in the fields of psychology, sociology, law, art, history, mathematics, pedagogy, political science, sociology, philosophy, military and other disciplines shows that on the basis of any contradiction, the conflict plays a decisive role.

It is also impossible to ignore the general theory of conflict that underlies contradiction when studying the problems of social conflict. Conflicts are due to differences in the needs, interests, and values of subjects in different mental states; among people of the same or different mental states; social spheres (industry, economy), social organizations (family, school, transport), social organizations (state, political parties, trade unions), nations, countries, etc.

The object of social contradictions is social contradictions and social conflicts of various forms in all spheres of society. Its subject is the study of the nature, causes, mechanisms of social conflicts in society and the development of technologies to prevent, detect, monitor and resolve them.

If we look at the science of modern conflict studies, there is no single definition for the concepts of 'conflict' and 'social conflict'. This is explained by the lack of consensus among scholars on the nature of the issue. We can also see cases in the literature where the terms 'conflict' and 'social conflict' are often used as synonyms. Below we review the most common definitions in this regard:

"Conflict is any connection of elements represented by objective (hidden) and subjective (explicit) contradictions;<sup>2</sup> "Conflicts are a form of interaction between people in society, a specific cell of social existence, a potential or active subject of social action. Their motivation is

related to conflicting values, interests and needs ”;<sup>3</sup> "Conflict is a sharp emotion, an experience-related conflict that is difficult to resolve." In these definitions, conflict is expressed as a concept that represents contradiction. "Conflict is a drastic way of resolving conflicts that arise in the course of a relationship, and usually includes the negative feelings of the parties to the conflict";<sup>4</sup>

"Social conflict is a struggle between contenders for status, power, or limited resources, in which the conflicting parties seek not only to achieve the intended goal, but also to neutralize, harm, or destroy the opponent";<sup>5</sup> "Social conflict is an extreme situation, which is manifested in the conflict between different social groups, social institutions due to the contradiction or significant difference in social interests, goals, development trends";<sup>6</sup> "A social conflict is a confrontation in which the parties seek to seize territory or resources, in which opposition members or groups, their property or culture are threatened, and the struggle takes the form of an attack or defense."<sup>7</sup> Thus, conflict is often seen as an active and reciprocal action, enriched with strong emotional experiences to achieve their goals. But a social conflict is an open conflict between the incompatible needs, interests, and values of two or more subjects and other participants in social life.

The process of realizing the need to take certain steps towards resolving conflicts is a complex phenomenon, and often the problematic situation that is perceived as subjective, i.e., one-sided, unbiased. The reason for the subjective perception of reality is related not only to the nature of the psyche, but also to the social differences between the participants. These differences are reflected in social values, goals, ideas, and interests. The reason for the individuality in the perception of reality is also due to differences in the level of knowledge, needs and other characteristics of the participants in the process. The more complex the situation, the faster it develops, the more likely it is that spontaneous opponents will misinterpret the reality, unnaturally. The assessment of the pre-conflict process as a threat to the interests of the parties is reflected in their "conflict behavior". Behavior of the opponent, excessive fear of his actions will bring the situation to the level of conflict. It is this situation that confuses the situation and leads to the onset of conflict behavior.

The manifestation of the contradiction is the readiness of both sides to start an active struggle against each other, recognizing the conflict situation. The incident, the escalation of the conflict, the balanced confrontation, the end of the conflict - all these are processes specific to the conflict.

Balanced confrontation is a characteristic of the contradiction in which the parties continue to fight each other, but now the enthusiasm and intensity of this struggle is not so noticeable. The parties realize that the continuation of the conflict by force will not yield results, but the struggle will continue because no agreement on reconciliation has been reached yet. If the negative emotions in the period of conflict are not completely eliminated, the process of partial normalization of the relationship takes place. Painful experiences, rethinking one's point of view are characteristic of this period. Attitudes towards the opponent, claims and requirements against him, the process of correction in self-assessment - are among the above features. Feelings of guilt for one's own actions in times of conflict increase. But the old memories that have been preserved in relation to each other's evaluation do not allow the relationship to be normalized immediately. As soon as the parties realize the need to establish a healthy, constructive relationship, the full normalization of relations will begin. The establishment of mutual trust in the middle also provides an opportunity for this. It should also be borne in mind that there are

certain differences in the dynamics of conflict in normal everyday conditions and in extreme situations. In extreme conditions, conflict develops rapidly. For example, 70% of conflict processes in extreme conditions are completed within a week, and 55% within the first three days.

The scientist R. Darendorf, who deals with the issue of contradiction, has mentioned one of the broadest classifications of contradiction.<sup>7</sup>

If we look at the classifications proposed by A.V. Dmitrov<sup>8</sup> on the manifestation of conflict, he cited the areas of conflict by economic, political, labor, social security, education, and so on. It can be seen that the types of conflicts with respect to a particular subject can be internal (personal conflicts) and external (interpersonal<sup>9</sup>, between individual and group, intergroup).<sup>10</sup>

In the field of psychology, one can see the types of contradictions such as orientation, cognition, role-playing. K. Levin introduces internal contradictions in many ways into the directional contradictions (lack of satisfaction with their work, many do not believe in themselves, experience stress, spend too much time at work).<sup>11</sup> L.Berkovits, M.Doych, D.Maers consider the reference contradictions to belong to the group.<sup>12</sup> Cognitive contradictions are described in the literature in terms of both internal and intergroup conflicts.

Based on his observations, F. Lutens also identifies three types of internal contradictions, such as the contradiction in the division of tasks, the contradiction caused by despair, and the contradiction caused by the inconsistency of goals, and their occurrence.<sup>13</sup>

When English sociologist E. Giddens says “contradiction,” I mean a clear struggle, regardless of the source, means, and methods of struggle used by the parties. Unlike contradiction, the concept of contradiction is specific to a particular structure. These two concepts are close to each other, because the contradiction represents a weak link in the social system,”he said.<sup>14</sup>

Internal conflicts arise because of the opposite sides of the same event, while external conflicts arise because of the opposite sides of different event-processes. Internal conflicts are decisive in the course of events, while external conflicts are random. Usually, external conflicts arise as a result of internal conflicts and lead to the development or destruction of a living organism, country, culture, and so on.

Major or significant contradictions determine the status and development of an event, and the longer the event lasts, the longer it will last. Insignificant or non-essential contradictions represent the state and development of some insignificant aspects of a particular event and are present at a certain period of the event’s existence. For example, assimilation and dissimilation in the animal kingdom, and the class struggle in an antagonistic society that are among the main contradictions. Examples of insignificant conflicts include proteins and carbohydrates in the digestive system of a living organism, conflicts between non-basic classes of society, such as urban and rural populations.

non-antagonistic conflicts are conflicts between social units, social institutions, and social organizations in which the interests of the subjects coincide. Conflicts between parents and children, teachers and students are also considered antagonistic.

On the sides of social contradictions we see the following social subjects. Social units, social institutions, social organizations, nation, society, civilization.

Any social entity on one side of a particular conflict has its own interests and ways of working. Owners of conflicting interests sometimes show kindness to each other, sometimes reject each other. Mutual conciliation proves that a society cannot exist without the unity of social subjects with conflicting interests. That is, if a society consists only of the rich, the unconditional obeyers of the law, the educated, the kind, and the like, only the “good,” or only the poor, the bully, the marginal, the ruthless, and all sorts of other “bad,” such a society cannot survive. Thus every event, process in nature, society, and consciousness involves many contradictions.

The spread of conflicts in society is manifested in the process of ideological, economic, political struggles, the intensification of hostilities. Its character depends on the type and subjects of the contradictions. Class struggle, wars, is the highest form of social conflict in which the parties commit various forms of social violence against each other.

Social contradictions serve as a source of social processes. For example, according to E. Giddens, the transformation of contradictions into conflicts is necessary in order to understand the conflict of interests and the motivation of the subjects to act accordingly. In his view, the conflict will not start until the parties realize their conflicting interests.<sup>15</sup> From this point of view, social contradictions can be considered as the basis, the precondition of conflicts.

Depending on the nature of the conflicts, there are the following types. Objective related to real problems and shortcomings, subjective due to different assessments of certain events and actions, types of conflicts according to their consequences, constructive, proposing rational change, destructive, destructive to the organization, and so on. The following are necessary for effective conflict management. Identify the type of conflict, its causes, its characteristics and select and resolve the appropriate solution to the conflict. There are many ways to resolve internal conflicts. Compromise, retreat, sublimation, idealization, squeezing, redirection, correction, and so on. But the whole complexity is that it is very difficult for a person to identify, properly evaluate, and manage these internal conflicts. They are very well described in the scientific literature, and in practice they are very difficult to solve independently.

Interpersonal conflicts cover almost all aspects of human relationships. In managing interpersonal conflicts, we consider two aspects of it - internal and external. The inner aspect has to do with certain qualities of the individual and the ability to rationally behave in conflict.

The external aspect reflects the manager’s managerial performance in relation to a particular conflict. The two-dimensional method of personality behavior developed by K. Thomas and R. Killman is widely used in the development of the module of social conflict. At the heart of this model is the question of whether the parties to the conflict should focus on their own interests and those of the opposing parties. Conflict participants analyze their own and their opponent’s interests and choose five behavioral strategies (struggle, retreat, privilege, compromise, cooperation). The conflict between “individual and group” is resolved in two ways. A person entering into a conflict admits his or her mistakes and corrects them, while a person who is a participant in the conflict who cannot bring his or her interests into line with the interests of the group leaves the group. It is best to follow the tips below to build and maintain a positive relationship without getting into conflict. Get off the hook, analyze the situation, explain the cause of the problem to the other person, give the opportunity to “get out” of the conflict. With a full understanding of these criteria, it will be possible to assess social conflict and determine its resolution.

**ABSTRACT**

*This article describes the problem of increasing the self – activity of the assimilation of knowledge independent thinking by organizing self – education in higher educational institutions.*

**KEYWORDS:** *Education, Development Activities, Practical Lessons, Self – Education, Thinking, Free Thinking, Activities, Self – Study, To Exchange Opinions, Training, Tree Thinking, Discussing, Education Activates, Self – Thinking.*

**INTRODUCTION**

Organization of independent work of students on the basis of the Regulation approved by the order of the Ministry of Higher and Secondary Special Education of the Republic of Uzbekistan dated August 14, 2009 No 286 "On the organization of independent work of students" is one of the problems.

To this end, the main task of teachers is to provide students with independent education and independent work, in turn, to be able to apply the knowledge and skills acquired in the classroom, to strengthen their skills, to master them consciously. divided into groups according to the specific characteristics of the bird, and the outcome of teaching them independently should be taken into account separately. [1]

Identifying problem signs in independent learning allows you to separate important information from secondary information and look for factors and additions.

Subjective of the educational process to strengthen the knowledge of students studying in secondary schools, self-education, independent work, development of knowledge, the formation of understanding, skills, abilities is to organize regular independent education in accordance with the purpose [2].

Independent education - when successfully completed, students' independence is nurtured.

Usually, independent learning is brought to the attention of students in the form of a problem that can be solved immediately. In the process of offering students independent learning in the form of problems, in the process of finding or expressing conditions in specific problem situations, the activities organized by the subjects seem to be performed by the teacher instead of the students.

In independent study, the conditions are not known in advance. If in the process of independent educational work provided by the teacher, the student can not find a solution, then in the face of a specific situation, he can not turn this independent work into a situation that allows him to seek a solution.

Independent learning requires strict adherence to certain didactic tasks.

When the conditions of independent study are set in advance by the developer, the student is not required to demonstrate the ability to change.

In independent learning, you have to complete tasks that do not have more conditions. On the basis of independent learning, the subject becomes acquainted with the laws of changing conditions, uses existing skills and abilities to analyze a specific problem and perform independent work [3].

Forming concepts using independent learning allows subjects to independently identify problem signs, separate important information from secondary information, and search for additions.

Independent learning, which allows for independent work, involves the creation of favorable conditions for students with low levels and dissatisfaction with the development of concepts, motives and values.

Independent education is the organization of regular independent activity in accordance with the subjective purpose of the educational process on the formation of self-education, independent learning, the development of imagination and the formation of cognitive skills.

One of the first principles of the independent learning factor is the intellectual mastery of scientific ways and advanced pedagogical practices. Scientific knowledge is a true reflection of reality.

Only knowledge that reflects the laws of the world around us, the intrinsic properties of objects and events, and their interrelationships is scientific.

The scientific principle of independent education is necessary in order to create the right conditions for the teacher to reflect, understand, master the laws of the teaching material.

Understanding of theoretical rules is an important feature of interpreting material on a scientific basis, which determines the characteristics of the student's thinking activity. Scientific knowledge can reflect the realities inherent in science to varying degrees. Scientific interpretation one of the tasks of the rules of science in each group at all stages of independent

learning is to know the structure of theoretical data, in terms of how deeply it reflects the world around them. [4]

In the process of acquiring scientific knowledge, students acquire a scientific outlook and beliefs. Thinking develops.

The principle of the scientific nature of independent education is aimed at equipping students with future scientific knowledge in accordance with the current level of education in order to acquaint young people with the methods of scientific research.

Therefore, in the education system, the role of the teacher is great in the free, creative, independent thinking of students in the educational process and independent work. It is expedient to use independent work in the structure of education and two principles in its organization - the principle of systematic and consistent work of independent work.

The historical experience of the institute in each period of social development shows that the task of education cannot be accomplished without a certain system.

The system of explaining the learning material depends on the ideas that are clearly stated in the learning material, which of these ideas the teacher wants to explain, how old the students are to allow them to acquire knowledge, whether the student knows well or not and the nature of students' thinking activities at this level depends on how the process of learning in the classroom is usually explained.

Independent work is about being systematic, consistent. A characteristic feature of consistency is that it is aimed at deepening, expanding and strengthening new knowledge, skills and abilities on the basis of previously acquired knowledge and skills of students [5].

Independent work is also important in showing that each academic discipline is inextricably linked to each other through the principle of structure and consistency.

The principle of independence of independent education is to strengthen the stated teaching materials and serve to supplement the previously taught materials, to ensure that students work independently and continuously and systematically, to ensure that the knowledge and skills acquired by students. The acquired skills also include taking into account their skills.

The three principles of organizing independent work are to link it with the practical activities of independent work.

The most basic and guiding rule is to link independent work with life and production practices. As students' independent, creative activities are served and linked to life, it helps them not only to master the content, but also to apply their knowledge in practice.

In the organization of independent work, it is effective if the tasks between the members of the group are clearly approved, and cooperation is established. The following elements should be taken into account in the organization of independent work of students.

1. Preparing students to work in groups, clearly adding learning tasks, giving an idea of group work, setting rules.
2. Develop and discuss a plan for completing the assignments. Identify solutions and share responsibilities.

3. Be able to organize work on the completion of educational tasks.
4. Monitor the work process and the workplaces of the members in the organization of group work and provide assistance if necessary.
5. Provide information on the results of the tasks in groups, group discussions, additions and corrections to the work process. The teacher draws conclusions and summarizes the results of the work.
6. Establish peer review and monitoring of group assignments.
7. Analytical assessment of the results of each group's work, group work.

The success of group work depends on the teacher's ability to organize learning activities.

That is, the ability of the teacher to organize the individual activities of each student in the group, the ability of each student to receive the support of the teacher, the success of the work depends on the ability to show the end result. There are a number of shortcomings in the organization of group work. One of the challenges is to be able to form groups with the right goals and organize work in them.

When working in groups, students find it difficult to solve some difficult tasks independently. Therefore, in the organization of work in groups, it is necessary to organize individual work at the same time as the organization of general work. In these cases, good results can often be achieved. In general, depending on the level of difficulty of the assignments in the subjects, a creative environment is created in the group. When working in groups, the work of groups gives the expected results, if there is an atmosphere of mutual cooperation and mutual assistance between the student and the student. Independent work is given to develop work skills in interactive methods. In independent work, students think creatively, develop skills and competencies to use in their learning activities. The work gives the expected results. Independent work is given to develop work skills in interactive methods. In independent work, students think creatively, develop skills and competencies to use in their learning activities.

In the organization of the educational process, the teacher must first pay attention to the content of education, scientific, modern, compliance with the SES (state education standard).

Training is one of the main forms of additional education, the peculiarity of which is that students learn to use time efficiently, independently, to work, to make decisions.

There are so many types it's hard to say. For example, group discussions, game-based methods, situation modulation, human sensory development techniques, mediation techniques, and more.

Group - discussion - this method requires theoretical and practical, creative participants in the joint discussion of problematic issues. Such methods are designed to look at the solution of the problem from different angles, each participant has a different opinion on the solution of the problem, and on this basis a solution is reached. The facilitator leads the discussion by asking a variety of questions and leading them to a solution. If team members ask a question, they can find a solution on their own without a leader.

The training can begin with a discussion of the rules of organization, and end with a discussion of questions such as what is a group, the formation of a group, and the criteria by which it is

formed. Effective training leads to the acquisition of new skills, the development of creative, independent activities.

The trainings have their own peculiarities of organizing independent work in groups.

- In this form, students are divided into groups, and each group is given specific, individual tasks.
- Each group works on separate (ie the same or differentiated) tasks.
- The task is based on interaction or is organized under the guidance of a leader.
- In groups, the task is carried out in such a way that at the end of the session, the contribution of each participant or group member is taken into account.

The composition of the group may not be permanent, they create an environment in which a member of the group can contribute to the maximum.

Groups can be formed in different sizes. Usually groups consist of 4-6 members.

It may change depending on the content and nature of the assignment.

The group should be formed in such a way that the presence of students in each group with the skills of independent work gives the expected results.

Some students felt the need for individual help in organizing group work. In such cases, it is advisable for the teacher to help students who are not well prepared.

Group learning - educational activities, laboratory work, practical training, practice in the natural sciences, speech practice in the natural sciences, speech development (dialogue), mastering texts, studying historical materials and pedagogy very helpful in their lessons. In these cases, group communication and independent work give good results.

Practical classes are organized on the basis of scientificity, conformity to the nature of the student, consistency, structure, comprehensibility, robustness, comprehension and activity, the relevance of the exhibition to practice, the ability to apply in practice and develop independent thinking and achieve the following .

- When using active methods, he uses all his strength and skills to organize practical training, tries to explain well with the help of visual aids, didactic handouts. The teacher discusses the topic with the students. Solves exercises by giving creative work. Performs development through independent work, repetition. They will be able to master the content of education. The organization of practical classes on the basis of new technologies creates a favorable environment for students to master the learning process, allows students to exchange ideas. Conditions will be created for mutual receipt and transmission of information. They discuss and resolve issues that need to be resolved. They find a solution together to get out of the situation. They demonstrate their knowledge to each other based on the information they receive. Inspired by each other, they are satisfied and do not know that time has passed. Each participant feels the content of education as an author. Achieve full mastery of the content of education.

The practical training is focused on everyone by the teacher, that is, there is a bit of abstraction.

Curiosity motivates everyone, regardless of their abilities, to search, think and work towards the same goal.

Due to the fact that students have the same level of development and preparation, the acquisition of knowledge and skills does not guarantee the same results.

Therefore, in practice, questions and answers, laboratory work, exercises should be as focused on the student as possible.

In conclusion, it should be noted that practical training should be organized on the basis of interaction, interaction, debate, debate, thinking, joint solution of an activity or problem.

### ABSTRACT

*Based on the study of the norms of national legislation, the activities of prevention inspectors for the prevention of offenses, as well as their interaction with the self-government bodies of citizens in the field of crime prevention, are considered. Discussions are being held on the prospects for the development of crime prevention activities in the mahallas, as well as on the importance of organizing the reporting of crime prevention inspectors to the population.*

**KEYWORDS:** *Prevention Of Offenses, Chairman Of The Mahalla, Citizens ' Self-Government Bodies, Reporting, Control.*

### INTRODUCTION

One of the main directions of the policy of any democratic state is crime prevention activities, which consists in the implementation of a set of interrelated measures carried out by bodies and institutions that directly carry out crime prevention in order to preserve and strengthen law and order, identify, suppress offenses, as well as identify, eliminate the reasons for committing offenses and conditions conducive to them.

In accordance with the Decree of the President of the Republic of Uzbekistan «On measures to raise the activity of internal affairs bodies in the field of ensuring public safety and combating crime to a qualitatively new level», the internal affairs bodies have developed a qualitatively new system «Smart mahala» the process of their consideration, conduct a mutual operational dialogue with the population, evaluate the activities of prevention inspectors and sector leaders.

The practice of «preventive and preventive treatment» of the heads of the internal affairs bodies of regions, districts and cities to the population about the state of the crime situation in the relevant territory at the end of each month through information resources of the Internet is being introduced[1].

In accordance with the State Program for the Implementation of the Strategy of Action in Five Priority Areas of Development of the Republic of Uzbekistan in 2017-2021, in the «Year of Development of Science, Education and the Digital Economy», a completely new procedure for hearing reports from ambassadors of Uzbekistan in foreign countries has been introduced in the Senate of the Oliy Majlis of the Republic of Uzbekistan, as well as holding meetings of the Kengash and Senate committees on the issues studied directly with visits to the field with the participation of heads of ministries and departments in order to promptly resolve problems of concern to the population[2].

Thus, the analysis of the Law of the Republic of Uzbekistan «On the Prevention of Offenses» showed that the main idea of the normative legal act is to consolidate at the legislative level the priority tasks, principles and types of prevention of offenses, the system of bodies and institutions directly involved in the prevention of offenses, as well as their powers[3].

In particular, in accordance with chapter two of the Law of the Republic of Uzbekistan «On the Prevention of Offenses», the internal affairs bodies, prosecutors, the National Security Service, the National Guard, Justice, the State Customs Service, the State Tax Service, have entered the system of bodies and institutions directly involved in the prevention of offenses. bodies for labor and social protection of the population, public administration bodies for education and educational institutions, governing bodies of the state health care system and health care institutions and bodies of the State Committee of the Republic of Uzbekistan on ecology and environmental protection in the field of crime prevention, etc.[3].

In turn, the prevention of offenses carried out by the internal affairs bodies, as one of the authorized subjects of prevention, is understood as a set of special measures for recording and preventing the criminogenic consequences of human activity, as well as for identifying, studying and influencing criminogenic factors, conditions and circumstances, various negative phenomena and processes that affect crime.

The modern approach to crime prevention presupposes the creation of a system capable of influencing the causes and conditions of crime, objectively corresponding to the state of public relations and the established scientific approaches in this area, the main principle of which is a partial rejection of the dominance of control and preventive practice (which does not mean, of course, complete rejection of it) in favor of the security and protective orientation of the entire prevention system.

In accordance with the Action Strategy for five priority areas of development of the Republic of Uzbekistan in 2017-2021, one of the important areas is the reform of the system of public administration and civil service through decentralization of public administration, increasing the level of professional training, material and social security of civil servants, as well as a phased reduction state regulation of the economy[5].

The control and preventive function should be activated as a social legal system for the protection and protection of the rights of citizens and other persons, the state and society. The formation of an effective system for the prevention of offenses should be based on clear legal regulation of the activities of all subjects of prevention.

In accordance with the Decree of the President of the Republic of Uzbekistan «On measures to radically improve the activities of crime prevention units of the internal affairs bodies», a

procedure was introduced on October 1, 2017 for citizens' self-government bodies to hear monthly reports of preventive inspectors. It was determined that, based on the results of hearing the reports of preventive inspectors, the measures taken and the results of work to fulfill the assigned tasks are critically discussed, a personal assessment of the effectiveness of their activities is given, and recommendations are made on the suitability or inadequacy of the position held.[6].

In accordance with the Decree of the President of the Republic of Uzbekistan «On measures to improve the social and spiritual atmosphere in society, further support the institution of makhalla, as well as raising the system of working with families and women to a new level» cooperation in identifying and solving problems of the population on the basis of the principle of «mahalla - sector - People's reception – mahalla» ensuring the real formation of the mahalla as a reliable «bridge» between the people and the state, support for families and women»[7].

Analysis of the order of the Minister of Internal Affairs of the Republic of Uzbekistan «On approval of the Regulations on the procedure for hearing reports of inspectors on the prevention of strong points of internal affairs bodies in citizens' gatherings» establishes the procedure for organizing and conducting prevention inspectors and showed to the population that the report of the prevention inspector is his in-person speech in the prescribed manner before the chairman of the makhalin committee and other interested persons, the population once a month. The inspector's report on prevention is part of the mandatory activities of the territorial body of internal affairs. The report of the prevention inspector is carried out in order to: create conditions for the implementation of the rights of citizens of the Republic of Uzbekistan, public associations and organizations, state bodies, established by the Constitution of the Republic of Uzbekistan, laws, to receive reliable information on the activities of the internal affairs body; ensuring openness and publicity in the activities of the internal affairs body; increasing the level of citizens' confidence in employees of internal affairs bodies, as well as early prevention of offenses and crimes in the territory.

The tasks of conducting reports of crime prevention inspectors are: informing public authorities of the Republic of Uzbekistan, citizens about the state of law and order in the served territory; development, within the framework of the current legislation, of a system of public control over the activities of internal affairs bodies; ensuring the interaction of the internal affairs bodies with state bodies, public organizations, and citizens for the prevention and disclosure of crimes and offenses; legal education of citizens.

The hearing of the report of the prevention inspector is carried out in the presence of the chairman (oxakal) of the gathering of citizens, his advisers, representatives of educational institutions, family clinics, rural medical centers, the population living in apartments, apartment buildings, the head of the law enforcement agency. The date of hearing the report of the preventive inspector is established by the council of the citizens' gathering in agreement with the head of the law enforcement agency assigned to the given territory. Three days before the meeting, an announcement will be posted in a prominent place at the meeting of citizens and measures will be taken to inform the public. The meeting to hear the report of the prevention inspector is conducted by the chairman (oxakal) of the citizens' gathering. The minutes of the meeting are signed by the chairman (oxakal) of the meeting of citizens, the executive secretary of the meeting of citizens, the head of the internal affairs body of territorial subordination.

Representatives of bodies and institutions directly involved in the prevention of offenses and participating in it are invited by citizens to gather at a meeting to hear reports from prevention inspectors. Hearing reports from prevention inspectors at citizen meetings.

Prevention inspectors report on the following main areas: organizing the prevention of offenses, especially among minors and young people, identifying, studying and eliminating the causes of offenses, the conditions that allow them; conducting direct work with minors and young people aimed at educating them in the spirit of love for the Motherland, patriotism, respect for national and universal values, protecting the younger generation from the ideas of terrorism, religious extremism, violence and cruelty; interaction with other bodies of internal affairs, state bodies, organizations, self-government bodies of citizens on the prevention of offenses, improving the legal culture of citizens; implementation of special preventive measures to identify and suppress offenses, eliminate the causes of offenses and the conditions that allow them, as well as preventive work with persons prone to offenses; monitoring the attendance of students in educational institutions, to carry out preventive work with minors and young people who are in a socially dangerous situation and do not attend educational institutions, as well as with parents of this category of persons.

During the reporting period, prevention inspectors must ensure state and official secrets protected in accordance with the law, as well as ensure the inviolability of personal and family secrets of people.

In cases where the prevention inspector cannot speak at public meetings (when the prevention inspector is temporarily incapacitated, transferred to another position, resigned), the head of the internal affairs body assigned to this area, in agreement with the chairman of the citizens' meeting, sets another date for the performance.

In cases where the prevention inspector cannot speak at public meetings (when the prevention inspector is temporarily incapacitated, transferred to another position, resigned), the head of the internal affairs body assigned to this area, in agreement with the chairman of the citizens' meeting, sets another date for the performance.

The prevention inspector reports to the gathering of citizens on the work done from the date of appointment. In order to ensure a fair assessment by the population of the activities of preventive inspectors, the chairman of the gathering of citizens ensures the participation of the population (their representatives) in yards, houses, streets and neighborhoods on the territory. It is not allowed to prohibit citizens from attending a meeting for various reasons. Based on the results of the hearings of prevention inspectors, the measures taken and the results of their work are critically discussed, their effectiveness is assessed, recommendations are made on the suitability or unsuitability of their position and presented to the head of the internal affairs bodies. The assessment of the performance of the prevention inspector is determined by the decision of the meeting. A meeting of citizens is permitted if more than half of the total population eligible to participate is present. If it is impossible to convene a meeting of citizens, a meeting of representatives of citizens is held. A meeting of citizens' representatives is competent if at least two thirds of citizens' representatives are present in yards, houses, streets and districts. At a meeting of citizens (meeting of citizens' representatives), a decision is made by a majority vote of those present. In case of equality of votes, the vote of the persons responsible for holding the meeting is decisive.

Thus, the organization of the reporting of the crime prevention inspector to the population is carried out in order to implement the principles of openness and publicity, to create conditions for ensuring the rights and freedoms of citizens, public associations and civil institutions to receive reliable information about the activities of the internal affairs bodies. The report of the subjects of prevention is his face-to-face presentation in the prescribed manner before a competent meeting of the legislative (representative) body of state power or a meeting of citizens. The report of the subject of prevention is part of the mandatory activity of the territorial body of internal affairs to inform state bodies and citizens about the activities of the internal affairs bodies.

## THEORY OF POLITICAL COMMUNICATION

**Ravshanjon Omonov\***

\*Researcher,

Named after Mirzo Ulugbek National University of UZBEKISTAN

Email id: nuuzteacher@mail.ru

### ABSTRACT

*The article discusses theories of political communication based on theoretical and methodological views developed by scientists of the world. In particular, theories of minimal effects; theory of usefulness and satisfaction of needs; cultivation theory; setting the agenda, etc. are investigated. The author also examined the characteristics and functions of theories of political communication, the means of struggle for political power in the process of communicative impact on the political consciousness of society. During the article, the nature and content of informational relationships between the subjects of political communication and objects of political communication are studied. The author believes that the considered theories are developed primarily within the general framework of the positivist trend of modern political science and the study of political communication should be focused on the elements of perception. For instance, instead of analyzing the text of the message, it is necessary to find out how this text is perceived by the audience.*

**KEYWORDS:** *Communication, Political Communication, Theory, Micro Level, Agenda-Setting, Elections, Media, Audience, Theory Of Minimal Effects, Theory Of Uses And Gratifications, Theory Of Cultivation.*

### INTRODUCTION

The large-scale changes taking place in all spheres of social life in recent years, in particular in politics, economics, culture, communication, including the rapid development of information technology, the formation of a single information space, the spread of the Internet and technical means. contributes to the growing importance of information, communication, and especially political communication in the world. The purpose of the study is to study the role of communications in the political space, the degree of empirical validation of micro-level theories, the relationship between subject and object.

---

## RESEARCH METHODOLOGY

Since the article is mainly of a theoretical nature, it analyzes the theoretical views of world researchers. The following approaches were used throughout the study: historical, behavioral (to determine audience behavior), and comparative (comparative). In preparing the article, the rules on the nature and structure of political communication, micro-level theories developed by researchers in political science, sociology, philology, journalism, psychology and other fields of knowledge were used. The study is based on the views of the founders of political communication theories G. Lasswell, L. Festinger, E. Katz, J. Gerbner and other scholars. The use of a systematic approach has played an important role in solving research tasks.

### Theoretical analysis and results

The study of political communication is initially based on the first conceptual notions of mass-communication processes known as the "miracle bullet theory" and the "theory of theorists". These concepts stem from the assumption that information propaganda has a huge, unlimited impact on the public audience. This audience behaves inactively in gathering information and essentially reminds the patient that his condition will change after receiving the required amount of the drug in the form of injections. One of the founders of these theoretical models was G. Lasswell, who in his work on the analysis of propaganda mechanisms for the masses during the First World War gave a classical definition of public propaganda as a "hammer and sickle of collective solidarity." This definition unites millions of atomized individuals into a single "mass of hatred, hope, and trust". In the political context, such a question about the information "miracle bullet", which on the one hand can always find its target, on the other hand, can be seen as a single system of stimuli that creates a holistic system of reactions, and as a result completely subjugates the whole collective body. arouses interest. However, a study of the popular electoral process in the late 1930s and 1950s, led by P. Lazarsfeld, B. Berelson, and E. Campbell, shows that these theoretical views have not found empirical confirmation.

On the eve of the 1940 election, based on an analysis of the results of social data obtained through a series of parallel voter surveys in Erie County, Ohio, P. Lazarsfeld, B.C. Berelson and H. Gode propose a two-tier classical model of communication, which eventually becomes one of the first generally accepted theoretical constructions in political communication [11]. According to this model, the impact of mass communication on the individual is largely mediated by small groups, where individuals who actively read the newspaper, listen to the radio, then discuss what they read or hear from others, and give personal interpretations of facts and events. that is, specific "opinion leaders". In other words, interpersonal and intra-group communication mediates mass communication according to the following scheme: ideas are transmitted to public opinion leaders through radio and newspapers, and from them to the less active segments of the population.

According to the "minimal effect theories" of mass communication, the influence of information through the media during election campaigns tends to favor other factors that determine the specificity of the electoral system, such as belonging to a particular social group or political party. Until recently, other concepts were put forward in the mid-1950s, as opposed to the "minimal effect theories" of researchers' interest in the problems of political communication. According to the concept proposed by L. Festinger, views, ideas, and thoughts that force people to doubt their personal ideals or touch their feelings and tastes are forced to assimilate and

experience psychological discomfort and fall into a state of “conscious (cognitive) dissonance”. In order to avoid discomfort, a person selects only information that is consistent with his or her views and opinions, and ignores conflicting messages. Although research on mass communication effects during the election campaigns created by W. Weiss in the 1960s did not confirm or partially refute this theory, the idea of selecting information for a specific purpose has continued recently in the works of a number of well-known authors, particularly D. Graber. P. Lazarsfeld's reader and follower, E. Katz's popular theory called "theory of uses and gratifications" originally developed in his work, actively ignored the message, which did not meet the interests of individuals, and in an unattractive way sorts by. The benefits and satisfaction that come from incoming messages can be both emotional and intellectual in nature. For example, during an election campaign, a person may focus only on a message that is not only useful in voting in the upcoming election, but also evokes a sense of personal political competence. In the mid-80s, K.S. Rozenzweig, L. Wenner and F. The materials of the collective monograph, which saw the world under the editorship of Palmgrin, testify. The influence of the media on election campaigns and the study of election results became more active in the late 1960s and early 1970s. A number of studies have suggested that this phenomenon was largely due to the public appearances and intuition of current politicians. Rather than finding some universal effects, these studies focus on determining the conditions necessary to achieve this or that desired result. The party's influence in the election of a candidate allowed television, which was widespread and very popular at the time, to become a powerful force.

The results of research in the 1970s and 1990s strongly argue in favor of the conclusion that the media and television can influence election campaigns in different ways. The study focuses on the analysis of specific print and electronic “media reality” communication strategies used in election campaigns at the national, regional and local levels, as well as directly working with the individual. This line of political-communicative research first showed in the early 20s that there was a pseudo-environment in the media that replaced the real environment of the average member of society. He was born in Lippmann's works. Of these conditions, in particular Dj. Gerbner's "cultivation theory" (cultivation) stems from [6], according to which the media creates a symbolic world that television viewers tend to perceive as real in the first place. Contrary to the classical theory of rational election, L. Bartels' famous study [3] shows that the electoral campaign is a dynamic (growing) process in which individual desires change frequently, bringing collective decision to an unpredictable level. T. Gitlin, D. Graber, K. Johnson-Karti and G. Koplend, K. and G. Leng, E. Austin and B. Pinklton, R. Hart, Dj. Edwards and S. Wayne's [8] published work in recent years has focused the public audience on the personal qualities of candidates: strength of nature, self-confidence, leadership skills, empathy, and so on, rather than the position of candidates on specific political issues. more interesting, but also says that the financial situation of the candidates for the elected positions is also of great interest. E. Dennis and Dj. Merrill, K. Djemison, D. Kellner, S. Kraus, L. Keyd, M. McKinney and Dj. Tedesco, E. Mikevich, Ch. Firestone and L. Rosell's research [4] has shown that in the context of candidates' superficial thinking about current issues, these areas attract the attention of many citizens who are hesitant in their choice, rather than thinking superficially about current issues.

Mass media companies can have not only a direct but also an indirect impact on the emotions and mood of voters. Thus, P. Abramson, Dj. Oldrich and D. Roud said [2] that if media outlets caused a wave of protests, which in turn affected the political environment and the election

results, these results could be partly explained by the impact of mass communication. One of the leading theoretical approaches to the study of the influence of the media on political ethics is the concept of "agenda-setting". From the point of view of this concept, the influence of the media on the audience has a specific structural nature: the more the press, radio or television pays more attention to the coverage of this or that event or problem, the more the event or problem is perceived by the audience. The concept of "agenda-setting" was first introduced in 1972 by D. Shaw and M. Associated with McCombs names. Thus, in the late 50s, N. Long notes that newspapers "play an important role in identifying events that, as a result of the establishment of a larger public agenda, can be talked about by most people, are listed as factual facts, and are assessed as major problems" [12].

On the development of G. Lasswell's proposals, the "Handbook of Political Communication", 1981, edited by D. Nimmo and K. Sanders, D. Judging by Svenson and D. Nimmo's 1990 New Directions in Political Communication and the 2004 L. Cade's Handbook of Political Communication Research, political scientists need to fill in some gaps in sociology and psychology. experts helped. Instead of an example of such research, in particular, the widely popular A.D. Benidger's monograph, as well as U.R. Neyman, L. McNight and R. Dj. Solomon's work can be cited [13].

## CONCLUSIONS AND SUGGESTIONS

Thus, the following theories were considered during the study: "minimal effect theories" (according to which information influence through the media during election campaigns by its effectiveness favors other factors that determine the specificity of the electoral system, such as belonging to a particular social group or political party); "Theories of utility and satisfaction" (in which the information is actively sorted, ignoring the message, which is manifested in a way that does not meet the interests of individuals, as well as unattractive); "Cultivation theory" (according to which the media, primarily television, creates a symbolic world that viewers tend to perceive as real); "Setting the agenda."

The theories we have considered are mainly developing within the positivist direction of modern political science. In turn, the study of political communication should focus on the elements of perception. For example, instead of analyzing the text of a message, it is necessary to learn how that text is received.

The study of the "critical" direction will focus primarily on the analysis of the social consequences of political communication. Thus, M. Edelman's influence [5] seeks to define the "structure" of messages that leads to the inertia and submissiveness of the oppressed masses due to their bias towards dominant groups. B. It is noteworthy that Ginsberg and M. Schefter did not see elections as a true expression of the desires and interests of society [7], the authors of this study came from certain assumptions about what OKV (not what it actually should be) should look like. These perceptions are adapted to the ideal of an absolutely free, independent OKV that represents the public interest and at the same time enlightens these masses. In fact, the fact that the press, radio, and television are almost inconsistent with this ideal is not uncommon. Baudrillard allows us to write in the spirit of a "requiem on the media" and to think about the "death of importance" that results from their activities. At the same time, most researchers in the "critical" field believe that scientists should take an active political position and take all possible measures to promote the transformation of society based on the principles of equality and justice

and change the structure of political and communication processes. This activity is in many respects S. According to Hall's descriptive description [9], at first glance it takes on the nature of a "discursive war" against the already established socio-political order, which is reflected in the revelation of the hidden ideological essence of innocent messages. As a result, the concept of political communication in "critical research" expands until any communicative activity has a political nature.

**ABSTRACT**

*In recent years, global weather and climate change in the world may lead to a decline in higher and higher quality grain yields from agricultural crops, including winter soft wheat. Taking into account the different soil and climatic conditions of the country, it is necessary to further improve the technology of cultivation of high-quality varieties of cereals, suitable for the conditions of each region, high-yielding, early ripening, resistant to various diseases, salinity, drought and heat. This article evaluates the effect of sowing time, sowing rate and fertilization norms on field fertility of winter wheat varieties, selects and recommends the most optimal options that have a significant positive effect on field germination.*

## INTRODUCTION

In the largest wheat-growing countries in the world, the increase in grain yield and quality is achieved through the use of soil conditions, varietal characteristics and advanced methods of cultivation. It is important to increase the yield and grain quality of winter bread wheat varieties, to select promising winter wheat varieties that are high yields, resistant to diseases and pests. Depending on the soil and climatic conditions, the development and implementation of the timing of sowing, norms, fertilizer rates of winter wheat is one of the urgent tasks of the grain industry.

According to scientific sources, the yield increased by 15-20% when sowing first-class seeds from the first and second reproduction crops in the field, while sowing time and norms also have a significant impact on the field germination of winter bread wheat seeds [15].

A number of scientists have shown experimentally that the field germination of winter bread wheat seeds sown very early or late was much lower than that sown at optimal times [6, 7, 18].

According to H. Keldiyorova, U. Karshieva, when winter wheat varieties are sown late (November 30), compared to those sown in grain harvest (October 15), 44.4% in Sanzar-8, 33.7 in Skifyanka, 32.0 in Intensive and 32.0 in wheat it decreased by -41.4% [13].

In experiments carried out in the conditions of typical gray soils of Kashkadarya region, Krasnodarskaya-99 variety of winter bread wheat was sown early (October 1), field germination was 88.6%, medium-term (October 10) -89.6% and late sowing (November 10) -80, 7% [2, 3, 4].

It is considered that the area of grain can be assessed as “satisfactory” when sowing is carried out in optimal terms and norms for high and high-quality winter bread wheat varieties with an average of 4.5-5.0 million seedlings per hectare or 450-500 seedlings per 1 m<sup>2</sup> [5, 10, 17,].

When J.Saidov, K.Muminov studied sowing time, norms and fertilization norms (N<sub>200</sub>P<sub>140</sub>K<sub>100</sub> Ba N<sub>240</sub>P<sub>160</sub>K<sub>120</sub> kg / ha) of Nota, Jasmina, Yaksart varieties of winter bread wheat in Surkhandarya region, field seed germination control (88.3 without fertilizers) was used. from 84.8% to 3mln. when seeds were sown, 89.6% and in 6 million -86.6% of seeds germinated [16].

According to a number of researchers, the field germination of seeds of winter bread wheat varieties is always lower than laboratory germination. The difference between seed germination in field and laboratory conditions can be caused by a number of factors: lack of moisture in the soil, changes in soil and air temperature, past crops, pests and microorganisms, incorrect choice of planting dates, etc. [11, 14].

The optimum temperature for full, flat and sloping germination of seeds of winter bread wheat varieties is 12-20 °C, usually the average daily temperature sum required for germination of plants on the soil surface is 120-140 °C [1, 8, 9, 12].

This means that only when the bread winter wheat varieties are sown at the optimal time and norms for the region will the seeds germinate evenly, the plant will grow strong, accumulate well, prepare well for winter and be resistant to severe winter frosts.

## MATERIALS AND METHODS

Feeding of winter bread wheat varieties in the experimental field was carried out in accordance with the experimental structure. The entire annual rate of phosphorus and potassium fertilizers was applied under plowing, 40% of the nitrogen fertilizer rate was given during the period of tillering and shooting, and the remaining 20% was during the heading phase (Table 1).

**TABLE 1 STANDARDS AND TIMING OF APPLICATION OF MINERAL FERTILIZERS TO WINTER WHEAT.**

№	Annual norms of mineral fertilizers, kg/ha	Before planting, kg/ha		Feeding with nitrogen fertilizers during the growing season, kg/ha		
		P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O	Tillering	Shooting	Heading
1	N <sub>180</sub> P <sub>108</sub> K <sub>54</sub>	108	54	72 (40%)	72 (40%)	36 (20%)
2	N <sub>210</sub> P <sub>147</sub> K <sub>105</sub>	147	105	84 (40%)	84 (40%)	42 (20%)

Field experiments were conducted in 2014-2016 in light gray soils of the experimental fields of the Kashkaryana branch of the Scientific Research Institute of Cereals and Legumes. The level of groundwater is located at a depth of 2.5-3.0 m, not saline with harmful salts, the granulometric composition of the soil is average, the previous crop is cotton. The following options were explored in the field experiment.

The area of each option is 100 m<sup>2</sup> (length 41.7 m, width 2.4 m), of which 50 m<sup>2</sup> is taken into account. The number of variants was 36, the experiment was placed in 3 replications, the variants were placed in 3 tiers. Our research was conducted in accordance with generally accepted recommendations and guidelines.

**Results.** In our experiments in 2014-2016, it was observed that when sowing the seeds of winter bread wheat varieties (Krasnodarskaya-99, Yaksart, Bunyodkor, Gozgan) earlier or later, the field germination of seeds decreased. In the control (fertilizer-free) variant of the experimental field, winter bread wheat varieties were 4.0; 5.0 and 6.0 million seeds were sown at normal rates. Sowing periods were carried out in the early time (October 1), medium time (October 20) and late time (November 10) periods. In the sown variants, it was studied that the field germination of seeds depends on the sowing time and norms. According to the results, the field germination of Krasnodarskaya-99 variety is 76.0-73.6%; 83.3-81.7; 68.5-66.9%, Yaksart variety 77.9-76.0; 84.5-81.6; 71.0-69.2%, in Bunyodkor 79.1-74.0; 84.1-82.0; 72.3-68.7% and in the Gozgan variety ranged from 77.9-75.0 83.1–81.2 and 71.5–69.5% (Table 2).

In the study, when Krasnodarskaya-99, Yaksart, Bunyodkor, Gozgan varieties of winter soft wheat were sown in the early (October 1) period against the background of N<sub>180</sub>P<sub>108</sub>K<sub>54</sub> kg / ha with 5.0 million seeds, the field germination of seeds was 76.9; 78.4; 80.6; and 78.2%. When planted in the medium sowing period (October 20) and late sowing period (November 10) field germinations found to be 8.0; 6.7; 5.9; 6.0% higher and 5.8; 6.9; 7.0; 4.9% lower. It was found that the field germination of seeds in the early (October 1) period was 78.3, 79.3, 80.8, 78.9% when sown wheat varieties on the background of mineral fertilizers (N<sub>210</sub>P<sub>147</sub>K<sub>105</sub> kg / ha) in the above period and norms. In the medium-term planted variant (October 20) was found to be 6.3,

7.3, 6.6, 6.8% less. In the late sown variant (November 10), it was noted that the field germination of seeds was higher by 5.9, 5.3, 6.6, 5.3%.

In the experimental field, high field germination rates of seeds were observed in winter bread wheat varieties sown in the medium (October 20) period. Field germination of seeds at different sowing rates (4.0; 5.0; 6.0 million seeds / ha) compared to early sowing (October 1) was found to be as high as Krasnodarskaya-99, Yaksart, Bunyodkor, Gozgan, respectively, from 7.0 to 7.5%, from 7.4 to 6.8%, from 5.2 to 5.7%, from 3.7 to 7.3%.

With the delay in sowing the seeds of winter soft wheat varieties, a decrease in seed germination was taken into account in all sowing norms as well.

According to a number of studies in cereals, sowing rates also have a significant effect on seed germination. There are conflicting opinions among researchers on this issue.

In our experiments, sowing norms had a significant effect on the field germination of seeds of autumn bread wheat varieties sown at different times.

<b>5 mln.</b>	394		78.9	423	84.7	367	73.6		
<b>6 mln.</b>	461		76.9	505	84.2	435	72.3		

Fertility of seeds in field conditions varied depending on sowing norms, duration and varieties. For example, winter wheat varieties have an acceptable (October 20) When sown in fertilizer-free plots at the rate of germinated seeds of 4.0; 5.0; 6.0 million / ha, seed germination in accordance with sowing norms ranged from 83.1 to 81.7% in Krasnodarskaya-99 variety, from 84.5 to 81.6 in Yaksart variety; The Bunyodkor variety ranged from 84.1 to 82.0% and the Gozgan variety from 83.1 to 81.2% (Table 2).

At the above sowing rate and duration, seed germination when fertilizers are applied N<sub>180</sub>P<sub>105</sub>K<sub>54</sub> kg / ha is 85.3-83.3, depending on the variety; 86.6-84.1; 87.7-84.2 and 85.7-83.0%, respectively. In fertilizers applied N<sub>210</sub>P<sub>147</sub>K<sub>105</sub> kg / ha, these values are 85.8-83.6, respectively; 87.4-85.2; Ranged from 88.3-84.9 and 86.4-84.2%. Fertility of seeds of winter soft wheat varieties in field conditions was the highest (87.4-85.7%) in Bunyodkor and Gozgan varieties when sown at an acceptable level (5.0 million seeds / ha) and on time (October 20). When seeds of winter bread wheat varieties were sown below the acceptable norm (4.0 million units / ha) or more (6.0 million units / ha) in the early (October 1) or late (November 10) periods, a decrease in seed germination under field conditions was observed.

In our experiments, Bunyodkor and Gozgan varieties of winter bread wheat were sown early (October 1) from 7% to 82.7%, the increase in the sowing rate during this period to 6.0 million germinated seeds reduced the germination of varieties in field conditions by 4.8 and 5.8%, respectively. A similar pattern was observed in the medium (October 20) and late (November 10) planting periods. When sowing of seeds of winter bread wheat varieties were carried out later than the optimal time (November 10), the field germination of seeds decreased in all sowing norms. However, in the late sowing period (November 10), the difference in sowing rate from 4.0 million germinating seeds per hectare to 6.0 million germinating seeds was only 2.5 and 1.9%, respectively.

Thus, in our experiment, as the sowing rate increases throughout the sowing period, the germination of seeds of winter bread wheat varieties decreases in the field. This decrease is explained by the fact that most researchers release a lot of harmful (toxic) substances during seed germination and germination. .

## CONCLUSION

In the conditions of light gray soils of Kashkadarya region to sow the seeds of winter bread wheat varieties for full and short-term sowing in optimal terms (October 20) and sowing rates (5 million seeds / ha) on the background of mineral fertilizers  $N_{210}P_{147}K_{105}$  kg / ha, seeds of Bunyodkor and Gozgon varieties provided the highest (87.4 and 85.7%) field germinations.

It was found that when field seeds of winter wheat were sown earlier (October 1) or late (November 10) than the optimal sowing period, less than the sowing norm (4 million seeds) or more (6 million seeds), the field germination of seeds decreased.

### **ABSTRACT**

*The emanation and essence of crowd funding in investment process is analyzed in this manuscript and several researches have been conducted for revealing deeply the significance of crowd funding in businesses. A successful project mandates that the several months' worth of meticulous networking be set aside even before the campaign is launched. A poorly prepared campaign is a recipe for disaster. A campaign is never just a day's work – owners of the company will need to be constantly*

**KEYWORDS:** *Crowd Funding, Investment, Economy, Innovation, Start-Up, Equity, Reward, Dividend, Entrepreneurship*

### **INTRODUCTION**

As technology and business environment has been facing to the great shifts, growing number of young and emerging businesses are requiring obtain financial resources through open calls over the internet. As a result special platforms have been introduced and such campaigns are often hosted on specialized platforms that serve as intermediaries between founders and potential funders. In recent years, crowd funding platforms in particular have had extraordinarily high success rates in these published campaigns and they have already become a central role player in the overall investment.

## MATERIALS AND METHODS

Although, the origination of crowd funding has deep roots during the centuries, the first recorded use of term “crowd funding” was in August 2006, by entrepreneur Michael Sullivan[1]. He used it in the launch of his company fundavlog, which was an attempt to create an incubator for video blog projects.

According to the scientists[2-3], crowd funding is a way of raising money to finance projects and businesses. It enables fundraisers to collect money from a large number of people via online platforms. Crowd funding is most often used by startup companies or growing businesses as a way of accessing alternative funds. It is an innovative way of sourcing funding for new projects, businesses or ideas and it can also be a way of cultivating a community around the offered projects. By using the power of the online community, the owners of the projects can also gain useful market insights and access to new customers.

Additionally, Agraval[4] and others refer that crowdfunding platforms are websites that enable interaction between fundraisers and the crowd. Financial pledges can be made and collected through the crowdfunding platform. Fundraisers are usually charged a fee by crowdfunding platforms if the fundraising campaign has been successful. In return, crowdfunding platforms are expected to provide a secure and easy to use service. Many platforms operate an all-or-nothing funding model. This means that if you reach your target you get the money and if you don't, everybody gets their money back – no hard feelings and no financial loss.

Scientists of economics stress[5-6-7] that there are a number of crowd funding types which are explained below but three most common types of crowd funding are used by profit-making SMEs and startups: peer-to-peer, equity and rewards crowd funding.

Main types of crowd funding are followings:

**Peer-to-peer lending.** The crowd lends money to a company with the understanding that the money will be repaid with interest. It is very similar to traditional borrowing from a bank, except that you borrow from lots of investors.

**Equity crowd funding** - sales of a stake in a business to a number of investors in return for investment. The idea is similar to how common stock is bought or sold on a stock exchange, or to a venture capital.

**Rewards-based crowd funding.** In this type of crowd funding individuals donate to a project or business with expectations of receiving in return a non-financial reward, such as goods or services, at a later stage in exchange of their contribution.

**Donation-based crowd funding:** individuals donate small amounts to meet the larger funding aim of a specific charitable project while receiving no financial or material return.

**Profit-sharing / revenue-sharing.** Businesses can share future profits or revenues with the crowd in return for funding now.

### **Debt-securities crowd funding**

Individuals invest in a debt security issued by the company, such as a bond.

Last but not least, **Hybrid models** offer businesses the opportunity to combine elements of more than one crowd funding type []

Cassar refers[8] that related findings provide capital-seeking entrepreneurs with a preliminary orientation from which they can increase their probability of receiving funding, once they obtain access to multiple investors. In general, for innovative start-ups seeking external financing, reducing the comparably high information asymmetries with potential investors is always a major challenge. This problem is even more pronounced in crowd funding, which often entails considerable regional distances between the project initiators and potential funders. Therefore, Rasmussen and Sørheim[9] note that, it seems to be essential that entrepreneurs present and communicate their investment case in a manner that corresponds with the investment process of a particular funding source.

According to Tomczak and Brem[10], in recent years, the emergence of crowdfunding has enabled the funding and realization of countless entrepreneurial projects via open calls over the internet. The vast majority of the initiated campaigns are conducted on web-based platforms serve as intermediaries between project initiators and potential funders.

### Methodology of the research

The methodology of the research includes mathematic-statistic analyzes, historical analyzes and modeling methods. Statistics of the research have been made by the authors based on the official statistics of the world.

### Results

Conducted researches revealed that entrepreneurs and innovators have faced to pressing issue which is access to finance, and over the years it was issue for small and medium-sized enterprises (SMEs) as well as start-ups. Thus, crowd funding was investigated how to address financing as a barrier to ICT-enabled innovation. In fact, crowd fundings are sources of financing beyond the traditional form of financing. Clearly, traditional methods of financing usually come from funds from friends and family, bank loans, business angel and venture investments. Exactly, crowd funding is identified as a potential way to go beyond the traditional methods of financing businesses and innovation and as a potential way to address this barrier to innovation. Several researches have been conducted offering an overview of crowd funding using the current literature on the topic. Conducted researches explain how crowd funding campaigns and platforms function. Crowd funding is the raising of small funds from a large number of individuals. In its current form, crowd funding involves intermediaries, which are called funding portals. These funding portals are usually web-based. Analysis identified that crowd funding has already become one of the main sources of funding in investment processes.

Studies showed that following four platforms are top crowd funding platforms currently available and the fees and sustainability are provided below:

**TABLE1 TOP 4 CROWDFUNDING PLATFORMS OF THE WORLD[11]**

No	Platforms	Fee	Sustainable for:
1	Kickstarter	5% of the total funds raised	Startups, video game developers, designers, musicians, artists, e.t.c.
2	Indiegogo	5% of the total funds raised	Small scale businesses, start-ups, non-profit organizations, e.t.c.

3	GoFundMe	2.9% plus 30 cents for donation	Non-profits, Charities, designers, artists, e.t.c.
4	Patreon	Subscription-based, varies between creators	Artists, musicians, Streamers, online Models, e.t.c.

It is important that platforms should be chosen based on the several criteria in order to minimize the risk and not to be in a crisis status. When it comes to the specific project, there are many variables to take into account and they could be followings:

- Reason for raising fund
- How much would like to raise
- Resources for marketing
- The level of control over the project

Statistics showed[12] that the global crowd funding market size was \$84 billion as of 2018 and is expected to reach \$114 billion by 2021. Additionally, it is identified that fewer than a quarter (22.9%) of all crowd funding operations end up being successful and a research has been conducted for revealing the reasons of fail of those companies and they can be seen below:

#### 1) Campaign is not unique

One of the main reasons for the failure of a campaign is the lack of a competitive edge. Competition arises when the product or service offered is not unique. It is a very difficult proposition to sell an idea that isn't idiosyncratic, and convince investors to invest their hard-earned money in a product that is unable to justify its advantages over its competitors.

#### 2) Campaign is poorly prepared and organized

A lot of preparation is essential for a successful campaign. A lot of time and effort needs to be invested in the campaign. A successful project mandates that the several months' worth of meticulous networking be set aside even before the campaign is launched. A poorly prepared campaign is a recipe for disaster. A campaign is never just a day's work – owners of the company will need to be constantly in touch with their campaign and always they should be available to tweak it to their advantage whenever the necessity or opportunity comes. A campaign fails when:

**Not enough time is invested:** Time is of great essence to any successful campaign. When one prepares a project, one would need to dedicate enough time for its planning and its promotion. Without a meticulous plan that looks ahead, the project is doomed for failure.

**The message of the campaign is not consistent:** Unless the core idea is well-defined, it would not be possible to have all the people involved on the board. Without clear goals and clear-cut strategies to achieve them, investors will be in the dark about what the target is. Without proper communication, investors may bank upon unrealistic objectives that will lead to conflicts later on.

**No video is included:** In a successful campaign, the prerequisite of having a video is a given. Without a meaningful video that clearly illustrates the vision of the entrepreneur(s), a campaign

cannot hope to succeed. A well-made video not only describes how aim to go about your project, but also exemplifies why owner is going for that project at all. The video has to be persuasive and should lend itself to being shared on multiple platforms. It should be long enough to include all core messages, however short enough to retain interest. It should have clear audio and should include on-screen captions wherever necessary to aid in understanding.

Campaign is too complicated: When it comes to an advertising campaign, it is the best bet to have things simple and sweet. Too many complications in the campaign will result in drastic narrowing down of the target audience, and you will end up losing many prospective investors just because your campaign was too tricky for them to comprehend.

Campaign is targeting the wrong crowd: It is essential for you as an entrepreneur to have the backing of the right audience. Targeting one and all, irrespective of the domain of interest is a futile attempt at advertising – this will never bring the right people in the loop.

### 3) Campaign is not emotional

To be successful, it is obligatory for the campaign to strike a chord with the investors and the general public. It is not possible for owner to connect on an emotional scale with investors when investor is not emotional about project. Lack of passion and self-motivation will invariably result in a poor image of the campaign. Failing to get investors excited will literally translate into a poor prospect of investment in the campaign.

### 4) Campaign has unrealistic funding goals

One of the main reasons for the failure of a crowdfunding campaign is the setting of unrealistic goals as far as funding is concerned. Many times, a project is under-financed due to faulty predictions about capital requirements. Many campaigns have failed because entrepreneurs overlooked vital areas of funding while preparing plans. Only a comprehensive plan – one that takes care of all possible situations and scenarios, however, miniscule or trivial, will be successful in attracting the right amount of funding.

### 5) Campaign has low exposure and popularity

Low exposure is one of the foremost reasons for the failure of a crowdfunding venture. Also, too few PR contacts will have an adverse effect on campaign. It is vital to know that owners will need to make as many PR contacts as possible before starting campaigning project. For example if you are planning on manufacturing a fluoride-free herbal toothpaste, it is important to create and distribute a PR article about the ill-effects of fluoride-based toothpastes and the benefits of herbal toothpastes on all possible platforms at least a fortnight before the actual launch of the product.

### 6) Campaign perks do not add enough value

The main motivation behind campaign should be to deliver certain perquisites to stakeholders. Without a distinct set of perks, it would be impossible to grab the attention of any investor. An investor will only invest when he feels assured about certain returns that add value to his cause.

It is best to assume that investor is going to be very selfish in demanding that he gets his fair share of returns from his investment.

### 7) Campaign owner does not have sufficient experience

Many projects meet with failure when the project owner or the entrepreneur does not have any or sufficient experience in the field. It is not uncommon for an entrepreneur to pursue a project outside the domain of his primary experience. However, it is mandatory for such an entrepreneur to associate himself/herself with people who possess the relevant expertise and experience.

#### 8) Campaign has faulty timing

Campaign may have everything going its way in campaign, but just the one factor of wrong timing is enough to foul up all future scope of project. It is essential to hit off the project at the right time of the day, given, of course, the geographical location of the target audience. For example, if you are located in the United States and your target audience is in Japan, you will need to work out a suitable time slot in Japan (and not in the United States) to kick off the campaign.

Let's get the ball rolling with some of the key stats on crowdfunding worldwide. It's difficult to accurately assess the overall size of the crowdfunding market. There are all sorts of factors to consider: the global volume of transactions with all of the associated costs, equities earned and their fluctuating value on the market, donations, indirect contributions of the industry to the global economy...

For this reason, many online crowdfunding statistics tend to throw around wildly different numbers, ranging from tens to hundreds of billions of US dollars. For the sake of simplicity, when we refer to the global market, we're talking about everything related to crowdfunding, and when we mention transaction value, it's purely the monetary value of crowdfunding transactions themselves.

One trend these stats clearly show is that North America is still the leading region driving the crowdfunding industry globally. The top crowdfunded[11] projects are still those organized in business and entrepreneurship ventures, while social causes account for about a fifth of the total crowdfunding budget.

Finally, regulation crowdfunding – a popular method of avoiding registration requirements for securities-based crowdfunding projects – is gaining serious traction in the US.

The core of every good crowdfunding effort is a well-thought-out and realized campaign. Proper crowdfund marketing can make all the difference: more than three-quarters of all campaigns fail to obtain the necessary funding. Most of those that do, however, end up exceeding it greatly.

With well over six million campaigns in 2019 alone[13], managing to both attract and retain crowdfunding donors is a key challenge for both crowdfunding companies and individuals.

The most successful crowdfunding campaigns tend to be ones organized for nonprofit causes. They generate almost twice as many funds compared to the industry average. Diversifying your crowdfunding sources and having a cause that people can believe in are the keys to success.

Starting a crowdfunding campaign off on the right foot is the key to its success. Most successful crowdfunded projects tend to capture the attention of the majority of their potential backers with a good initial pitch. People tend to have short attention spans though, and it's important to keep your backers regularly updated and engaged.

Most crowdfunding backers are younger people, so making engaging and personal content that employs plenty of personal video and image material is a surefire way of getting and retaining the interest of your target audience.

Crowdfunding success rates often depend on having loyal repeat backers, as well as making large last-minute pushes as the funding deadlines start approaching. Many backers tend to generally like an idea but hold off from investing until they can see how the project develops.

They often end up forgetting about it in the process. Giving them something to go back to can make the difference between failing a campaign goal miserably and achieving it with flying colors.

Although the rate of growth has somewhat slowed down in the last few years, crowdfunding is still showing signs of constant improvement, as the industry grows ever larger.

Of particular note is how things are changing in terms of the overall structure and distribution of crowdfunding funds. Back in 2016[13], the lending market accounted for 70% of the entire industry. Equity crowdfunding statistics from the past four years, however, show that things are slowly changing.

To be clear, the industry still primarily revolves around its lending segment. However, equity crowdfunding is currently growing more than three times as quickly, so it will be interesting to see where we are 10 years from now.

Real estate is one of the most consistent segments of the global crowdfunding market when it comes to growth. With average investment returns being no smaller than 10%, it's little wonder that the industry has a solid future ahead of it.

With almost two-thirds of the crowdfunded real estate market investments in 2018, the Americas are driving the majority of the industry, with the US and Canada being the largest markets. In terms of growth, however, crowdfunding stats show the EU and other European countries as the fastest-growing players.

Although residential property investment still dominates the market, experts predict lucrative future gains for investors ready to support the growing commercial sector.

**Diagram1 Total Worldwide Crowd funding Volumes except China from 2015 to 2018[14]**

It can be seen from the above given diagram that the volume of crowd funding is raising year by year around the world. Exactly, if the total volume of crowd funding was 44 billion dollars in 2015 year, it indicated 60 billion dollars in 2017, after a year it showed sharp increase and the volume was 89 billion dollars.

**TABLE 2 GLOBAL TOP 10 CROWD FUNDING BY COUNTRY IN 2019[15]**

Country	Rank	Volume(\$)	Market Share	Yearly Growth Rate
China	1	215,396,387,848	70,73%	-39,88%
United States	2	61,134,356,480	20,07%	42,93%
United Kingdom	3	10,367,889,408	3,40%	32,04%
Netherlands	4	1,806,298,624	0,59%	480,72%
Indonesia	5	1,451,228,928	0,48%	1711,43%
Germany	6	1,276,201,472	0,42%	92,90%
Australia	7	1,166,546,048	0,38%	1,57%
Japan	8	1,074,756,864	0,35%	208,26%
France	9	933,132,928	0,31%	26,98%
Canada	10	909,255,296	0,30%	4,80%

Above given table illustrates the Global top 10 crowdfunding by country. It is clear from the table that market share of crowdfunding is relatively high in China and it is equal to 70,73 % in numbers, 215,396,387,848 dollars. However, the growth rate of crowdfunding decreased to 39,88% in 2019 compared to the last year. Additionally, America is also one of the top countries which has great crowdfunding rate. Clearly, the amount of crowdfunding was 61,134,356,480

dollars and its market share was 20,07% in 2019 and indicated 42,93% yearly growth in that year.

## CONCLUSION

In conclusion, it can be said that innovators or entrepreneurs can use a crowdfunding platform, i.e. a web -based funding portal, to campaign and raise funds from a broad crowd including their social networks and the network of the portal. Entrepreneurs enjoy the obvious benefits of being able to access new funds that might not be otherwise available but they also enjoy non-pecuniary benefits such as feedback about their idea from the crowd and access to the skill set of contributors, who are often willing to lend a hand. The crowd enjoys access to products before they become widely available and become engaged and involved in the production process.

### INTRODUCTION

The environment of upbringing in the family depends, first of all, on the culture of family relations. , is a subtle aspect of family relationships, such as a deep sense of responsibility for one's duty. The family is the basis of human rights. Because in the first world the child sees, there is a relationship between parents and siblings, neighbors, cousins, and the child observes and studies them, during which he sees who is in what position,

Raising children in the family in the spirit of devotion to their duty is closely linked with such qualities as responsibility, awareness, conscience. This is the basis for a sincere relationship between parents, close and friendly relations with their children, understanding of their future dreams and goals, the healthy development of children. A person has good behavior, habits and intelligence in the process of upbringing. if he has, he understands life lessons so well and does

good deeds, and conversely, the less educated he is, the less life skills he has, the more he sometimes commits bad deeds, knowingly or unknowingly.

After the independence of our country, radical reforms are being carried out in all spheres. In particular, in Uzbekistan, positive work is being done to strengthen families, provide them with social protection, bring up a harmoniously developed person, spiritually mature and physically healthy generation. In this regard, in accordance with the Resolution of the President of the Republic of Uzbekistan "On additional measures to increase the effectiveness of spiritual and educational work" No. PP-4307 dated May 3, 2019, guaranteed preparation of young people for independent living is based on gradual and uninterrupted education. In order to develop and implement the methodology, to guide young people to self-development as individuals, to educate them as broad-minded, active citizens, the "Concept of continuous spiritual education" was approved. The difference of this Concept from the previous one is that it is aimed at providing Human Capital capable of implementing the Action Strategy in citizens. This gives a clear purpose to the upbringing that has been common so far. The specific goal is to cultivate in young people clear, basic competencies and qualities. [1]

Accordingly, in our country, great attention is paid to the centuries-old national pedagogical traditions, the broad and rational use of universal values in the upbringing of children. Every parent is well aware of the need to raise their child diligently, every day, to be happy. However, they do not pay attention to the timely, continuous, continuous upbringing of their children from an early age. The main task of the family is to raise a healthy generation. After all, the priceless treasure of every nation and society is a healthy, spiritually harmonious family. [1].

In the current situation, the spiritual and moral relations in families, based on universal and national values, reflecting the Eastern moral features, are being established, and the legal, moral and spiritual foundations in families are improving. If a healthy moral environment, a culture of interaction, and a moral principle are not deeply rooted in the home, there will be a gap in the family, and negative situations will inevitably be resolved.

The importance of the family in the spiritual upbringing of the child is emphasized. Only when the parents' relationship with each other in the family on material, organizational, educational and personal issues is built on a pure, sincere, mutual respect and chastity towards the husband's wife, the wife will have a pure spiritual environment and harmony in the family. In the parental relationship, their kindness to each other, the same treatment of their children, therefore, the mistakes made in upbringing do not appear all at once.

Complications of improper upbringing appear many years later in the social problems caused by the human factor in society. The child is one of the highest blessings bestowed on man by Allah and is the successor of the parental life. Every blessing has its own gratitude, and the gratitude of a child's blessing is to give him a beautiful upbringing. It is scientifically based in one way or another in the sources of the blessed religion of Islam, in the works of all thinkers. The Prophet (peace and blessings of Allaah be upon him) said: "Parents cannot give their children anything better than good manners."

The word upbringing should not be narrowed down to the fact that the Prophet (peace and blessings of Allaah be upon him) said: "Every child is born in nature. His parents make him either a Jew, or a Christian, or a pagan." From this hadith, we know that the child will go the way he was guided.[3]. This means that the duty of a parent is not only to teach the child good

manners, but also to protect him from various ideologies and inhuman ideas. Because a child with a healthy faith and a correct ideology will grow up to be a kind and selfless person who is kind to his parents and loyal to his country. It is the duty of parents to bring up their children in a physically healthy and strong way. be faithful to religious traditions. It is well known that raising our children on the basis of good manners and good education is a topical issue at the national level.[1]

Children should be taught science from an early age. After all, a person who is interested in any field of science and creates information through reading and studying, will definitely be among the people who will benefit himself, his family, his people and his homeland. Not only they, but also the society is interested in making their child such a person.

The civic duty of parents requires the same. Therefore, every parent must first of all remember that he is educating the future life of the country, the future citizen - the parent himself plays an important role in the upbringing of the child. None of their wise teachings can replace their personal example. In the formation of the qualities of harmony in children, mutual harmony, honesty and truthfulness in the family, the existence of mutual trust, in general, a healthy environment are important. [2] In the family, it is important to love children, respect their identity, and never touch their self-esteem.

It is advisable that any care is carried out with insistence. Each family has its own traditions, which have a strong impact on the child's mind and behavior. arouses the feeling. [1]. Therefore, every parent should look for answers to such questions as how we bring up our children today, what is the family environment, in which the virtues of their ancestors flow. After all, the family is a place where the human qualities, noble desires, values and traditions develop from the youth of each person. All human qualities such as humanity, kindness, honesty, truthfulness, honor, modesty, diligence are formed first in the family. Thus, family upbringing has its own characteristics and influencing factors. Without taking these into account, it is impossible to put the upbringing of a child in a family in a good way. To do this, first of all, the parents themselves must be educated. The whole life of parents, their civic image, their spiritual world is the basis of a child's upbringing. Parents are already dear and holy to their children. [7]

Therefore, they imitate them and strive to be like them. Based on our national mentality, in the spiritual and moral upbringing of a child in the family, the formation of high moral qualities in them, positive actions, This means that education, environment and family are important for a person's development. At the moment we are looking for people like Alisher Navoi, Beruni, Farobi, Imam Bukhari and Khorezmi who lived and worked in the past, but we can't find them? Have we ever wondered why? The reason is that they are great and hereditary, their parents had a strong spirituality, science, enlightenment and progress reached their peak during their lifetime, that is, the environment was good and, most importantly, the parents and teachers responsible for the upbringing of our ancestors they performed their duties to the best of their ability and had no shortcomings in their upbringing. If we eliminate the shortcomings in these factors that affect the development of our children, we will surely emerge from the next generation of brilliant scholars like Imam Bukhari.[7]

According to the research of scientists, children who have been brought up by their mothers, who feel their care and compassion at every step, are completely devoted to public work differs from

the kids who are separated from their mothers and grow up to be healthier, smarter, more educated, and more cheerful.

A study in the United States found that more than half of those incarcerated were young people who were not fed up with motherly love. Indeed, the role of the mother in the family is of particular importance in the upbringing of children. No one can give a greater feeling of love to a child than a mother [6.]

In short, the role of parents and teachers is invaluable in the development of our youth in all respects, well-behaved, independent thinking and worldview, free from various negative habits, vices and influences. Demakit must be acknowledged from the above considerations that the social environment plays an important role in the development of any society and in the building of civil society. One of the main functions of the social environment is the behavior of the individual, a set of external objective factors that affect his development and a certain system, which in itself forms the capabilities of the individual, brings them to life. As a result, everyone represents a clear area of social activity and communication that is directly related to the life of society.

## MODERN WATER EQUIPMENT: DESIGN FOUNTAINS

**Rakhmatova Mekhriniso Murodovna\***

Teacher of "Landscape Design and Interior"  
 Department of Samarkand State Architectural and,  
 Sivil Engineering Institute, Samarkand, UZBEKISTAN  
 Email id: mexriniso.raxmatova@gmail.com

### ABSTRACT

*This report provides general information on world-famous water devices, including fountains, their various parameters and designs. Specific examples are the features of fountains and the latest modern technologies. For example, the idea for the Julie Penrou (Colorado Springs) fountain belongs to architects David Barber and Bill Burgess. The fountain consists of 366 water pipes that rotate once every fifteen minutes. Today, many architectural designers are creating new projects using world practice. And in the future these projects will be continued and more positive projects will be created.*

**KEYWORDS:** *Springs, Streams, Waterfalls, Pools, Ponds, Rivers, Lakes*

### I. INTRODUCTION

Water is an integral part of the natural landscape and plays an important role in the formation of the garden and park environment. Water in nature can take many different forms and situations. Colorful types of water devices can be used in gardens, parks, large areas, recreation areas and in front of various public buildings. Water plays a particularly important role in shaping the park environment. This is due to the fact that water lowers the air temperature, increases its humidity and has a significant effect on the microclimate in general. The aesthetic value of water and its physical properties are also very important here.

When using water as part of landscape design, you must try to fully and with a high aesthetic taste show all its natural properties. The natural properties of water are associated with its fluidity and colorlessness, its ability to take any shape and color, its ability to reflect images of surrounding objects and its sound. In landscaping gardens and parks, such forms of water as springs, streams, waterfalls, pools, ponds, fountains, waterfalls, rivers, lakes, and pools are used [1].

## II. MAIN PART

Landscape and park design, the use of water devices in public open spaces, the improvement of their scenic solutions have become topical issues of our time. At present, it is necessary to know and apply modern typology and technology of water facilities in the organization of greenery in hot and dry climates of the Republic.

Today in the world there are unique water devices related to the topography, which are not repeated, and they are created on the basis of scientific and technical achievements. Waterworks built in several cities of the United States, Japan, Korea, UAE, Austria, Sweden, Peru, Canada, Italy, Singapore, China, Spain are distinguished by their originality.

The water system in the United States was developed long ago. For example, the idea for the Julie Penrou (Colorado Springs) fountain belongs to architects David Barber and Bill Burgess. The fountain consists of 366 water pipes that rotate once every fifteen minutes. Although the facility is located far from the city center, it has always attracted people with its perfection and charm. Examples include the Keller in New York, the 71 Fountain in Ohio, the Corona in Chicago, and the Vaillancourt Fountain in San Francisco.

The Buckingham Fountain in Chicago is considered by many to be one of the most beautiful fountains in the world. It is a monument built in honor of Clarence Buckingham. The diameter of this fountain pool is about 85 meters, and the composition in the center of the pool, which rises 7.5 meters above the water level, is made of 3 layers of pink marble. 65,000 liters of water are pumped every minute from 134 pipes. In the evening, the fountain is illuminated with 840 lamps. This view is enjoyed by visitors to the Grand Park from April to October each year.

In Irving, Texas, the sculptural composition "Las Colinas Mustangs" (1981) is made of bronze, with a statue of 8 horses moving along the water. Water gushes from the horse's hooves when it hits the water, which helps the horses look like they are moving. In the evening the underside of the hooves is illuminated. This fountain is one of the largest sculptural compositions in the world.

Modern fountain devices are based on completely innovative technologies. In Charlotte, the 7.6-meter, 14-ton Metamorphoses fountain by Czech sculptor David Cherny consists of a constantly rotating, stainless steel plate with a male head. The speed of movement of the plates is controlled by the program. The fountain is a product of innovative technologies and reflects the image of a strong, ambitious human being [3].

The Bellagio Music Fountain is located in front of the Bellagio Hotel and is one of the most visited places in Las Vegas. The fountain was designed by Mark Fuller, an engineer at WET, California. His pipes move based on the sounds of classical music and pop ballads. The height of the fountain is 80 m, consisting of 1,175 pipes and 4,500 lamps[4].

Figure 1. Bellagio Music Fountain Figure 2. Floating Fountains (Osaka)

A similar musical fountain is located on an artificial lake of more than 12 hectares near the Burj Khalifa skyscraper in central Dubai. The fountain has a width of 275 m, a shooting height of 152 m, 6600 lamps and 25 projectors. The United Arab Emirates is one of the most developed countries in the world. The Volcano Fountain in Abu Dhabi is also impressive. Water flows like lava from a volcano-like tower. To enhance the effect, yellow light was used.

The tallest fountain is the King Fahd Fountain, built in Saudi Arabia. Its height is 312 m, 18 tons of water is thrown into the air per minute, water comes to the fountain from the Red Sea. Its base is designed in the form of a crown.

A number of modernized waterworks have also been built in Japan. In Osaka, Japanese architects discovered a new artificial waterfall called the Clock at the railway station. The waterfall not only lifts a person's mood, but also gives him pleasure, showing watery patterns in different looks and showing the time every minute. The waterfall flows through a large window. "Floating fountains" are widespread in Osaka. Such fountains were designed by Isamu Noguchi. A cube-shaped geometric body moving under strong water pressure in a recreational water basin is mounted on steel pylons. The light that illuminates the fountain device in the evening makes it look special.

We can see an antique pool in the XII Century Art Museum in Japan. This pool was created on the idea of the talented artist Leonardo Irlich. The secret of the pool is that it consists of 2 parts, which are separated by a mirror. The window is mounted above the pool, parallel to the water level. The height of the water above the window is 10 cm, and the bottom of the window is painted with aquamarine, the lower part of the pool is entered through a special path, where vacationers can easily walk, walk.

The world's longest fountain-bridge "Moonlight" (2009), which is included in the Guinness Book of Records, was built in Seoul, South Korea. The bridge consists of two floors, with water flowing from both sides of the upper floor. At night, they are illuminated by 10,000 LED lamps reminiscent of a rainbow of different colors. The length of the bridge is 1140 m, the water for the fountain is taken from the Hangang River and consumes 190 tons of water per minute. The fountain is equipped with 38 Grundfos pumps, the maximum water consumption for each pump is 420 m<sup>3</sup> / s. The water pressure is 810 m / s.

At the entrance to the Crystal Words Swarovski Museum in Wattens, Austria, a giant fountain in the direction of phytoplastics on a high hill depicts a treasurer with a green giant's head. His eyes are made of Swarovski crystals. When the fountain lights are turned on in the evening, the giant's eyes appear in a green crystal state. The museum is located under this hill.

Vortex fountain “Charybdis”, sunderlandThis original fountain was created in 2000 by sculptor William Pye for the luxury Seaham Hotel in England. According to Homer’s Odyssey, Charybdis was a mermaid who was hit by Zeus’ thunderbolt and transformed into a whirlpool as harsh punishment for stealing Hercules’ herd. Pye later carried on this concept building similar sculptures in Oman and Brazil[8].

The boat "Fountain" on the beach Malvarosa in Valencia, Spain, was built on the basis of skillful engineering ideas. Built of 6 metal constructions, this fountain shows the shape of a full boat when the water is thrown. In the evening the fountain is illuminated with a reddish light. A similar fountain is also available in Israel and Portugal. There is a red Crane Fountain in El Puerto de Santa Maria, Spain. A large amount of water flows out of a large water tap in the air and hides the pipe. In fact it moves water inside the pipe. The design of the fountain, though simple, does not fail to amaze. Similar fountains have been built in a number of cities in Spain, Belgium, the United States and other countries.

Another Guinness Book of World Records fountain is the Property Fountain in Santek, Singapore. The fountain was completed in 1998. The fountain device is made of bronze and the 4 supporting curved columns hold a ring-shaped structure, which symbolizes the unity, solidarity and equality of all races and religions in the country.

The Red Fountain in the UK is like a stepped garden. Once a year, that is, at the David Festival in March, it will have a special look. During the festival, the water of the fountain is given a red color as a symbol of the blood of the righteous.

Dacien Si is a 15,000-square-meter musical fountain in Dayanta Square, Xi'an, China. In the fountain area, 1024 pipe holes are installed in a regular sequence, allowing you to walk and walk freely through the vertical corridors. Foshan Falls in China consists of 10,000 old toilets[5].

The Fountain Park in Lima, Peru, is the largest fountain park in the Guinness Book of Records. The creation of the park was designed almost a hundred years ago. However, the construction of the park was completed in 2007 with the discovery of a new project on its territory. As a result of the project, the park has created the largest complex of fountains in the world, among which there are 13 different fountains, most of which are interactive. All the fountains are lit at night, some of them constantly changing colors. The largest fountain in the park is called the “Magic Spring” and is capable of lifting water over 80 meters. There is a “Tunnel Fountain” that connects the part of the park with other facilities for regular exhibitions.

The park has a "Fantasy Fountain", a musical fountain, a pyramid-shaped fountain, a children's fountain, phytoplasic fountains[6].

The Peterhof Grand Cascade in St. Petersburg is also the largest and most beautiful collection of fountains in the world. It was built in the 18th century and has 3 cascading staircases, 17 fountains, 29 bas-reliefs and 255 bronze statues[7].

In addition, thousands of beautiful and unique waterworks around the world have been built with high design skills. It takes a long time to describe them one by one.

### III. CONCLUSIONS AND RECOMMENDATIONS

In conclusion, we can say that the world's waterworks serve as a great practical example for our state. Today, many architectural designers are creating new projects using world practice. And in

the future these projects will be continued and more positive projects will be created. At our institute, a project of aqua parks and fountains has been created, and construction work is underway, studying the unusual fountains of the world.

## IMPROVING THE STATUS, MOVEMENT AND OBSOLESCENCE ACCOUNT OF CONSTRUCTION MACHINERY

**O. Kh. Kholikulov\***

\*Basic doctoral student of Samarkand Institute of Economics and Service,  
 UZBEKISTAN

Email id: xox\_774@bk.ru

---

### ABSTRACT

*This article describes condition of existing construction machinery of construction companies operating in our country and ways to improve traffic accounting. It is important that any business entities operating in the country, including construction companies, accurately reflect the accounting and positively establish the control function. The direct revaluation method should be used to determine the current value of the equipment. In cases where the initial (replacement) value of fixed assets is revalued in accordance with paragraph 26 of NAS No. 5, their cumulative depreciation on the revaluation date is adjusted to the relevant change indices in the initial (replacement) value of fixed assets.*

**KEYWORDS:** *Construction Organizations, Accounting, Construction Works, Construction Machinery, Construction Machinery Movement, Accounts Chart, Construction Machinery Condition.*

---

### INTRODUCTION

The large-scale reforms implemented within the state program framework "Action Strategy" on the five main priorities of the country's development in 2017-2021 are also giving result in the construction companies' activities. In particular, it was adopted a radical reform of the construction industry, the widespread introduction of modern foreign experience in construction practice on the basis of national and international standards, and most importantly to ensure the accuracy, reliability and information transparency on the status, movement and accounting of construction machinery, a number of normative and legal documents. In particular, the following tasks play a key role in the state program, i.e.:

- ✚ removal of obsolete and not used in practice technologies and machines in the estimate documents preparation, revision in the introduction of market mechanisms. [1]

As noted in Presidential address of the Republic of Uzbekistan Sh.M.Mirziyoev to the Oliy Majlis on December 29, 2020, "Over the past 4 years, serious steps have been taken to introduce market mechanisms in all our economy sectors. The task now is to lay the foundation for long-term sustainable growth through deep structural reforms". [2]

**Literature analysis.** Accounting plays an important role in the construction companies activities in the Republic of Uzbekistan, taking into account the condition and movement of construction machinery. It is important that any business entities operating in the country, including construction companies, accurately reflect the accounting and positively establish the control function. According to the Law of the Republic of Uzbekistan "On Accounting", accounting consists of a regulated system of collection, registration and generalization of accounting information through a complete, continuous, documentary accounting of all business transactions, as well as the preparation of financial and other reports. [3]

It is known that many economists and researchers of our country have conducted direct research in the construction machinery, i.e. in the scientific research in the fixed assets structure in the activities of construction companies.

Economists of our country N.A. Makhmudova [4] have developed theoretical and practical skills on the operation of direct lifting machines and equipment in a cyclic mode, and the mutual kinematic scheme and the position and movement of structural cranes and loaders, features of construction machinery i.e. their description of road construction machines in quality use have scientifically substantiated by T.I. Askarhojaev, Kh.N. Dimitov, R.O. Shukurov, A.O. Ikramov, S.I. Ibrokhimov, Z.O. Maksudov, M.T. Umirov [5], K.B. Urazov [6] contributed to the vast practical and theoretical knowledge and skills harmonization in the basic accounting basis substantiation in all accounting operations substantiation in construction organizations operating throughout the country. Today, many international and national procedural principles are being studied in theoretical and practical aspects of accounting for machinery and equipment in construction companies and improving their condition, movement accounting<sup>1</sup>.

**Research methodology.** As a result of this research, systematic analysis, accounting methods were used to study the construction machinery state and movement in construction organizations on the basis of international standards.

**Analysis and results.** The status and movement of existing construction machinery in the construction companies operating in the country, as well as their receipt and sale is an important treatment for the construction company. Therefore, it is expedient to pay special attention to the construction companies operations on the income and expenditure of construction machinery.

"SUFAT I D" LLC construction company purchased a crane XCMG QY25K5-C (EURO-5) from "NAVOI PROM GRAND" LLC at 1,612,210,000 soums cost (as of the date of registration of the customs cargo declaration). The amount of the accumulated exchange rate difference is 10,000,000 soums. It is advisable to record these transactions in the following accounting records.

**TABLE 1<sup>2</sup> REFLECTION OF OPERATIONS RELATED TO THE IMPORT OF FIXED ASSETS (CONSTRUCTION MACHINERY) IN THE ACCOUNTING RECORDS**

№	The content of the business transaction	Amount, (thousand	Correspondence*		The basis document
			debit	credit	

		soums)			
1.	Construction machinery was purchased for a fee	1 612 210,0	0820	6010	contract, invoice
2.	Construction machinery was introduced	1 612 210,0	0100	0820	act
3.	According to the additional agreement, the construction machinery will be provided free of charge	1 612 210,0	6010	8530	contract, act
4.	The exchange rate difference was reflected as income	10 000,0	6010	9390	contract, calculation

When fixed assets (construction machinery) are put into operation, their value is reflected in the correspondence with the account 0820 on the account debit 0130 "Machinery and equipment". When concluding an additional agreement on the transfer of equipment free of charge, its initial value must be reflected in the account 8530 - "Property received free of charge." When closing the account 6010 "Accounts payable to suppliers and contractors" on the date of the additional transaction, the balance of the accumulated exchange rate difference in the account 9390 - "Other operating income" should be reflected as income.

In the existing construction organizations operating in the country, the use of specific methods based on the accounting functions in the construction machinery sale is important. In construction organizations, fixed assets (construction machinery) can be reduced due to their sale, liquidation, free transfer, included in the cost of the facility and other costs. These transactions are reflected in the account with the following accounting transfers.

**TABLE 2<sup>3</sup> ACCOUNTING FOR TRANSACTIONS ON THE EXPENDITURE OF FIXED ASSETS (CONSTRUCTION MACHINERY) IN CONSTRUCTION ORGANIZATIONS**

№	The operation content	Amount	Correspondence* [7]		The basis document
			Debit	Credit	
<b>Sale of fixed assets (construction machinery)</b>					
1.	Sale value of fixed assets (construction machinery) (without VAT)	600 000,0	4010	9210	Contract, invoice
2.	To the amount of VAT (if the enterprise is a VAT payer and subject to taxation). VAT rate is 15% <sup>4</sup> . (600 000,0*15/115)	78 260,9	4010	6410	Contract, invoice
3.	To the initial value of the main engine (construction machinery)	500 000,0	9210	0130	Contract, invoice
4.	Write-off of accumulated depreciation of fixed assets (construction machinery)	120 000,0	0230	9210	Contract, invoice

5.	Write-off of revaluation reserve	80 000,0	8510	9210	Accounting
6.	Profit from sales	300 000,0	9210	9310	Form 2
7.	Damage from sales	-	9430	9210	Form 2

Based on the data in the table above, it is advisable to implement fixed assets (construction machinery) in any business entities activities, including construction companies. It should be noted that on the basis of the data in Tables 1-2, the fixed assets expression features (construction machinery) in the accounts of profit (9310) or loss (9430) as a result of income and expenditure are highlighted.

“SUFAT I D” LLC has technological equipment for the liquid concrete production with a recovery cost of 1,393,702,013 soums. Its obsolescence is 100%, the residual value is zero. The equipment is in good condition and is used in the production of liquid concrete products. The equipment was evaluated by an independent appraiser to adjust its value to market prices and to make a realistic calculation of the produced liquid concrete product cost. According to the appraisal act, the market residual value of this equipment on the appraisal date is 1,200,047,119 soums. It is important for the construction organization to reflect the change in this equipment value in accordance with NAS 21. In this regard, it is necessary to pay special attention to the fact that this change is the organization income and the tax consequences.

According to paragraph 45 of NAS № 5 "Fixed assets"<sup>5</sup> which is one of the existing by-laws in the country, the useful life of fixed assets can be revised by the enterprise, taking into account the costs that improve the condition of fixed assets and, consequently, prolong service life. “SUFAT I D” LLC should extend the useful life of the equipment and make appropriate changes to the technical documentation. The direct revaluation method should be used to determine the current value of the equipment. In cases where the initial (replacement) value of fixed assets is revalued in accordance with paragraph 26 of NAS No. 5, their cumulative depreciation on the revaluation date is adjusted to the relevant change indices in the initial (replacement) value of fixed assets. Depreciation is then calculated from the revalued amount. Since only the residual equipment value (the difference between the initial value and the obsolescence amount) is specified in the appraisal act, determine the initial value of the equipment and the amount of obsolescence on January 1, 2020 by calculation for revaluation according to NAS № 5 and NAS № 21 should.

Since “SUFAT I D” LLC does not provide information on the "old" and "new" service life of the equipment, we offer the **following method** of calculating its initial cost and the amount of depreciation.

**1. On the revaluation date**, the construction machinery obsolescence degree is determined as a percentage. It is equal to the sum of the service periods divided by the newly defined service life and multiplied by 100% until the full depreciation of the equipment and then the revaluation date.

**The obsolescence rate of the construction machinery at the revaluation date<sup>6</sup>** is calculated using the following formula, i.e.:

$$QMM_{bed} = \frac{X_m + O'd}{U_m} \times 100\% \quad [1]$$

Here,

$X_m$  - service life;

$O'd$  - depreciation period;

$U_m$  – extended term.

**1-Case.** The service life of depreciated equipment has been extended from 20 to 35 years. 2 years and 3 months have elapsed since its full depreciation until January 1, 2020. Equipment obsolescence rate on 1.01.2020:

This is calculated as follows.

$$(20 + 2,25) / 35 \times 100 \% = 63,6 \%$$

**2. The initial value of the construction machinery** is equal to its residual value according to the appraisal act divided by 100 on the revaluation date and 100 times the difference in the equipment obsolescence level.

The initial value of the construction machine<sup>7</sup> is calculated by the following formula, i.e.:

$$QMM_{qb} = \frac{Qq}{100 - Ed} \times 100\% \quad [2]$$

Here,

$Qq$  – residual value;

$Ed$  – obsolescence rate.

**2-Case.** According to the appraiser, the residual value of the equipment is 1,200,047,119 soums. Its depreciation rate is 63.6% in 1.01.2020. We calculate the initial value of the equipment on the same date:

$$1\ 200\ 047\ 119 / (100 - 63,6) \times 100 = 3\ 296\ 832\ 745 \text{ soums.}$$

**3. The amount of obsolescence revaluation date** is multiplied by its depreciation level, divided by 100, equal to the initial value of the equipment on the revaluation date.

The amount of depreciation of a construction machine<sup>8</sup> is calculated using the following formula, i.e.:

$$QMM_{es} = \frac{Bq \times Ed}{100} \quad [3]$$

Here,

$Qq$  – residual value;

**Ed** – obsolescence rate.

**3-Case.** On January 1, 2020, the initial cost of the equipment is 3,296,832,745 soums, its obsolescence rate is 63.6%. Determine the amount of obsolescence:  $3\,296\,832\,745 \times 63,6 / 100 = 2\,096\,785\,626$  soums.

After determining the initial value and the amount of construction machinery obsolescence revaluation account № 21 NAS and on January 1, the annual revaluation of fixed assets is carried out on the basis of standard accounting entries in accordance with the Regulations<sup>9</sup> on the procedure for conducting revaluations. The difference between the amount of additional equipment assessment of "SUFAT I D" LLC between the starting price on January 1, 2020 and 1 393 702 013 soums, the amount of additional obsolescence assessment of the equipment will be the difference between the amount of obsolescence on January 1, 2020 and 1,393,702,013 soums.

The result of the equipment revaluation is reflected in the accounting with the following entries:

Debit 0130 – to the sum of the additional valuation of the initial value of the equipment;

Credit 0230 – to the amount of additional assessment of equipment obsolescence;

Credit 8510 - to the amount of the difference between the amount of the additional assessment of the initial value and the amount of equipment depreciation.

According to Article 355 of the tax code, equipment value revaluation is not considered the enterprise income and is not taxed.

## CONCLUSIONS AND SUGGESTIONS

In addition, on the basis of the above operations in the construction organizations and construction products production, we would like to note the following as suggestions and recommendations:

- clarification of management and financial accounting data on the construction machinery description and classification;
- assistance in determining the real state of construction machinery;
- ensuring timely and accurate operations reflection on the condition and movement of construction machinery in the accounting and reporting;
- to be the basis for providing accurate information to internal and external users on the condition, movement and obsolescence of construction machinery;
- to create a basis for timely calculation and payment of tax on the condition, movement and obsolescence of construction machinery.

In conclusion, based on the above information, accounting serves as a key factor in ensuring the continuous implementation of the control function.

### **ABSTRACT**

*The development of transport communications and the improvement of their use is one of the most pressing tasks in the development of the economy. In fact, the share of domestic goods in the transport of goods in the country is the share of roads shows that roads are one of the key factors in the development of the economy of the republic. The use of lanes determines certain modes and procedures for the movement of vehicles and pedestrians. Road lanes are a means of visual guidance for drivers and play an important role in increasing the speed and through put of vehicles and ensuring road safety.*

## INTRODUCTION

### Main part

The priorities of the state road policy are the creation of international transport corridors that ensure the conditions of economic development of the country, ensuring reliable transit and inter-regional transport links, the formation of a single integrated transport environment of the republic, the restoration of the Great Silk Road and access to world markets. marked as The practical solution of these tasks requires improving the quality of transport and operation of the existing road network, adapting the technical and operational conditions of roads to the needs of road users, ensuring the comfort and safety of traffic, effective organization of road maintenance [1].

Speaking of "Motor Roads", the purpose of the Law of the Republic of Uzbekistan "On Motor Roads" dated 29.07.2007 is to regulate relations in the field of design, construction, reconstruction, repair, maintenance and operation of highways.

Highway - a set of engineering structures designed for the movement of vehicles, ensuring their continuous and safe movement at a specified speed, weight, size, as well as the land allotted for the placement of this complex and the space within the specified range above the complex [2].

The classification of the appendix to the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan "On improving the organization and quality control of construction and operation of roads" dated 29.07.2007, public roads, inter-farm rural roads, cities, urban settlements, villages and defines the types and structure of repair and maintenance of aul streets (hereinafter referred to as "highways") and the basis for substantiating the use of funds, forecasting the cost of repair and maintenance of roads and road structures and the organization of road works is calculated.

Road diagnostics is a key element in the system of collecting information on the condition of roads and includes determining the technical condition of roads in the period under review, forecasting the technical condition of the road after a certain period, identifying the primary causes of defects on roads.

Roads in the Republic of Uzbekistan are classified as follows:

Public highways;

Streets of cities and other settlements;

Farm highways [3].

The constant proliferation of vehicles and the operation of asphalt pavements in aggressive conditions of external factors lead to the appearance of various defects and, as a result, premature deformation and deterioration of roads. Most of the defects are primarily due to the specific physical, mechanical and rheological properties of the organic binder used. The use of modified additives that affect its structure and properties and, consequently, improve the quality of road-building compositions, allows to regulate the properties of bitumen.

Along with highways, lanes also play an important role in ensuring road safety.

Edward N. Hines (Edward N. Hines, 1870-1938), a member of the Wayne County Road Commission in Michigan (USA), is the inventor of road lines. In 1911, Woodward Avenue in

Detroit proposed the use of the world's first road line to split the flow of traffic in the middle of a concrete road. [4].

Ten years later (in 1921) the first British road markings appeared in the English town of Sutton Coldfield (on the outskirts of Birmingham). This experience in improving road safety has been very successful, and later white road lines became the standard in the UK and many other countries. [5].

For some time, different options have been used for road signs in different countries. In Germany, for example, black marks were used in the 1930s, which were later rejected as ineffective. Nowadays, black is used in conjunction with white when vertical symbols are used.

In the 1930s, the British Percy Shaw invented cataphats ("cat's eyes"), a device that reflected light even in the dark, and these catapults were widely used by drivers in the UK during the dark hours of the day during World War II.

In the 1950s, Elbert Daysart Botts, an expert in paint chemistry at Caltrans (California Department of Transportation), used paint containing glass beads to improve the appearance of road lines. At the same time, the light-reflecting elements in the line began to rise to a quarter of the way (about 6 mm) so that the water layer covering the road line would not worsen the view. At the same time, if the driver did not notice the lanes, he felt the shocks as the car wheel crossed the raised lanes, in this way the "lanes" begin to warn drivers that they are crossing the lane.

Botts was invented by former student Herb Rooney in the 1950s as a durable adhesive epoxy resin on the road with a special nail with the addition of ceramic or plastic markers. Since 1966, markers called Botts-Dots have been used on U.S. roads and later in other parts of the world. [6].

In 1955, the first peripheral noisy (road lane) lanes appeared in New Jersey. Today, they are widely used in many countries, including the United States, Canada, Finland, Norway, Sweden and others. [7].

With the increase in traffic on highways, vertical lines have also been used to block dangerous sections of roads, to identify sudden obstacles.

At the same time, road lines are widely used in gas stations, underground and above-ground parking lots, as well as in the territory of airports in neighboring areas outside the roads.

Road lanes can be permanent or temporary. In all countries, white paint is used for permanent road lines. Yellow paint is used for temporary road lines, and such colors mainly indicate parking lots for vehicles and taxis on the route, as well as places where parking or parking is prohibited.

It can be applied with yellow (Germany, Estonia), orange or red (Austria, Switzerland) paints when drawing permanent road lines and is used in traffic repair and reorganization.

Permanent and temporary road lines can be drawn at the same time, when using temporary road lines, it is usually applied with a paint with a short shelf life, when the repair work is completed, the road line itself is erased or removed by road service personnel.

Noisy road lanes (noise lanes) are used to draw attention, especially at emergency pedestrian crossings, to show the edges and subdivisions of federal roads. This marking method allows the tired driver to "Trigger" and also reminds them to slow down the car. [8].

Relevance of the case. The use of lanes determines certain modes and procedures for the movement of vehicles and pedestrians. Road lanes are a means of visually guiding drivers and play an important role in ensuring road safety, increasing the speed and throughput of vehicles, and in conditions that are not sufficiently visible.

Currently, the marking of roads is carried out using paints, cold and hot plastics, polymer tapes, materials using traditional and new technologies. Studies show that the design and performance efficiency of horizontal road signs depends on the drying time (thermoplastic) of the paint, its recovery, adhesion coefficient and abrasion resistance. To ensure traffic safety, horizontal lanes should be visible at any time of the day and easily recognizable (understandable) to drivers of vehicles.

The most budget and most common option for marking with road lines are acrylic and alkyd paints, in other words, these are acrylic or alkyd resin-based paints containing organic solvents with the addition of coloring pigments and targeted additives.

Acrylic and alkyd paints are used for marking concrete, asphalt and petroleum bitumen coatings. They provide the coating with a separate coating. Other advantages of this type of marking material include:

- good meteorological stability, including abrupt changes in temperature and high humidity;
- resistance to chemicals, abrasives and mechanical damage.

Alkyd or acrylic marking paints are applied without a compressor (using a sprayer) or in a pneumatic manner. For road lines, it is advisable if the air temperature is above 20 degrees Celsius, and the paint dries in 5 minutes.

Road thermoplastic is a granular mixture of thermoplastic resins, plasticizers, pigments and various target additives. It is designed for drawing road lines on asphalt and concrete pavements. To draw road lines on roads, thermoplastics are placed on the pavement using a special machine in the form of a solution. The melting temperature of thermoplastics requires a temperature of 170-200 degrees. Excessive heat should be avoided, as this can cause the thermoplastic to crack or turn yellow. In order for the paint to solidify in a short time (10 minutes), it is advisable that the air temperature is above 10 degrees and the air humidity is at least 80%.

For better adhesion of thermoplastics to concrete, the road surface should be cleaned before applying thermoplastics. Paint for this type of road sign is applied only to dry surfaces. In areas with large temperature differences, cracks may appear after the application of thermoplastics.

To increase the visibility of the marking line, light-reflecting particles reflecting the appearance of microscopic balls are added to the thermoplastic for marking. It is recommended to apply a layer of quartz sand to the markings before coating with thermoplastic to enhance the grip of the car tires on the road.

Thermoplastic road signs have clear advantages over alkyd and acrylic paints. First, it's a long-lasting coating. Second, thermoplastics do not contain solvents and volatiles, which means that the negative impact on the environment is minimized.

Thermoplastics are a mixture of a hard resin plasticizer (30 2%) and an inorganic pigment fraction (70 3%). Petroleum polymer paint and varnish resin is used as a binder, POD oil

(oxidation and dehydration products, waste from caprolactam production) is used as a plasticizer. becomes a mass.

Thermoplastic is used in the molten state for marking road markings (drawing a safety line), which is done using road marking machines. The cost of drawing a safety line is 8-10 kilograms of thermoplastic granules per 1 square meter of asphalt-concrete road with a thickness of 3-5 millimeters of coating.

Cold plastic, unlike thermoplastic, all components of the mixture are in a liquid state and the solvent is added separately before drawing.

Cold plastic is the most modern and reliable, and the advantages of this type of material over thermoplastics for road signs include:

- high resistance to friction of car tires with spikes;
- good adhesion to asphalt, as well as concrete after its initial cleaning;
- Installation (drawing) of thermoplastics on the road does not require the use of separate techniques, cold thermoplastics can also be done by hand.

Cold plastic, as well as the thickness of the line after laying the thermoplastic is 1.5-3 mm, and even in summer the material has excellent weather resistance. A hot air temperature of 0 to 40 degrees is suitable for cold plastic laying.

This material does not contain thermoplastics as well as solvents or other volatile substances, making it environmentally friendly for the workers and the environment in which it is installed. It is only applied to a dry surface at a temperature not lower than 0 degrees.

## CONCLUSION

Road strips made of thermoplastic and cold plastics are modern methods of marking on the road surface, they are used more economically, have a high level of environmental friendliness and ensure almost perfect teething of car tires on the road. These advantages allow these two types of lanes to be used on any highway. As a result, it plays an important role in ensuring road safety and preventing road traffic accidents.

### ABSTRACT

*Empowerment is a multi-dimensional social process that helps people gain control over their own lives communities and in their society, by acting on issues that they define as important. Empowerment occurs within sociological, psychological economic spheres and at various levels, such as individual, group and community. Empowering women puts the spotlight on education and employment which are an essential element to sustainable development. One of the powerful approaches to women empowerment and entrepreneurship is the formation of Self Help Groups (SHGs) especially among women's SHG is conceived as a sustainable people's institution that provides the poor women with space and support necessary for them to take effective steps towards achieving greater control of their lives. Women played various managerial and non-managerial roles in the decision making process. Women constitute one- half of the segments of population in India and women are vital and productive workers in Indi's national economy. Hence an attempt is made to analyse whether there is any significant difference between Nativity and Factors towards empowerment.*

**KEYWORDS:** *Empowerment, Women, Nativity, Factors Of Empowerment*

### 1. INTRODUCTION

Micro Finance is emerging as a powerful instrument for poverty alleviation in the new economy. In India, micro finance scene is dominated by Self Help Groups (SHGs) – Bank Linkage Programme, aimed at providing a cost effective mechanism for providing financial services to the “unreached poor”. Based on the philosophy of peer pressure and group savings as collateral substitute , the SHG programme has been successful in not only in meeting peculiar needs of the

rural poor, but also in strengthening collective self-help capacities of the poor at the local level, leading to their empowerment.

Micro Finance for the poor and women has received extensive recognition as a strategy for poverty reduction and for economic empowerment. Increasingly in the last five years, there is questioning of whether micro credit is most effective approach to economic empowerment of poorest and, among them, women in particular. Development practitioners in India and developing countries often argue that the exaggerated focus on micro finance as a solution for the poor has led to neglect by the state and public institutions in addressing employment and livelihood needs of the poor.

## 2. REVIEWS OF LITERATURE

**Kabeer (1991)<sup>1</sup>** Empowerment signifies increased participation in decision-making and it is this process through which people feel themselves to be capable of making decisions and the right to do so.

According to **Emma Zapata (1991)<sup>2</sup>** empowerment is power within and can be expressed in different ways, such as a chance to negotiate as a group, to share power, to get the support of other organisations, to look for outside support, all building up power in positive way.

According to **Sankar Chatter Jee (1993)<sup>3</sup>** empowerment through group strategy is multi faced process which encompasses many aspects enhancing awareness increasing the access to resources economic and social. An equally component is the mobilization and organization of women into groups. The group strategy provides the required basis for solidarity strengths and collective action among the women. Empowerment is also linked to issues of social justice and equality.

**Sakunthala Narashimhan<sup>4</sup>**, The author focuses on the positive aspects of the empowerment such as economic, social, political and psychological empowerment and the author concludes that to empower women with hope and enthusiasm in the inner layers of their psyche (mind) and thousands of women, irrespective of the educational achievements or economic status, women show their determination as useful and productive citizens who are eager to contribute their mite to the national effort.

**Mayoux, (1993)<sup>5</sup>** has identified three ‘paradigms’ on micro-finance and gender. The ‘financial self-sustainability paradigm’, currently dominant within most donor agencies and USAID, World Bank, UNDP, etc. assumes that increasing women’s access to micro-finance services will lead to individual economic empowerment, well-being and social and political empowerment.

**Punithavathy Pandian and Eswaran (2005)<sup>6</sup>** argued that the economic empowerment of poor women is the only way for poverty eradication. Because increased access to financial resources enables poor women to increase their employment and income in the petty business that has local demand and also based on local resources.

Microfinance, according to **Otero (1997)<sup>7</sup>** is the provision of financial services to low-income poor and very poor self-employed people. These financial services, according to **Ledgerwood (1997)** generally include savings and credit but also include other financial services such as insurance and payment services.

**K.K.Kundu, K.S.Suhag, U.K.Pandy and Kusum Jain (2001)**<sup>8</sup> in their article, “sustainable Micro Financing through SHGs in Gurgaon district (Haryana)”, pointed out that through SHGs the poor had developed courage and confidence and served as decision makers SHGs inculcated the habit of savings among women.

### 3. Statement of the Problem

In India, 93 per cent of all workers are self employed. Women constitute more than half of this workforce. More than 96 per cent of women workers are self employed. Self employed workers are those who earn a living through their own small business or through their own labour. Unlike workers in the organised sector, they do not obtain a regular salary. These workers are characterised by insecure employment, low incomes, lack of capital assets, lack of access to institutional support and social security benefits, leading to an extreme level of poverty. The women generally vendors, home based workers such weavers, garment makers, food processors and craft people, manual labour and service providers such as agricultural labourers, construction workers, rag pickers domestic workers and cart-pullers.

One of the powerful approaches to women empowerment and entrepreneurship is the formation of Self Help Groups (SHGs) especially among women's SHG is conceived as a sustainable people's institution that provides the poor women with space and support necessary for them to take effective steps towards achieving greater control of their lives. Also create awareness about health and hygiene, sanitation and cleanliness, environmental protection, importance of education and better response to development schemes. Through SHGs they are provided credit and extension support for various production oriented and income generating activities. Also Micro finance for the poor and women has received extensive recognition as a strategy for poverty reduction and for economic empowerment.

The impact of microfinance in Kodikanal is a subject worthy of serious examination for a number of reasons. In kodaikanal there are ample opportunities for entrepreneurial development. Most of the women here are poor and earn for livelihood through self employed activities. If they are supported financially by affordable schemes like Micro Finance to sustain their life, they can concentrate more on their employment activities and slowly they could become an better entrepreneur.

Against this backdrop, the present study has been carried out to assess the impact of micro-finance on socio-economic status of women.

### 4. Objectives

- To analyse whether there is any significant difference between Nativity with respect to empowerment

### 5. METHODOLOGY

The present study depends on both Primary and Secondary data. Primary data is based on the survey method. To facilitate the survey, Interview schedule was constructed as optional type as well as in Likert's five point scale. The optional type is aimed at information search and other details of the respondents. The likerts five point scale is applied to seek the opinion of the respondents regarding opinion, satisfaction and expectations. Interview schedule was used to

know the perceptions of the respondents regarding their socio economic details, empowerment factors, micro finance provision.

Survey is conducted among the Self Help Group Members in Kodaikanal. The Stratified Random sampling technique adopted. The selection process is given below

This study was intended to analyse the role of SHGs in the promotion and development of the women members. For the purpose of analysis, the study was designed with a comprehensive profile.

Kodaikannal is divided into

- Kodaikannal Municipality and
- Kodaikannal Union

In Kodaikannal Municipality, we have

➤ Wards : 24

In Kodaikannal Union we have,

- Panchayat Union : 01
- Town Panchayats : 01
- Panchayats : 15
- Firrkas : 03
- Villages : 16
- Hamlets : 81

Table 1 shows the details relating to total no. of SHGs in Kodaikannal Municipality

	<b>TOTAL</b>	<b>124</b>	<b>135</b>	<b>76</b>	<b>57</b>	<b>148</b>	<b>9</b>	<b>67</b>	<b>616</b>

**Selection of panchayat-**The Union-wise and panchayat-wise details of the Self Help Groups are maintained systematically by the taluk administration. The details regarding thrift, loans, and the number of NHGs, which are updated monthly was collected. As the number of SHGs is definite, the population can be known. Hence, the researcher resorted to Random Sampling Technique. In Kodaikanal, more than 1200 self help groups are functioning. These self help groups were stratified and on basis of stratification sample, respondent groups were selected.

There are 24 wards in Kodaikannal Municipality and 132 wards in Kodaikannal Union. In these wards, there are approximately 1200 SHGs. Each ward is given equal weightage. Out of these SHGs, 1 SHG from each ward is selected as sample. So, totally 120 SHGs were selected. (i.e. 10% of the total population). The researcher contacted the sample SHGs and requested the SHGs to conduct a survey with the required number of members. On the recommendation of the animator, the survey was conducted with the members. Thus, sampling was done scientifically and survey was carried out according to the research norms without prejudice and bias.

## 6. Tools used for Analysis

To analyse, the objectives framed, percentage, Mean Standard deviation and t test are used.

## 7. Analysis of the study

The analysis consists of two parts I Profile of the sample respondents and II their empowerment level before and after access of micro credit.

## i) Profile of the Respondents

TABLE 3

Sl.No	Particulars	Classification	No of Respondents	Percentage

## II Analysis of the Study

*Null Hypothesis*

There is no significant difference between Education with respect to empowerment

TABLE 4.3.6 T TEST FOR SIGNIFICANT DIFFERENCE BETWEEN EDUCATION WITH RESPECT TO EMPOWERMENT

Empowerment of women		Education				t value	P value
		Illiterate		Literate			
		Mean	SD	Mean	SD		
Economic Empowerment	Before	23.23	4.78	24.20	4.70	2.109	0.035*
	After	37.13	4.89	36.77	4.73	0.786	0.432
Social Empowerment	Before	15.38	5.41	17.43	6.04	3.647	< 0.001**
	After	39.66	5.12	39.32	5.05	0.706	0.481
Decision making Empowerment	Before	21.10	4.36	21.73	3.77	1.631	0.104
	After	31.41	3.76	30.87	4.16	1.373	0.170
Familial /Interpersonal Empowerment	Before	25.83	3.61	27.36	3.12	4.754	< 0.001**
	After	36.05	3.95	35.44	3.73	1.656	0.098
Psychological Empowerment	Before	20.15	4.47	22.47	4.08	5.639	< 0.001**
	After	35.06	4.20	35.21	4.47	0.359	0.720
Overall Empowerment	Before	105.71	15.67	113.19	13.31	5.419	< 0.001**
	After	179.31	17.60	177.61	17.70	0.997	0.319

Note: \*\* Denotes significant at 1per cent level

\* Denotes significant at 5per cent level

Since P value is less than 0.01, the null hypothesis is rejected at 1 percent level of significance with regard to Social empowerment, Familial empowerment, Psychological empowerment, overall empowerment before joining SHGs. Hence there is significant difference between Illiterate and Literate with respect to Social empowerment, Familial empowerment, Psychological empowerment and overall empowerment before joining SHGs. Based on mean score, the Illiterates have better overall empowerment after joining SHGs than literate. Since P value is less than 0.05, the null hypothesis is rejected at 5 percent level of significance with regard to Economic empowerment before joining SHGs. Hence there is significant difference between Illiterate and literate with respect to Economic empowerment before joining SHGs. Based on mean score, the Illiterates have better Economic empowerment after joining SHGs than literate.

There is no significant difference between Illiterate and literate with regard to Economic empowerment, Social empowerment, Familial empowerment, Psychological empowerment, overall empowerment after joining SHGs, and with regard to Decision making empowerment before and after joining SHGs, since P value is greater than 0.05. Hence null hypothesis is accepted at 5per cent level with respect to after joining SHGs of Economic empowerment, Social empowerment, Familial empowerment, Decision making empowerment, Psychological empowerment and overall empowerment.

#### *Null Hypothesis*

There is no significant difference between Education with respect to other factors towards empowerment

**TABLE 4.3.7 T TEST FOR SIGNIFICANT DIFFERENCE BETWEEN EDUCATION WITH RESPECT TO OTHER FACTORS TOWARDS EMPOWERMENT**

Factors towards Empowerment of women	Education				t value	P value
	Illiterate		Literate			
	Mean	SD	Mean	SD		
Benefits of Education	52.65	5.16	51.31	5.61	2.534	0.012*
Satisfaction with training programme	25.76	3.35	25.46	3.33	0.832	0.406
Satisfaction towards the Empowerment	32.39	4.56	31.28	4.52	2.535	0.012*
Problems at work place	13.84	1.79	13.71	1.90	0.749	0.454
Problems at homes	15.87	3.33	15.18	3.28	2.182	0.030*
Problems at marketing	29.51	3.33	29.25	3.19	0.839	0.402
Overall Problems of Micro Finance	59.23	6.14	58.13	6.23	1.827	0.068

Note: \* Denotes significant at 5per cent level

Since P value is less than 0.05, the null hypothesis is rejected at 5 percent level of significance with regard to Benefits of Education, Satisfaction towards empowerment and Problems at homes. Hence there is significant difference between Illiterate and literate with respect to Benefits of Education, Satisfaction towards empowerment and Problems at homes. Based on mean score, the Illiterates of various factors towards empowerment are better than literate. There is no significant difference between Illiterate and literate with regard to Satisfaction with training programme,

Problems at work place, Problems at marketing and overall problems of micro finance, since P value is greater than 0.05. Hence null hypothesis is accepted at 5per cent level with respect to various factors of Satisfaction with training programme, Problems at work place, Problems at marketing and overall problems of micro finance.

### SUGGESTIONS AND CONCLUSIONS

A process in which women challenge the existing norms and culture, to effectively promote their well being is known as women empowerment. The participation of women in Self Help Groups (SHGs) made a significant impact on their empowerment both in social and economic aspects. This study examines Women Empowerment in Self Help Group through micro finance.

As we know that women in our country have a respectable place in the society. But after six decades of independence, the situation of women is very severe in the rural and backward areas. Women constitute around fifty percent of the total human resources in our economy. Yet women are the more poor and under privileged than men as they are subject to many socio-economic and cultural constraints. Women development activities must be given importance to eradicate poverty, increase the economic growth and for better standard of living. Self Help Group (SHGs) is small credit cooperatives, usually all poor and all women.

Empowerment results in a change in the balance of power, in the living conditions and in the relationships. To achieve this, women must be free to decide about their income and should gain self-confidence.

### ABSTRACT

*The article examines the large-scale reforms carried out in the transport sector of our country, the provision of logistics and transport services in high-quality and competitive conditions to all sectors of the economy and all segments of the population, in the near future, the effectiveness of the implementation of investment and innovation programs, as well as a significant contribution to sharpening the economic potential countries.*

**KEYWORDS:** *Investment, Trend, Communication, Innovative Development.*

### INTRODUCTION

Transport is a critical area where all digitalization indicators must drive growth. In particular, the issues of electronic control and regulation of transport, increasing the speed of transport and logistics work, reducing the level of environmental pollution by transport, ensuring road safety are considered. The formation of a system of "intelligent transport" on the basis of the widespread introduction of ICT in the transport sector should become the most important direction of the strategy of medium and long-term development of our country. Modern trends in

economic development and ongoing reforms indicate that, taking into account the geographical location of the Republic, the formation and implementation of a unified transport policy aimed at ensuring the quality and popularity of transport services, is of particular importance in the implementation of modern technologies and management systems in this area. In recent years, our country has been implementing a wide range of measures aimed at developing transport and transport communications, ensuring a high level of transport safety, improving the management system in the transport industry, and training qualified specialists for this industry.

In order to radically improve the public administration system in the field of transport, increase the investment attractiveness and export potential of the Republic, ensure the strategic development and sustainable operation of transport communications, as well as, in accordance with the tasks set out in the action strategy for five priority areas of development of the Republic of Uzbekistan for 2017- 2021, on the basis of the Uzbek Agency for Road Transport, by the decree of the President of the Republic of Uzbekistan No. PF-5647 "On measures for the development of road transport in the Republic of Uzbekistan", the Ministry of Transport of the Republic of Uzbekistan was created. This is the first strategic document in the history of independent Uzbekistan, which sets out the main directions of the country's long-term transport policy.

One of the most important reforms in the transport sector is the liberalization of the transport services market, the gradual reduction of state monopolies and restrictions, the provision of large facilities based on the principles of public-private partnership with foreign investors on favorable terms.

In particular, the introduction of the "Open Skies" regime, which provides for "Airspace" of the fifth level in the regions and international airports of the Republic of Karakalpakstan, as well as "Airspace" at the international airports of Navoi and Termez from August 1, 2020 for foreign airlines, creates the basis for the entry of potential investors into the air transportation market in our country. Despite serious obstacles and risks for the implementation of investment projects in the context of a pandemic in the transport system, systematic work is underway on projects planned for January-June of this year. In particular, in 2020, the second stage of the Yunusabad line of the Tashkent metro (2.9 km.), The first stage of the land ring of the metropolis in the city of Tashkent (11.4 km.) Was completed, railway station Andijan-Savay-Khanabad (65 km.), construction and installation works on modernization projects have been completed. In addition, as a result of research carried out in the field of the transport system, the results of the implementation of projects identified in the investment programs amounted to 131 percent of the state budget funds for roads and 99 percent of the work performed in connection with the plan for investment projects, within the framework of 5 investment projects financed by at the expense of the federal budget., Two projects are being implemented under the system of JSC "Airports of Uzbekistan". Projects "Construction of the Samarkand International Airport". Samarkand airport receives \$ 62 million. As a result of research carried out in the field of the transport system, the results of the implementation of projects identified in the investment programs amounted to 131 percent of the state budget funds for roads and 99 percent of the work carried out in connection with the plan for investment projects, within the framework of 5 investment projects financed from funds federal budget., Two projects are being implemented under the system of JSC "Airports of Uzbekistan". Projects "Construction of the Samarkand International Airport". Samarkand airport receives \$ 62 million. As a result of research carried

Projects "Construction of the Samarkand International Airport". Samarkand airport receives \$ 62 million.

To date, several projects have been implemented to introduce universal transport systems (ITS) in the transport sector, in particular, this year, from January 1, in the state office of the city of Tashkent (bus and metro), an automated electronic payment system has been introduced, a mobile application "atto" has been launched for making payments through the "QR code", an automated online system for the distribution of foreign multilateral forms of permits was launched in order to create an automated information system based on the "Atto" system. In order to create more comfortable conditions for passengers, a unique Uztrans portal has been created, which allows online purchase of tickets for buses, rail and air transportation,

According to the "Action Plan for the Development of Digitalization Technologies in the Sphere of Transport and Road Facilities" of the Republic of Uzbekistan, a total of 61 projects are planned to be implemented, of which 38 projects are planned to be implemented in 2020, 13 projects in 2021 and 26 projects in 2022.

The introduction of advanced information technologies for the digitization of the entire transport system, the development and implementation of strategies for the further development of a single interconnected system of the transport system of the Republic of Uzbekistan

Increasing the level of innovative development of the transport system, the development of digitalization processes for all types of transport, the policy of stimulating the innovative development of the transport system and its individual components is the most important component of the state transport policy. It dresses up to solve most of the tasks facing the transport system and all its components, without increasing the level of innovation and without introducing modern digital technologies. In the proposal, the formation of large statistical databases (Big Data), an increase in the volume and quality of transport services, the formation of a modern market for passenger, freight, transport and logistics services, improvement of the planning and forecasting system of traffic based on access to the World Wide Web, ensuring the safety of space, transport and other types of transport. At the same time, the transport sector is not only a consumer of software services, new information and communication technologies and equipment, but also serves as a locomotive of demand for the development of these services and can be one of the driving factors in the development of the national ICT sector.

The main directions of increasing the innovative development of the transport industry are:

- a) introduction of a system of support for innovative technologies and training of research personnel by the Ministry of Transport of a unified and wide scope of scientific and technical policy of the transport industry;
- b) develop and promote the production of transport and logistics technologies, rolling stock, technical means and systems that ensure an increase in the throughput and quality of transportation of goods and passengers;
- c) creation and implementation of modern transport systems to improve the quality of passenger and freight traffic, as well as the introduction of modern information and telecommunication technologies and highly efficient brand and logistics technologies using global navigation systems GPS and GLONASS, vehicles and flow control technologies;
- d) Form a legislative and regulatory framework that will facilitate the introduction and digitalization of innovative technologies for the entire network of passenger and freight traffic.

In recent years, systemic reforms have been carried out in targeted areas, such as reducing the state monopoly on transport, introducing modern principles of corporate governance in industries and enterprises, implementing new initiatives in public-private partners, digitalization, Foreign Trade Management, membership in international transport and logistics systems. Also, certain work is being carried out to increase the investment attractiveness of the transport industry, expand the circle of investors, and implement mutually beneficial cooperation with foreign partners. Specifically, Uzbekistan ranked 99th in the Logistics Performance Index maintained by the World Bank, which includes the Logistics Performance Index (LPI). The report covers 168 countries measuring supply chain performance, providing access for local companies to national and international markets. LPI will also focus on emerging issues such as supply chain stability, environmental impact and the need for skilled workers.

**If we consider the index by its components, then Uzbekistan occupies:**

Customs procedure	140th place
Infrastructure	77th place
International transportation	120th place
Item tracking	90th place
Delivery period	91st place

Active and decisive measures are also being taken to remove obstacles to integration into the world community. Enhancing the country's image in the international arena is one of the topical issues of developing models of trade, economic, investment and social development, strengthening ties with leading international analytical and research institutions, as well as business associations around the world.

### ABSTRACT

*Much work has been done in the years of independence to study the literary heritage of educated authors who lived and worked in the Kokand literary environment during the late XIX and early XX centuries, but still, the fact that there are much work waiting for researchers to be explored, is also true. One of such authors, Muhammad Aminhoja Mirzakhoja's son Mukimi's life and creative legacy, has not ever been studied in a monographic way in the years of independence as it has not been objectively and thoroughly explored in the context of communist ideology. Therefore, there is a need for a comparative-textual study of the manuscripts of Mukimi and to re-examine the works of the poet and poems that are gathered based on modern achievements in textual and literary sources. Various lyrical and comic books in different sizes of Mukimi have been interpreted differently. It is also important to note that these interpretations are often far from the real nature of the text and are based on certain narrow templates. Therefore, there is a great need to study poet's poetry as an example within the issues of the textual interpretation. In the late XIX and early XX centuries, the commentary on the work of Kokand literary circles was also invaluable in explaining the historical events of the period. In this respect, the interpretations of Mukimi's literary heritage are of particular importance in the study of the literary-aesthetic world of the poet.*

**KEYWORDS:** *Histories, Poet, Interpretation, Line, Gazelle, Stophe, Editing, Literary Environment, Edition, Manuscript, Poems, Style, Turkistan.*

## INTRODUCTION

Although the study of Mukhimi's work began in his lifetime, the literary heritage of the poet has not been studied in terms of the history and editing of the text. Oriental studies began mainly with the publication and popularization of the works of the poet Mukimi. For instance, his lyrical poetry and satirical poems were published in the Turkestan Gazette (annual editions in the years 1891-1903-1907).

N. Ostroumov gave examples of the regular comic works of Mukimi in the IX collection of «Notes of the Eastern Branch of the Imperial Russian Archaeological Society» published in St. Petersburg in 1894. After that, N. Ostroumov sorted Mukimi's works, and in 1907 he wrote «Devoni Muqimiy», Muhammad Qasim Doda Muhammad's son «Devoni Muqimiy ma hajwiyyat» (1910-1912) for two times, and ordered Abdulqadir Khodandi to publish the collections by the pressing printing method «Bayoz ma hajwiyyat Mawlano Muqimiy ma Mawlano Furkat». It is known that the literary heritage of the poet attracted the attention of researchers in the XX of the last century. A serious study of the poet's work began in the 30s of past century. The poet Gafur Ghulam stood at the origins of this work. At his initiative, the «Muqimiy bayozi» was created and published in 1938. Several scientific articles, collections<sup>1</sup> and monographs devoted to Mukimi's life and his creative heritage have been published. The doctoral dissertation of Professor G. Karimov, entitled «The Uzbek democrat poet Mukimi and the literature of his time», occupies a special place in the field of contemporary studies of Mukimi.

## MATERIALS:

Mukimi's «Collection of Works» and «Selected Works», as well as the manuscripts and other sources, including materials of the Central State Archives of the Republic of Uzbekistan and poetic works in the manuscript funds. manuscripts 7521, 1325, 7688, 9309, 49.4100, copied by the poet, kept at the Abu Rayhan Beruni Institute of Oriental Studies and the Gafur Gulom Museum of Ferghana Literature, have been proven to be an important source.

## DISCUSSION:

At the end of the 19th and the beginning of the 20th century, the history of the representatives' works of Kokand literary environment is valuable as it clarifies the historical events at that time. Particularly, one of the well-known authors in Kokand's literary heritage, the history of Muhammad Aminhodja Mukimiy's works is important. The poems written by the poet on various events can be grouped as follows:

- 1) Signs written on people's death;
- 2) Histories on the construction of buildings and structures;
- 3) Writings on historical events.

Signs written on the people's deaths. In poet's five distichous elegy written in Tajik named "The Favtites of the Fate of the Nation", Inomkhodja Umarchodjaev's fate and death who was Tashkent's noble and participated in a popular uprising in Tashkent in 1892, is mentioned.

Sar zi hayrat barkashidu guft aql

Khojai In`om, sad afsus, murd

*Translation:*

He began to shudder,

Unfortunately, Ho'ja Ab'yom died.

Muqimiy's love to Inomkhodja Umarhodjaev who opposed to the policy of Russian monarch, was explicitly expressed in the historical elegy. "Though he wailed in the prison, he was killed. On the day of his death, all the people of Kokand, olds and young, were mourning," - says in elegy. [1].

According to Hijri count, 1322 appears from the second line of the distich. According to the gesture of the distich, the first letter of the word "admiration" in the first line is the value of "h", so as if the number 8 is taken away from 1322, distinction is 1314. This is the year in when Inomhodja died with the account of Hijri. If we convert it into modern year, the year 1897 will be appear. So, Inomho'ja Umarhojaev died in 1897 [2]. Professor G. Karimov tried to find out evolution of Mukumiy's creative works and said his opinions about the poem beginning like this:

Bahri fazoil ichra ichra erdi chu durri maknun

Ohir falak, darigo, tufroqqa kildi madfun

"... in the problem the Hijri count of the words which show the history is 1287 Hijri, 1870-1871. Thus, Mukumiy was interested in the genre of "Muammo" and in the late 1970s he continued his own experiments in this genre," - he says. It should be noted that this poem does not appear in the publications of Mukumiy's works. In the manuscript 7521, written with the Mukumiy's handwriting, it comes in the

form of 6 distiches:

Bahri fazoil ichra chu durri maknun,

Oxir falak, darig'o, tufroqqa qildi madfun.

Ul kun musibatidin aylandi subh shoma,

Guyo bo'lub qiyomat, oqillar o'ldi majnun.

To Besharig' mardum ko'zdin oqizdi selob,

Xosu avom yig'lab chun lola diyda purxun.

Farqi saridin ajrab, taslim aylayub jon,

Bo'ldi topib shahodat, Haq rahmatig'a maqrun.

Piri xirad, Muqimiy, favtining ta'rixichun,

Yetti karomatidin ko'nlig'a ushbu mazmun:

Ot shatta soldi nogah, doril fanodin, afsus,

Ketti "shifo" topolmay "Eshon xoja Tursun". [4]

Prof. G. Karimov considers the history in this poem as Hijri 1287, the year 1870-1871 which consists of the sum of the letters in the utterance "От шатта солди ногаҳ". In essence, the history is "Eshon Hoja Tursun", denomination of 1693. According to the indication at beginning of the line, the sum of the letters "keti", "shif", is equal to 381.

When it descended from the number 1693, the year 1312 Hijri occurs. When we turn it into modern-year-count, it's equal to 1894. Thus, Mukumiy's friend from Beshariq, Eshon Hoja Tursun died in 1894.

#### ANALYSIS:

Mukumiy's seven-distich poem dedicated to the death of Abdurahman Margilaniy has not published his collection of works. The text of poem is found in the manuscript bayaz, which is kept in A.Madaminov's personal library. The 5th, 6th, 7th distiches of the poem.

Men ham ayyomi vafoti bor edim,

Boshlarimg'a tushdi guyo kulfati.

Solini so'rdim, Muqimiy, g'aybdin,

Guftigo' bo'lganda nogah rihlati.

Gap chiqib ta'rixidin azro'yi nom,

Dedi: "Mirzo Abdurahmon rahmati". [5]

In the last verse of the poem, the expression "Mercy of Abdurrahman Mirza" is a denominator, in which the letters in the Arabic alphabet amount to 1241 AH. According to the first line of the last distich, the initial letter of the word "nom" will be 1291, adding 50 to the number 1241, it will be 1291. It's 1873, when we convert it into modern-year-count. Thus, it is known from this theory that Mirzo Abdurahmon Margilaniy died in 1873. Histories on buildings and structures. Mosque construction:

Xusho! Bar himmati Mirzo bino shud masjid xishtin,

Maboda lahza, Yo rab, az namozi mo'minon xoliy.

Muqimiy, justam az piri xirad ta'rix ta'mirash,

Ba ro'yi aqlu donish guft: "Ibodatxonai oliy".

"This poem was first published by A. Madaminov in the book "Yangi bayoz". The poem – the copy of the Mukumiy handwriting, is stored at the G. Gulam Museum of Literature in Kokand today under number 86. According to the note written in the Nasta'liq letter of the Nation's poet of Uzbekistan, Charik, a resident of the Darhon neighborhood of Tashkent, Mirzo Ubaydullai had built a mosque and asked Mukumiy to write a poem. In the fourth verse of the poem, the phrase "Supreme Mosque" is a historical sign as 1318 Hijri derived from that phrase. If it is converted into modern-year-count, it will be in 1900. [7] Another poem of Mukumiy appears in the manuscript No. 7521 (page 50b):

Ko'rib ushbu farax afzo binoni,

Muqimiy so'rdi aqlidin nihoni.

Dedi az ro'yi lutf ohista nogah,  
Xirad tarixina “ta'miri soniy”.

It seems that the poem is about the restoration of a beautiful building. In the fourth verse, the phrase "Second restoration" is sign of history. According to Hijri account, it is in 1281. If it is turned into a modern-year-count, it dates back to 1863. Thus, it is known that the building was reconstructed in 1863.

Writings Historical events. It is well known that the representatives of Kokand literary environment wrote poems in many different genres dedicated to the Andijan earthquake. 27 distichal poem titled "The history of an earthquake in Andijan by Mevlana Mukumiy" was published in "Turkistan Region Newspaper", in April 22, 1903 by the Mukumiy. Unfortunately, the text of the poem was published in the 19 distiches in the collection of Mukumiy works in the Soviet era, 8 distiches were dropped. There are valuable comments in the article of the literary critic R.Tojiboev, titled "The full version of the poem of the history of Andijan earthquake" which was published in scientific collection "Literature mirror" in 2004. The full version of the poem is included in the collection of Muqimiy Poems named "Around the Garden" was published with the help of A. Turdaliev in 2010. The last distich of poem is as follows:

Jon boshina zilzila qasd aylagach,  
Tarixin aql aydi: “darig' Andijon”.

Apparently, the word "narrow Andijan" is a sign of history and according to Hijri it is equal to 1323. According to the first verse of the distich, the first letter of the word "soul" is “jim”. The letter express the number of three. If the number of three is removed, 1320 Hijri will appear. And in the modern year count, it is the year of 1902. Hence, in Andijan the earthquake happened in 1902. [9]

The poem of the Mukumiy written in political theme, election, in the genre of “ghazal” is known to experts. It has also been discovered that there are two poems written in the genre of “muhammas” in the same subject. One of them is a muhammas that is close to the ghazal of Zavkiy. The last paragraph is as follows:

Xalq tavriga qil, Muqimiy, nazar,  
Amali oriyatga karro far,  
Ko'rmadi sud juz ziyonu zarar,  
Jon chiqib, axchasi bo'lub besar,  
Qozi Isfandiyor o'ldi, deng.

"This “muhammas” was published for the first time in 1997 by Madaminov in the book "New Bayez". In the last verse of the poem, the expression "Qadi Isfandiyar" is a sign of history, the compound of the number of letters in the Arabic alphabet is equal to 1313. Hence, this election took place in Hijri 1313. By turning 1313 years into modern-year-count, it dates back to 1895. [10]

**CONCLUSION**

In conclusion, the Muqimiy's poems, which dedicated to history clarify historical events, social and political life in the late 19th and early 20th centuries, as well as prove that the poet wrote efficiently in the genre of "Ta'rix" which literally means "history".

In general, the study of the history, editing and interpretation of Muhammad Aminhoja Mukimi's poetry complements some of the theoretical considerations of the text, secondly, demonstrates the groundlessness of the scientific conclusions made on the basis of primary sources, and, thirdly, the critical review of existing works, important conclusions. Experience shows that only scientifically sound conclusions can be made to the development of textual and literary studies, based on originality.

### ABSTRACT

*For the solution of objectives there were studied patients aged from 2 years up to 45 years with benign formation of a throat respiratory recurrent papillomatosis – 59 patients. The 1st group - 38 patients with a recurrent respiratory papillomatosis of children's age, the 2nd group - 21 patients with a recurrent respiratory papillomatosis of adult age, the 3rd group made 12 almost healthy people. Study of hemostasis system indicators; activated partially thromboplastin time (APTT), thrombin time, antithrombin-III, fibrinogen was tested by the conventional method using sets from HUMAN. As it can be seen from the presented results of the studies, the number of platelets in blood plasma in patients of group 1 has a decrease dynamic, in particular, when compared with healthy persons, the concentration of platelets in blood plasma decreases by an average of 30%, while in group 2 the platelet content tends to decrease by an average of 43%. The detected disorders in the hemostasis system can serve as a marker of endothelial dysfunction that contributes to the constant maintenance of inflammation, increased neoplastic effects, which can lead to frequent recurrence of RRP of the infant contingent and stunning of RRP - an adult, and require appropriate targeted correction of the detected disorders.*

## INTRODUCTION

Benign tumors and tumor-like changes are found in the larynx much more often than malignancies. According to various authors, benign laryngeal neoplasms are found in 55-70% of cases among productive processes of the upper respiratory tract [1,2,6].

Tumor pathology is characterized by involvement in the pathogenesis processes of integral homeostasis regulation systems, including endocrine, immune, and hemostatic ones. At the same time, tumor cells can directly produce various procoagulants and anticoagulants. It is known that tumor cells activate the procoagulant link of the hemostasis system due to the formation of the factor V receptor. This receptor is located on the surface of the membranes of tumor cells and accelerates the formation of the prothrombinase complex (factor V + factor X + calcium + platelets). Proinflammatory cytokines secreted by tumor cells significantly increase the expression of tissue factor monocytes. Pro-inflammatory cytokines released by the tumor and blood cells also disrupt the regulation of thrombomodulin in endothelial cells, as well as increase the expression of tissue factor and fibrinolysis inhibitors - a plasminogen-1 activator inhibitor (PAI-1) in endothelium. Impaired control function of the endothelium reduces the synthesis of antithrombin III and protein C by the liver. This leads to increased procoagulant and decreased anticoagulant and fibrinolytic activity of the vascular wall, which is essential in the formation of vascular blood clots [8]. Tumor cells and circulating particles of tumor cell membranes affect the platelet link of the hemostasis system, increasing platelet adhesion and aggregation [3,4,5,7].

Thus, activation of a system of a hemostasis as a result of influence of tumoral pro-coagulants, inflammatory cytokines, a fabric factor of monocytes, fabric macrophages and endothelial cells and also leads to increases in functional activity of platelets to emergence of thrombin and deposition of fibrin in and around tumoral fabric. Modern researches showed that local accumulation of fibrin forms a matrix for growth of a tumor and angiogenesis. Tumor cells are capable to express all proteins necessary for regulation of a fibrinolysis on the surface. The constant fibrinolytic activity, i.e. formation of plasmin, promotes a tumor invasion.

On the basis of the above presented the purpose of this research was to reveal a contribution of system disorders in the haemocoagulation of blood to pathogenesis of benign tumors and throat cancer and also to define their predictive and diagnostic importance.

### Material and methods of a research

For the solution of objectives from 2016 for 2018 on the basis of the Republican scientific and practical medical center of pediatrics there were studied patients aged from 2 years up to 45 years with benign formation of a throat respiratory recurrent papillomatosis – 59 patients. From them 34 children (aged from 2 years up to 6 years) with a frequent recurring form, and 28 adults from 18 to 45 years.

The 1st group - 38 patients with a recurrent respiratory papillomatosis of children's age, the 2nd group - 21 patients with a recurrent respiratory papillomatosis of adult age, the 3rd group made 12 almost healthy people.

The developed clinical diagnosis was established on the basis of the nature of complaints, of the anamnesis, results of clinical examinations, investigations of ENT organs: otoscopy, pharyngoscopy, front and back rhinoscopy, indirect laryngoscopy. Specialized methods of inspection: a videolaryngoscopy by means of a rigid pharyngo-laryngotelescope with a point of

view 70 ° or 90 ° (diameter of trunk is 10 mm, useful length is 15 cm), “KarlStorz” with removal of the image on the monitor and an opportunity photo, and video documenting for the subsequent analysis; an indirect microlaryngoscopy at increase 6x8x12 with an operational microscope of Zeiss; a fibrolaryngoscopy, a laryngostroboscopy with photo and video documenting of the image output to the monitor for the further analysis of time-lapse reproduction of a video; Neck MSCT; a research of acoustic indicators of a voice (in Hz, before operation); a direct microlaryngoscopy for a research and sounding of pathologically changed departments of a throat under control of big increase in a microscope (6x 8x12) and also rigid endoscopes viewing angles 0 °, 30 °, 70 °, sufficient operating length, for the final decision about the of surgical intervention and a possibility of its rying out. Additional tool methods: measurement of pH in the lower and middle third of a throat, and the top third of a gullet (according to indications).

The mandatory plan for the examination of patients included generally accepted clinical-laboratory and instrumental diagnostic methods. Study of hemostasis system indicators; activated partially thromboplastin time (APTT), thrombin time, antithrombin-III, fibrinogen was tested by the conventional method using sets from HUMAN.

Statistical processing of the obtained results was carried out using the application package "STATISTICA" (version 6.0, StatSoft Inc, 2001). Differences and correlation coefficients were considered significant at  $p < 0.05$ .

## RESEARCH RESULTS AND DISCUSSION

We used global (screening) methods for assessing of hemostasis: determining APTT, TV and fibrinase concentration, as well as a refinement test - determining antithrombin AT III. The patients we examined had an increase in the level of fibrinase, a shortening of APTT and an increase in TV with a decrease in the level of antithrombin AT III, which appeared to be the signs of the hypercoagulation syndrome.

As it can be seen from the presented results of the studies, Table 1, the number of platelets in blood plasma in patients of group 1 has a decrease dynamics, in particular, when compared with healthy persons, the concentration of platelets in blood plasma decreases by an average of 30%, while in group 2 the platelet content tends to decrease by an average of 43%.

Therefore, in patients with RPP, a state of thrombocytopenia is observed in blood plasma.

As it can be seen from the results obtained (Table 1), the activated recalcification time in patients with RRP decreased by 35% on average ( $P < 0.05$ ). ABP contraction indicates an acceleration of chronometric hypercoagulation due to the state of the external pathway of the hemostasis system, i.e. activation of the vascular-platelet link of the hemostasis system by tissue factors.

Activated partial thromboplastin time (APTT) is used as a screening test to evaluate the internal plasma clotting cascade, which uses reagents containing contact activation phospholipids rather than tissue factors. In our study, APTT in 28 children with recurrent respiratory papillomatosis was  $25.9 \pm 1.07$  sec, and in 10 of them less than 25 s. This is 19% ( $P < 0.05$ ) lower than in the comparison group. This coagulogram index is closely related to the structure of the thrombus formed and is due to the state factors of the blood coagulation system. Activation of the vascular-platelet unit of the hemostasis system along the cascade chain activates its plasma unit and leads to chronometric and structural hypercoagulation. When analyzing the results in children with RRP, the often recurrent form of the disease is on average 1.2 times lower when compared with

the indicators of a group of healthy patients. As is known, APTT is directly dependent on the level of endogenous anticoagulants. Therefore, the elongation in time of the APTT index in patients with RRP indicates disorders in the plasma unit of the hemostasis system, which may be one of the causes of frequent recurrence as a result of maintaining inflammation. As it is known, one of the factors disrupting the procoagulant link of the hemostasis system is enhanced thrombin synthesis, which plays a dual role in the hemostasis system. It can activate the process of thrombosis and fibrinolysis, worsening the local rheology leading to dystrophic mucosal changes supporting inflammation, which increases the possibility of relapse.

To prevent this situation, vascular endothelial cells synthesize antithrombin-III, which, when endogenous heparin is involved, binds thrombin. In our studies, the observed increase in thrombin levels is accompanied by a significant decrease in plasma antithrombin-III. So, in patients of group 1, there was a decrease in the level of antithrombin-III by an average of 33% when compared with the control group. As is known, the dynamics of thrombin time may indicate the risk of developing thrombohemorrhagia in a given contingent of patients. Analysis of the obtained research results showed the risk of thrombohemorrhagia in patients of both groups, while in the second group the risk is higher than in the first. It is worth noting that hemorrhages in the postoperative period lead to the development of microthrombus and damage of mucosal trophies, deterioration of local blood flow. Endothelin serves as a compromising factor. Under the action of factors that activate or damage the endothelium (viral endotoxins, CEC, cytokines, inflammatory mediators), a sharp change in the para- and autocrine activity of the endothelium occurs with the loss of its inherent property of thromboreactivity and the enhancement of procoagulant and proaggregant effects: increased formation of Willebrand factor, type 1 plasminogen activator inhibitor (IAP-1), tissue thromboplastin, fibronectin, decreased synthesis of tissue-type plasminogen activator, thrombomodulin, antithrombin, prostacycline, nitric oxide, endothelium included in synthesis of prooxidants, vasoconstrictors to enhanced thrombosis, disorder local homeostasis and endothelial dysfunction, which increases the risk of papilla staining of adults with RRP.

The state of hypercoagulation that we observe in patients of group 1 can lead to compensatory activation of the fibrinolytic unit of the hemostasis system, expressed by an increase in fibrinolytic activity of blood plasma, due to an increase in thrombin levels. The increased consumption of thrombin and fibrinogen against the background of the depletion of antithrombin II is reflected in the properties of the resulting clot. This is expressed by an increase in the activity of factor XIII - fibrinase, in which additional crosslinking is formed in the fibrin clot, partially dehydrates it, and the clot becomes more dense. That is, in patients of group 2, the level of fibrinase increases by 27.0% ( $P < 0.05$ ). Thrombin formed in the cascade chain binds to antithrombin III. The mediator and activator of this complex is endogenous heparin. Plasma tolerance to heparin indirectly indicates the content of endogenous heparin, an increase in the level of which indicates the depletion of antithrombin II.

Thus, in patients with RRP, the fibrinolytic link of the hemostasis system is activated against the background of disruption of the plasma link of the hemostasis system and dysfunction of vascular endothelial cells. The detected disorders in the hemostasis system can serve as a marker of endothelial dysfunction that contributes to the constant maintenance of inflammation, increased neoplastic effects, which can lead to frequent recurrence of RRP of the infant

contingent and stunning of RRP - an adult, and require appropriate targeted correction of the detected disorders.

**TABLE 1 DYNAMICS OF THE CHARACTERISTICS OF THE HEMOSTASIS SYSTEM IN THE PATIENTS OF THE RECURRENT RESPIRATORY PAPILOMATOSIS**

Characteristics	Healthy patients n=12	Patients with recurrent respiratory papillomatosis, children n=38	Patients with recurrent respiratory papillomatosis, Adults n=21
Thrombocytes (x10 <sup>9</sup> /l)	228,14±9,34	158,46±7,89	131,15±8,56*
Activated partially thromboplastin time APTT (cec)	31,78±2,57	25,90±1,07*	38,69±2,94*
Prothrombin time PT(cec)	16,43±1,22	20,41±2,65	33,86±3,72*
Antithrombin AT III (%)	101,12±7,84	70,86±5,12*	62,84±7,05*
Activated recalcification ART(cec)	58,21±3,44	41,42±3,12*	37,64±2,38*

## INTRODUCTION

The ancient architectural monuments of the world are a universal value. At the same time, they bear witness to the culture, history and contribution of these peoples to world civilization. Preservation of historical architectural monuments is now considered a universal problem. It is recognized that the identification of traditional methods used in the construction of historical and architectural monuments, on this basis, the improvement of architectural and compositional criteria of monuments, their repair and restoration is an effective way to preserve and pass on to future generations.

Preservation of our unique historical monuments is a sacred duty of every citizen living in the territory of Uzbekistan. After all, it is impossible to build a rule of law and civil society in our country without the development of spirituality and enlightenment. In this regard, changing the spiritual world, the system of ideas, the psyche of man requires many years of tireless research and hard work. While the well-being of the citizens of our independent land is partly the responsibility of the architects, the restoration and preservation of the architectural heritage built in the past is the highest duty of the people, so that the foundations of a prosperous future are strong. Therefore, one of the most pressing issues today is the study of repair theories, problems and their use in future practical work by many of our scientists who have worked on the repair of monuments in their lives.

## 2. Methods, analysis of relevant literature and sources

The article uses methods of scientific abstraction, analysis and expert evaluation. Several literature, articles and researches are devoted to the study and repair of architectural monuments of Uzbekistan. G.Pugachenkova, L.Rempel, B.Zasytkin, L.Voronin, V.Nilsen, K.Kryukov, M.Bulatov, P.Zohidov, L.Mankovskaya, I.Notkin, M.Ahmedov, D.Nozirov, A. The scientific works of Urolov, I.Azimov, M.Yusupova, H.Pulatov, A.Ziyaev and other scientists are an example of this.

One of the scientists who contributed to the development of architectural science in the republic. Zohidov [1] and T.F. Kadyrova [2] can also be mentioned. For example, while P. Zohidov often focused on the history of architectural monuments and their condition, T.F. Kadyrova's monograph provides a comprehensive analysis of practical experience in the field of modern architecture and urban planning in Uzbekistan in the XX and early XXI centuries.

French archaeologist Adolf Napoleon Didron believed that the rights of the repairman should be restricted. He wrote that "no poet should attempt to complete the poems in the Aeneid epic, no painter should attempt to finish a work that Raphael did not finish, no sculptor should attempt to finish a statue of Michelangelo that no sane architect should attempt to finish an unfinished building." Dideron also condemns the method of "cleaning the monument from subsequent

additions and achieving stylistic integrity." He found that the only way to avoid many mistakes was to carefully study medieval architecture.

### 3. Results of research

In Uzbekistan, in 1919-1924, more than 15 decrees laid the foundations of the system of protection of monuments of the former Soviet state. In 1926, the main archeological organization was renamed the State Academy of History of Material Culture. His tasks were: to develop a framework for the protection of monuments; conducting searches, systematic excavations and collecting artifacts related to the preservation and study of antiquities, arts and folk lifestyles; to supervise the development of monuments, scientific guidance of excavations and the promotion of monuments [4]. The formation of protection and repair of existing historical and architectural monuments in Uzbekistan began relatively late. Given the importance of the vast cultural heritage of our ancestors, the preserved monumental architectural monuments began to be transferred to the special state body for the protection of monuments in the early twentieth century, ie from 1920. This body was originally performed by a special committee for the protection of historical and artistic monuments under the Central Archives of the Republic of Turkestan, which began its work on January 30, 1920. By a special decree of the leadership of the Republic of Turkestan dated May 23, 1921, the Committee was transformed into an independent state body - the Turkestan Committee for Museums and Monuments, Arts and Nature Protection (Turkomstaris) by the Decree of the Council of People's Commissars of the Republic of Turkestan. The consequences of the policy of the former Soviet government on the administrative-territorial issue had an impact on the organizational and structural activities of this committee. As a result, this organization was renamed the Central Asian Committee for Monuments and Nature Protection (Sredazkomstaris) in 1925 after the national demarcation of the Central Asian republics. The Committee was responsible for the protection, use and restoration of monuments in the newly formed Central Asian republics and Kazakhstan. In 1929, by Resolution No. 501 of the Central Executive Committee and the Council of People's Commissars of the Uzbek SSR, the Uzbek Committee for the Protection of Ancient Monuments was reorganized and transformed into Uzkomstaris instead of Sredazkomstaris. In the early days of its activity, the scope of tasks of this body was not wide, it was to take into account the archaeological monuments of the country. Due to the severity of the economic situation and their unpreparedness for restoration work, the protection authorities of the monuments were limited to carrying out the necessary repairs aimed at preventing the complete destruction of the architectural monuments. During this period, the issue of creating a scientific basis for production related to the restoration and conservation of monuments had only just begun to arise. Nevertheless, in those complex political and economic conditions, the theoretical basis of the scientific methodology of restoration and conservation began to be created.

In general, the basic concepts of the architectural-archaeological method of studying cultural monuments were formed in the late 1920s, and it was published in the collection of restoration issues published in 1928 [5]. However, the initial scientific research and the mass organization of the protection and repair of architectural monuments were hampered by the policy of the Communist Party, which aimed at achieving general equality. The revolutionary spirit that envisioned socialist change led to the destruction and equalization of the distinction between the new and the old city, as well as the distortion and humiliation of many ancient forms of urban planning as a result of ideas against religion and values, especially in the first decades of Soviet

rule. These radical ideas have caused irreparable damage to Tashkent, Samarkand, Bukhara, Shakhrisabz and other historical cities of Uzbekistan. Therefore, an investigation into the activities of Uzkomstaris in April-May 1939 on the basis of a special instruction of the government of the republic showed that the monuments given to him were used for other purposes. In particular, the only inspection in Bukhara revealed that the Madari Abdullah Khan Madrassah was located for housing, another monument to Abdullah is a warehouse for the Sakharsbit organization, the Kalon Mosque and the Chor Minor are a warehouse for Gortorg, and the Devonbegi Madrasa is a Bukhara Bukkomstaris was found to have been used for the office and for residential purposes. At the same time, many historical monuments in the city were destroyed as a result of the expansion and beautification of the city. In particular, as a result of the reconstruction of the city of Bukhara and the increase in traffic, using the powers given to the Bukhara city council, in 1939, 6 ancient city gates were demolished along with the walls. However, despite the above-mentioned tragedies, the experience of scientific restoration and practice gradually increased, and as a result it became possible to solve a number of complex engineering-constructive and architectural tasks related to the preservation of architectural monuments. By this time, a new generation of talented professionals began to form in the republic. They organized early expeditions, identified and began to take into account historical, archaeological and architectural monuments. The compilation and systematization of accounting documents began in 1920-1930. In addition, the development of the first science-based projects for the restoration and conservation of architectural monuments in different districts of Uzbekistan coincided with this period. The creation of building materials and cladding materials similar to the old patterns has been one of the problems in the restoration of architectural monuments for many years.

Thanks to the efforts of experts and folk masters, the issue began to be resolved and significant progress was made in the restoration of the monuments. From simple conservation, which consists of fixing the coating with an alabaster mixture, to the restoration of mosaics, mosaics and carved majolica. An important factor should be the introduction of the method of strengthening architectural monuments with the help of engineering, the use of modern building materials. In this process, the role of the school-workshop, which began to operate in Samarkand in 1937, specializing in the teaching of ancient construction methods, was great. Architect from Bukhara, master plasterer Master Shirin Murodov was one of the leading architects of his time. Together with Zasytkin, they prepared a textbook for this school that teaches the mystery industry of ancient construction techniques and geometric ornament methods. Drawings of 238 pages were also attached to the manuscript. At the same time, well-known master restorers such as master Usmon Umarov, master Shamsiddin Gafforov, master Abdulla Boltaev, Nasim Gafurov, master Muhiddin Rakhimov took an active part in the educational process. Later, the graduates of the school, such as master Ibrahim Shermuhamedov, master Abdugaffor Hakulov, Anvar Quliev, master Mirumar Azizov, Tashmukum Kurbanov, reached the level of mature master restorers. During the Second World War, a new stage of organizational and structural changes began for the state body for the protection of architectural monuments in Uzbekistan. In 1943, the Uzkomstaris organization was abolished and the Department of Architecture was established under the Council of People's Commissars of the USSR, and a department for the protection of architectural monuments was established under the department. Subsequent practice has shown that this structural change has led to the disappearance of many historical monuments. This is due to the fact that the Committee for Architectural Affairs, based on its

main area of activity, focuses on the construction of housing and other objects of economic and social significance in the cities and villages of the country. In particular, the main projects of the committee developed by the leading organizations of the center in 1950-60, including the construction of new buildings in historic cities. However, this operation was intended to be carried out in the traditional residences of the population. Given the fact that in the historical cities of the republic, such as Samarkand, Bukhara, Khiva, the houses of the population are located close to the monuments, it was natural that this operation would damage the old buildings.

In particular, as a result of large-scale work carried out according to the plan, educational institutions, palaces of culture, cinemas or multi-storey boxes around the architectural monuments of Samarkand, which spoil their original appearance, were filled. In Bukhara, at the same time, the historical walls of the city were almost demolished and served as a raw material for bricks, the 16th-century Yor Muhammad Ataliq room in the city center and the 18th-century Ernazar Elchi madrasah were demolished. This list could go on and on with similar tragic events. In general, if at that time the economic and financial capabilities of the state were not limited, the work envisaged in the master projects of cities would be fully implemented. This would have further limited the list of historical and architectural monuments that have survived to the present day. The financial capacity of the organizations protecting the monuments, as well as the level of staffing, had fallen into disrepair. The situation required a change in the activities of the organization related to the preservation of cultural monuments in the republic. On the initiative of a number of zealous, progressive intellectuals of the republic, on August 30, 1957 by the Government Resolution of the Republic of Uzbekistan №557 - "Committee for the Protection of Monuments of Material Culture" was established. A council was set up under this Committee, which included such leading scientists as Ya. Gulomov, M. Masson, T. Koriniyozov, G. Pugachenkova. Despite the fact that the Council was active for a short period of time (1957-1961), it helped to preserve a significant part of the existing cultural and historical monuments in Uzbekistan, to develop repair work in some of them, to study them, to revive the school of restorers in the country. Extensive work has been done on. Importantly, the efforts of the country's leading scientists working in this organization were not in vain, but had a positive impact on the future work on the preservation of cultural and historical heritage in the republic. 1968 was an important event for the work being done in the field of protection of our cultural heritage. The law on the protection of cultural monuments was adopted. It should be noted that this was done 8 years (1976) before such a law was adopted at the level of the Union. In accordance with this law, the government has approved guidelines for its application, regulations on the protection of material and cultural monuments and the construction of buildings around them, the right to conduct archeological excavations and prospecting in Uzbekistan.

### ABSTRACT

*The article depicts the problem of the concept of term from different viewpoints of linguists and approaches to the word term in English, Russian and Uzbek languages and analyzes the specific features of term in different languages.*

**KEYWORDS:** *Term, Terminology, Brevity, Concept, Definitivity, Denomination, Nominativity, Scientific Term, Systematicity.*

---

### INTRODUCTION

The quality problem of a scientific term is solved in terminology from the position of the theory of *term* as a special type of nomination. The definition of *term* itself contains information about its specificity. It should be said that most researchers define *term* as a word denoting something specific: a specific object, a specific concept. In the search for the concept of *term*, it is extremely difficult to identify its most essential features not only in terms of content, but also in terms of expression.

### The main results and findings

According to Rondeau, *term* is basically a linguistic sign in the Saussurian sense; it has a signifiant and a signifie. He gives the name *denomination* to the label, and the name *notion* to the concept. Unlike Wuster, who used the word *term* to refer exclusively to the *label*, Rondeau uses the word *term* to describe the combination of *denomination and notion*, i.e. the combination of *label* and *concept*. Sager offers the following definition of *terms*: the items which are characterized by special reference within a discipline are the 'terms' of that discipline, and collectively they form its 'terminology' [2].

H. Felber defines *term* as a linguistic symbol assigned to one or more concepts (defined meanings). The meaning of *term* which is a concept, is dependent on the position of this concept in the system of concepts concerned.

M. Teresa Cabre states that a *term* is a unit referring to a reality that is expressed by means of a form and used for intercommunication [1].

Russian linguists also made a significant contribution to history terminological schools and terminology as a science. The Russian founders of modern terminology studies are considered A.A. Reformatsky, D.S. Lotte and V.P. Danilenko. They examined issues that are still in the focus of linguistic analysis, namely, questions about the linguistic essence of the term, nature and the formation of terminologies.

*Term* as the basic unit of interprofessional communication has different interpretations. According to A. A. Reformatsky, *terms* are words limited by their special purpose; words striving to be unambiguous as an exact expression of concepts and the name of things [8]. In the definitions of *term*, it can be revealed the maximum or minimum of the signs recognized as mandatory for this type of sign. According to V.V. Vinogradov a word performs a nominative or definitive function, i.e. it is a means of clear designation, then it is a simple sign, or a means of logical determination, then it is a scientific term [4].

In the definitions of *term* it can be found maximum or minimum features acknowledged obligatory for this type of sign. In particular, N.V. Vasileva defines *term* as a linguistic unit of a special sphere of use possessing a nominative-definitive function. This definition characterizes *term* according to such essential features as belonging to a special sphere of use and a nominative-definitive function. We can note that one of the leading theorists of terminology V.P. Danilenko in his monograph cited 19 definitions of the notion '*term*' from various scientific sources and analyzed various points of view of famous researchers: O.S. Akhmanova, R.A. Budagov, V.V. Vinogradov, G.O. Vinokur, B.N. Golovin, A.A. Reformatsky and others. V.P. Danilenko gives the following definition for the concept of *term*: *term* is a word (or word combination) of a special sphere of use, which is the name of a special concept and requires a definition. It is easy to see that this definition coincides in content with the definition by N.V. Vasileva in which *term* is considered a nomination of a special sphere of use. The sign of relevance to a special concept is also found in the definition given by V.A. Tatarinov that *term* can be defined as a language sign (word or word combinations) correlated with a special concept, phenomenon or subject. The same feature is contained in the definition of *term* given by V.D. Tabanakova, in which besides this, a sign 'scientific' appears and *term* is considered as a sign that is very significant, it is about the expression of a special concept and the reflection of the

place of this concept in the system of concepts: a scientific term is a sign expressing a special concept and reflecting the position of this concept in an appropriate system of concepts.

In the definition of *term*, which is formulated by A.S. Gerd, there is also a sign 'scientific' and *term* is considered as a conditional sign, which brings this definition closer to the definition of *term* given by V.D. Tabanakova, namely, a scientific term is a sign to which one or another meaning is attributed conditionally, by a collective agreement.

According to V. M. Leychik *term* is a lexical unit of a certain language for special purposes, denoting a common-specific or abstract concept of the theory of a specific special field knowledge or activities [6].

From O.S. Akhmanova's point of view *term* is a word or a phrase of special (scientific, technical and etc.) language created (accepted, borrowed, etc.) for the exact expression of special concepts and designation of special objects [3].

There is a well-known point of view according to which *term* has special formal and semantic properties. Such a definition of *term* is formulated by B.A. Plotnikov, who supposes that *term* is a word with special formal and semantic properties. He attributes two main points to the formal features of the term. Firstly, the fact that terms express scientific and technical concepts not only by individual lexical units, but also by their combinations (compound terms). Secondly, in the language of science and technology, as a rule, nouns are considered to be terms, but terms belonging to the other parts of speech can be also formed from them. According to B.A. Plotnikov, the semantic feature of terms is that the meaning of terms has a manifest denotative nature. In other words, this aspect of the meaning of *term* is always in the foreground. B.A. Plotnikov's opinions about special formal and semantic features of *term* seem to us convincing.

As it can be seen while defining the word *term* the notion *scientific* is often mentioned among a lot of other features of *term*.

The language of science is nominated as an independent functional variety of the general literary language a great number of researchers. The vocabulary of the language of science, like all other varieties of the general literary language, is not the same type. Three relatively independent types are distinguished in it:

- 1) Non-terminological vocabulary (significant and official words of the general literary language);
- 2) General scientific vocabulary (special words of a scientific sphere of communication in general);
- 3) Terminological vocabulary (special words of specific branches of knowledge).

The general position of all studies of terms of science is as follows:

- a) Terminological vocabulary is a totality of special denominations combined in terminological systems.
- b) Each term system reflects the categorial apparatus, the system of concepts of a specific science, scientific direction, school and concept.
- c) Terms, undoubtedly, constitute the main distinguishing feature of the vocabulary of the language of science. This is the most informative part of this language.

From V.P. Danilenko's point of view, there are five specific features of *term*. They differ as follows:

- 1) Semantic: terms refer only to special concepts;
- 2) Functional: terms have not only a nominative, but also a definitive function;
- 3) In accordance with the sphere of distribution: terms serve only as a means of professional communication in its direct function;
- 4) According to the sources, methods and means of creation: scientific terms, in addition to general literary sources, methods and means of their creation, have their own specialized resources that do not find application in other varieties of the general literary language;
- 5) In terms of the semiotic composition of denomination units: in terminology, symbols going beyond the scope of verbal means of expression are used widely [5].

Linguistics takes a special position in the system of the humanities. According to N.B. Gvishiani, it is due to the specifics of the subject of study, since linguistics is characterized by three main stages of scientific research including the study of linguistic facts, the creation of concepts, the development of metalanguage. This is the difference of linguistics from the abstract sciences logic and philosophy, in which research begins from the second stage, from the consideration of generalizations considered the direct object of study. First of all, linguistics is a discipline that studies the phenomena of human speech.

In theoretical terminology there is a postulate of an ideal term, according to which the term must have the whole range of qualities in contrast to vocabulary units of a common language: brevity, systematicity, unambiguity, lack of emotional coloring and independence of context, and only under such a condition it can fulfill the main function to express a special concept exactly.

In addition, among the properties that distinguish a term from a non-term, according to D.S. Lotte is that terminological vocabulary is unaffected to the process of polysemy and synonymy that are characteristic for a general literary language and all cases of their demonstration in terminological systems are considered as shortcomings to be eliminated [7].

Another list of ideal requirements for the term is given by V.D. Tabanakova. Based on the sign of the term, it is attributed the following properties: accuracy; unambiguity within one terminological system; lack of ideographic synonyms; a lack of emotionality (that distinguishes it from professionalism); motivation, which is determined by the fact that the terms are secondary denomination; nominativity - the function of designation of a special concept that is implemented independently of context; definitivity - when the meaning of a term is formulated as a logical definition; consistency - the feature to occupy a certain place in a system of terms which, in turn, is determined by a certain place of a special concept denoted by a term in a system of special concepts; systematicity - the property of reflection systematicity at morphological level.

The terminologists, who develop a complex of ideal requirements for *term*, notice that there are more or less deviations from an ideal in the practice of creation and use the term. Therefore, we can state that in general, both the properties of the term and the requirements for it represent certain trends that are realized to a greater or lesser degree.

A significant contribution to the activity of the national terminology in Uzbek linguistics was made by research of N. Mamatov, S.F. Akobirov, A. Hojiev and R. Doniyorov.

According to A. Madvaliev *term* is a word or phrase that is a clear and stable expression of a specific concept specialized in the field of science, technology or profession [9].

A. Hojiev's states that *term* is a word or phrase that is clear to an understanding of something related to science, technology or another field whose field of activity is limited to these areas. Terms differ from ordinary words according to what they mean and do not have emotionality [10].

In the process of studying the definitions thoroughly, it can be concluded that the whole list of ideal characteristics of *term* deserves an attention. In some definitions of *term*, the authors identify two or even more essential features which all of them are considered to be the most specific for the *term*.

Having analyzed basic concepts related to the *term*, we have come to the following conclusions:

1. The term can be a word, phrase or symbol of non-verbal nature;
2. It has a sign of belonging to a special concept;
3. The term requires a definition;
4. It possesses the sign 'scientific';
5. The term is involved in a system of terms;
6. It has got a conventional character.

We formulate our own, definition of *term*: A scientific term is a language sign (word or phrase) that has got a specific nominative and definitive functions and reflects the position denoting concepts in the system of concepts of science according to its denotative and significative content and in an appropriate terminological system.

## CONCLUSION

Thus, it can be confirmed that terms are formed both on the basis of the natural national literary language and on the basis of an inventory of specific means of expression of special concepts, which is created by researchers on the basis of existing and new material in each branch of knowledge, primarily universal - international. To understand and explore the peculiarity of terminological systems of specific directions, terminology comes from the specifics of a particular scientific field, in our case, linguistics.

## NEWS MEDIA TEXTS IN CONTEMPORARY ENGLISH: COGNITIVE SEMANTIC AND LINGUOCULTURAL CHARACTERISTICS

**Khilola Otakhonova\***

\*Master's Student,  
 Uzbekistan State University of World Languages,  
 Tashkent, UZBEKISTAN

### ABSTRACT

*This article discusses the cognitive semantic and linguocultural features of media texts for modern English news. The article also gives examples of cognitive semantic and linguocultural features and discusses this topic. A unique type of human speech activity is fiction. Linguocultural analysis plays an important role in the study of his language. Linguocultural can be understood as a branch of philology that studies the aesthetic features of an artistic context. The subject of Linguocultural is the set of language tools used by the author in a work of art to achieve his ideological and artistic goal. The aesthetic effect of a work depends not on what the text is about, but on how it is narrated. The purpose of Linguocultural analysis is to determine how the author uses this or that linguistic unit in the process of artistic creation, and how this or that phrase creates an aesthetic effect.*

**KEYWORDS:** *Linguocultural, Information Technology, Communication Technologies, Media Linguistics, Traditional Media - Print, Radio, Television, Baltic Countries, Central Asia And Eastern Europe.*

### INTRODUCTION

The formation and development of media linguistics as an independent direction in modern linguistics is due to a number of factors, both linguistic and 4 related to information technology and socio-cultural spheres of public life. Among the most significant prerequisites for the emergence of media linguistics are the following:

- The rapid growth of information and communication technologies (ICT), expressed in particular in the creation of a global network of media communication;

- Formation and development of a single information space as a new virtual environment for text communication;
- The formation and scientific understanding of the concept of “language of the media”, the definition of its functional and stylistic features and internal structure;
- Awareness of the need to apply an integrated approach to the study of media speech, based on combining the efforts of representatives of different humanitarian disciplines;
- Consideration of studies of the language of the media in the framework of media studies (media studies) - a new independent discipline, the subject of which is a comprehensive analysis of the historical development, current state and features of the functioning of the entire complex of mass media.

### **The role of the media in the dynamics of language processes.**

The second half of the XX - beginning of the XXI century is characterized by the rapid growth of mass communication and new information technologies. The dynamic development of traditional media - print, radio, television, the emergence and spread of the World Wide Web - the Internet have led to the creation of a single information space, a special virtual environment formed by the aggregate of many media streams. All this could not but affect the processes of production and distribution of the word, on the features of speech use and the nature of linguistic changes. The main volume of speech use today falls on the sphere of mass communication. Mass media texts, or media texts, are one of the most common forms of modern language use, and their total length far exceeds the total volume of speech in other spheres of human activity. At the same time, the corpus of texts produced and transmitted daily through the media continues to grow steadily. This, in particular, can be judged by quantitative indicators: the number of television channels is growing (in the United States it reaches seventy-five, including cable television), their further specialization is taking place - there are mainly news channels (for example, CNN - Cable News Network), entertainment (MTV), sports (Eurosport), educational (Discovery Channel), music, etc. New radio stations appear, new newspapers and magazines appear, designed both for a wide audience and for satisfying the interests of a wide variety of age, professional and social groups. Communication on the World Wide Web makes a huge contribution to the constant growth of the mass of media speech. The proliferation of online versions of printed publications, the emergence of online publications - all this contributes to an increase in the total number of texts functioning in the world information space, which is considered by researchers as a special sphere of speech use, which has its own characteristics and characteristics. The concept of a single information space is of key importance for understanding the dynamics of linguistic changes, since it allows us to present the multifaceted activities of the world and national mass media in the form of a single, integral system, the functioning of which has a significant impact on the course of linguocultural processes. In modern science, to designate this new virtual territory without state borders and tangible barriers, a whole set of terms and concepts are used that relate to one semantic series, but emphasize one or another side of mass communication processes, such as: information space, information environment, information field, media environment, media landscape, infosphere. The concept of a single information space allows you to better understand the laws of movement of information flows, as well as to present a holistic information picture of the world in dynamics. The most important component of the world information space is its linguocultural component, the importance of

which is difficult to overestimate, since any verbally expressed information is the embodiment of a certain language and culture. Understood as the area of distribution of a particular language and culture in the global media landscape, the concept of a linguocultural space allows us to demonstrate the actual discrepancy between the boundaries of territorial, state and the boundaries of information spheres of influence. Thus, the real contours of the Anglo-American linguocultural space go far beyond the territories of the respective states due to the huge coverage of English-language media broadcasting and the spread of the Internet.

### **The Main Findings and Results**

Linguocultural can be defined as a branch of philological science that studies the aesthetic properties that form language units in an artistic context. As long as the researcher works with non-artistic, non-verbal discourse, his perception can be generally described as a direct understanding of language units as a whole in terms of content and expression. If we are meant to read a literary text, then our perception moves from one side of linguistic perception to another, shifts, rises to a new level. Once the various elements of language are incorporated into the realm of word art, they change in the course of demonstrating the possibility of the aesthetic task entrusted to them. Both of these words become the subject of Linguocultural analysis when they undergo aesthetic changes in the text under study in accordance with the author's idea.

At the semantic level, language units in their own right imply a study in the correct sense; it is a linguistic analysis of the word in the language in which the text is created. At the metasemiotic level, we move on to the study of the process of their activation in speech (in which the main focus is on the additional content, connotations, which they form directly in speech). In this scientific article we will consider how the word demonstrates its aesthetic position in practice, how it becomes a tool of figurative thinking, on the example of the romantic poems of the Great Russian poet A.S. Pushkin and their translations into Uzbek. Scholars point out that the ability to study the perception of the scope of the aesthetic influence of this or that text during its translation into several languages gives an effective result. The study of a text within two or even three languages makes it possible to identify its properties that are not expressed in one language. It is possible that the translation of the text does not provide new information about its properties and essence, but with the help of translation it is possible to get a deeper impression of the text. Indeed, the translated text, enriched by several generations of translators, is undoubtedly important, in which, along with the best translations, unsuccessful experiments also play an important role. L.N. Tolstoy gives an example in this sense: he realizes the perfection of the text only after reading Pushkin's poem "Gypsies" in French: the comparison reveals to the great writer the unexpected, new aesthetic features of the poem. The result of the collapse of the USSR was not only changes in the state and socio-political nature, but also noticeable changes in the existing culture and information space, which, in particular, resulted in a significant reduction in the presence of the Russian language and culture in the Baltic countries, Central Asia and Eastern Europe.

Thus, speaking about the role of the media in the dynamics of linguistic processes, it must be emphasized that we mean not only and not so much the changes caused by the introduction of new information technologies, but qualitative transformations in the general linguocultural situation. In turn, assessing the impact of modern mass media on the course of linguistic processes, it is possible to distinguish between the following three levels of analysis: 1) geolinguistic, 2) interlinguistic. ***The geolinguistic level***, as the name implies, involves an analysis

of how the media influence the state and development of the general linguocultural situation in the world and in the regions. Here, attention is focused on such important quantitative and areal indicators as a change in the number of speakers in a particular language, a redistribution of linguistic spheres of influence, an increase in the role of some and a decrease in the role of other languages in the world information space. At the interlinguistic or interlanguage level, researchers are interested in the issues of interaction and mutual influence of languages, mechanisms and methods of borrowing are studied, as well as functional styles and spheres of speech that are most susceptible to foreign language influence. *Intralinguistic level*, or intralingual, allows you to focus on media-conditioned linguistic processes within one linguistic-cultural area. These include: a tendency to blur clear style boundaries, the spread of colloquial style norms in the basic corpus of media speech (news, information analytics, commentary), the replication of erroneous speech use (for example, wrong stress, grammatical errors and incorrect collocation), a decrease in the speech norm due to the use of in the media with reduced and profanity, etc. Let's dwell on each of the listed levels in more detail. One of the main features of the modern geolinguistic picture of the world is the indisputable dominance of the English language, which manifests itself, among other things, in the field of mass communication. The total volume of English-language media texts, due to a number of economic, political and socio-cultural reasons, significantly exceeds the volume of mass media texts in other languages of the world. So, instant reaction to events anywhere in the world, their objective coverage helped the American world news channel (CNN) to gain popularity among viewers around the world. This channel broadcasts in English. BBC World enjoys a reputation as one of the most objective news channels, which is why it is watched in Western Europe, the United States and other countries around the world. Since the beginning of the 90s in connection with significant socio-economic changes, English-language media are becoming more widespread in Russia. In the mid-90s, foreign journalists working in Moscow created the Independent Media company, which publishes the popular publications The Moscow Times, The Moscow Tribune, The St. Petersburg Times, Capital, and also oversees the release of Russian-language analogs of well-known magazines: "Cosmopolitan", "Good Housekeeping" and others. All this testifies to the further integration and globalization of international information systems and is reflected in the course of language processes, the qualitative aspect of speech use, the movement of language norms, as well as the interaction of languages and cultures. The globalization of the world information space has contributed not only to a significant expansion of the sphere of influence of the English language, but also to its transformation into a generally recognized language of international communication - the lingua franca. Currently, English has become the language of international business and trade, politics and diplomacy, science and information technology, media, popular music, show business, sports and education. Today it is hardly possible to find an area of human activity in which the English language would not have a dominant meaning. The global role of the English language in the modern world is perfectly described by the famous English linguist David Crystal in his book "English as a Global Language", noting the role of the media in promoting and spreading the English language and mass culture in national media landscapes. Indeed, the total number of media texts in English, distributed daily through media channels, significantly exceeds the number of texts in other languages, and in the national mass media of almost all countries of the world, there is an expansion of samples of English-language mass culture. The Beatles, Madonna, Backstreet Boys, Spice Girls, etc. - a constantly updated list of popular songs in English is well known to a mass audience both in the West and in Russia. In

this regard, the concept of linguistic imperialism, which arose within the framework of the Western European academic tradition in the early 90s of the XX century, as a reaction to a completely positive assessment of the global role of English in the modern world, is of certain interest. The concept of linguistic imperialism, formulated by the English researcher Robert Phillipson in his book "Linguistic Imperialism," considers the dominant role of the English language in the modern world as an expansion in relation to other languages and cultures. The author notes that the rapid increase in the share of the English language in the world linguocultural space is influenced by a number of political and economic factors: from the colonial domination of the British Empire and the transformation of the United States into a world superpower to the information technology revolution and the rapid development of transport networks. Explaining the "world domination" of the English language mainly for socio-economic and political reasons, as well as the advancement of the national interests of the most powerful English-speaking countries - the United States and Great Britain, Robert Phillipson emphasizes that the expansion of the English language causes irreparable damage to other national languages and cultures.

So, for example, from the point of view of the general typology of speech for mass media texts, in addition to the stable opposition of oral text - written text, monologue text - dialogical, the dichotomy of the author's text and the non-author's, corporate text turns out to be extremely important. In general, in the field of mass media, the category of authorship takes on special significance, since most informational texts are distributed here not on behalf of a specific person who created the text, the author, but on behalf of a corporate one, on behalf of a certain media structure that distributes this text to a mass audience. The main feature of corporate texts is that, regardless of whether they are compiled by one specific author or a group of people, they are always distributed to a mass audience on behalf of a whole team or organization, be it a newspaper editorial office, a radio station, a TV program, a news agency, etc. P.A typical example of such non-author's collegiate text is the messages of news agencies, which are an integral part of the daily information flow. On the pages of any newspaper you can find corporate texts like:

**1) London. Reuters.**

*According to a public opinion poll, most residents in the English capital believe that the monarchy should be "modernized and that members of the royal family should not receive funds from public funds.*

**2) London. The Associated Press.**

Two more bombs exploded in London early Monday, causing no injuries but prompting fears that the Irish Republican Army was stepping up an offensive against the capital's tourist areas.

The explosions followed a series of similar small bomb attacks in the past 10 days carried out by the IRA as part of its campaign to end British rule in Northern Ireland. The first explosion in the early hours on Monday occurred near the Novotel hotel in Hammersmith, West London. The second explosion came about an hour later. Police said it appeared to have been caused by a device planted near Leicester Square.

Texts of this kind are extremely common in all media - in print, radio, on television, as they represent a "finished information product" - the result of the activities of the largest news

agencies that control the world information market, such as Reuters, The Associated Press, Agence France Press, Itar - TASS, etc. They fill the news pages of newspapers, in particular the news in brief columns, from which radio news and television news programs are made. Corporate texts can vary in length: from extremely short 15-20 words to fairly detailed messages of 100-150 words with a more complex internal structure, involving the use of direct quotation and indirect speech, for example:

***Fire Damages British Art Academy***

***The Associated Press, London.***

A fire Saturday damaged part of the Royal Academy of Arts, one of Britain's major art institutions although gallery officials said no art was believed to be damaged. Fire swept through two galleries on the first and second floors of the academy's historic building, Burlington House, in Piccadilly, central London. "The fire was brought under control fairly quickly but the walls are blackened", said David Gordon, secretary of the academy. "There were about 30 to 40 paintings stacked up in the gallery that were removed by firemen and staff", Gordon Added. "The art work has not been damaged," said Bruno Bruniges, assistant divisional fire officer. Gordon said the two galleries damaged were to house the academy's summer exhibition.

The content of corporate texts naturally reflects the entire palette of the information flow and covers all the thematic blocks (topics) presented in the media: politics, business, finance, sports, culture, scandals, incidents, as well as events, which in English-language journalistic practice are usually called "human interest stories", Such as the following message about the tricks of the cat belonging to the Prime Minister of Great Britain.

Advertising texts are located closest to the "impact" pole on the conditional message-impact scale. Possessing clearly marked features at all levels - at the level of language, format and content - advertising texts easily stand out against the background of the general text flow of mass media. The specific features of advertising texts are due to their explicit focus on impact. To influence the mass audience through the media in order to convince them to purchase certain goods and services - this is the main goal of advertising texts. From a functional point of view, advertising texts seem to combine the implementation of two functions of influence: the function of influence as a function of the language, realized with the help of the entire arsenal of linguistic means of expression, and the function of influence as a function of mass communication, denoted in the English-speaking tradition by the stable term "persuasion" or "persuasive function"(function of persuasion or influence with the purpose of persuasion) and implemented with the use of all the latest technologies of influence available to a particular media.

**Linguistic features of advertising texts.** As already noted, the effectiveness of an advertising text depends on the successful combination of all its constituent components: image, sound, image, verbal fabric. At the same time, the researchers note the paramount importance of the verbal component of the advertising of the verbal text. "The verbal part of an advertisement is sometimes more significant than its visual aspect," writes English author Gillian Dyer. Indeed, the importance of verbal language for advertising is extremely important: after all, it is only thanks to the verbal text that the key advertising idea gets its real embodiment, in other words, it starts to "work". For example, the meaning of the trick with a cow running away from a picnic in a TV ad for Heinz ketchup becomes clear only when the inscription "80% of all cows in the world are eaten with Heinz ketchup" appears. Of course, ad images grab the consumer's attention

and convey some of the key points AD. But it is thanks to verbal signs that these key points are conjectured strictly according to those advertising communicative intentions that the advertiser had in mind and that were developed by the advertising agency. The verbal part of the advertising text has an internal structure: as a rule, it is the headline, the main advertising text and the echo phrase. The purpose of an advertising headline is to grab the audience's attention and generate interest in the advertised product or service. An advertising headline contains an advertising message and a main advertising argument, which subsequently develops in the main advertising text, for example:

*Carlsberg. Probably the best beer in the world., Philip Morris.*

*The Universal Taste of Lightness, EFG Private Bank: ... in tune with our clients. Business knows no boundaries.*

*Neither do We. The Economist, an investment bank of global intelligence,*

*Warburg Dillon Bank. Some of the most valuable things in life are virtually invisible. Mitsubishi Electronics.*

Based on the selection of facts, the range of linguistic media technologies for creating images is unusually wide. It includes the whole range of ways to form an image, using both the capabilities of various media and the means of language. The combination of linguistic means with media significantly enhances the overall effect of the impact, contributing to the creation of vivid memorable images. So, in television programs, the choice of video sequence not only illustrates the content of the verbal part of the text, but also helps to form a certain image. For example, the BBC correspondent's report on the new Russia in the program "From Our Own Correspondent" is accompanied by footage in which the viewer sees the Government House through a massive grid; The Kremlin, ominously covered by the palm of the figure of the monument to Minin and Pozharsky; a sculpture of a Worker and a Collective Farm Woman against the backdrop of a huge Nescafe billboard and a demonstration with red flags.

## CONCLUSION

In conclusion, it should be said that the study of mass media texts using the methods and techniques discussed in this article makes it possible not only to identify the national and cultural specifics of the text, but also to consistently describe it from the point of view of the interaction of cultures, manifested at all structural levels - language, format, content.

## THE PECULIARITIES OF USING DISTANCE LEARNING AND INDEPENDENT WORK IN TEACHING PROCESS

**Yusupova Shakhnoza Abdukhafizovna\***

\*Senior Teacher,  
Head of the Chair of “Methodology of teaching foreign languages”,  
Samarkand State Institute of Foreign Languages, Samarkand,  
UZBEKISTAN

### ABSTRACT

*The present article is devoted to embedment of distance education which is a kind of self-study and self-regulating learning process. The author pays attention to the advantages and peculiarities of using distance learning format in the system of education. The article has got an important actuality in the conditions of recent pandemy. The specifics of each model of the distance learning process determine the selection and structuring of the content of training, methods, organizational forms and means of training. Currently, all of these models of distance learning are observed in the practice of education both abroad and in our country.*

**KEYWORDS:** *Distance Learning, Educational Process, Self-Study, Independent Work, Module, Network Database.*

### INTRODUCTION

**Actuality of the theme of the research.** Modern educational paradigms are based on scientific and theoretical concepts that reflect the main features of reality. These include personality-oriented learning, individualization and differentiation of learning activities, formation of learning motivation, self-development of students, etc. These conceptual ideas of education are successfully implemented in the modern information and educational environment, which provides the organization of the educational process with the help of information and communication technologies.

**The aim of the research** is to investigate the advantages of the distance learning in teaching foreign languages and peculiarities of self-study in learning foreign languages.

Modern paradigms of teaching foreign languages reflect the main features of the modern education system [1, p. 926]. Training highly qualified specialists is one of the urgent tasks today. Let's consider distance learning as one of the most relevant areas of modernization of education, as well as the features of distance learning in foreign languages.

**The object of the research** is the process of distance learning, its advantages and lacks.

Distance learning is a way of independent study or self-study which is a form of learning aimed at strengthening the acquired knowledge, skills and abilities, learning of additional information or material [2].

**The task of the research:** to define the role of distance learning and independent work in modern methodology of teaching foreign languages; to study the advantages of distance learning process in teaching foreign languages; to work out methodical and didactic recommendations in using distance teaching of foreign languages.

Independent activity serves to form the knowledge, skills and competencies that are defined in the curriculum of a particular subject and should be mastered by the student, performed in the classroom or outside the classroom on the advice and recommendations of the teacher. Depending on the nature of the science, assignments are developed for independent work.

Self-directed learning serves to form the knowledge, skills and competencies that are defined in the curriculum of a particular subject and should be mastered by the student, performed in the classroom or outside the classroom on the advice and recommendations of the teacher. Depending on the nature of the science, assignments are developed for independent work.

## RESULTS AND DISCUSSION

The specifics of the subject "Foreign language" correlates with the specifics of distance learning, the main features of which are network interaction of all participants in the educational process and a relatively large amount of independent work carried out in the "Just in time" mode, interactivity, selection and structuring of educational material (authentic texts), pedagogical technologies, etc. Working with information based on reading texts and watching videos in a foreign language allows you to use Internet resources, expanding the content of the textbook with authentic and up-to-date information (the latest events in the world (sports, cultural, political, etc.), texts of native speakers (speeches of political figures at conferences, seminars, information from leading TV shows, films, videos, electronic libraries, etc.).

Up-to-date information helps to increase motivation to learn a foreign language. The potential number of individual educational trajectories in this case is significantly greater than in traditional education. However, at present, not every text from Internet resources can be used in the educational process, since not all texts are suitable directly for educational purposes [3, p.72]. It is possible to increase the volume of speech communication or the density of communication in a foreign language both orally and in writing by means of Internet technologies (blog, forum, chat, Skype, etc.), multimedia means within the framework of integration of full-time and distance learning; within the framework of a single information and educational environment of general and additional education, as well as in specialized training (elective course, network model of distance learning).

One of the requirements for the content of a modern foreign language textbook is the availability of tasks related to project activities. On the one hand, such tasks contribute to the development of creative, research activities, on the other hand, to the formation of information and communication competence of schoolchildren, since in the course of project research, as a rule, educational resources of the Internet are involved, which, in turn, require the ability to work with information. Communication with native speakers plays a significant role in the mastery of a foreign language by schoolchildren and students. It is participation in international educational projects that allows you to communicate in a foreign language with peers of foreign countries, native speakers [6, p.562].

Computer technologies, Internet resources, digital devices, Web 2.0 technologies, and distance learning are increasingly used in the education system. However, the unsystematic, unregulated use of modern information technologies in the educational process reveals a pedagogical problem: the lack of teachers' clear understanding of what didactic, psychological and pedagogical tasks can be solved with the help of new technologies. The process of implementing distance learning in the education system in different countries has its own characteristics. This depends on the state policy of the country: either distance learning is recognized as a form of education along with other forms of education, or distance learning technologies are used in the education system as a means of learning.

Distance learning is a form of learning in which the interaction of teachers and students and students with each other is carried out at a distance and reflects all the components inherent in the educational process (goals, content, methods, organizational forms, learning tools), implemented by specific means of Internet technologies or other means that provide for interactivity [5, p. 201].

Distance learning technologies are understood as educational technologies (Moodle, Zoom, etc.) implemented mainly with the use of information and telecommunications networks in the indirect (at a distance) interaction of students and teaching staff. E-learning is understood as the organization of educational activities with the use of information contained in databases and used in the implementation of educational programs and providing its processing of information technologies, technical means, as well as information and telecommunications networks that ensure the transmission of this information over communication lines, interaction between students and teaching staff.

The choice of the model depends on the objectives of the training and on the conditions under which it is possible to carry out distance learning. Depending on the training model used, the activity of the teacher changes. The specifics of each model of the distance learning process determine the selection and structuring of the content of training, methods, organizational forms and means of training. Currently, all of these models of distance learning are observed in the practice of education both abroad and in our country. Let's turn to teaching foreign languages in the modern information and educational environment. It has its own characteristics, which are due to the specifics of the subject "Foreign language". The specificity of the subject "Foreign language" is primarily related to the fact that the leading component of the content of teaching a foreign language is not the basics of science, but the methods of activity – teaching various types of speech activity: speaking, listening, reading and writing.

Academician L.V. Shcherba points out that teaching a foreign language is teaching a certain activity and the specificity of the subject consists in mastering speech, communication, and the formation of speech-thinking activity [7, p. 89].

The authors of the issue "Methodology of teaching foreign languages", edited by A.A. Mirolubov [4], also highlight the volume of educational activities necessary for successful communication in a foreign language as the specifics of the subject "Foreign language". It is obvious that a high density of communication, maintained for a long time, provides a large amount of communication. These features are interrelated.

Distance learning of foreign languages, based on the use of information and communication technologies, is increasingly included in the practice of various educational institutions. The main feature of distance learning is the mediated nature of teacher - student telecommunications communication and the associated limited opportunities for their interpersonal interaction. This form of training allows you to maximize the independent work of students, which is especially important in the conditions of university training, since the future specialist must be able to independently organize their cognitive activities.

Currently, in the remote form of teaching foreign languages, such remote technologies as: modular technology, which is based on the organization of independent cognitive activity of students, the development of training modules of a particular course, are widely used.

Web-quest technology is focused on the maximum practical activity of students and is a role-playing game, for which information resources of the Internet are used. A special place among innovative educational technologies is occupied by the modular technology of professional training.

Modular training is characterized by advanced study of the material in enlarged blocks-modules, algorithmization of educational activities, completeness and consistency of activity cycles. The modular program consists of blocks that are formed from a set of modules, and the modules in turn consist of topics of educational material united by one topic and intended for study by students with different levels of knowledge:

The training module consists of the following components:

- 1) The name of the module;
- 2) The integrating didactic goal;
- 3) The target plan of students' actions;
- 4) The information basis (the actual educational material in the form of a training program);
- 5) Methodological guidelines for achieving goals;
- 6) Practical exercises for the formation of the necessary skills;
- 7) Output control (control work that strictly corresponds to the goals set in this module).

The process of modular training is focused on the formation of ways of educational work through training in the skills of rational implementation of practical actions through a specially organized system of exercises. The modules of each stage should be introduced gradually, according to the degree of increasing difficulties and as students study the core disciplines.

In view of the logical sequence and continuity of all stages of language training, the modular nature of training contributes to the systematic mastery of linguistic material, the expansion of

the background (linguistic and cultural studies, professional, cultural studies, etc.) knowledge of students, and the improvement of skills in the main types of speech activity. Teaching a foreign language using modular technology allows you to comprehensively solve such urgent pedagogical tasks as ensuring an individual pace of learning, taking into account the capabilities, inclinations and needs of the student, teaching the skills of independent work with different sources of information, independent development of the material and, consequently, the acquisition of high-quality knowledge and skills. Currently, the task of the teacher is not only to equip students with modern knowledge, but also to teach students to extract this knowledge independently, to be able to assimilate it, based on what they have already learned.

To achieve these goals, the Web Quest technology is used, which is used in both school and university teaching practices. The rating system for assessing students' knowledge includes regular monitoring of the knowledge and skills of each student, with the assignment of a rating depending on the quality of training as the discipline is studied during the academic period. It is the main part of the complex of continuous multi-level education and is designed to organize the educational process based on learning technologies that activate the independent work of students. Employees of higher education institutions can now develop web-based quests for correspondence and distance learning students, which are included in the list of tasks for self-completion. They can also be used for extracurricular work in the full-time department. Students complete the completed tasks in the form of a foreign language test for a certain semester. Then the test papers are checked and evaluated by the teacher.

In addition to the above programs, the following distance learning technologies for foreign languages are widely used:

case-technology, which is a close analogue of the technology of distance learning (when a student receives a special set of teaching materials (case) for self-study and periodically consults with teachers in regional training centers created for this purpose;

TV-a technology that uses television lectures and consultations with teachers.

A network technology based on the use of the Internet for consulting students and transmitting educational and methodological materials to them. Thus, it should be emphasized that pedagogical education today needs pedagogical technologies that provide effective training of specialists who are competitive in the market. The success and quality of distance learning in foreign languages largely depend on the effectiveness of the organization and the methodological quality of the materials used, as well as the skill of the teachers involved in this process. Distance language learning emphasizes the importance of developing the ability of learners, where language is the ideal basis for practical communication, an important principle of which should be the principle of ethical duty.

Students' self-study plays an important role in cultivating a conscious attitude of students' execution mechanisms to the acquisition of theoretical and practical knowledge, strengthening the habit of mental work focused on them. It is very important that students not only learn, but also master the ways to get it.

Independent work always poses a number of challenges to students, especially freshmen and sophomores.

The main difficulty is related to the need to organize their work independently. Most students face difficulties related to the individual characteristics of their mental activity and physiological capabilities, almost complete lack of psychological readiness for independent work, ignorance of the general rules of its organization, work with key sources, ability to express themselves clearly and concisely, lack of analytical skills is coming.

Therefore, one of the main responsibilities of a teacher is to help students organize their independent work. This is especially important in the modern context of the development of society, in which the specialist engages in self-education after graduation - increasing his level of knowledge through self-study.

Students' self-learning is carried out for the following purposes:

- systematize and consolidate the acquired theoretical knowledge and practical skills;
- deepening and expanding theoretical knowledge;
- formation of skills in the use of normative, reference documents and special literature;
- developing students' cognitive abilities and activism: creative initiative, independence, responsibility and organization;
- formation of independent thinking, self-development, self-improvement and self-awareness skills;
- developing research skills.

There are two types of independent work in the learning process, such as in-class and out-of-class. Independent work in the classroom is carried out under the direct supervision of the teacher and on his assignment. At the same time, students are provided by the teacher with the necessary textbooks, didactic materials, including manuals and methodological developments. Independent work outside the classroom is carried out by the student on the instructions of the teacher, but without his direct participation.

Independent work includes: preparation for classroom lessons (lectures, practical, laboratory, seminar classes) and performance of relevant tasks; independent work on specific topics of academic disciplines in accordance with future thematic plans; preparation for practice and performance of tasks provided in practice; execution of written control and term papers, electronic presentations; preparation for all types of tests, exams and tests; preparation for final state certification; work in topic circles; participation in optional classes, seminars and conferences, etc.

### **CONCLUSION:**

1. Distance learning is a motivating factor in the study of foreign languages, contributes to the achievement of personal, meta-subject, subject learning results and, ultimately, the achievement of the goal of teaching foreign languages: the formation of foreign language communicative competence.
2. Distance learning contributes to the implementation of modern educational paradigms such as individualization and differentiation of educational activities, self-education and self-development of students.
3. The introduction of information and communication technologies in teaching foreign languages reveals a pedagogical problem. Pedagogical science is faced with the task of

methodological development of existing modern teaching tools, the study of new technical means that are promising in teaching a foreign language.

4. In short, the independent work of students requires the development of a conscious attitude of students to the acquisition of theoretical and practical knowledge, the strengthening of the habit of mental work focused on them.

Instructions to the teacher on the organization of independent work of students are as follows:

Independent work should be organized at all stages of the educational process, including in the process of learning new material.

Students should be placed in an active position, making them direct participants in the learning process.

The organization of independent work should help to develop students' learning motivation.

Independent work should be purposeful and clearly formulated.

The content of independent work should define complete and in-depth tasks for students.

It is necessary to ensure the combination of reproductive and productive learning activities of students in the process of independent work.

Adequate consideration should be given to the organization of independent work, i.e. the control system should be properly organized.

## LEGAL FRAMEWORK FOR THE ACTIVITIES OF POLITICAL PARTIES

**Usmonova Nigora Aktamovna\*; E.A. Qadirov\*\***

\* Master's student at Tashkent State University of Law,  
 UZBEKISTAN

Email id: usmonovanigora314@gmail.com

\*\*PhD Scientific supervisor (consultant),  
 Professor of the Department of constitutional law,  
 UZBEKISTAN

### ABSTRACT

*The article examines the process of formation and development of the organizational and legal framework of political parties in developed countries, i.e. institutionalization and constitutionalization processes. It is argued that political parties in developed countries rely on a solid legal basis in their activities. It was also noted that over the years of independence in the Republic of Uzbekistan, a solid legal basis has been created for the activities of political parties, which contributed to the formation and development of civil society institutions, including the institutions of people's representation in our country.*

**KEYWORDS:** *Political Party, Organizational And Legal Basis, Constitution, Law, Legal Basis, «Institutionalization», Legal Norm, «Constitutionalization», Normative Act, Popular Representation.*

### INTRODUCTION

Throughout the modern history of mankind, political parties have always played a prominent role in the representation of the people. It was they who largely contributed to the consolidation of electoral procedures in the mass consciousness. However, without sufficient and legally established institutional opportunities to influence the bodies of popular representation, the parties for a long time could not rely on the effective constitutional and legal instruments of legal regulation of their organization and activities, which are characteristic of most countries of Western democracy. World experience shows that the level of development of constitutionalism, the degree of formation of civil society depends on how institutionalized political pluralism has

become. There is no denying the fact that in recent years, political parties have become an important component of public relations: they have factions in the parliaments of different countries, legislative (representative) bodies of the subjects of these countries, and influence the process of making and implementing important public decisions. However, the constitutional regulation of ensuring the participation of political parties in the system of popular representation largely does not meet the requirements of modern society and needs further improvement.

Political parties in the modern sense of the term first appeared in Europe in direct connection with the revolutions, during which the people's representation was created – a system of power of the people, carried out through elected representatives [1, p.159-160].

Initially, the party united, on the one hand, the supporters of the monarch and the feudal lords, and on the other – the defenders of equality and political freedom. Subsequently, parties began to appear that defend the interests of individual social and regional groups of society. With the strengthening of class differentiation, the deepening of social contradictions, and the involvement of more and more broad strata of society in politics, the role of parties increased, and they became the main subject of politics and a necessary element of democratic statehood.

Parties differ from other public associations operating in the political arena (pressure groups, professional and business unions, etc.) in that they openly compete for seats in parliament and the government, which make it possible to govern the state and, through it, the entire society.

Political parties play a crucial role in public, political and state life, being one of the central components of the political system. The struggle between them is connected with the solution of the question of political power – its ownership, use, methods and forms of implementation. Parties actively participate in political life at all stages of the political process: in elections, the formation of state bodies, the adoption of political and state decisions, and their implementation.

The supporters of the party who vote for the candidates nominated by it in the elections to state bodies form its electorate (from the English "elector", French "electeur" – "voter"). The social strata or regional communities to which the majority of the electorate belongs constitute the social base of the party. In countries with stable social relations (for example, in Switzerland, the Netherlands), the electorate of individual parties is based not so much on the specificity of their programs and ways of activity, but on local and family traditions: the current generation votes for a particular party, following the example of their fathers and grandfathers.

A political party is an active and organized part of society, united by common interests, goals, or ideals, and striving to seize State power or to influence its exercise in a decisive way. A political party is a specific type of public association whose purpose is to participate in the political life of the state. The party as an independent political force, has an organizational structure, develops its own program of national development, and is characterized by a long period of existence [2, p.3-4].

Political parties represent a legal and political institution that acts as an intermediary between the State and the structure of civil society.

The place of political parties is determined by their position in the system of power and civil society. Having originated in it, they gradually won their place first in the system of legislative power, then in the executive. Finally, the totality of the parties of society formed a party system, which became a separate political institution. The party system, or the totality of the parties of

society, is located between civil society and the state, at the junction of public and state structures.

At present, the political and legal system of modern states has various legal forms of state regulation of party activities.

Among the forms of regulation of party activities by the state, the following can be noted::

- Development of special regulations (laws, decrees, resolutions) on political parties;
- Adoption of normative acts concerning state-legal institutions and mentioning political parties (electoral laws, regulations of parliaments, codes of municipal administration, etc.);
- The use of judicial precedents related to the activities of political parties [3, p. 39].

At the present stage, the processes of constitutionalization have been implemented in the political and legal sphere of political parties. The constitutionalization of political parties is understood as the consolidation of their role and place in the constitutions, or at least their mention, recognition by the basic law of the country as a public-state institution [4, p. 187-212]. The general direction of the process of constitutionalization of political parties is already clear: having begun in developed countries, it has now taken on a global character: most new constitutions contain references to parties, and special laws are being adopted about them in an increasing number of countries around the world. In addition, parties, as political institutions, appear in other laws. This process is due, on the one hand, to the increasing role of political parties in modern societies, on the other – to the financial and legal difficulties that they constantly face, and the need to control the manifestations of corruption and dirty electoral technologies.

The constitutionalization of parties allows State bodies to exercise control over certain aspects of their activities. On the one hand, to help them with financial resources, on the other - to reduce corruption to control their income and expenses.

The process of constitutionalization of political parties began with the adoption in 1947 of the new Constitution of Italy, in article 49 of which it was noted that "all citizens have the right to freely unite in parties in order to democratically contribute to the determination of national policy" [5, Article 49]. Then a similar article was written in the constitutions of Germany (1949) [6, Article 21], France (1958) [7, Article 4] and many other states of the world. The Russian Constitution of 1993 also contains an article on parties, which recognizes their ideological and political diversity, multiparty membership; It declares the equality of all parties before the law (as a guarantee against the return of the totalitarian past) and prohibits the creation of parties whose activities are anti-systemic or extremist in nature.

In connection with the expansion of the process of constitutionalization, German political scientists put forward the concept of a party state. G. Leibholz, in particular, argues that the parties were previously free associations, but thanks to constitutionalization they rose to the rank of constitutional bodies, i.e., from a legal point of view, they became the same as, for example, the federal government and the Bundestag. At the same time, the functionality of parties in modern society stems from their place as public-state structures and the link between society and the state. Therefore, they can be equated with state institutions only from a legal, formal, but not from a political point of view. This question was raised in practical and legal terms in Germany

in 1966, when the Federal Constitutional Court decided the problem of financing political parties.

On the basis of the legal provisions of the state institutions enshrined in the constitution, the parties of the Federal Republic of Germany began to apply for funding for their activities, which, in their opinion, should be proportional to the number of mandates received by each party in the Bundestag. The Constitutional Court established a distinction between the formation of the will of the people, carried out by parties in the sphere of society free from the influence of the state, and the formation of the will of the state, which is implemented through its constitutional bodies [8, p.114]. Since it is the parties that perform such a function as the selection and nomination of candidates for state posts, the will of the state, according to the Constitutional Court of the Federal Republic of Germany, cannot be formed without the participation of parties. Thus, from a legal point of view, elections to state bodies are a means of transforming the political will of the people into the state will. It follows that it is permissible to reimburse parties from the state budget for the costs of electoral struggle.

In the Republic of Uzbekistan, a solid foundation has been established, i.e., the legal and regulatory framework for the activities of political parties. The Constitution of the Republic of Uzbekistan sets out the norms concerning political parties. A number of laws have been adopted that regulate the activities of political parties.

Based on the provisions of the Constitution, the laws "On Public Associations" (1991), "On Political Parties" (1996), "On Non-governmental non-profit organizations" (1999), "On the financing of Political parties" (2004), "The Electoral Code of the Republic of Uzbekistan" (2019) and a number of other legislative acts were adopted. Of particular note is the Constitutional Law "On Strengthening the Role of Political Parties in the Renewal and Further Democratization of Public Administration and Modernization of the country" (2007), which clearly formulated the legal status of party factions that adhere to different political orientations, including the opposition party. The law expanded the field for political parties to participate in the formation of executive bodies by directly participating in the formation of the government, in the selection of candidates for certain positions in executive bodies at various levels.

After making some changes to the law "On Political Parties", the activities of political parties in our country have acquired a completely new legal framework. This has led to significant changes in the legal status of political parties, and especially in the formation of State authorities. Political parties in the Republic of Uzbekistan have gained real opportunities to participate in the formation of state authorities, to influence the internal and foreign policy of the country, so their role in the relations between the state and society has increased immeasurably.

In general, the current laws have strengthened the role of political parties in the democratization of state and social construction and contributed to the implementation of the following tasks:

1. Increasing the initiative, role, effectiveness and responsibility of political parties in implementing the country's reform, ensuring effective public control over the implementation of domestic and foreign policy by the state authorities.
2. Creation of organizational and legal conditions for the active participation of political parties in the formation of representative and executive branches of government. Important practical and mobilizing importance is attached to the fact that political parties that have won seats in

legislative and representative bodies of power can directly participate in the formation of executive bodies in the center and in the field and implement their program goals through them.

3. Creation of effective legal mechanisms that establish and ensure the accountability of the Government and state authorities to political parties represented in the Parliament and local representative bodies.

In addition, these and other legislative innovations made it possible, in our opinion, to achieve the following:

- strengthening the political responsibility of the parties for the implementation of their program objectives and election promises, and, ultimately, for the success and effectiveness of the country's modernization;
- The emergence of a strong real inter-party competition and struggle-both in parliament and in representative bodies;
- strengthening public control over the activities of state bodies and increasing the responsibility of their officials;
- Adequate representation in the parliament and other representative bodies of the legal political forces existing in the society, the whole diversity of opinions and interests;
- stimulating social and political activity of citizens, increasing their political culture and consciousness;
- Overall positive impact on the processes of democratization and modernization of the country.

Thus, the reform of the party legislation of the Republic of Uzbekistan allowed:

- \* create institutional prerequisites for the formation of strong and effective political parties, encouraging the strengthening of the parties' positions in the legislative and representative bodies;
- \* overcome the underdevelopment of the party system, strengthen the legal status of political parties;
- \* encourage political parties to participate in elections and the work of representative bodies of state power and the formation of executive bodies, as the most important task of their statutory activities.

As a result, the parties began to aim at gaining their political representation in the state authorities through elections and influence on the process of appointing the heads of executive bodies, and, thereby, participation in the government.

### ABSTRACT

*The article covers the analysis of deformed state of textile threads with regard for their relaxation characteristics. As a model, The Boltzmann-Volterre integral relation has been used. For a specific calculation, a kernel with four parameters has been used.*

**KEYWORDS:** *Mechanical Properties, Tension, Deformation, Materials, Viscoelastic Properties, Relaxation Processes, Elastic Modulus, Various Materials, Mechanical Properties, Curve, Kernel, Distribution, Experimental*

### 1. INTRODUCTION

As we know, to describe relaxation processes the model of the thread considered should be used. The model view is based on fact that textile materials are modeled by a set of interconnected elements that symbolize elasticity and viscosity in pure form. Under the mechanical model is understood not only a set of springs and dampers, but also a system of closed equations that

determine the stressed-deformed state of the material. This model approach allows obtaining mathematical description of any new model built of elastic and viscous elements.

It should be noted that correctly chosen model allows more deeply studying the patterns of textile threads and predicting its behavior under certain operating conditions. If the model method of studying relaxation processes in polymer materials can be considered developed, then for textile threads and clothes it is still deficient [1].

A number of models to describe the mechanical properties of textile materials with different deformation times have been proposed.

1. Maxwell model. The model consists of two successively connected elastic and viscous elements. Along with the positive effects, there is a drawback composed of not sufficiently taking into account the tension behavior of the material.
2. Kelvin-Voith model. The model consists of two parallel-connected elastic and viscous elements. However, this model presents only one mechanism of high-elastic deformation.
3. Eyring, Dogadkin, Bartnev, Reznikovsky model. The model is a parallel-connected Maxwell element spring and piston. This model is often used in research of relaxation phenomena in polymer materials, as well as in fibers and threads.
4. Generalized Kelvin-Voith models. The model consists of three components generalized by Kelvin-Voith model.
5. Mathematical models. It is possible to build complex models, which consists of four or more elastic and viscous elements. However, the use of multi-element models leads to lengthy mathematical expressions and does not allow to satisfactorily describing the deformation of real textile materials [2].

## 2. MATERIALS AND METHODS

Relaxation processes that occur in textile threads can be described by the modeling method. Herewith, it should be observed that the correct selection of the model allows really the laws of deformation of materials in real conditions. Mechanical models are widely used when describing the mechanical properties of various materials, including textiles. They allows simulating the relation between tension and deformation of the materials under study [3].

We use the hereditary Boltzmann-Volterr theory of viscoelasticity to describe the processes of threads deformation taking into account the viscoelastic properties. The mathematical record of the dependence of tension on deformations is as follow [4]:

$$\varepsilon(t) = \frac{\sigma(t)}{E} + \frac{1}{E_0} \int_0^t K(t-s) \sigma(s) ds, \quad \sigma(t) = E \varepsilon(t) - E \int_0^t G(t-s) \varepsilon(s) ds \quad (1)$$

Where  $\sigma$  – is tension;  $\varepsilon$  – is relative deformation; E – is elastic modulus;  $K(t-s)$  and  $G(t-s)$  – are dependence functions; t – is time of observation;  $\tau$  – is time prior to time of observation.

In (1), formulas for calculating the parameters of viscoelasticity were proposed [5].

$$E = \frac{\sigma_1 \alpha (\alpha + 1)}{\varepsilon (\alpha (\alpha + 1) - A t_1)} \quad t_1^\alpha (\sigma_2 - \sigma_3) - t_2^\alpha (\sigma_1 - \sigma_3) + t_3^\alpha (\sigma_1 - \sigma_2),$$

$$A = \frac{((\sigma_1 - \sigma_2) \alpha (\alpha + 1))}{\sigma_1 (\alpha + 1) (t_2^\alpha - t_1^\alpha) + (\sigma_1 - \sigma_2) t_1^{\alpha+1}}, \quad \beta = \frac{(\sigma_4 - \sigma_1) (\alpha + 1) \alpha + E \varepsilon A (t_4^\alpha - t_1^\alpha) (\alpha + 1)}{E \varepsilon A (t_4^{\alpha+1} - t_1^{\alpha+1})}$$

Knowing the nature of the distribution of tension and deformation of the thread allows predicting the tension-deformation state of the thread [6].

At  $\sigma = const$ , from relation (1) we obtain the creep equation

$$\varepsilon(t) = \frac{\sigma(t)}{E} \left[ 1 + \int_0^t K(s) ds \right] \quad (2)$$

If the influence function is known, then equation (2) can be used to construct a constant curve of tension creep. The latter is determined from the known creep curve. In particular, if the influence function  $K(t)$  has the form of an exponent, then we obtain the Kelvin model. If the kernel of the integral equation is in the form of a sum of damped exponential functions, then the integral equation (1) is equivalent to a linear differential equation of the  $n$ -order.

There are different types of kernels. For example, the kernels of Rabotnov, Slonimskiy, Ilyushin, etc. In computational practice have found great application the kernels proposed by Yu.N. Rabotnov, A.R. Rjanitsyn, M.A.Koltunov [7]. For example, the relaxation kernel proposed by A.R. Rjanitsyn has the form

$$R(t-s) = \frac{A e^{-\beta(t-s)}}{(t-s)^{1-\alpha}}, \quad (3)$$

Where  $A, \alpha, \beta$  are material parameters. The resolvent of this kernel is obtained by M.A.Koltunov in a form [8]

$$K(t-s) = \frac{\exp(-\beta(t-s))}{(t-s)} \sum_{n=0}^{\infty} \frac{[A - \Gamma(\alpha)]^n (t-s)^{n\alpha}}{\Gamma(n\alpha)} \quad (4)$$

For materials with a finite long-term modulus of elasticity, a four-parametric kernel is used, which has a form

$$K(t-s) = \frac{A \exp(-\beta(t-s))}{T^q (t-s)^p}, \quad 0 < p < 1; q = 1 - p \quad (5)$$

Where  $A, T, p, q, \beta$  are - material parameters determined by graphical method [8].

Corresponding relaxation kernel has the form

$$R(t-s) = \frac{\exp(-\beta(t-s))}{(t-s)} \sum_{n=0}^{\infty} (-1)^{n+1} \frac{[A \Gamma(q)]^j}{\Gamma(jq)} \left( \frac{t-s}{T} \right)^{qj} \quad (6)$$

For a constant load applied at time  $t=0$ , according to expressions (5) and (1), we have

$$\varepsilon(t) = \frac{\sigma(t)}{E} \left[ 1 + \frac{A}{T^q} \int_0^t \frac{e^{-\beta(t-s)}}{(t-s)^p} ds \right] = \frac{\sigma}{E} \left[ 1 + \frac{A}{(T\beta)^q} \gamma(\beta t, p) \right], \quad \gamma(\beta t, p) = \int_0^{\beta t} e^{-s} / s^p ds$$

Where  $\gamma(\beta t, p)$ – is incomplete gamma function, whose values are tabulated [9]. When  $t \rightarrow \infty$  then deformation is equal to

$$\varepsilon(\infty) = \frac{\sigma}{E} \left[ 1 + \frac{A}{(T\beta)^q} \Gamma(q) \right]$$

An algorithm to determine the parameters based on experimental creep curves has been developed, and practical techniques based on graphical constructions has been developed for approximate engineering estimates [10].

### 3. RESULTS AND DISCUSSION

Let us show the efficiency of using a kernel of the form (3) in comparison with other types.

Fig. 1 shows the graphs of tension relaxation changes according to three theories in comparison with the experimental curve. Hence, we clearly see that for the deformation of textile materials, the best description is given by the weakly singular kernel (3) and Rjanitsyn-Koltunov function-resolvent. As an example, we consider the process of deformation of a cotton thread with a linear density of 28 tack.

Instantaneous modulus of elasticity  $E$ , breaking load and breaking deformation are determined before the creep test. The tests are carried out at constant temperatures and relative humidity of the material. Wherein, machines, equipment and stands designed for long-term static tests are used. Therefore, for example, one end of a thread or fabric is fixed motionless, and a load is suspended from the other end. In this case, tensile deformation relaxes in the thread or fabric at constant tension. In this position, the sample is kept in an unloaded state at a given test temperature for 30-60 minutes. After that, the sample is loaded at loads up to 5% of the short-term strength limit. In this case, the possibility of sliding of the sample in the clamps during the test should be excluded.

The loading rate is taken constant for the entire series of tests. The loading time should not exceed five seconds. The moment of full load of the test sample is taken as the reference point for creep. Moreover, deformations are recorded in 0.5;1;2;3;5;10;30;60 min after loading, followed by approximate doubling of period between indications.

After the creep tests have been performed, the samples are unloaded and the unloading creep is observed. All tests are repeated on samples at least three times, and processed by the method of complex analysis. The values of the averaged deformations for each tension level and time are recorded in a table and presented in the form of graphs indicating the experimental confidence intervals.

Figure 1 shows the deformation curves at different load levels

Fig. 1. Deformation curves of 28 tack cotton thread at different load levels

The mentioned curves show that the deformation is linear with respect to the tension. The determination of the modulus of elasticity and the parameters of the kernel is carried out by combining the experimental curves of flexibility and theoretical curves [11]. Having this experimental theoretical curve (Fig. 1), determined by the parameters  $\alpha_t$ ,  $\beta_t$ ,  $A_t$ , we can easily determine the parameters of experimental curve  $\alpha_e$ ,  $\beta_e$ ,  $A_e$  for a given material, and its instantaneous modulus of elasticity  $E$  is found by the formula

$$E = \frac{1 + \int_0^t K dt}{\varepsilon_x(t) \sigma_k} \quad (7)$$

Thus, the found parameters  $\alpha_e$ ,  $\beta_e$ ,  $A_e$  can be introduced into the relaxation equation and into the constraint equation  $\sigma \sim \varepsilon \sim t$ .

Fig. 2. Creep curves for different kernels ( $\varepsilon_1(t)$  is experimental curve;  $\varepsilon_3(t)$  is Rjanitsyn kernel;  $\varepsilon_2(t)$  is four-parameter kernel)

#### 4. CONCLUSION

Analysis of the studies carried out allows concluding that it is necessary to use a model method to calculate the values of deformation of textile materials in the process of relaxation. It was determined that Boltzmann-Volterra model, generalizing other known models for textile materials, is the most acceptable. To describe the behavior of textile materials with viscoelastic properties, it is necessary to use weakly singular heredity kernels, for example, the Rjanitsyn-Koltunov kernel (3), which very satisfactorily reflects the quasi-static and dynamic behavior of viscoelastic material, and is most convenient for carrying out quasi-static and dynamic

calculations and determining mechanical constants. However, as numerical experiments show, a kernel of the form (5) is the most acceptable for a number of materials (Fig. 2). In the case of kernel with four parameters, the creep curve is closer to the experimental one than the kernel with three parameters.

### ABSTRACT

*The organization of financial accounting and reporting through the principles of IFRS, which is not carried out within the framework of special government programs, is not supported by the state, will not allow to solve the main tasks of the transition in the coming years.*

**KEYWORDS:** *According To The Resolution.IFRS. Digitization Of The Economy.Acquiring And Mastering.New Uzbekistan.Our Main Goal Is To Please The People.*

### INTRODUCTION

In today's global economy, our country pursues global accounting policies and adopts standards. Because the accounting policy and transparency are clear to any user of information and allow a potential investor to make qualified financial decisions.

Resolution of the President of the Republic of Uzbekistan "On additional measures for the transition to international financial reporting standards" PQ-4611 dated February 24, 2020 oopened a new page in the accounting policy in our country. (1)

According to the resolution, from January 1, 2021, accounting will be conducted on the basis of IFRS:

- joint stock companies
- commercial banks
- insurance organizations
- legal entities included in the category of large taxpayers.

In particular, this decision is another step for our Republic, which has a new look at the world, to abandon the closed economy as much as possible and create an open, transparent and new economy.

In our opinion, the need to conduct financial reporting in accordance with international standards is based on:

**First**, the countries of the world should be able to formulate on the basis of national requirements for financial accounting and reporting, not to fail to provide an opportunity to determine, compare and contrast the financial condition of the object of study;

**Second**, the use of IFRS requirements as a benchmark for accounts and reports serves to increase the country's investment attractiveness and meet the information needs of domestic owners;

**Third**, the national securities market will be able to sell on world stock exchanges and increase foreign exchange inflows:

**Fourth**, it serves to increase the number and expand the activities of international companies in the national economy;

**Fifth**, the preparation of a single, recognized financial statement in accordance with IFRS requirements increases its efficiency and reduces the cost of preparation;

Well, the transition to IFRS gives so many opportunities, and there are several reasons why this process has dragged until this day:

- Before the beginning of the new history of Uzbekistan, the authorities of the republic were interested in the fact that the economy of our country was closed for the world economy.
- the state becomes a provider of financial information and at the same time a user of financial information. This, in turn, has led to a one-sided view of the value and formation of financial information.
- The low level of digitization of the economy in our country and the fact that it is not technically well established.
- lack of qualified specialists and lack of textbooks, as well as low level of knowledge of foreign languages.
- the high share of our country in the shadow economy.

The success and timing of the transition to a full financial reporting system in accordance with IFRS requirements can be predetermined by the fact that the idea of transition is directly understood by companies and organizations as the basis for effective management.

The organization of financial accounting and reporting through the principles of IFRS, which is not carried out within the framework of special government programs, is not supported by the state, will not allow to solve the main tasks of the transition in the coming years.

One of the most pressing issues is the misinterpretation of certain actions and the task of translating the content of international standards into Uzbek in a correct, competent and readable manner. Therefore, it is necessary to translate the existing IFRS standards into Uzbek, to republish and adopt new ones, as well as to provide free access to these materials, taking into

account the structure of the IFRS Board and the changes, comments and standards made through it.

The president's decision requires this new economic knowledge. For this reason, dissatisfaction and grievances can be expressed by accountants in a number of Internet networks. Acquiring and mastering new knowledge, learning a new way of working takes effort and hard work. But the real situation in the world economy today is that the basis of the activity of an accountant is the interests of the user of financial information, that is, investors and decision-makers, no different. Unfortunately, many businesses and organizations do not understand that the role of accountants is to ensure that tax returns are accurate and timely, or that they are accountable for control and audit.

It can be observed that accountants accustomed to thinking and working in the old way accuse IFRS principles of ambiguity and over-abstraction. One of the main reasons for this is that the new rules force the chief accountant to understand the business of the organization in which he works as an economist and financier.

At the same time, there is no doubt that the introduction of international reporting standards will enter a new stage in the development of the country's economy. The IFRS report reflects the real processes in the activities of Uzbek enterprises, organizations and companies. If the assets are measured at market value, and the reserves are calculated correctly, it will be understandable to external users in most countries of the world. As a result, the introduction of IFRS will not only help Uzbek enterprises, companies and banks to reach the international level, but also attract investment.

With this in mind, the President's decision is aimed at creating conditions for the formation of an investment climate in the country and accelerating its work.

Thus, the established legal framework creates favorable conditions for a wide range of investment activities of foreign partners, serves to meet their information needs and protects their investments.

For example, the dynamics of the volume of investments in fixed assets in 2015-2020 can be seen in the fact that further intensification of the work on the transition to IFRS from 2016 will have a significant impact on the economy of the country. (3)

**Table 1**

Foreign investment is the investment of capital-exporting countries in the real and financial assets of economic entities of importing countries and joint ventures. (2)

Investment means the flow of capital from one economy to another, allocating resources on more favorable terms.

This, in turn, allows an investor with a foreign capital to stay in a certain area for a longer period of time and resources, which is easier for the investor to understand.

For Uzbekistan, the dynamics of change in investment in fixed assets, except for 2020, which is very difficult for the world economy, continues to show growth. Table 2. (3)

**Table 2**

In recent years, Uzbekistan has undergone a radical change in the state's economic policy and rapid reforms.

Under the motto "New Uzbekistan" the state began radical changes, twists and turns in public policy and the economy.

A new, democratic image of our country is being created in Uzbekistan on the basis of modernization of our economy, ensuring that every decision and reform is based on human rights and freedoms, the rule of law.

Due to the fact that the basis of our reforms, dialogue with the people, the satisfaction of the people has risen to the level of public policy, the atmosphere of openness and freedom in our society is growing. The President's decision can be seen by comparing the per capita investment in fixed assets over the years. Table 3. (3)

**TABLE 3**

In the Republic of Uzbekistan, the transition to IFRS has chosen a unique and appropriate way for our national economy. This was a way to develop and implement national accounting standards that meet international standards.

In this regard, the President's decision has become a key document defining today's requirements and the economic future of our country. The most important issues now are how the system works, whose interests come first, and the potential of economic information and transport documents.

In conclusion, the ultimate goal of the IFRS in our country is to increase the welfare of the people, as our President said, "Our main goal is to please the people."

### ABSTRACT

*This article focuses on the use of equipment used in the field of agricultural mechanization, especially in the initial processing between rows. The tanch (3) wheel provides balance by protecting the frame from the vibrations that give rise to the resistance forces generated by the working bodies. We use a trail (4) traction so that the quality of processing is high during the next growing season without losing the row.*

**KEYWORDS:** *Device frame, base wheels, rail, working grilles and 2 series-mounted customized rollers for tillage.*

## INTRODUCTION

The onset of heavy rains of the year turns the soil into a muddy chaff, making it difficult for the seeds to germinate, making replanting possible. In order to overcome this difficulty, ration motigo (ROR) is used. [M.Shoumarova, T.Abdillaev.IIbob.176 page]

The main disadvantage of this ration motigo is that it does not produce complete crushing when processing between rows. As a result, not being able to achieve full seedlings reduces yields.

Given that the seeds are sown at a depth of 5–7 cm, the required heat, humidity, germination in the air environment is ensured, the successive rains and high sunlight spoil this environment. In the conditions of Bukhara region, the optimal time for sowing seeds is the first 15 days of April. It is at this time that there is a lot of rainfall, and the effect of sunlight on the ground is the same, ie heating to 30-35 degrees, which causes problems in agriculture.

The purpose of the utility model is to solve the above problems. To do this, we take the existing seeder SChX-4 compacting wheels (rollers) and use it as a working body. We put 2 different shaped teeth on the wheels and install them on the grills in series. The compacting wheels now loosen the soil, which has been turned into cotton, one by one, creating an environment for the seeds to germinate.

The problem is solved by mounting 2 adapted wheels on 4 grids mounted on the main frame of the device and moving it along the rows on a mowing tractor.

Getting the desired harvest will lead to comprehensive economic growth.

In an effort to find a solution to this problem, we embarked on an honorable task, such as creating a device to protect the cotton field from rot.

The working body of the rotary motor is broken by the fact that its star-shaped blade is combined with disks consisting of sharp-toothed teeth and the formed cosettes move into the ground.

In the proposed device, the purpose is to break the fold. The roller in the first row breaks the crust, the roller in the second row serves to grind the lumps and compact the soil. As a result of the softening of the lumps that fall into the roller, the mud crumbles and a fine soil is formed.

The function of the proposed utility model is that the conversion of soil prepared for planting in the rainy season of the year into muddy cotton not only causes problems with seed germination, but also causes seed rot.

In this case, the task of creating a favorable environment for the germination of seeds, the formation of betalofot full seedling area is assigned to the proposed device.

The device, which protects the cotton field from hardening, is aggregated to the mowing tractor. The main (1) frame is mounted on it by means of a fastener (2) of all details made by integral welding. The tanch (3) wheel provides balance by protecting the frame from the vibrations that give rise to the resistance forces generated by the working bodies. We use a trail (4) traction so that the quality of processing is high during the next growing season without losing the row. The tillage working bodies (5) are attached to the pole. The sharp-toothed roller (6) and the spring-loaded (7) plate welded roller do the main job, ie they grind the soil and create a favorable environment for seed germination.

The device, which protects the cotton field from hardening, is aggregated on a mowing tractor, such as TTZ-80, MTZ-80. The tractor power that pulls the device should not be less than 80-100 horsepower. The main (1) frame is made by integral welding, all details are mounted on it by means of fasteners (2). The support (3) wheel provides balance by protecting the working forces from the vibrations transmitted to the frame by the resistance forces generated. In order not to lose the row, we use the cultivator (4) to ensure high quality of processing in the next growing season. The tillage working bodies (5) are attached to the pole.

The sharp-toothed roller (6) and the spring-loaded (7) plate welded roller do the main job, ie they grind the soil and create a favorable environment for seed germination. When assembling the device, it is advisable to adjust the parallelism of the working rollers in the horizontal plane.

The device, which protects the cotton from the husk, is equipped with a main frame, support wheels, a column, a harrow and a series of mounted tillage working bodies, which is distinguished by a flat plate roller that crushes the husk.

## CONCLUSION

Following the above recommendations, we should follow the following.

1. It is necessary to determine the number of hectares of cotton fields in the region and to determine how many devices are needed for processing during the cultivation period.
2. We need to put into practice that this device, which is created when we organize planting on the basis of agro-technical requirements, is effective in cotton growing, the first prototypes of the device are used in advanced farms of our region.
3. Introduction of this device in the existing clusters and farms in the region in this way we use advanced technology in agriculture.

Our task now is to get a certificate from the Intellectual Property Agency, to develop a lot with the support of the Ministry of Innovation Development and to contribute to the well-being of our people, easing the burden on farmers.

**ABSTRACT**

*The article highlights the methodological components of the 11th-grade biology textbook in secondary schools, the importance of developing students' independence in the study of topics. In particular, the textbook shows that the methodological components of the textbook are in demand, such as "Apply your knowledge", "Write down the meaning of terms", "Express your opinion", instructions for 5 laboratory classes, 74 color pictures to make the content easier to understand.*

**KEYWORDS:** *A New Generation Of Textbooks, Information System, And Model, "Ecology And Life", The Phylogeny Of The Organic Universe, Hierarchical Structure, Biogeocenosis, Ecosystem, Artificial Ecosystem, Autotroph, Heterotroph.*

**INTRODUCTION**

Great work is being done in our country to create a new generation of textbooks based on the requirements of state educational standards. According to the theory of modern education, the textbook is a multifaceted information system and a tool for organizing the learning process. Now textbooks are required not only to educate students but also to perform tasks such as educating, informing, developing, consolidating knowledge, testing, and evaluating their own knowledge. In addition, there is a growing emphasis on the fact that the textbook should be a tool

for students to learn the basics of science independently, which will serve to develop their practical work skills on the textbook.

### **MATERIAL AND METHODS**

There are different views in the literature on textbooks and their structure and functions. Including, D.Zuev [7] describes it as "a textbook that describes the knowledge of various fields of science, its achievements in modern science and production in a certain volume and logical sequence." V.P. Bepalko [6] shows that independence means that people do one task without the help of another, including the teacher's assignments aimed at doing a series of practical tasks so that students can master the newly learned topic more thoroughly.

S. G.Antonova and L.G. Tyurina [4] emphasizes the need to use the positive methodological components of the textbooks published in previous years in the development of methodological components of textbooks. O.Akhmedova and K.Zokirov [5] comment on the successes and some shortcomings of the methodological components given in the 10th-grade biology textbook. Z.A. Mendubaeva [9] shows that the logical connection of topics in the development of methodological components of textbooks, the correct choice of their means of study, taking into account the types and content of lessons are important tasks. E.S. While Tsikalo [10] shows that the content of textbooks consists of main, supplementary, and explanatory texts and non-textual components, T.N. Glubsheva and S.D. The Chernyaevskys [6] comment on the role of textbooks in the educational process.

Most of the textbooks published in previous years did not pay enough attention to the methodological components that serve to improve the content of the lesson, such as independent study, thinking, creative research, with the aim of providing students with ready-made knowledge and narration of their topics. Therefore, the students of the time called for the creation of a new generation of textbooks. Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. PQ-4805 of August 12, 2020 [1] and the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated April 5, 2019, № Resolution No. 281 [2] made it one of the urgent tasks to create new generations of textbooks that fully meet the modern requirements.

In education, "A bad teacher explains a topic. A good teacher directs the student to search for the content of the topic on his or her own." One can see the importance of students' independent work in education. One of the protagonists of the novel by the French writer Anatole Franz: - The idea that "to digest knowledge, you need to eat it with appetite" is another example of the importance of independence in education. For this reason, there is a growing focus on improving the methodological components of textbooks that allow students to use them independently and effectively.

### **The results obtained.**

In the literature, the textbook is described as an information system and model of the educational process. According to the theory of modern education, the textbook is a multifaceted information system and a tool for organizing the learning process. Therefore, textbooks should serve not only the task of educating students in accordance with modern requirements but also to educate, inform, develop, strengthen the knowledge base, the student to check their knowledge, assessment and so on.

In biology education, as in other disciplines, textbooks are the most important teaching tool from which students learn scientific knowledge in certain disciplines. From this point of view, the biology textbook is an example of a systematic reflection of knowledge about the distribution, structure, life processes, diversity, the importance of different representatives of living organisms. The textbook describes the system, content, scope of knowledge, and skills in the field of biology, some plants, animals, humans, cytology, and genetics, which should be mastered in the study of biological sciences. The textbook is intended for students of a certain age and training and consists of information obtained by modern science on specific groups of living organisms selected materials from innovations in production.

It is known that the content of textbooks consists of text, non-textual components. The text is also divided into main and additional texts, respectively. While the main text of the textbook consists of groups of basic concepts relevant to the age characteristics of students, covering the modern achievements of various disciplines in accordance with the requirements of state educational standards and curricula, the additional text is given for students interested in biology. Examples of additional materials include the history of the discovery of some discoveries in science, some scientists, their lives, and work.

The non-textual-methodical components of textbooks play an important role in the development of students' independence in the study of topics in education. The methodological components of the textbooks consist of methodological guidelines such as rules of work with the textbook, symbols, pictures, tables, table of contents, laboratory work, independent work, instructions for homework. Extracurricular components allow students to independently and practically study the topics covered in the textbook, to develop skills in working with the textbook. Therefore, in creating new generations of textbooks, the authors are trying to radically improve the methodological components that will help students to easily master the theoretical material.

As evidence of the above, we present a textbook of biology for students of 11th grades of secondary schools, academic lyceums, and vocational colleges (Biology: Textbook for 11th grade of general secondary schools: 1st edition / Authors: A. G 'afurov, A. Abdugarimov, J. Tolipova, O. Ishankulov, M. Umaraliyeva, I. Abdurahmanova. - T.: «Sharq», 2018. - 240p.).

The textbook consists of four chapters and 42 paragraphs on 240 pages: "Ecology and Life", "General biological laws of the ecosystem level of life", "General biological laws of the biosphere level of life", "Phylogeny of the organic world".

Due to the systematic selection of topics, the whole chapter, the training materials given in the paragraphs formed a logical whole with each other.

The authors paid serious attention to the issue of methodological elements of the textbook. First of all, at the beginning of each chapter of the textbook, they show the students what scientific knowledge they will have when studying the materials of this chapter. For example, at the beginning of the first chapter, students are told: "After reading the content of Chapter 1, you should:

- be able to describe the structural structure, basic features and importance of living organisms;
- be able to explain the hierarchical structure and general properties of biological systems;
- be able to analyze the tasks of ecology;

It is said that you need to be able to compare the peculiarities of the structural levels of living organisms. This encourages students to master this system of knowledge as they begin to study the chapter material, knowing what the most important scientific material in it consists of.

Another methodological component of the textbook is the "Apply Your Knowledge" guide to students at the beginning of each topic. For example, the second paragraph of the textbook is entitled "Development, sections and methods of ecology." In it to the students: Why do you think man needs knowledge about the way of life of the surrounding organisms?

*Where is this knowledge used?*

- *What environmental issues do you know?*
- *Instructions are given as to why every member of society should have environmental knowledge.*

Each subject consists of a common set of concepts arranged in a certain order. These concepts are slowly evolving, repeating and evolving from topic to topic, from chapter to chapter, from subject to subject, and acquiring a certain amount of knowledge. For example, topics such as the distribution and habitat of different animals in 7th grade zoology, "About biological systems" in 10th grade biology, and "General biological laws of life at the organism level" require use in 11th grade "Components of Ecosystems". Therefore, remembering the knowledge acquired by students from other disciplines in the study of a new topic, and linking this knowledge with the new subject, serves to implement such important requirements as the implementation of the systematic principle of didactics in the acquisition of knowledge, developing biological concepts in education. ! We consider the instruction "Apply your basic knowledge" to be one of the achievements of the authors and the textbook.

The textbook "Record the meaning of terms" is also reflected in the fact that the authors have developed questions aimed at further improving the quality of the methodological components of the textbook and the development of students' knowledge and skills on the studied topic. For example, after studying the topic "Components of Ecosystems" to students

1. Compare the concepts of "biogeocenosis" and "ecosystem". Identify the similarities and differences between them.
2. Explain the importance of producers in the ecosystem? Give examples of phototrophic and chemotrophic organisms.
3. Explain the role of reductants in the ecosystem based on examples.
4. Explain the nature of indicators such as self-recovery and sustainability of biogeocenoses.
5. What do you mean by self-regulation of biogeocenoses?

In finding answers to such tasks as

We believe that the task in the textbook, "Express your opinion", which allows students to explore the topic in more depth and fill in the tables for personal feedback, will also allow students to master the same topics independently and thoroughly.

It is well known that a person's cognitive ability is initially realized through his senses. Therefore, as important as the texts are in explaining the topics in the textbooks, the attached

pictures, diagrams, tables are equally valuable in terms of their functions and meanings, they can visually prove the content of the textbook, easily master the basic concepts of the subject, it is a fact that learning serves to perform important educational tasks such as understanding the morphological, anatomical, structural features of plants and animals in the subject under study. Since texts play an important role in the role of the source of knowledge in textbooks, the pictures attached to them will have the same value in terms of their function. For this reason, we will focus on some comments on the pictures attached to the study of the main text in this textbook

The textbook provides 74 color illustrations to explain and interpret the main text. The authors have worked hard to decorate the textbook with pictures, and it seems that the selected pictures correspond to the content of the topics studied. The authors have selected images that serve as a visual explanation of the topic materials and the most basic concepts in it. The color pictures in the textbook are intended to give students an initial idea of the topic being studied (table).

**TABLE THE NUMBER OF PICTURES ATTACHED TO THE PARAGRAPHS IN THE TEXTBOOK**

№	Chapters in the 11th grade textbook	Number of paragraphs in chapters	The number of images in the paragraphs	
			colored	colorless
1	I CHAPTER. Ecology and life	2	1	-
2	CHAPTER II. General biological laws of life at the ecosystem level	21	33	1
3	III. CHAPTER. General biological laws of the biosphere level of life	11	22	
4	VI. CHAPTER. Phylogeny of the organic world	10	17	

As can be seen from the table, four chapters in the textbook, 74 colors, one colorless picture were added to enrich the content of 34 paragraphs. All the pictures will undoubtedly serve to make it easier for the students to understand the content of the topic being studied. In particular, for the 21 paragraphs in the chapter on the general biological laws of life at the ecosystem level, Figure 3 allows students to clearly distinguish between autotrophic and heterotrophic organisms, Figure 5 allows students to visualize materials on aquatic animals, Figure 6 shows students living on land and air. allows them to master the material on the example of various animals distributed in this environment. In addition, we believe that Figures 44, 45, 49, and 63-67, selected for the study of the structure of the skin of animals, attached to the topic "Metabolism and Energy in the Biosphere" will serve to further improve the essence of the topics.

The textbook contains 5 topics of laboratory classes. Carrying out of these laboratory classes allows students to solidly study the subject materials through practical work, to further develop intellectual, qualification, potential.

A glossary of key terms is provided at the end of the textbook. The fact that the 4 chapters included in the topic are given in blue makes it easier for students to find the chapter they need.

However, we have seen that there are some more vague assignments in the methodological elements of the textbook. In particular, the sixth paragraph is given in the independent work on "Land, air, soil, living organisms as habitats." It is tasked to identify and tabulate the habitats of animals such as manta, redstart, golden ergazar, rishta, lobster, aurelia nereida. However, the text on this topic does not provide materials on the above-mentioned animals and does not specify how to perform an independent work assignment. We wanted the authors to indicate whether the animals given in this assignment could indicate which literature was given.

Similar vague assignments were encountered in the textbook's instructions for laboratory work 1. The guideline states, "Observe the growth and development of plants. Record the results of the observations in a weekly chart." However, there are no instructions on how to organize the growth and development of plants, the methodology of transfer. For example, paragraph 21 of the methodological components of the topic "Artificial ecosystems" in the section "Express your opinion" describes the main features of urban flora and fauna. How did the adaptations in them come about? Isn't the so-called task more difficult for students? In our opinion, it would be expedient to give this task to students in a simpler and clearer way and to show them what materials and tools to use in finding the answer.

## CONCLUSION

In our opinion, the above ideas in the textbook do not affect the quality and value of the methodological components of the textbook. We hope that our comments will be taken into account in the next edition of the textbook if the authors like them. Indeed, the above-mentioned Resolutions of the President of the Republic of Uzbekistan dated August 12, 2020 PQ-4805, the Cabinet of Ministers of the Republic of Uzbekistan dated 05.04.2019 No 281 also encourage authors to fulfill new tasks, such as creating new generations of textbooks that fully meet modern students.

Based on the above considerations, we believe that the authors of the biology textbook published for 11th-grade students of secondary schools have made a significant contribution to the creation and improvement of new generations of textbooks.

## MEDICAL LINGUISTICS, LINGUISTIC ANALYSIS OF DISEASES

**Shohida Olmasovna Ergashova\***

\*Assistant teacher of Department of Languages,  
 Medicine and Education Faculty,  
 Samarkand State Medical Institute,  
 UZBEKISTAN

### ABSTRACT

*Analysis of the linguistic features of diseases, the application of psycholinguistics in medicine, the causes of diseases in the human body, the contribution of scientists to the development of science, the study of the characteristics of the human response to the environment. Environmental factors play a leading role in the development of the disease, as they can directly affect the body and change its internal characteristics, which can be passed from generation to generation and cause the disease. On the contrary, any influence that only injures a particular place will, of course, lead to general events. For example; It is known that if a rash appears on any part of the body, a person becomes feverish, lazy, loses appetite, and so on. The process of verbal information, that is, the process by which people communicate and receive information from each other through speech, is the subject of study in many disciplines.*

**KEYWORDS:** *Genealogical Method, Quarantine-Quarantine, Psycholinguistics, Analyzer, Severe Pain, Leprosy.*

### INTRODUCTION

By the end of the 1990s, the inheritance of normal and pathological symptoms in more than four thousand people had been studied. 4.5-5.0% of newborns are currently born with genes that cause hereditary diseases. The genealogical method is also used to diagnose hereditary poor health. The essence of this method is that the causes of hereditary illness in humans are identified and studied by collecting and analyzing information about the genealogy of generations. Using the genealogical method, the science of genetics has shown that human abilities, talents, intelligence are passed from generation to generation, and this, in turn, depends on genetic factors.

Illness, sickness, disease is a pathological process that occurs when the body is exposed to harmful factors of the external or internal environment. The concept of disease has changed in the history of medicine. Environmental factors play a leading role in the development of the disease, as they can directly affect the body and change its internal characteristics, which can be passed from generation to generation and cause the disease. The disease is often caused by over-exposure to various microorganisms and toxins. This reduces the body's ability to adapt to the external environment and disturbs its balance with the environment. Developmental defects or hereditary defects can also cause the disease. For example, certain diseases, especially allergies, are sometimes congenital (Allergy). The causative agent affects and harms the organism, while activating the body's defenses and adaptive responses. Hence, the disease is usually characterized by the combination of two interrelated processes – the process of damage and protection against it.

Each disease disrupts the vital functions of the whole organism, but in many diseases the location of the pain in the body, as well as the signs of greater damage to a particular organ or system, are clearly visible. For example; Gastric or peptic ulcer: It is a common disease of the whole organism. It is a local symptom of ulcerative colitis. On the contrary, any influence that only injures a particular place will, of course, lead to general events. For example; It is known that if a rash appears on any part of the body, a person becomes feverish, lazy, loses appetite, and so on. In the culture of every nation there is a set of views that represent the names of diseases. They embody the worldview, religion, customs, way of life and history of this people. In particular, in the practical speech of the Uzbek people, the names of dangerous diseases such as cancer, tuberculosis, plague have long appeared. There are historical reasons for this. Although their cure has been found today, our people are satisfied with the use of such compounds as “bad disease”, “severe disease”, “bad disease”, “severe pain”. Our great thinker Abu Ali ibn Sina in his work “Laws of Medicine” cited many terms that form the basis of medical science. In particular, leprosy is described in the Laws of Medicine by the terms “lion's disease” and “Do ul-Assad.” It is clear that the patient is like a “lion” (animal), taking into account the symptoms of the disease.

The term quarantine, which is now rapidly entering our lives, is also interpreted by our great scientist. Ibn Sina worked on the treatment of diseases transmitted by microorganisms, bacteria, viruses, and to prevent it, the patient introduced into medicine a method of self-isolation for 40 days, self-isolation from humans. Ibn Sina called this method Al-Arba'in iyya. The word means “forty days.” The method he introduced spread to Italy and all of Europe with the help of Venetian merchants. And the method of self-isolation was called “quarantine-quarantine”, which means “forty” in Italian and “quarantine” in English.

Moreover, computer linguistics, which is rapidly developing in our lives, has not left the field of medicine indifferent, among all fields today. In social networks and forums on websites that are an integral part of modern society, we can find discussions on the topic of almost any debate and editing requirement that we cannot imagine. Of course, various diseases, problems with treatment, medical topics related to a healthy lifestyle are no exception. Due to the pandemic, the number of people who publish any information about their health on the Internet is growing every day, so every day a lot of information is received. The list goes on and on. The creation of projects, platforms, mobile applications, scientific research on medical terms used in the Uzbek language is important as a solution to the problem. In particular, the introduction of automated methods of information processing in the field of medical linguistics, lexicography requires

working on the basis of special optimal technologies based on the capabilities of mobile applications, the active use of modern information lexicographic software in lexicography. The creation of mobile applications in the field of medical lexicography shows that only electronic dictionaries allow you to quickly convey the whole essence of the lexeme to the reader. Automation of data processing, creation of new active lexicographic systems, as a result of which requires the acceleration of the transition from traditional dictionaries to automated (electronic) dictionaries. After all, the introduction to the field of linguistics is practically connected with the development of society. Because the health of society depends on the mental, physical and spiritual health of the individual. This means that research in this area requires medical professionals working with different categories and strata of the population to have high cultural speech skills in their work and to use every word in the language carefully. Requires a responsible approach to linguistic tools, which is a necessary condition of professionalism.

In Uzbek linguistics, medical linguistics has not been specifically studied as an object of monographic research. The existence of monographs on medical terminology in Russian, Turkish and English – a comprehensive analysis of the linguistic means of speech softening – shows the seriousness of this issue in world linguistics and its level of importance. Therefore, it is necessary to conduct a comprehensive study of medical linguistics in Uzbek linguistics and to study this issue. Because such research is of practical importance not only in speech linguistics, medical deontology, in particular, it serves to develop the culture of speech and enrich the content of medical education for medical professionals and to use it as a teaching material in education.

Psycholinguistics is the study of the formation of speech, as well as the processes of speech perception and formation in the context of their interaction with the language system; arose from the synthesis of psychology and linguistics. Psycholinguistics Develops a model of human speech activity and psychophysiological speech formation and examines them through psychological experiments. Psycholinguistics, which is close to linguistics in terms of its source of research, is close to psychology in its methods of research. It uses interrelated experiments, such as “semantic differential” and other experimental methods. A number of psycholinguistic practical issues include the teaching of the mother tongue, especially a foreign language; issues of speech education and speech therapy for preschool children; clinic of diseases of speech centers in the brain; problems of speech influence, especially in the activities of the media and propaganda; forensic psychology and criminology are responsible for identifying people based on the nature of their speech; It arose in the 1960s due to problems with machine translation and computer input of speech information and the need for theoretical explanations.

The concepts of language and speech are not interchangeable in physiology, psychology, pedagogy and medicine. Physiologists and psychologists are always engaged in speech, and in pedagogy they talk about the formation, development and enrichment of children’s speech. In medicine, speech disorders are closely related to the neurology department of linguistics. Recently, a new branch of science called Neurolinguistics has emerged between the disciplines of psychology, neurology and linguistics. This science studies the fact that speech activity is a product of the brain, the impact of brain disease on speech activity. Simply put, the object of study of neurolinguistics is aphasia. Damage to the speech area of the brain and the consequent impairment of speech activity were mentioned in the works of our ancestors Ibn Sina, Beruni, and although they focused on the treatment of this patient, but it could not be formed as a

separate branch of science. The problem of the effects of brain damage on speech has been studied consistently since the second half of the 19th century. Neuropsychology and related neurolinguistics as a special science was formed only recently – in the seventies of our century. In the Origin of this Science, A.A. The services of such scientists as Leontev, A.R. Luria, E.S. Bain, R.M. Boskis, Y.N. Venarskaya, O.S. Vinogradova, N.A. Eisler are great.

The first comprehensive book on neurolinguistics was written by A.R. Luria. The process of verbal information, that is, the process by which people communicate and receive information from each other through speech, is the subject of study in many disciplines. In particular, this process has been studied in depth by linguistics and psychology. Linguistics distinguishes between language, which is the main means of human communication, and the speech that occurs in the process of its direct communication, the internal structure, structural units, the different occurrence of these structural units in the speech process, the transition from “internal structure” to “external structure”. A number of issues have been studied in detail, such as the main stages and the relationship between the two structures. Man reflects being in his mind. Reflection is done using the sensory organs. The sensory organs, on the other hand, transmit certain information about the external world to the brain. The brain, on the other hand, generalizes this information. Apparently, the process of reflecting the objective world occurs through the central nervous system, the brain. The nervous system usually includes two groups of nervous systems: 1) the central nervous system and 2) the borderline nervous system. Speech that provides information about existence and its understanding is carried out through the direction of the borderline nervous systems towards the center. Boundary nervous systems provide the central nervous system with information about specific signs of objects and events in an objective being. That is why the organs involved in the borderline nervous system are called analyzers. They are the organs of sight, hearing, and taste. In each analyzer, two types of nerve structures are distinguished.

The structure that carries information from this sensory organ to the cerebral cortex;

The structure that directs the objects of existence (the cognitive zone of the brain);

The third level is the zone of the lingual membrane with a complex anatomical structure.

In this zone, a complex of signs from different analyzers of the brain is combined, resulting in the transition from sensory perception to language generalization. Speech formation occurs when language behavior is reversed: from the center to the border. The speech program formed in the zone where the brain analyzers are collected is concretized in the zone of speech practice and occurs using a projection motion system involving the speech organs (as well as the system that generates written speech). In contrast to the practical system of the brain (sensory or motor), the gnostic-practical curtain and the zone of closure of the curtain analyzers are characterized by functional asymmetry: the language system and thinking expressed through speech are connected with its hemisphere. The human brain is a complex biological network made up of hundreds of billions of nerve fibers – neurons. As a result of the interconnectedness of the neurons, the brain functions normally. Modern artificial neural networks are based on a model of neurons in the human brain. Today, neural networks are widely used to solve a number of practical problems. In particular, it is used in weather forecasting, image recognition (especially in the detection of oral and written speech), and in medical diagnosis.

### INTRODUCTION

In the current pandemic, the tourism industry is developing very slowly. The pandemic caused an economic crisis in 185 countries around the world<sup>1</sup>. The main focus on the formation and development of tourism in Uzbekistan began after gaining independence. To date, tourism in our country is considered a priority of economic development, and attention to the development of this sector has risen to the level of public policy. Necessary organizational, legal and economic mechanisms for the development of tourism have been created, relevant legal documents have been adopted by our government, and work in this direction is still ongoing. In this regard, decrees, resolutions of the President of the Republic of Uzbekistan, resolutions of the Cabinet of Ministers of the Republic of Uzbekistan have been adopted and are being implemented.

Implement comprehensive measures to fully utilize the potential of tourism, accelerate the development of foreign and domestic tourism, ensure economic growth and improve the quality of services in accordance with international standards and increase the share of tourism in economic growth. In order to ensure the implementation of Resolution PD-4058 "On measures to support enterprises, ensure their sustainable operation and increase export potential", the Cabinet

of Ministers of the Republic of Uzbekistan on January 30, 2009 approved the resolution of the Ministry of Foreign Economic Relations and Trade. Approved the proposal to establish an Interdepartmental Coordination Council for Support and Development of Tourism<sup>2</sup>.

This decision of the Cabinet of Ministers of the Republic of Uzbekistan marked a new stage in the development of sustainable and equitable development of tourism in the country. In fact, it was recognized that tourism in Uzbekistan is developing mainly in central, industrialized cities.

According to the data, 76.2% of the total tourist flow in Uzbekistan falls on the cities of Samarkand, Bukhara, Tashkent and Khiva, 24.6% of foreign tourists are interested in the Fergana oasis. 40% of the tourist potential is in Tashkent city and Tashkent region, 37% in Samarkand, Bukhara and Khorezm regions, 16% in Fergana oasis and Surkhandarya region. The remaining provinces, which occupy 50% of the territory, account for only 7% of tourism potential<sup>3</sup>.

Therefore, the Cabinet of Ministers of the Republic of Uzbekistan has established a working group on the development of tourism in the regions under the leadership of each regional administration. Because the tourism potential of the regions has not been studied yet, the development of tourism in the regions is very slow, the existing tourist resources in the regions are not fully explored, and the development of tourism in the regions is unsatisfactory. The main reason for the serious problems in the smooth and sustainable development of tourism in Uzbekistan in all regions is the uneven use of tourism potential and tourist resources in the regions. The decision of the Cabinet of Ministers is an important step in solving these problems. Second, from the point of view of transforming tourism into the main sectors of our economy, we can distinguish its four main regional links or stages:

1. Development of international tourism in Uzbekistan;
2. Development of national tourism in Uzbekistan;
3. Development of local tourism in Uzbekistan;
4. Development of regional tourism in Uzbekistan.

It is known that today Uzbekistan pays more attention to the development of international tourism. However, in the development of tourism in the country, all the regional geographical links will have to work in one system.

Scientific and methodological issues of zoning of tourism geography in Uzbekistan have not yet been fully studied. The fact that this serious problem has not been resolved indicates that the tourism industry is in the formative stage. In particular, theoretical issues such as factors of tourist zoning, classification and topology of tourist areas, their economic relations with regional tourist complexes or systems require serious research in the future.

One of the key issues in the development of tourism in our country is the development of ecological and recreational tourism in the context of modernization of the economy. The fact that this problem is considered in the case of Jizzakh region shows its even greater importance. Because it is at this level that there is an organizational and legal basis for the organization and development of tourism. Another aspect of the topicality of the topic is that in order to increase national tourism in Uzbekistan, it is necessary to effectively use the tourist opportunities in the regions. Tourist resources in the districts of the regions, the study of opportunities, scientific

evaluation of existing tourist facilities, their protection, development of promising tourist routes, the organization of various directions of tourism in the regions are of great practical importance.

Since the development of any sector of the macroeconomy is primarily based on improving the material and spiritual well-being of people, the development of national tourism in Uzbekistan and the development of ways to effectively use the tourist potential of the regions to determine the future is one of the most pressing issues in tourism in Uzbekistan.

The topic we have chosen is also aimed at addressing the current issues and the development of promising areas for the development of regional tourism.

In this regard, the President of the Republic of Uzbekistan I.A. It is appropriate to quote Karimov: "When I say tourism business, I mean not just the development of tourism, but a broader concept. It is about the development of services and services directly related to tourism. The development of this sector will inevitably make a huge contribution to the economic and social development of our country by attracting many foreign tourists to our country and, most importantly, by providing large foreign exchange earnings."<sup>4</sup>. In this regard, the development of tourism in Jizzakh region, the main part of which is religious and recreational tourism, is one of the most pressing issues. The origin of ecotourism has led to an increase in the anthropogenic (human activity) burden on natural and social resources, cultural and historical tourist resources as a result of the growing popularity of international tourism. The World Tourism Organization's 21st Century Tourism Forecasts pose serious and global challenges to tourism demand, needs, and the use of natural resources. This is because European ecologists and economists proved in the 70s of the last century that the growing popularity of tourism around the world has a negative impact on the environment and nature.

Today, anthropogenic pressure in the form of tourism affects almost all sectors of the tourism industry. The German Council for Global Change was one of the first to develop the following models. The models are called syndromes (a set of symptoms characteristic of a disease) and are referred to the WTO.

Land Crisis Syndrome. The fact that lands (fertile) lands are becoming unusable in agriculture and are being taken out of use altogether is a serious obstacle to the development of recreation in nature. Developmental syndrome. The complete crisis of natural landscapes and the natural catastrophe in these places, the ecological crisis (Aral Sea), the eternal extinction of major biological species (Turan tiger).

Waste syndrome. The fact that the global ecological crisis is threatening the survival of mankind as a result of the controlled and uncontrolled development of toxic waste (land) and burial (world oceans) in the world.

After the publication of this international document with all its calculations and proofs, more than 400 articles will be published abroad on the use of natural and historical-cultural tourist resources in tourism and the negative impact of tourism on these resources..

In 1996, the World Tourism Organization (WTO) and the World Tourism and Travel Council (WTC), the World Green Movement, and the World Green Movement launched the concept of sustainable tourism development in the 21st century. "(Adenda 21 for travel and tourism industry). The 21st Century Agenda and Comprehensive Action Plan for the Tourism Industry

and Travel was signed by 182 heads of state at the 1992 UN International Conference on Environment and Development.

In 2002, to mark the 10th anniversary of the 21st Century Agenda, the UN General Assembly in Rio de Janeiro declared 2002 the International Year of Ecotourism. According to P. Shackelford, a WTO expert on Europe, the word ecotourism was used before the "21st Century Agenda". There are also sources that A. Mueller first used the word "ecotourism" in 1978<sup>4</sup>.

In Russia, the term "eco-tourism" began to appear in the press in the 1980s. The Bureau of International Youth Tourism of the former Soviet Union, Irkutsk region Specialists of the Sputnik Youth Center of the Leninist Communist Youth Union of the All-Union for the first time developed Ecotour routes, and these ecotour routes are officially called "Ecological Tourism" routes. Then in 1997, Gujin G.S. and M.Yu. Belikov and E.V. Klimenok was one of the first in Russia to define "the basis of eco-tourism is environmental protection and conservation." For that time as well as now, it has been concluded that this definition is the most convenient and represents the true essence of ecotourism<sup>5</sup>.

For the first time in Uzbekistan, the concept of prospects for the development of the essence, goals and objectives of ecotourism was developed by the State Committee for Nature Protection of Uzbekistan<sup>6</sup>.

In the development of tourism in any country, it is necessary to have tourism resources and development factors, which are inextricably linked. Tourism resources are understood by tourism professionals in different ways. In fact, it means a single economic sector in terms of tourism resources and the content of tourist resources. Only the availability of tourist resources will be the basis for the formation of tourism. That is, tourist resources are the basis of tourism development.

Many experts divide tourism resources into levels and assess these levels as a priority or downside in tourism. For example, in order to develop tourism in certain countries, the first parties prioritize international tourism in this country and the diversity and attractiveness of tourism facilities and resources in this country. This is a very correct conclusion.

On the other hand, for the development of tourism in a country, well-known accommodation resources (hotels, restaurants), transport system, tourist routes and services on these tourist routes, excursion services on the routes meet the requirements of the perfect world. Without denying the above, the third party believes that the development of tourism is the provision of excellent services in the field of tourism in a particular country. Also, those who put the idea that good tourism management in the country will create a basis for the development of tourism in this country, and the rest can be developed, are right.

As tourism is a complex socio-economic sector, it is possible to prioritize each direction in tourism. It really should be that way. However, the development of tourism in a particular country depends primarily on the fact that the first tourist resources in tourism combine diversity and antiquity, mystery, splendor, miracle, history and other similar features.

If the tourist resources of the countries are of international importance, if this resource is known in the countries of the planet, the international tourist flow will start to flow into this country and vice versa. Therefore, when the above-mentioned tourism resources function perfectly for the same purpose, tourism in a particular country will develop at the expected level. Therefore, the

use of tourism resources in the development of tourism or the development of tourism resources should be placed in the following order:

Tourist resources are all anthropogenic (man-made) and natural objects (natural geographical area, flora, fauna, biodiversity, unique natural landscapes, climatic features, recreation areas, etc.) that attract and attract tourists.

Tourist accommodation resources - tourist accommodation or houses, hotels, tourist camps, rental houses, etc. Tourist catering resources - kitchens, bars, restaurants, teahouses, cafes.

Resources that provide transport services to tourists - all vehicles, local modes of transport.

The main reason for our brief focus on tourism resources in this chapter is to identify and identify opportunities for tourism development based on the study of the availability (scarcity, abundance, international or local significance) of tourism resources in research areas or administrative territories of the state. Second, the use of tourism resources mentioned in the formation of the dissertation or the possibility of creating these resources, the priorities of use in planning tourism are developed.

When we analyze the number and activity of tourist flows around the world, so far the number of tourists visiting ancient, historical and miraculous monuments is in the first place, recreational tourism is in the second place and shrine tourism is in the third place. It is also known from the periodicals and international media that eco-tourism has been gaining the status of secular tourism in the last five years.

Therefore, before studying the possibilities of developing ecological and recreational types in our country, it is important to know the essence of these types of tourism, to analyze the current state of development of these types of tourism in our country.

### **ABSTRACT**

*The aim of this study was to evaluate the acceptability of online examinations to students at ZCAS University. The emergence of coronavirus disease 2019 (COVID-19) forced the education system world-wide to adopt online education immediately. An online survey was conducted amongst the students at ZCAS University in Lusaka, Zambia after the June 2020 online examination session. A random sample of 218 students participated in the online survey. Firstly, a descriptive statistical analysis of the responses was conducted in which frequencies were tabulated to give details of age, sex, programme level and mode of study of the respondents. Thereafter, cross tabulations which produced chi-square value testing for significance were run. The main findings of the study were that mode of study and programme level had significant influence on acceptability of online assessments. Students who were on the distance study mode and those that were doing postgraduate programmes had better experience of online assessment than the others. Gender and age had no significant influence on acceptability of online assessment. With respect to the challenges associated with online assessment, the study found that candidates' typing speed, electricity load shedding, internet speed and the cost of data bundles had adverse impact on acceptability of online assessment. The respondents also indicated that unavailability of the platform and internet access rarely affected their experience of online assessment, while bad electronic gadget was never a factor. The majority of the respondents were however satisfied with their experience of online assessment.*

## 1. INTRODUCTION

The aim of this study was to evaluate the acceptability of examinations delivered through online platforms to students at ZCAS University. Accordingly, we conducted an online survey of students at ZCAS University after the June 2020 examinations.

In order to enhance integrity of assessments in online education, universities need to understand challenges students face and tailor their offerings accordingly. Therefore, the overarching question we set ourselves to guide this study was: *To what extent do gender, mode of study, age, and level of study affect acceptability of online assessment in higher education?* For example, do female students respond the same way to online assessment as their male counterparts? How about students studying on different modes of study such as full time, part time and distance education? Is online assessment equally acceptable to students from different age groups? Similarly, to what extent is online assessment attractive to undergraduate students compared to their postgraduate counterparts?

On 18<sup>th</sup> March 2020 the Government of the Republic of Zambia announced the closure of all schools, colleges and universities in the country to mitigate against the spread of the coronavirus disease 2019 (COVID-19). Higher learning institutions were encouraged to switch teaching and learning to online platforms. Accordingly, ZCAS University switched all full time, part time and distance education teaching and learning to online platforms.

At the end of the semester i.e. in early June 2020, the university had to decide how the final examinations would be conducted since the country was still on lockdown and in-person contact with students was still suspended. Following deliberations of the University Senate, it was decided to conduct examinations via the virtual learning environment used by the university i.e. MOODLE platform. Accordingly, question papers were uploaded on the platform for students to download. Students were then required to answer the questions offline and upload their answer scripts on the platform within specified time limits.

In order to mitigate against poor internet speed, slow typing speed, electricity load shedding and other factors that might have affected students' ability to deal with this novel method of examination, students were given an additional 30 minutes to the hitherto three hours examination duration in which to answer the questions. Additionally, the number of questions was reduced by one. Since the examination was effectively a non-proctored open-book exam taken in real time, examiners were required to set problem-based questions so that students could not easily find answers by searching their reading materials and internet sources.

In order to assess students' experiences with online examinations at ZCAS University during the COVID-19 pandemic, we conducted an online survey after the June 2020 examination session. Our findings indicate that the mode of study and programme level had significant influence on acceptability of online assessment, while gender and age did not have such effect.

With respect to mode of study, only 33.8% of full-time students were willing to take all or most of their future assessments online, while a larger proportion, i.e. 39%, indicated that they would not prefer to take any future assessments via online platforms. On the other hand, 58.1% of part-time and 54.5% of ODeL students indicated that they would prefer to take all or most of their future assessments online. The Pearson chi-square value of 0.021 which is less than 0.05

confirms that there is a significant relationship between mode of study and desire to take future assessments via online platforms.

With regards to level of study, majority of the undergraduate students (53%) did not have enough time to attempt the final examinations. On the other hand, 59% of the postgraduate students had enough time to attempt the examinations at least most of the time. This indicates that postgraduate students had better experiences with the online assessment compared to their undergraduate counterparts. The Pearson chi-square value of 0.006, which is less than 0.05, buttresses this conclusion.

With respect to challenges faced by students, our study found that most of the respondents always had an issue with typing speed, electricity load shedding, internet speed and cost of data bundles during their online assessments. Unavailability of the platform/link and access to internet rarely affected the students during online assessments; while the state of their electronic gadgets such as laptops was never an issue.

Lastly, the respondents were asked to rate their overall satisfaction/dissatisfaction with online assessment. The majority of students, i.e. 60%, were either satisfied or highly satisfied with the online assessments. Most of the respondents also indicated that they were willing to take some (25%), most (15%) or all (33) their assessments online in future. These findings suggest that ZCAS University students were generally satisfied with online assessments.

We organise the remainder of the paper as follows. Section 2 provides a brief review of the prior literature, while a description of the methodology and dataset is provided in Section 3. We discuss our empirical results in Section 4, and offer concluding remarks in Section 5.

## **2. LITERATURE SURVEY**

Abdullah and Ward (2016) designed a General Extended Technology Acceptance Model for E-Learning (GETAMEL) which suggests external factors that affect students' adoption of e-learning. We believe that these factors can be used to assess effectiveness of examinations that are delivered through online platforms. The five factors they identified as having a significant effect on students' perceived ease of use (PEOU) and perceived usefulness (PU) of e-learning are Self-Efficacy, Subjective Norm, Perceived Enjoyment, Computer Anxiety and Experience. PEOU and PU of online assessments affect students' attitude towards online examinations, and subsequently their intention to participate and actual participation in online examinations. We have used the GETAMEL model in our review of the literature to identify challenges of adopting online examinations in higher education.

### **2.1 CHALLENGES IN ONLINE ASSESSMENTS**

Kearns (2012) categorised online assessments into five groups, namely written assignments, online discussions, fieldwork, quizzes and exams, and presentations. In the absence of in-person assessment during the COVID-19 lockdown, online assessments were the only option available for universities that switched to online learning mode. However, online assessments have unique challenges in addition to those found in in-person assessments. Due to distance between the student and the university, and technology deficiencies, e-proctoring and in-person supervision of students during the assessment may not be feasible. Accordingly, students' commitment to submit their work wanes (Kearns, 2012; Guangul *et al.*, 2020). Other challenges faced in

administering assessments online include slow internet speed, lack of electronic gadgets, poor time management and delayed feedback from tutors.

The issue of academic integrity or cheating by students in online assessments is particularly thorny. Although some researchers have raised concerns about the possibility of students cheating in online assessments (Kearns, 2012; Guangul *et al.*, 2020), the majority of studies have concluded to the contrary. For example, in her review of the academic integrity literature, Eaton (2020) found that there was actually more academic misconduct in face-to-face environments compared to online assessments. In the case of postgraduate students, Ladyshevsky (2015) concluded that there was no statistically significant difference in the mean test scores when multiple choice questions for postgraduate students were administered in person compared to unsupervised online arrangements.

However, in the COVID-19 era, the immediate switch to emergency remote learning has different implications for academic integrity compared to ordinary online learning. For example, the stress levels students experience as a result of a sudden switch to emergency remote learning are much higher (Eaton, 2020; White, 2020b). At the same time, commercial contract cheating and academic file-sharing companies have increased in number and become more aggressive in their marketing practices (White, 2020a). Consequently, students face greater temptation to engage in academic misconduct during the COVID-19 era compared to ordinary online learning circumstances (Eaton, 2020).

## 2.2 SATISFACTION WITH ONLINE ASSESSMENT

In a study in India involving 431 students, Bisht, Jasola and Bisht (2020) discovered that online examinations were more acceptable than traditional face-to-face ones. This was particularly the case with female students compared to their male counterparts. Another study carried out by Elzainy, El Sadik and Al Abdulmonem (2020) noted that students' performance in online assessments was better than in previous face-to-face assessments for the same group of students, particularly in the case of female students. This study found that majority of the students and staff, i.e. 58.82%, were satisfied with online assessment.

Other researchers have affirmed this position by demonstrating that students' performance in online examinations was better than in in-person assessments (Gonzalez *et al.*, 2020; Prigoff, Hunter and Nowygrad, 2020; Abdollahi *et al.*, 2021; García-Peñalvo *et al.*, 2021). The enhanced student performance during the COVID-19 lockdown has been attributed to students having more study time and also due to lack of security of the examinations.

However, some researchers concluded to the contrary. For example, Slamet, Amrullah and Sutiah (2021) found that online dissertation supervision was not effective, while online assessments were less effective compared to in-person assessments. Similarly, for examinations that require student-patient contact, such as in dentistry, online assessment is not feasible (Wu *et al.*, 2020).

## 3. DATA AND METHODOLOGY

We collected data for this study from a Google Docs online questionnaire that was availed to all students at ZCAS University through the virtual learning environment (VLE). A message was sent to all students through the VLE urging them to provide feedback about their experiences with online examinations since the COVID-19 induced lockdown that prevented in-person

examinations. 272 students out of a population of 2,015 who sat for the June 2020 final examinations completed the online questionnaire.

The main research question we set out to answer in this study was: *To what extent do gender, mode of study, age, and level of study affect acceptability of online assessment in higher education?* To answer this question, we used SPSS's cross tabulations, chi-square tests and analysis of variance (ANOVA) to process and analyse the data.

#### 4. EMPIRICAL RESULTS

We imported the questionnaire responses from Google Docs into an Excel spreadsheet for data cleaning. After data cleaning, we remained with 218 usable questionnaire responses.

##### 4.1 DESCRIPTIVE STATISTICS

In order to determine internal consistency of the survey questionnaire, we generated the Cronbach's alpha coefficient after importing the data into SPSS. The Cronbach's alpha coefficient obtained for the data was 0.73 as can be seen from Table 1 below. The coefficient is higher than the recommended minimum of 0.7, suggesting that our data collection instrument was reliable.

**Table 1 Cronbach results from SPSS**

Reliability Statistics		
Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.732	.737	8

We present descriptive statistics in Tables 2 to 3 and Figures 1 to 2 below. As can be seen from Table 2 below, majority of the respondents were male (57.8%), while female student comprised 42.2%. There were slightly more male than female students in the sample compared to the student population which has a proportion of about 50:50 (Edurole, 2021).

**Table 2 Gender of Respondents**

		Gender			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	92	42.2	42.2	42.2
	Male	126	57.8	57.8	100.0
Total		218	100.0	100.0	

In terms of age, Figure 1 below shows that most of the respondents were in the lower age groups of between 16 to 44 years. This reflects the country's population distribution by age as 65.7% are aged 24 or younger, while only 5.2% are over 55 years (IndexMundi, 2021).

**Figure 1 Age of Respondents**

With regard to mode of study, the University offers its learning programmes on three modes. Some students study on a full-time basis, which means they engage with their lecturers during normal working hours from 08:00 hrs to 17:00 hrs. Part time or evening students have classes from 17:30 hrs to 20:00 hrs. The third mode of study is referred to as open, distance and e-learning (ODEL). Most of the teaching and learning on ODeL takes place through the VLE, while in-person classes were conducted for two weeks within the semester.

As shown in Figure 2 below, majority of the respondents were ODeL students (50%), followed by full time students (36%) and part time students (14%).

**Figure 2 Mode of Study of Respondents**

In terms of the level of study, the University offers undergraduate and postgraduate learning programmes. As shown in Table 3 below, the majority of the respondents were undergraduate students (82%), while postgraduate students comprised (18%). This reflects the overall student population composition in the University.

**Table 3 Programme level**

### Programme Level

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Undergraduate	179	82.1	82.1	82.1
	Postgraduate	39	17.9	17.9	100.0
	Total	218	100.0	100.0	

## 4.2 GENDER AND ONLINE ASSESSMENT

To establish whether there was any significant relationship between gender and acceptability of online assessment, we ran a cross tabulation between gender and the perceived effect on grades/results as a result of the switch from face-to-face to online assessment. The results are given in Table 4 below.

**Table 4 cross tabulation between gender and effect on results/grades**

**Gender \* Change to online exam negatively affect grades/results Crosstabulation**

			Change to online exam negatively affect grades/results					Total
			Significantly	Highly	Moderately	Minimally	None	
Gender	Female	Count	12	14	23	22	21	92
		Expected Count	12.7	21.1	23.6	18.1	16.5	92.0
		% within Gender	13.0%	15.2%	25.0%	23.9%	22.8%	100.0%
	Male	Count	18	36	33	21	18	126
		Expected Count	17.3	28.9	32.4	24.9	22.5	126.0
		% within Gender	14.3%	28.6%	26.2%	16.7%	14.3%	100.0%
Total	Count	30	50	56	43	39	218	
	Expected Count	30.0	50.0	56.0	43.0	39.0	218.0	
	% within Gender	13.8%	22.9%	25.7%	19.7%	17.9%	100.0%	

### Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	7.807 <sup>a</sup>	4	.099
Likelihood Ratio	7.953	4	.093
Linear-by-Linear Association	5.052	1	.025
N of Valid Cases	218		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 12.66.

We noted similarities in the perception of both male and female students as regards the effect of the switch in the assesment model on grades. Although a larger proportion of female students were more positive about the switch to online assessment, majority of both male (57.1%) and female (71.8%) students thought that the switch to online assessment would not affect their grades highly or significantly. We could not find any significant relationship between gender and

the perceived effect on grades/results as a result of switching from face-to-face to online assessment. This is also confirmed by the Pearson chi-square value of 0.099 which is above 0.05.

To buttress the conclusion above, we ran another cross tabulation between gender and the proportion of future online assessments the respondents were willing to take. We present the results of this cross tabulation in Table 5 below.

**Table 5 cross tabulation between gender and future online assesment**

**Gender \* Proportion of future online exams Crosstabulation**

			Proportion of future online exams				Total
			All	Most	Some	None	
Gender	Female	Count	28	10	21	33	92
		Expected Count	30.4	13.5	23.2	24.9	92.0
		% within Gender	30.4%	10.9%	22.8%	35.9%	100.0%
	Male	Count	44	22	34	26	126
		Expected Count	41.6	18.5	31.8	34.1	126.0
		% within Gender	34.9%	17.5%	27.0%	20.6%	100.0%
Total	Count	72	32	55	59	218	
	Expected Count	72.0	32.0	55.0	59.0	218.0	
	% within Gender	33.0%	14.7%	25.2%	27.1%	100.0%	

#### Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	6.822 <sup>a</sup>	3	.078
Likelihood Ratio	6.807	3	.078
Linear-by-Linear Association	3.461	1	.063
N of Valid Cases	218		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 13.50.

As can be seen, there is no significant relationship between gender and the proportion of future online assessments the respondents were willing to take. This is supported by the Pearson chi-value of 0.078 which is above 0.05. We can therefore, conclude that there is no significant relationship between gender and acceptability of online assessment at ZCAS University.

Our findings are contrary to what some researchers have found elsewhere. Bisht, Jasola and Bisht (2020) and Elzainy, El Sadik and Al Abdulmonem (2020), for example, concluded that online examinations were more acceptable than traditional face-to-face ones particularly for female students compared to their male counterparts.

#### 4.3 MODE OF STUDY AND ONLINE ASSESSMENT

We were also interested in establishing whether candidates studying on different modes had any peculiar experiences with online assessment. Accordingly, we ran a cross tabulation between

mode of study and desire to undertake online assessments in future. The results are presented in Table 6 below.

**Table 6 Mode of study & proportion of future online assessments cross tabulation**

**Mode of Study \* Proportion of future online exams Crosstabulation**

			Proportion of future online exams				Total
			All	Most	Some	None	
Mode of Study	Full time	Count	20	6	21	30	77
		Expected Count	25.4	11.3	19.4	20.8	77.0
		% within Mode of Study	26.0%	7.8%	27.3%	39.0%	100.0%
	Part time	Count	14	4	9	4	31
		Expected Count	10.2	4.6	7.8	8.4	31.0
		% within Mode of Study	45.2%	12.9%	29.0%	12.9%	100.0%
	Distance Education	Count	38	22	25	25	110
		Expected Count	36.3	16.1	27.8	29.8	110.0
		% within Mode of Study	34.5%	20.0%	22.7%	22.7%	100.0%
Total	Count	72	32	55	59	218	
	Expected Count	72.0	32.0	55.0	59.0	218.0	
	% within Mode of Study	33.0%	14.7%	25.2%	27.1%	100.0%	

#### Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	14.961 <sup>a</sup>	6	.021
Likelihood Ratio	15.324	6	.018
Linear-by-Linear Association	5.820	1	.016
N of Valid Cases	218		

a. 1 cells (8.3%) have expected count less than 5. The minimum expected count is 4.55.

Only 33.8% of full-time students were willing to take all or most of their future assessments online, while a larger proportion, i.e. 39%, indicated that they would not prefer to take any future assessments via online platforms. On the other hand, 58.1% of part-time and 54.5% of ODeL students indicated that they would prefer to take all or most of their future assessments online. Part-time and ODeL students who did not prefer to take any future assessments online were a significant minority at 12.9% and 22.7% respectively. The Pearson chi-square value of 0.021 which is less than 0.05 confirms that there is a significant relationship between mode of study and desire to take future assessments via online platforms.

To buttress the findings above, we carried out an analysis of variance (ANOVA) to ascertain whether there was any significant difference in the means of fulltime, part-time, and ODeL students as regards adequacy of time to submit their online assessments. We present the ANOVA results in Table 7 below.

The ANOVA significance value of 0.007, which is less than 0.05, indicates that there is a significant relationship between mode of study and experience with online assessments. Clearly,

the mean of the respondents from the fulltime students (3.23) was significantly different from that of the part-time students (2.45) and their ODeL counterparts (2.63).

The reason part-time and ODeL students seem to prefer online assessments could be related to travelling costs and convenience. Part-time and ODeL students are normally in full time employment, so getting permission/leave to travel for face-to-face examinations could be a challenge. ODeL students are particularly adversely affected as most of them live in towns and cities far away from the University. We can also attribute our study's findings to the fact that part-time and ODeL students, most of whom are in gainful employment, have more resources and greater access to the internet than full-time students, and can therefore, easily participate in assessments conducted via online platforms.

**Table 7 ANOVA table for Mode of study and adequacy of time in submitting answer scripts**

**Descriptives**

Adequate time for submitting answer scripts

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Full time	77	3.23	1.413	.161	2.91	3.55	1	5
Part time	31	2.45	1.434	.258	1.93	2.98	1	5
Distance Education	110	2.64	1.463	.140	2.36	2.91	1	5
Total	218	2.82	1.469	.099	2.63	3.02	1	5

**ANOVA**

Adequate time for submitting answer scripts

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	21.099	2	10.549	5.075	.007
Within Groups	446.924	215	2.079		
Total	468.023	217			

#### 4.4 AGE AND ONLINE ASSESSMENT

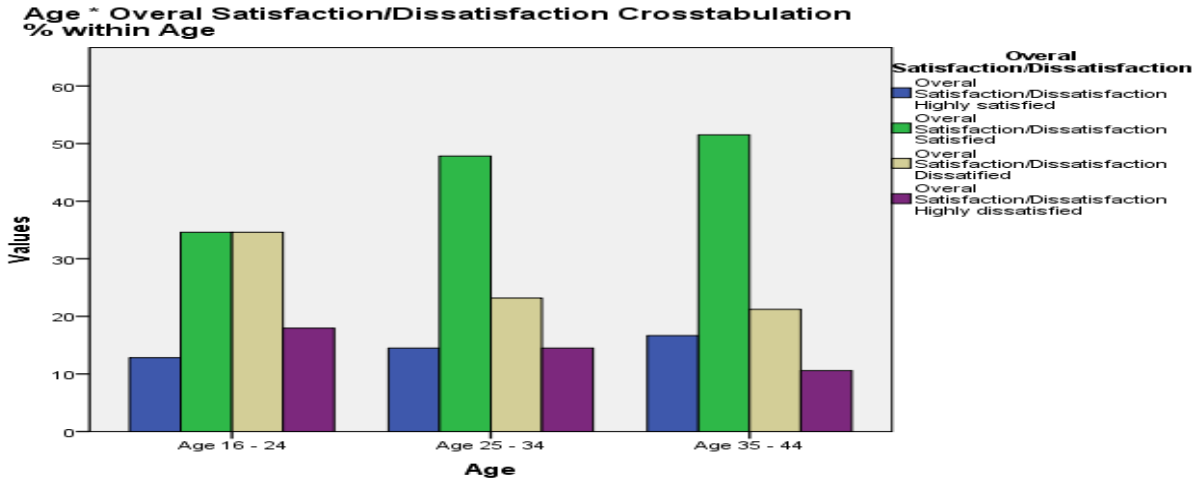

The other issue we addressed in this study was to determine whether any significant relationship exists between age of the respondents and their experience with online assessments. Firstly, we ran a cross tabulation between age and overall satisfaction with online assessments. The results of the cross tabulation are presented in Figure 3 below.

We note from the cross tabulation that majority of the respondents across all the age groups were generally satisfied with their experience with online assessment. This is confirmed by the Pearson chi square value of 0.302 which is greater than 0.05, indicating that there is no significant relationship between age and satisfaction/dissatisfaction with online assessments.

Secondly, we ran another cross tabulation to establish whether there was any significant relationship between age and perceived effect of the switch to online assessments on results/grades. We present the results Table 8 below.

Again, the response patterns were generally similar across the age groups. The Pearson chi square value of 0.501, which is way above 0.05, indicates that there is no significant relationship between age and perceived effect of the switch to online assessments on results/grades.

**Figure 3 Cross tabulation between age and level of satisfaction/dissatisfaction with online assessment.**

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	7.204 <sup>a</sup>	6	.302
Likelihood Ratio	7.235	6	.300
Linear-by-Linear Association	4.471	1	.034
N of Valid Cases	213		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 9.61.

We think that age is not a factor in acceptability of online assessment because most of the University’s students are aged 44 or below. People in this age category have lived with modern information and communication technologies (ICTs) for most or all of their lives. They are therefore, likely to be tech-savvy. Additionally, the usage of ICTs in the country is quite high with mobile subscription and internet usage penetration rates of 106.81% and close to 60% respectively (Zambia Information and Communications Technology Authority, 2020).

**Table 8 Cross taulation between age group and effect on result/grades.**

**Age \* Change to online exam negatively affect grades/results Crosstabulation**

			Change to online exam negatively affect grades/results					Total
			Significantly	Highly	Moderately	Minimally	None

		% within Age	18.2%	25.8%	27.3%	13.6%	15.2%	100.0%
Total		Count	29	48	56	42	38	213
		Expected Count	29.0	48.0	56.0	42.0	38.0	213.0
		% within Age	13.6%	22.5%	26.3%	19.7%	17.8%	100.0%

**Chi-Square Tests**

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	7.337 <sup>a</sup>	8	.501
Likelihood Ratio	7.393	8	.495
Linear-by-Linear Association	5.462	1	.019
N of Valid Cases	213		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 8.99.

**4.5 PROGRAMME LEVEL AND ONLINE ASSESSMENT**

We further analysed whether the level of study, i.e. postgraduate or undergraduate, had any significant influence on acceptability of online assessments. Accordingly, we firstly ran a cross tabulation between programme level and sufficient writing time during the online assessment. The findings are shown in Table 9 below.

**Table 9 Cross tabulation between programme level enough time allocation****Programme Level \* Enough time allocation for the exam Crosstabulation**

			Enough time allocation for the exam					Total
			Always	Most of the time	Often	Rarely	Never	
Programme Level	Undergraduate	Count	36	25	23	35	60	179
		Expected Count	42.7	26.3	24.6	33.7	51.7	179.0
		% within Programme Level	20.1%	14.0%	12.8%	19.6%	33.5%	100.0%
		% of Total	16.5%	11.5%	10.6%	16.1%	27.5%	82.1%
	Postgraduate	Count	16	7	7	6	3	39
		Expected Count	9.3	5.7	5.4	7.3	11.3	39.0
		% within Programme Level	41.0%	17.9%	17.9%	15.4%	7.7%	100.0%
		% of Total	7.3%	3.2%	3.2%	2.8%	1.4%	17.9%
Total		Count	52	32	30	41	63	218
		Expected Count	52.0	32.0	30.0	41.0	63.0	218.0
		% within Programme Level	23.9%	14.7%	13.8%	18.8%	28.9%	100.0%
		% of Total	23.9%	14.7%	13.8%	18.8%	28.9%	100.0%

**Chi-Square Tests**

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	14.510 <sup>a</sup>	4	.006
Likelihood Ratio	16.128	4	.003
Linear-by-Linear Association	13.579	1	.000
N of Valid Cases	218		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 5.37.

We note that majority of the undergraduate students (53%) did not have enough time to attempt the final examinations. On the other hand, 59% of the postgraduate students had enough time to attempt the examinations at least most of the time. This indicates that postgraduate students had better experiences with the online assessment compared to their undergraduate counterparts. The Pearson chi-square value of 0.006, which is less than 0.05, buttresses this conclusion.

Secondly, we carried out an ANOVA to ascertain whether there was any significant difference in the means of undergraduate and postgraduate students with regard to their overall satisfaction/dissatisfaction with online assessment. The results are shown in Table 10 below.

**Table 10 ANOVA table of Programme level and Overall satisfaction**

**Descriptives**

Overall Satisfaction/Dissatisfaction

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Undergraduate	179	2.48	.938	.070	2.34	2.62	1	4
Postgraduate	39	2.15	.745	.119	1.91	2.40	1	4
Total	218	2.42	.914	.062	2.30	2.54	1	4

**ANOVA**

Overall Satisfaction/Dissatisfaction

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	3.416	1	3.416	4.151	.043
Within Groups	177.758	216	.823		
Total	181.174	217			

The mean for the undergraduate students was 2.48, which was different from that for postgraduate students at 2.15. Given that the significance value of 0.043 from the ANOVA output was less than 0.05, we conclude that there is a significant difference in the group means.

This implies that the overall level of satisfaction/dissatisfaction with online assessment was significantly different between postgraduate and undergraduate students.

We attribute our study's findings to the fact that postgraduate students, most of whom are in gainful employment or running their own businesses, have more resources and greater access to the internet than undergraduate students; and can therefore, easily adopt online education, including online assessments. Many studies on acceptability of online education have concluded that postgraduate students are more amenable to online education than undergraduate students (Gautam and Gautam, 2021; Kayombo and Mwiinga, 2021; Chung, Subramaniam and Dass, 2020b).

#### 4.6 FACTORS THAT INFLUENCE EFFECTIVENESS OF ONLINE ASSESSMENT

In the study, we also set out to establish the factors that impacted online assessments. Our results are presented in Figure 4 below.

We note that majority of the respondents' online examinations were always or most of the times adversely affected by typing speed, electricity load shedding, internet speed and cost of data bundles. Our findings in this regard are not surprising because these factors have been found to adversely affect online education in general (Agormedah *et al.*, 2020; Kajiita, Nomngcoyiya and Kang'ethe, 2020; Motala and Menon, 2020; Kayombo and Mwiinga, 2021).

Figure 4 also shows that access to the internet and unavailability of platform/link rarely affected students' online assessment, while bad electronic gadgets never affected their online assessments.

**Figure 4 Factors affecting online Assessments**

#### 4.7 OVERALL SATISFACTION WITH ONLINE ASSESSMENT

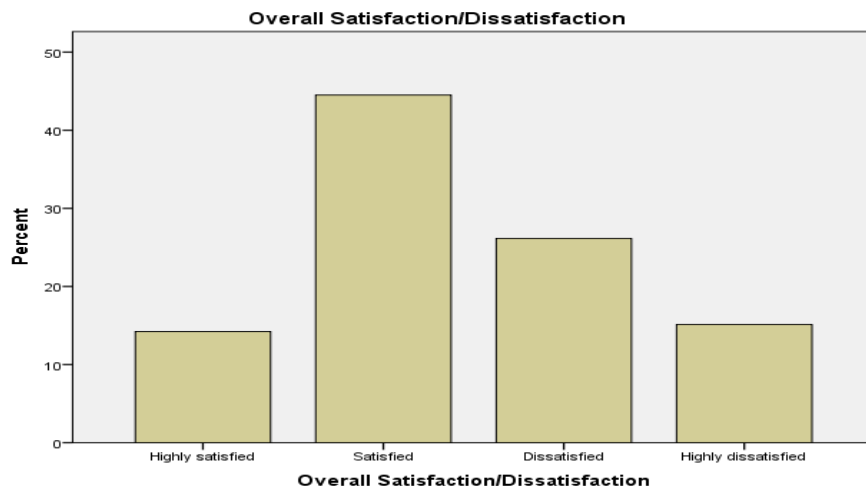

Lastly, the respondents were asked to rate their overall satisfaction/dissatisfaction with online assessment. The majority of students, i.e. 60%, were either satisfied or highly satisfied with the

online assessment as depicted in Figure 5 below. 40% were either highly dissatisfied or dissatisfied.

As shown in Figure 6 below, when the respondents were asked about the proportion of assessments they were willing to take online in future, only 27% indicated that they were not willing to take any of their future assessments via online platforms. The rest were willing to take all (33%), most (15%) or some (25%) of their future assessments online.

The findings in Figures 5 and 6 suggest that ZCAS University students were generally satisfied with online assessments. These findings are in accordance with the general view in the literature as evidenced in many studies (Bisht, Jasola and Bisht, 2020; Elzainy, El Sadik and Al Abdulmonem, 2020; Gonzalez *et al.*, 2020; Prigoff, Hunter and Nowygrod, 2020; Abdollahi *et al.*, 2021; García-Peñalvo *et al.*, 2021). The actual students' performance in the June 2020 examination session, which was similar to previous face-to-face sessions, seems to confirm that students' experiences with online assessments were positive.

**Figure 5 overall satisfaction/ Dissatisfaction of Online assessment**

**Figure 6 Proportion of future online Assessment**

## 5. CONCLUSIONS AND RECOMMENDATIONS

### 5.1 CONCLUSIONS

This study endeavoured to explore the acceptability and challenges of online assessment at ZCAS University during the COVID-19 pandemic. The study assessed whether gender, age, programme level and mode of study had a significant impact on acceptability of online assessment. From the 218 respondents who participated in the online questionnaire, we were able to note that mode of study and programme level had a significance influence on acceptability of online assessments. Part-time, ODeL and postgraduate students were more inclined to online assessment than their full-time and undergraduate counterparts. However, gender and age did not seem to influence acceptability of online assessments.

The study went further to establish some of the common factors that influenced acceptability of online assessments. Typing speed, electricity load shedding, internet speed and cost of data bundles were some of the common factors that affected adoption of online assessments. However, even with the above impediments, the respondents were satisfied with online assessments overall.

### 5.2 RECOMMENDATIONS

Based on the findings and conclusions above, the following recommendations can be made with regards to online assessments:

- i. ZCAS University should consider introducing a dual assessment system whereby students are free to choose whether to take the examination in-person or online. Many full-time students who were not satisfied with the online assessment, for example, could choose in-person examinations, while part-time and ODeL students might opt for the online option. The system could be piloted during the mid-semester examinations in the second semester of 2021.
- ii. Although the University has entered into an agreement with one of the local internet service providers to zero-rate student access to the VLE, student uptake of this facility remains unknown. It is therefore, likely that many students are not benefiting from the reduced data cost that results from zero-rating access to the VLE. The University should carry out more sensitisation of the zero-rating facility to encourage student uptake.
- iii. Since typing speed adversely affected student experience with online assessment, the University should take steps to address this issue. For example, multiple choice and short answer questions that do not require a lot of typing could be introduced in future online assessments.

## INTERACTIVE METHODS OF TEACHING MATHEMATICS IN PRIMARY EDUCATION

**Laziza Gaybullaevna Rasulova\***

\*Lecturer,  
Bukhara State University Bukhara,  
UZBEKISTAN

### ABSTRACT

*The article is devoted to the issues of interactive teaching of primary schoolchildren. The subject of the research is interactive methods for use in mathematics lessons in elementary school. You need to start by gradually using these methods. Both the teacher and the students need to get used to them and gain some experience in using them. It is better to carefully prepare a few interactive activities in the school year than to run often hastily prepared "games". During this process, all participants in the educational process interact with each other, exchange information, jointly solve problems, model situations, evaluate their own behavior and the actions of others.*

**KEYWORDS:** *Primary Education, Mathematics, Interactive Learning, Interactive Methods, Primary School Age.*

### INTRODUCTION

With the introduction of new educational standards in Uzbekistan, the ability to build a teaching technology becomes necessary for every primary school teacher. In accordance with the requirements of the standards, the educational process is organized by the teacher, taking into account the characteristics of the students. In this regard, the teacher must know the technique of constructing the learning process for younger students, including the use of interactive means.

Analysis of scientific literature shows that the use of interactive tools requires compliance with certain approaches described by many scientists of various profiles (philosophers, psychologists, didactics, methodologists).

However, despite the fact that the educational standard directly indicates the need for the active use of interactive tools for solving cognitive problems, there are still no developments in the

practical application of interactive tools for teaching mathematics to junior schoolchildren. In this regard, the question of finding ways to use new technologies for teaching mathematics is currently relevant.

During the years of independence, the system of education and upbringing has been radically reformed in our country, all organizational and legal conditions have been created for the comprehensive education of the younger generation. The Law of the Republic of Uzbekistan - On Education and on the National Program for Personnel Training contributes to increasing efficiency, reaching new heights. Consequently, in accordance with them, educational institutions were updated in accordance with the requirements of the time, educational institutions equipped with modern equipment were created, and most importantly, a system of training and retraining of qualified pedagogical personnel was created. All this is incredibly important from the point of view of a happy future of the younger generation, focused on ensuring that it grows no worse than anyone else.

### **The Main Findings and Results**

Especially over the past 20 years, the teaching of mathematics in our country, especially in secondary school, has undergone tremendous changes, especially in the primary education system. This is evidenced, in particular, by the publication of the law on elections and other decrees after the independence of our republic. Setting fundamentally new goals for the school leads to a radical change in the content of teaching mathematics. Mathematics makes significant changes both in the content of the initial course and in the methodology of teaching it in textbooks and manuals. When entering school, a 6-7-year-old child has a minimum of knowledge and skills in organizing his activities at school hours. This problem has become relevant in modern primary schools. Interactive teaching methods require a certain change in the life of the class, as well as a lot of time for preparation, both from the student and from the teacher. You need to start by gradually using these methods. Both the teacher and the students need to get used to them and gain some experience in using them. It is better to carefully prepare a few interactive activities in the school year than to run often hastily prepared "games". Using interactive methods is not an end in itself. It is only a means to achieve the atmosphere in the classroom that best contributes to the understanding of the spirit of the law and civil society as a spirit of cooperation, mutual understanding, goodwill. Thus, the knowledge gained by the student is at the same time a tool for self-acquisition.

According to RN Buneev, "the school has lost its monopoly on the provision of knowledge. Much of the information today is acquired from "external" sources. But school education should take on an equally important function: to teach activities with the subject material, to stimulate the development of the child by means of the subject, and in general to create a basis (platform) for students in the learning process for the systematic development of subject material, which will further allow expanding and replenish your subject knowledge. Each subject has a different developmental potential (compare, for example, mathematics and literature) and, of course, involves specific ways of studying. But there are several strategic provisions that are common to subject learning.

Acquaintance with basic information on the subject and with key concepts (creating a picture of the subject) - all this is necessary as an indicative basis for organizing activities on the material of the subject.

Training in various operations with subject material.

Formation of universal educational actions on the subject material.

Formation of subject competencies (for example, teaching counting, solving problems in the study of mathematics, etc.). Acquaintance with active and passive vocabulary (terms) characteristic of this subject, and mastering them in speech situations.

Mastering reading texts on this subject, listening techniques, speaking and composing your own texts using lexical means and structures characteristic of this subject "

The most important task of the modern education system as indicated

The law on education is "the formation of universal educational actions that provide students with the ability to learn, the ability to self-development and self-improvement."

As part of the main types of universal educational activities, set by the key goals of general education, four blocks can be distinguished:

- personal;
- regulatory (including also self-regulation actions);
- informative; communicative".
- Regulatory actions provide students with the organization of their learning activities.

**These include:**

- goal-setting as a formulation of an educational task based on the correlation of what is already known and assimilated by students and what is still unknown;
- planning - determining the sequence of intermediate goals, taking into account the final result; drawing up a plan and sequence of actions;
- forecasting - anticipating the result and the level of assimilation of knowledge, its temporal characteristics;
- control in the form of comparing the method of action and its result with a given standard in order to detect deviations and differences from the standard;
- correction - making the necessary additions and adjustments to the plan and method of action in the event of a discrepancy between the standard, the actual action, and its result; - assessment - the allocation and awareness by students of what has already been mastered and what else needs to be learned, awareness of the quality and level of assimilation;
- self-regulation as the ability to mobilize strength and energy, to volitional effort (to make a choice in a situation of motivational conflict), and to overcome obstacles.
- Cognitive universal actions include general educational, logical, as well as posing and solving a problem.

**General educational universal actions:**

- - self-selection and formulation of a cognitive goal;

- -Search and selection of the necessary information; application of information retrieval methods, including with the help of computer tools;
- -structuring knowledge;
- -conscious and arbitrary construction of a speech utterance in oral and written form;
- -selection of the most effective ways to solve problems, depending on specific conditions;
- -reflection of methods and conditions of auction, control, and evaluation of the process and performance results; - statement and formulation of the problem, independent creation of algorithms of activity in solving problems of a creative and exploratory nature.

**The main methods of interactive learning in primary school are:**

1. Creative task - it forms the basis and content of any interactive method, and also gives meaning to learning, motivates students;
2. Work in small groups - this gives an opportunity to practice the skills of cooperation, interpersonal communication, to participate collectively in the work;
3. Brainstorming - this method activates creative thinking in a group. In brainstorming, any student's answer to a question is accepted;
4. The "carousel" method consists in the fact that it is necessary to form two rings: external and internal. In the first case, students change places after a certain period of time, and in the second case, these are students sitting motionless;
5. Decision tree method - the class is divided into 3 or 4 groups with the same number of students. Then each group should discuss the issue and make notes on their "tree", then the groups change places and add their ideas on the trees of neighbors;
6. Method "mosaic" - the necessary material is divided into parts, to work with it, students are united in small groups. Each student in the group reads their piece of material, becoming an expert in its content and preparing to teach this content to others;
7. Method "aquarium" - for observation and analysis, the teacher distributes the roles of observers, critics, experts, and analysts among the students, but the remaining students act out the situation in a circle;
8. Method "puzzles" - a material or concept is divided into separate puzzles, which are put together piece by piece into one common picture. The teacher's task may vary depending on the goals and objectives set within the lesson. Students can assemble the final picture themselves, guess the coded answer or compose a story, build a logical chain, explain why the details of the picture were formed in this order, etc.

From my own experience, I can say that there are a large number of methods and they are all diverse, but each teacher should choose those methods that will be most appropriate and interesting for use in their class.

**Communicative actions include:**

Planning an educational collaboration with teacher and peers;

- Determination of the goal, functions of the participants, methods of interaction; - posing questions;
- Proactive cooperation in the search and collection of information;
- Resolution of conflicts - identification, identification of the problem, search and assessment of alternative ways to resolve the conflict, decision making, and its implementation;
- Management of the partner's behavior - control, correction, assessment of his actions;
- the ability to express their thoughts with sufficient completeness and accuracy in accordance with the tasks and conditions of communication; possession of monologue and dialogical forms of speech in accordance with the grammatical and syntactic norms of the native language.

**We can highlight the features of the formation of universal educational actions at primary school age:**

- 1) The younger student becomes the subject of educational activity, that is, the formation of universal educational actions ensures continuity in the transition from preschool to primary general education;
- 2) the formation of motivation for learning, the internal position of a younger student, since this age is sensitive for the development of stable cognitive needs and interests, it is necessary to ensure the student's conscious entry into the space of educational activity;
- 3) The level of physical readiness, manifested in the formation of basic skills and qualities used in any subject area, the ability to perform subtle movements appears, to master the skill of writing;
- 4) the level of psychological readiness is determined by the formation of arbitrariness and awareness in the management of perception, attention, memory, activity takes on an organized character, an important ability to express one's thoughts orally and in writing is acquired, thinking develops from emotionally figurative to abstract logical;
- 5) The formation of social and moral qualities, the elements of social feelings develop in the younger schoolchild, the skills of social behavior are formed (collectivism, responsibility for actions, mutual assistance, etc.) and the foundations of moral behavior are laid;
- 6) The assimilation of cognitive actions manifests itself in the formation of mechanisms for the transformation of educational material and its independent application in changed conditions and in the implementation of control;
- 7) The level of communicative actions, is considered in the formation of the relationship of a younger student with others, it is included in the whole system of collectives (all-school, classroom).

The development of universal educational actions ensures the formation of psychological neoplasms and abilities of the student, which in turn determine the conditions for high success in educational activities and the development of subject disciplines. Interactive teaching methods allow you to develop students, critical thinking, creativity, communication skills, and abilities, to establish emotional contacts between students, to provide educational tasks, as a result of which creative self-development of students occurs. The use of interactive teaching methods in

mathematics lessons in primary school makes it possible to conduct lessons at a high aesthetic and emotional level, to provide positive motivation for students' learning and a high degree of differentiation of learning. Also, significantly increase the efficiency and volume of work performed in the classroom.

Practice shows that interactive methods involve learning in collaboration, that is, students and the teacher are subjects of learning. During this process, all participants in the educational process interact with each other, exchange information, jointly solve problems, model situations, evaluate their own behavior and the actions of others. Students are immersed in a real atmosphere of business cooperation in solving problems, thus the lessons will be very exciting and informative.

As a result of our research, we came to the following conclusions. The analysis of psychological and pedagogical literature made it possible to consider the concept of interactive learning - this is a process of cognition, where knowledge is obtained in joint activities through dialogue, a polylogue of students between themselves and the teacher.

We have revealed the essence of interactive learning, which is that the interaction of a teacher and a student is understood as direct interpersonal communication. The most important feature of such communication is the ability of a person to "take on the role of another", to imagine how the communication partner (or group) will perceive this role, and to interpret the situation and construct their actions accordingly.

### ABSTRACT

*The article discusses the results of the effective use of modern teaching methods in teaching students Latin and medical terminology. Efforts were also made to provide more detailed information on teaching methods.*

**KEYWORDS:** *Teaching, Method, Teaching, Interactive, Brainstorming, "Wheel", Student, Effective, Role Play, Independent Learning, Learning.*

### INTRODUCTION

Teaching methods and their types. The purpose of the training is to provide students with the knowledge and skills set out in the state education standards. Teaching can only be considered successful if it is accepted and understood by the student, or if the student is able to demonstrate the tasks designed to improve the skills in practice.

It is known that the process of learning (information acquisition) is a process of systematic development of spiritual and mental abilities, the formation of knowledge and concepts, and the formation of the ability to use the acquired knowledge. This process can be done by the learner or with the help of another educator. The learning process is based on different methods.

Method is derived from the Greek word *methodos*, which means a way of research or knowledge, theory, doctrine.

Teaching method (method) can be defined as a systematic and regulated approach to the organization of purposeful, joint activities of the learner and the teacher.

The education model can be thought of as a structure for the implementation of the learning process using one or more teaching methods.

A teaching method is a systematic approach to the purposeful, organized interaction of a learner and a teacher.

### **MATERIALS AND METHODS**

Teaching methods can be divided into the following groups according to the characteristics of the organization of joint activities of students and teachers to achieve educational goals:

Teacher-centered styles;

Student-centered (interactive or interactive) styles.

Typically, one or more of these methods is used alone in some teaching models. Typically, the teaching process consists of two or more basic methods, which are fully relevant to the topic of the lesson and are applied depending on the level of knowledge and experience of the students.

Teacher-centered style. In this way, the teacher looks for ways to transmit the knowledge and skills he has acquired through the senses of the students. In this case, the participation of students is passive, that is, they listen, observe and write lectures.

These methods are mainly implemented through the following types of teacher activities:

Oral teaching method (speech, story) One of the simplest ways of communication between people - oral speech - is an oral description or verbal expression of the main content. This method is the most formal method of teaching, which is carried out entirely through "speaking". It lasts 40 minutes or more and usually leaves no room for student participation. It basically uses the student's hearing.

How to use descriptive expressions (illustration). Students will be able to use visual aids to illustrate the knowledge or skills that need to be conveyed through this activity. The information that is to be conveyed to the students is conveyed through descriptions and various symbols. Such visual expressions are made using the following tools: board, special white board, flipchart, video image, video projector, overhead projector, computer graphics, magnetic board, pictures, drawings, color pictures, diagrams and tables, diagrams, sample and special transparent paper 'other images.

Demonstration method. The teacher can demonstrate the use of a particular tool or equipment or the actions associated with the task as an example. One-on-one demonstrations encourage students to use their eyesight.

Student-centered (interactive or interactive) methods. When these methods are used, the teacher encourages the student to actively participate. The benefits of a student-centered approach include:

- More effective learning;
- High motivation of the student;
- Taking into account previously acquired knowledge;
- Adapting the intensity of reading to the needs of the student.

- Support for student initiative and responsibility;
- Practical study;
- Creation of conditions for bilateral discussions;
- maintaining a healthy learning environment;
- The teacher becomes a facilitator.

The student participates throughout the process. As a result, there will be sufficient student participation and practice to develop students' knowledge and skills.

These methods are mainly implemented through various forms of teacher activity. Here are some of them:

### **Question-based teaching method**

The teacher puts the questions in front of the students and encourages them to repeat the given information. This will ensure that they understand the verbal and other communication methods used by the teacher.

### **Discussion method**

Students will be invited to talk, clarify issues, ask questions, and analyze the information through discussion with the teacher.

### **Conversation method**

It is important to explain the topic in the context of the source material and as part of the lesson. Normally, the lecture time should not exceed 30 minutes, and the main time should be given to the teacher during the lecture and at the end of the lesson to ask questions.

The method of discussion in groups. This method of teaching allows the teacher to "talk" very little, and most of the time is devoted to student discussions. It is advisable to use this method when students have some knowledge of the topic. They may even have no idea about the topic, or they may use it to review what they learned at the beginning of the lesson.

How to learn by discovering something new. This approach not only allows students to apply the theoretical knowledge they have acquired, but also allows them to accumulate knowledge and skills through self-motivation.

The basic principles are as follows:

The purpose of the study is to determine the purpose in advance.

The learning process should be focused on a specific task.

The assignment provides:

Basis for basic information

Focus on a question that encourages the reader to delve deeper into information that is unfamiliar to them

Results based on pre-determined and healthy research.

Success is based on activity-achievement motivation.

Group collaboration: encourages thought and action calls for observation provides two-way feedback within the group.

Depending on the needs of the individual or group, the amount of time a teacher can contribute is limited.

The teacher is primarily responsible for facilitating the learning process and providing two-way feedback. Rarely does a teacher provide information.

Practical training. A teacher can use this method if he or she wants to teach a group of students through hands-on activities that shape their skills in whole or in part. Typically, this process can include speaking, visual expression, and teacher demonstrations and discussions. However, this process is carried out in workshops where materials and special equipment are available.

It is also important to keep in mind that students learn not only through formal learning, that is, through books, newspapers and magazines, television, the Internet, and classmates, but also through more direct contact. These tools can be used to reinforce the teacher's previous lesson.

The following methods and techniques can also be used to achieve high efficiency in the teaching process:

#### **Debate method**

The study group is divided into two groups, and discussions on a topic are held in the form of an exchange of views.

#### **Research method**

The highest level of mastery; conduct individual or collaborative research on a small problem that students have not yet explored based on their knowledge; verify the accuracy of the hypothesis on the basis of the evidence sought; Stages: to put a problem or issue of interest to everyone in the lesson, to study it, to collect data for research, to make assumptions, predictions about the solution of the problem and to determine how accurate they are. data-based analysis and inference; Students independently complete some research on a scientific basis, write it down, and analyze the goals and outcomes.

#### **Role-playing games**

Business or role-playing games are a type of challenging task. Only here, instead of textual material, is a real-life situation in which students play roles. Stages: explain the situation, assign appropriate roles, explain goals and objectives; monitor student behavior during play; enabling students to acquire knowledge, skills and competencies through their actions; game results analysis; compare game results with real-life events;

#### **Project method**

This method implements a comprehensive approach to education that involves knowledge and skills, analysis and evaluation. In the project method, students are more involved in planning, organizing, reviewing, analyzing, and evaluating the results of the work done. Students design some small project work, diploma and course projects, graduation theses on a scientific basis, perform them independently, write them, make presentations, analyze the goals and results.

Independent study method. This method is aimed at the ability of students to independently master the material, self-examination skills, to fully and consciously describe the content of the given text. This method is conducted from time to time, developing students' skills of independent study, textbook work and independent practical activities. Each student completes an individual or group assignment. The teacher directs and supervises the students through external feedback without interfering with their practical activities.

Mental attack. A way of summarizing and sorting ideas to solve a problem or answer a question related to a lesson topic. participants work together to solve an unsolved problem or find an answer to a question. They come up with their own ideas for the best solution. Stages: creating a problematic situation; engaging students to find solutions; hearing presentations of various solutions; comparison and selection of solutions; conclusion;

Pinboard method. This method is a form of brainstorming, in which ideas for solving a problem are written on separate pieces of paper and nailed to the board. In the second stage, they are divided into classes according to various criteria, sorted and placed on the board in a certain order.

How to learn by teaching others. In this way, learners share information with each other on a given topic or problem and share what they know with others.

Dictionary dictation is the current form of knowledge assessment; usually short-lived; is conducted to check students' knowledge of the terms and concepts covered;

Conference. It is a form of midterm examination, usually in the form of an oral presentation of independently written work on a specific topic for a quarter or year.

Pair communication. Encourage students to sit side by side on a topic; exchange ideas and listen to some of them;

Voting method. Cite a contentious situation during the lesson; to put the opinions of the disputing parties to a vote in the classroom in order to manage the dispute; identify dissent, consent, and neutrality on each point of view; hearing the arguments and opinions of the parties; then vote again; summary

"Wheel" method. This method is an improved version of the method of working in groups, with the help of which students can independently acquire certain knowledge on the material studied, the ability to work in a team, to teach others, to inform will have the ability to share and make decisions as a team.

## **CONCLUSION**

The Samarkand State Medical Institute carries out systematic work on the wide and effective use of the above methods in the teaching of Latin and medical terminology, as well as the enrichment of students' knowledge.

Through the use of modern teaching methods, teachers are implementing plans such as, firstly, to increase the effectiveness of education, secondly, to improve the level of knowledge of students, and thirdly, to increase students' interest in their chosen profession.

Students learn to memorize Latin dictionaries, reinforce the topic by using memorized terms in practical exercises, learn grammar knowledge and skills by teaching others, work with

vocabulary, pair communication, voice He puts into practice modern teaching methods such as the method of putting, "Wheel" method, debate method, Brainstorming, Research method, role-playing games, independent learning method. This is how 70-90% of Latin lessons are organized.

The use of modern teaching methods and the use of student-centered methods in the classroom will help to increase the level of knowledge of students. Through interactive methods, students can apply their knowledge in other disciplines. This is the highest duty of a teacher.

### ABSTRACT

*This article describes the coating processes on the working surfaces of many parts from different polymeric materials. Obtaining coatings from polymers is superior to other coatings in terms of quality, efficiency and low cost. coatings made of polymer composite materials in order to protect working surfaces from corrosion and increase the durability of service parts made of metals. They are quite resistant to chemicals, so it will not be possible to remove the polymer layer with a solvent. The coating can only be removed with a special tool. Pural is not as resistant to plastic deformation as plastisol, and is more expensive than polyester, but in terms of price-quality ratio, it is the best option from all of the above. Pural coatings are most widely used in the production of galvanized metal roofing elements.*

**KEYWORDS:** *Polymer, Polyester, Plastisol, Pural, Coating, Anti-Friction, Material.*

### INTRODUCTION

Polymer coatings are used to protect metal parts from corrosion and give them a decorative appearance. Antifriction coatings are a special type of polymer materials, which not only prevent wear of parts, but also serve as a lubricant. Polymer coatings are intended for the treatment of metal surfaces in order to protect against corrosion and give a decorative appearance. Polyester, polyvinylidene fluoride (PVDF), plastisol, pural, etc. can be used as a polymer coating. Let's consider these materials, their areas of application and application technologies in more detail.

### Methods and objects of research

**Polyester.** Polyester (polyester) is the most popular polymer used as a coating. It is characterized by high resistance to UV radiation, excellent anti-corrosion properties, elasticity (easy to form).

Figure 1. The polyester coating can withstand almost any temperature - both low and high. Compared to other types of polymers, polyester is the most affordable. Compared to other types of polymers, polyester is the most affordable. Not too outstanding strength characteristics of the material are compensated for by additional processing with quartz sand. However, the cost of coating is increased. Transportation of products with a polyester-quartz protective layer presents certain difficulties, since sand can damage adjacent surfaces.

**Figure 1. Polyester coating**

### **PVDF coating**

Polyvinylidene fluoride (PVDF) is used to protect metals not much less often than polyester. This polymer consists of polyvinyl chloride (80%) and acrylic (20%). PVDF forms a shiny, fade-resistant layer on parts, therefore it is often used as a decorative coating. This material can give the surface a gloss, metallic effect, copper or silver tint. Polyvinylidene fluoride is resistant to mechanical stress and has the longest service life of all polymers. PVDF is used to treat metal surfaces that are exposed to aggressive environments.

### **Plastisol**

Plastisol, like PVDF coating, has excellent decorative properties. In terms of cost, it is the most expensive, but at the same time it has the best resistance to mechanical damage. Figure 2. Plastisol is applied in a thick layer (up to 200 microns) and is used to create textured coatings, embossed surfaces and stamped patterns.

**Figure 2. Plastisol coating**

This material perfectly protects parts from moisture and corrosion, however, under the influence of very high temperatures (over + 80 ° C) and direct UV radiation, it can lose its properties. That is why it is not recommended to use it in southern latitudes (in extreme cases, you can use light-colored plastisol with maximum reflectivity).

### **Pural**

Pural is made on the basis of polyurethane and modified polyamide. The pural coating has a silky-matte surface, high temperature resistance and resistance to sudden temperature changes. This material does not fade and does not deteriorate under the influence of chemically aggressive environments. Pural is not as resistant to plastic deformation as plastisol, and is more expensive than polyester, but in terms of price-quality ratio, it is the best option from all of the above. Pural coatings are most widely used in the production of galvanized metal roofing elements. Steel treated with pural gains a beautiful appearance, high anti-corrosion properties and resistance to UV radiation.

### **Polymer anti-friction coatings**

Antifriction solid lubricating coatings are a special type of polymer protective materials. Outwardly, they look like paints, but the pigment in their composition is replaced by highly dispersed particles of solid lubricants: molybdenum disulfide, graphite, polytetrafluoroethylene, etc. Figure 3.

**Figure 3. Polymer anti-friction coatings**

Solid lubricants are evenly distributed in a polymer binder: epoxy, titanate, polyurethane, acrylic, phenolic and other resins. The demand for antifriction solid lubricating coatings is due to their excellent performance characteristics: high bearing capacity, a wide range of operating temperatures, extreme pressure and anti-corrosion properties. Unlike conventional polymer coatings, anti-friction coatings withstand prolonged exposure to chemically aggressive media and extreme loads. At the same time, they perform not only a protective, but also a lubricating function, which also benefits from polymers.

Domestic coatings MODENGY can be cited as an example of such materials. They are used in a wide variety of industries and the automotive industry. Figure 4.

**Figure 4. Polymer anti-friction coating**

Typical coating units are medium and heavy loaded bearings, guides, gears, internal combustion engine parts (piston skirts, throttle valve, etc.), Threaded joints and other friction pairs made of various materials (metals, rubbers, plastics.) MODENGY anti-friction solid lubricating coatings are applied once for the entire service life of parts, which allows you to completely abandon oils and greases for further maintenance.

#### **ADVANTAGES AND DISADVANTAGES OF POLYMER COATINGS**

Polymer coatings have both undeniable advantages and obvious disadvantages.

The advantages of polymers include:

- Aesthetics
- Impermeability
- Relative heat resistance
- Electrical insulating properties
- Resistant to water
- Environmental friendliness
- High adhesion
- Large selection of colors

However, along with the positive aspects, polymer coatings are not without drawbacks. The main one is the high cost of application, which consists of the cost of the polymer itself, auxiliary (primer) materials, special equipment, etc.

Another disadvantage of polymer coatings is the difficulty of removing them. They are quite resistant to chemicals, so it will not be possible to remove the polymer layer with a solvent. The coating can only be removed with a special tool. A significant drawback of polymers is the impossibility of applying them without special tools, which are available only to industrial enterprises or narrow specialists. Among other things, not all metals can be coated with polymer compositions, but only those that conduct electric current. This is due to a special method of applying polymers - by magnetic induction.

## POLYMER COATING

Equipment plays a major role in polymer spray coating. Figure 5.

**Figure 5. The spray gun coating**

The spray gun tank is positively charged while the part to be painted is negatively charged. Due to this, when the polymer composition comes into contact with the surface of the product, a phenomenon similar to the magnetic induction when the electrode is closed occurs.

The entire application process is divided into stages, the adherence to which directly affects the quality of the final result. With the slightest deviations from technology, the performance of the polymer coating can be reduced to zero. At the first stage of work, the surface is prepared: it is thoroughly cleaned of dirt and degreased, those areas that do not need to be processed are closed. This is followed by preliminary priming of the product, application of the coating itself, varnishing is possible. All operations take place in a special closed chamber, isolated from the penetration of dust and other particles. One of the main requirements for this camera is good illumination, allowing the technician to see the surface of the part and apply the coating from any angle. The work-piece to be processed is suspended on special hooks, a negative charge is applied to it, and the coating is started. The whole process takes a lot of time, the material is applied in one layer to avoid unevenness.

The third stage is polymerization. The coated product is slowly warmed up in a special chamber with a maximum temperature of  $+200^{\circ}\text{C}$ . The process takes about 1 hour. The curing temperature and time depend on the layer thickness. An important factor in proper drying is the slow and uniform heating of the oven, during which the coating spreads over the part, penetrating into all hard-to-reach places. At the last stage, the product is cooled. For this, the temperature in the oven is gradually reduced to  $+100^{\circ}\text{C}$ . Do not allow the chamber to cool rapidly, as cracks may appear on the polymer coating. It is also forbidden to open the oven, as the temperature difference will cause the same consequences. The cooled part is removed from the oven and placed in a chamber for applying paint or varnish. This operation is optional and rather decorative. This gives the polymer coating additional shine and depth. Anti-friction solid lubricating coatings can be applied by standard painting methods: spraying, dipping, centrifugation, screen printing. Spraying is the easiest way. To implement it, you will need a spray gun with precisely tuned parameters, a source of compressed air and the coating itself.

## CONCLUSION

In conclusion, it should be noted that coatings made of polymer composite materials not only increase the life of the coated surface in terms of quality, but also have a positive effect on the

efficiency of the work. prevents unnecessary costs by protecting working parts from corrosion and external aggressive environment.

### ABSTRACT

*Policy of Soviet authorities regarding women in Uzbekistan is analysed in this article, and it has been given the analysis of the typical particularities of those policy and women's position in social life of Uzbekistan during this investigated period. They were partially freed from material dependence and were able to fully display their talents and abilities. This phenomenon has led to a change in the policy of almost all countries towards women, their attitude to them. From its earliest days, the Soviet government and the Communist Party pursued a policy of dividing the people into categories and groups. This undermined the idea of social partnership and created a social conflict among the local population. Not enough attention was paid to the problems of their marriage, life, family. The leaders of the Soviet government, in the interests of the Communist Party, tried and succeeded in exploiting women's labor in as many different ways as possible, that is, through incentives and coercion.*

**KEYWORDS:** *Women, Social Condition, Law, Idea, Economy, Policy.*

### INTRODUCTION

Although the issue of treatment of women has always been one of the most complex social problems in the history of mankind, the situation of Uzbek women was not considered an important social issue during the former Soviet regime.

The Soviet government and the Communist Party took the path of resolving this socio-political issue on the basis of their own political and economic interests. Therefore, many international documents adopted by foreign countries to address the issue of women's issues did not attract the attention of the former Soviet government [1]. For example, the 47th Convention on the

Reduction of Working Hours to 40 Hours a Week, adopted in Geneva on June 21, 1935, the Convention on Paid Annual Vacations, adopted on June 24, 1936, the Geneva Convention of 1919, and the 1952 These include the 103rd Convention on the Protection of Motherhood, revised on 28 June, and the Convention on the Elimination of All Forms of Discrimination against Women, adopted by the UN General Assembly in New York on 18 December 1979 and entered into force in 1981. . As a result, during the Soviet era, women's rights lagged far behind those of women in the world community in terms of social protection [2; 403].

Recognition of the shortcomings related to the problem of women as a global social phenomenon and a consistent effort to address these shortcomings, women's participation in public life, has increased their status in society. They were partially freed from material dependence and were able to fully display their talents and abilities. This phenomenon has led to a change in the policy of almost all countries towards women, their attitude to them. Recognizing that the future of the nation and society is full of women's participation, the world understands that society can have a perfect direction in its development only if they achieve their active participation in science, technology, production and management in all spheres of social life. It has been proven in every way, everywhere, that life in a place where women are helpless and cowardly is also full of helplessness and fear. It was found that a helpless woman could not give birth to and raise powerful sons and daughters. This paved the way for the feminization of society and enabled women to achieve great things in various social spheres.

During the former Soviet era, women's participation in public affairs increased due to "women's equal rights with men." While they were equally involved with men in society and public affairs, their traditional, ethnic status in the family: femininity, motherhood, and the division of family roles, they retained a large amount of work.

From its earliest days, the Soviet government and the Communist Party pursued a policy of dividing the people into categories and groups. This undermined the idea of social partnership and created a social conflict among the local population. This, of course, had a negative impact on women's marriages, further exacerbating their situation.

The Soviet government tried to mask the colonial nature of its policy among women in various forms.

**Including:**

- sought to change the social status and lifestyle of Uzbek women, ignoring the peculiarities of their mentality, their national and religious traditions, spiritual values;
- The feelings of rebellion and war in the psyche of women were directed to the production of material goods and mobilized to fight against their own national and religious traditions and customs;
- Due to the policy aimed at not forming the political and legal consciousness of Uzbek women, the awakening of their innate needs for national identity and the struggle for independence was not allowed;

To this end, efforts are being made to activate women in all spheres. We also see the Buja region during the war years.

From the first days of the war, the free-working women's movement in military hospitals expanded. In more than 30 hospitals in Uzbekistan, women worked with medical staff to care for soldiers who were seriously wounded in battle.

President IA Karimov said about the noble and humane qualities of the Uzbek people: “In those difficult years, when there was a shortage of bread, Uzbekistan sheltered thousands of families left homeless due to the war, gave bread, how many orphans were taken prisoner. rubs ». [3; 24]

However, the former Union's position, which was mainly focused on solving production tasks, had put social problems at the forefront. Therefore, the costs associated with the social protection of women who were forced to actively participate in production were significantly limited. The level of household and medical services provided to them was extremely low. The higher the demand for women's labor, the lower the focus on creating conditions for them [4; 153-154].

Women of the Republic took an active part in all spheres of public life during the years of post-war reconstruction and development of the national economy.

The percentage of unemployed women in Uzbekistan was higher than the average in the former Soviet Union, and the number of women living below the official poverty line was higher than in other Soviet republics.

Low-skilled, heavy, and low-paid labor slows down the socio-economic and spiritual development of a society. After all, he alienated those who worked from him, while at the same time intensifying in them the desire to protect their children from such hard labor in any way.

In the last years of the former Soviet Union, 14% of the able-bodied population of Uzbekistan (compared to 5.5% in other republics) was unemployed, and nine out of ten of them were women [5, 11].

In conclusion, the adopted laws and measures have been aimed at focusing women on socially useful work and praising the progress of production. Not enough attention was paid to the problems of their marriage, life, family. The leaders of the Soviet government, in the interests of the Communist Party, tried and succeeded in exploiting women's labor in as many different ways as possible, that is, through incentives and coercion.

### ABSTRACT

*Pullabrs threads is determined In work experimental for libit breakage a under existing and modernized adjuster instrument. As a result, in the process of dyeing aur yarns, dyes not provided for in the application penetrate the bonding areas where the specific density of the wrapping is insufficient. The specific gravity of the winding was measured with a PN-2 device (a device for measuring the density of the winding). Each measurement was repeated five times, and the experimental error did not exceed five percent.*

**KEYWORDS:** *Tossing.TONG-2.PN-2 Device. Experimental.Plots Of Libita*

### INTRODUCTION

The main peculiarity of obtaining patterns in auric weaving is that the weaving threads are dyed before weaving, tying the threads of the yarns together. Our research has shown that "Tossing" defect often occurs in tissues. The reason for such a defect is that in the process of tying the libit, due to the inequality of tension created by the tension, different specific densities of the yarns appear at the places of tying the yarn. As a result, in the process of dyeing aur yarns, dyes not provided for in the application penetrate the bonding areas where the specific density of the wrapping is insufficient. Experimental studies were conducted on the APM-3 avrband machine

and on this machine model (Picture 1). Along the width of the fill, the trunk tracks, which are fastened to the aurora threads on the avrband machines, are divided into ten sections.

1 - stand; 2 - engine; 3 - middle bullet; 4, 5 - hooks; 6 - rope; 7 - painted area of libit; 8 is the unpainted area of the libit

Pics. 1. Model of emergency vehicle

Pull the aurora the yarns created by the tensioning device were measured with a modernized device to measure the TONG-2 yarn group. The specific gravity of the winding was measured with a PN-2 device (a device for measuring the density of the winding). Each measurement was repeated five times, and the experimental error did not exceed five percent. (Tables 1. and Picture 3) show that existing devices do not provide the same voltage, requiring improvement. In this regard, we have developed a modernized device (Pic. 4) for measuring the tension of the auric thread when tying libit threads.

1 - set of aur threads; 2 - device for combing threads; 3 - leather pillows; 4 - adjusting screw; 5 - nuts; 6 - control eye

Pics. 2. Existing equipment for creating tension of Awr threads for tying libit.

Table 1 shows the results of measuring the winding density with an existing voltage device across the libit sections.

### ABSTRACT

*This article discusses the important structural changes that have taken place in the health sector in Uzbekistan in recent years. The data of the State Statistics Committee, obtained as a result of the ongoing reforms in the country, were also collected and analyzed.*

**KEYWORDS:** *Services, Health, Well-Being, Life Expectancy, Living Standards, Medicine, Rural Health Center, Medical Services, UNICEF, Health Infrastructure.*

### INTRODUCTION

Health care is a system of social, economic and medical measures aimed at protecting the health of the population. Health care includes general measures aimed at preventing and treating diseases, creating healthy living and working conditions, ensuring high working capacity and longevity, and its main task is to provide modern, specialized and appropriate care to patients.

Healthcare has a long history in the East, especially in Uzbekistan. Especially in the Middle Ages, the region reached a high level of medical science. During this period, ancient medical works from Greek and other languages were translated into Arabic, and their recommendations began to be put into practice. At the same time, Eastern thinkers created world-class works in the field of medicine. In this regard, Abu Rayhan Beruni's "Medicine in Medicine" and Abu Ali ibn Sino's "Laws of Medicine" are well-known and have long been the main guides in world medicine. In particular, Abu Ali Ibn Sina became very popular in his time as a physician who used new methods of treatment. In recent years, medicine has been the main form of health care in Turkestan. Doctors were educated in madrassas or taught to treat various diseases and prevent diseases through mentoring. Many of them not only treated patients, but also prepared medicines. Sahibkiran Amir Temur, along with other educational activities, paid special

attention to the protection of public health. He brought famous doctors from other countries to the capital Samarkand and opened special hospitals<sup>1</sup>.

The transition to a market economy has also placed new demands on the health sector. In particular, measures are being taken to reduce administrative costs, use low-cost and efficient methods of treatment of patients, transfer part of the workload of hospitals to polyclinics, reduce the number of inefficient places, charge for contract work and other measures.

The protection of public health depends to a large extent on the activities of the state epidemiological service. In Uzbekistan, the "Health" Centers, which carry out organizational, methodological and coordinating work on the formation of a healthy lifestyle among sanitary-epidemiological stations and the population, carry out this task.

A network of specialized medical institutions for children has been established. The program "For a Healthy Generation" developed in the country, first of all, on the basis of regular medical examinations, identifies students and adolescents with poor health and sickness, and implements measures to improve their health and the younger generation in general.

On May 7, 1993, the Order "For a Healthy Generation" of I and II degrees was established for special services in the protection of motherhood and childhood, the best material conditions and the moral environment for the development of a healthy generation..

In Uzbekistan, great importance is attached to the continuity of medical education and professional development of specialists. The country's health care system has been gradually reformed. In the first phase (1991-1994), all attention was focused on improving maternal and child health services, stabilizing demographics, and reducing infectious diseases. In the second stage (1994-1998) pharmacies and a number of treatment and prevention facilities were privatized, outpatient services were developed and restructured. As a result, hospitalization decreased from 13.3% in 1997 to 13.8% in 2001.

In accordance with the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan "On the program of development of social infrastructure of rural areas of the Republic of Uzbekistan until 2000" (May 21, 1996), a completely new institution in the field of health assistance was provided. For rural health posts, special criteria have been developed to meet international standards for all indicators - logistics, staffing, modern equipment and medicines.

Since 1998, a new era in the development of health care has begun - on November 10, 1998, the Decree of the President of the Republic of Uzbekistan adopted the State Program for the Reconstruction of the Health Care System for 1998-2005. It outlined measures to improve the quality of medical care for the population.

Under this program, measures have been taken to strengthen the primary health care system and to develop general medical practice. An extensive network of rural health posts has been established in all provinces, resulting in a two-tier system of medical care through rural health centers and the district central hospital. This work was carried out in cooperation with the World Bank on the basis of the project "Health". This has led to the development of new methods of managing and financing primary health care facilities, improving the quality of health care, and training general practitioners.

A new form of emergency care has been introduced. As a result, emergency medical care has been provided in all parts of the country, and the time between calling a doctor and receiving qualified medical care has been significantly reduced. The Republican Scientific Center of Emergency Care, its branches in Nukus and all regional centers, as well as departments of the central district and city hospitals. They provide training and retraining of personnel, as well as emergency medical care.

Positive changes have taken place in the training of medical personnel. The period of study at medical universities will be reduced to 6 years, and bachelors and masters, as well as highly qualified nurses - bachelors of nursing will be trained..

The main directions of the development of maternal and child health services are long-term state programs ["Maternal and child screening" (1998), "Healthy generation" (2000), "Mother and child" (2001), "Strengthening the health of women and the younger generation" on Additional Measures for Peace "(2002)]. In order to prevent the birth of children with congenital defects and inherited diseases, a system of screening of mothers and children has been established, and work is underway to create a State Register of Genetics.

As part of the implementation of measures to reform the health care system in the country, certain results have been achieved in the formation of a modern system of medical care. In the past, the system of primary health care has been improved through the establishment of rural health centers, urban and rural family clinics, and the population's access to these services has been expanded. A single centralized system of emergency medical care has been created, and the network of specialized scientific and practical medical centers providing high-tech medical care to citizens, including on the ground, is being improved..

The main wealth of the nation is its people, and the protection of public health has been and remains one of the main priorities of Uzbekistan and has always been in the focus of attention of the President and the Government. According to the Constitution, the population of Uzbekistan has free access to medical care provided through a network of state medical institutions - clinics, ambulances and public hospitals. In 2019, the health sector will reach 12.1 trillion soums (US \$ 1.27 billion), which is 30.5% more than last year, and in 2020 the state budget will allocate 14,842.6 trillion soums for health care. soums (1.56 billion US dollars).

From 2010 to 2019, the average birth rate in Uzbekistan remains almost stable, but with some growth. In 2019, the average life expectancy for women and men reached 77 years and 72.3 years, respectively. This is higher than the official figure for 2010, with a life expectancy of 75.1 years for women and 70.6 years for men. Life expectancy at birth in Uzbekistan ranges from 70 to 75 years. Women in Uzbekistan live an average of 5 years longer than men.

In 2018, 15.4% of Uzbekistan's GDP was directed to the health sector, which has doubled since 2016. This means that more and more attention is being paid to the health sector, attracting foreign investors to invest in this part of the public segment.<sup>2</sup>

Health is a sector of the national economy that is responsible for medicine in the broadest sense of the word. This is characterized by high barriers to entry for new entrants, as it requires licensing, large research costs, and intellectual property protection. According to various estimates, the global healthcare market will reach \$ 9.2 trillion in 2019, and the industry's projected growth rate will be 8.9 percent (2.6 percent of the world's gross domestic product).

taking into account the percentage increase). The prognosis is undoubtedly up to COVID, but the health care system is experiencing another crisis on a sustainable basis.

The health sector accounts for about 20% of the U.S. food program. The country is the world leader in per capita income: \$ 10,200 per year. It is followed by Switzerland (\$ 8,000) and Germany (\$ 5,700)<sup>3</sup>.

UNICEF supports the Ministry of Health in purchasing vaccines to ensure that every child is protected from preventable diseases. UNICEF is a key partner for the Global Alliance for Vaccines and Immunization (GAVI) in improving the planning, procurement and storage of vaccines. In particular, UNICEF calls for improved infrastructure at the national and regional levels, capacity building in the country and active participation in budget forecasting..

UNICEF works closely with the Ministry of Health, the Ministry of Finance, national and international research institutes, and UN agencies to achieve its goals. UNICEF is supporting the government in improving the planning, procurement and storage of vaccines through the Global Alliance for Vaccines and Immunization (GAVI). This work includes improving infrastructure at the national and regional levels, strengthening human resources in the country, and budgeting. UNICEF has spent perinatal care services and has provided evidence to demonstrate shortcomings in the existing system to improve the system.

If we look at the state statistics, we can see that the nominal volume of services has definitely increased in the last five years. The nominal size of the health sector within the service sector has also increased:

**Health care is one of the main types of economic activity volume of services provided in the field (in billions of soums)<sup>4</sup>**

<i>Table 1</i>	2016 y.	2017 y.	2018 y.	2019 y.	2020 y.
<b>Services - total</b>	<b>97 050,0</b>	<b>118 811,0</b>	<b>150 889,8</b>	<b>193 697,8</b>	<b>218 853,5</b>
Health services	1 416,3	1 701,5	2 220,0	3 104,3	3 209,4
<b>Share of health services (%)</b>	1,46	1,43	1,47	1,60	1,47

The table shows that the share of the health sector in services was the highest in 2019 (1.6%) and the lowest in 2017 (1.43%)..

**Health care is one of the main types of economic activity annual growth rates of the industry (as a percentage of the previous year)<sup>5</sup>**

<i>Table 2</i>	2016 y.	2017 y.	2018 y.	2019 y.	2020 y.
<b>Services - total</b>	<b>114,7</b>	<b>110,7</b>	<b>108,9</b>	<b>113,2</b>	<b>102,3</b>
Health services	122,2	116,9	113,4	114,7	89,9

The table shows that the highest growth in health services was in 2016 (+ 22.2%), while the lowest was in 2020 (-10.1%). we can say that Of course, the main reason for the decline is the damage to the economy caused by the coronavirus pandemic.

This crisis occurred suddenly in 185 countries around the world. This affected aggregate supply and aggregate demand at the same time. The emerging open global economy and national

economy have remained closed for several months. The world economic literature has not accumulated experience in identifying and mitigating the negative impact of the coronavirus pandemic on the world and regional economies, and the topic has not been routinely studied.

The head of state stressed that the main goal of all reforms is to improve people's lives, and that quality medical care plays an important role in this regard..

Over the past two years, 50 decrees, resolutions and orders of the President in this area, more than 70 resolutions and orders of the Cabinet of Ministers have been adopted. 6 new scientific-practical medical centers have been established, bringing their number to 16. In order to create more convenience for the population, 10 branches have been opened in the regions. 306 new specialized departments and 1,200 ambulance stations were opened in district and city hospitals. Another positive development was the recent Presidential Decree "On Measures to Strengthen Financial Incentives for Employees of Public Medical Institutions and Healthcare Bodies." According to him, the monthly salary of medical workers will be increased by 20% from December 1, and another 15% from April 1, 2019. President Sh.M.Mirziyoyev made proposals and recommendations on the development of a draft concept for the development of the healthcare system in Uzbekistan until 2025<sup>6</sup>.

 UZBEKISTAN

**ABSTRACT**

*The article describes the conceptual directions of improving the quality of service in hotels and scientific-theoretical and methodological issues of its evaluation. It shows the factors affecting the quality of hotel services, the specifics of hotel services, the system of indicators that reflect the quality of service in hotels, the content and ways to determine them.*

**KEYWORDS:** *Hotel, Service, Service, Quality, Quality Of Service, Quality Of Service In Hotels, System Of Indicators Of Quality Of Service In Hotels.*

**INTRODUCTION**

The implementation of measures for the development of tourism until 2010 has led to the acceleration of the growth rate of the industry and the growth of other economic indicators. The introduction of foreign currencies, the increase in profits and incomes of tourist organizations, the increase in jobs and the growth of current incomes of the population will be the result of the implementation of these measures.

Tourism is gaining a significant place in the country's economy. The development of this sector is characterized by the rapid development of the economy of the country (Table 1.3).

**TABLE 1.3 GROWTH RATE OF GDP AND TOURISM SERVICES IN UZBEKISTAN  
 IN 2000-2012<sup>1</sup>**

Indicators	Y e a r s													
	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	
GDP growth rate,%	3 , 8	4 , 2	4 , 0	4 , 2	7 , 4	7 , 0	7 , 3	9 , 5	9 , 0	8 , 1	8 , 5	8 , 3	8 , 2	

Growth rate of tourist services,%	31,6	47,0	55,9	11,1	2,3	123,2	14,6	43,9	10,3	28,3	18,7	21,6	23,4
-----------------------------------	------	------	------	------	-----	-------	------	------	------	------	------	------	------

The table shows that in 2000, the country's GDP grew by 3.8%, while the growth rate of tourist services was 31.6%. In 2005, the GDP increased by 7.0%, while the volume of tourist services increased by 123.2%. At the same time as the growth rate of GDP in 2009 was 8.1%, tourism products increased by 28.3%. In 2011, this figure was 8.3 and 21.6%, respectively. It is also clear that the country's economy is experiencing a high annual growth rate of hotel services.

This picture shows that tourism services have a high growth rate relative to the country's GDP. Only in 2004 was the figure lower. At the same time, the impact of the extremist activities of 2003 cannot be denied. However, the reason for its sharp increase in 2005 was the high level of the Sharq Taronalari International Music Festival in Samarkand this year, which had a significant impact on the growth of this figure.

Tourism mainly involves people's recreational activities. In addition, tourism includes meetings with business partners and distant friends, but during such trips, entertainment and leisure activities are not excluded.

In particular, the age of the tourist determines the share of the demand segment and the main requirements for tourism services of this or that age group (for children, young people, middle-aged people). For example, today's age group requirements for the tourism market include unmarried young people under the age of 35, who are characterized by a high level of education, a desire to succeed, financial security, and a reluctance to associate themselves with family and home worries. In the major industrial cities of Europe, the group of "lonely" makes up about 50% of the total population. There are firms in the western tourism market that only work with this segment. In particular, the level of demand in this segment in Germany is 6-8 million people. Another promising age group of demand is "seniors" (50 years and older). Representatives of this group are well-off, strive to actively enjoy life and are ready to spend money on a "beautiful life" for personal needs.<sup>2</sup>.

A statistical analysis of tourism flows shows that the number of adult travelers is constantly growing and that people over the age of 55 have begun to play an important role in international tourism. The main part of this category of tourists falls on many countries with a large population of the elderly, such as the United States, Canada, Japan. The average life expectancy increased from 1985 to 1995 by 1-2 years in Japan and 1 year in Europe and the United States. Not only do people live longer, but they also maintain high levels of physical activity as they get older. Older people began to be much healthier. This is important in terms of economic security and requires the creation of the necessary conditions for travel. People between the ages of 55 and 59 travel 2-4 times a year within their own country and 0.8 times abroad. As of 2005, there were 18.8 million people aged 55-59 in the UK, the US and Japan. the population is about 6.3 million abroad. man traveled. It is noteworthy that family tourism has been developing recently. Its distinctive feature is that family-related tourism can be divided into two groups, namely, the first with children and the second without children. Based on the requirements for tourism by occupation, it is possible to cite groups of people united by a specific occupation working in an institution or a particular sector of the economy.

Tourism as a complex socio-economic system performs various functions. These include: introductory, recreational or health, political, economic, educational areas. Through travel, a person gets to know the world, gains experience, discovers new things, forms his own

worldview, and as a result, develops science, culture, art and becomes a key factor in social development. Through travel, people restore their health, gain new impressions and improve their physical and psychological condition. With the help of tourism, countries establish foreign economic relations. Because historically, tourism has always connected countries as a symbol of peace and friendship. All this expanded the culture of the nation and served to establish peaceful relations between them.

The economic function of tourism is that it is an advanced sector in the country and promotes the development of certain types of economic activities in cooperation with the industry. The educational function of tourism is that as a result of travel a person acquires knowledge and experience, as well as hardens, overcomes difficulties, misses and appreciates his country, respects the worldview and traditions of other nations.

There are many vital services in the history of personality. One of them is the services provided by the hotel industry. Because people travel from one place to another for various reasons (business trip, vacation, tourist destinations, treatment and other types of hospitality) has been going on since ancient times and is still becoming a part of our lives as a very intense process. Due to this, this type of service is also developing in the service system.

The services provided in the hotel industry also have their own characteristics in the system of services. To identify and study these requires clarification of a number of terms related to this service. These include "Guest", "Hotel", "Hotel Management", "Hotel Services", "Hotel Industry", and "Hotel Business". As a result of the development of definitions of these concepts, the specifics of the services provided by the hotel industry will be clarified.

There are different views on these concepts in the scientific literature. However, we explain our views based on the comments given in the 5-volume "Explanatory Dictionary of the Uzbek language".

In the "Explanatory Dictionary of the Uzbek language" it is noted that the word "guest" is derived from the Persian language and means "guest, visitor".<sup>3</sup> He then gave her three comments. 1 Wedding, banquet, etc. the person who visited (visited) on the occasion. 2 A person invited from abroad to a meeting, assembly, council, etc. 3 Visitor from abroad, temporary landing person.<sup>4</sup>

By summarizing these, it is possible to develop a definition of the word guest. In our opinion, the guest should be described as follows. A guest is a person who temporarily visits the city (village, apartment) for various reasons (meeting, meeting, council, wedding, banquet).

The word "hotel" is also defined in the dictionary as "(guest + room)". "1 guest house. 2 A building with rooms for temporary accommodation of guests"<sup>5</sup>.

Apparently, the hotel is, to put it bluntly, a room that welcomes guests, consisting of special buildings such as a house. But it is also necessary to give a scientific definition. In our opinion, the hotel can be described as follows. A hotel is a special building with appropriate facilities, which welcomes visitors for various reasons and ensures their comfortable stay for a short period of time.

The phrase "hotel business" is not mentioned in the "Explanatory Dictionary of the Uzbek language". This word is different from hotel. First, the hotel does not always open for profit.

An example of this is a hotel in a private home. However, the hotel business is often organized on the basis of entrepreneurship, with the aim of obtaining a certain fee. Second, hotels do not always carry out economic activities. However, business activities take place in the hotel business, and it is registered as a business entity, obtains the appropriate permit and is obliged to pay part of the profits to the state budget in the form of taxes. Based on this, it is possible to describe the hotel business. A hotel business is a legal entity or an individual who is registered as a business entity in order to create favorable conditions for guests, has a permit to engage in this activity and is obliged to pay part of the profits to the state budget in the form of taxes.

When theoretically studying the issue of services provided by the hotel industry, it is necessary to clarify the concept of "services provided by the hotel industry." This can be deduced from the content of the hotel and the services provided. Based on the above, it is possible to develop a definition of this concept. In our opinion, this concept can be defined as follows. Hotel services are a set of all services (accommodation, catering, transportation, entertainment, entertainment, etc.) for a fixed fee, aimed at ensuring the comfort of guests.

In the current situation, the hotel industry also plays an important role in the development of tourism and economic growth. Therefore, we think it is expedient to develop a definition of this concept as well. There are several definitions of the term "hotel industry" in the scientific literature, and their content is given in glossaries. For example, H.M. Mamatkulov admits that he sees the hotel industry as a modern manufacturing enterprise, service enterprise and organization.<sup>6</sup>. "It specializes in serving visitors for short-term vacations, business meetings or personal purposes." Below we see his explanation of this concept in more depth. The hospitality industry includes services and links such as service activities, guest accommodation, catering, transportation, recreation, and entertainment. The hospitality industry, by its very nature, is part of the infrastructure of the leisure and tourism industries and is a segment of customer service in cooperation with their hotels, catering centers and infrastructure.<sup>7</sup>.

It is clear from this comment that the hotel industry also plays an important role in hospitality. In view of this, we found it expedient to describe it as follows. The hotel industry is a set of opportunities for the provision of services such as hotels, the number of rooms in them, accommodation, catering, transportation, travel, recreation (recreation), entertainment.

We have acknowledged that the hotel business is organized for business purposes. If this is the case, it should be noted that the hotel business is also reflected in it. The economic literature provides several definitions of the concept of business. However, the definition of the hotel business is poorly developed and rarely covered in the economic literature. In view of this, we consider it appropriate to define the "hotel business" as follows. A hotel business is a set of services provided for a certain fee aimed at satisfying all the requirements of guests related to accommodation and recreation. This definition is a combination of the words hotel and business and their meaning.

## **SOME DISADVANTAGES OF THE ARCHITECTURAL DESIGN OF RESIDENTIAL BUILDINGS AND THEIR SOLUTIONS**

**Rakhmonov Gayrat Fazliddinovich\***

\*Bukhara Engineering-Technological Institute,  
UZBEKISTAN

### **ABSTRACT**

*Currently, creativity is developing rapidly. But, unfortunately, there are drawbacks in the construction industry: Climatic conditions, underground geology and wind direction must be taken into account when designing medium and high-rise residential buildings, especially in the construction of residential buildings. Also, residential buildings are built without the use of external enclosing structures, entrances and other elements that protect them from excessive sunlight. On improving the design of residential buildings, taking into account the above factors.*

**KEYWORDS:** *Orientation, Temperature, Operation, Dew Point, Hygroscopic Humidity, Condensation*

## INTRODUCTION

5-storey houses built in 2018 on Bukhara Avenue, Kagan District, Bukhara Region.

When designing protective devices for buildings in the climatic conditions of the Bukhara region, it is necessary to take into account the environment and humidity of the device. The reasons for the formation of moisture, the moisture content of external barrier structures are inextricably linked with the physical properties of heat. For this reason, the moisture content of external barriers is also included in the topic "Special architectural issues". Moisture is measured in two different units: g/m<sup>3</sup>.

Since water is in a gaseous state, it will have pressure. Therefore, in the block pressure: Pa can be expressed in N / m<sup>2</sup>. Relative humidity is the ratio of the amount of water present in the gaseous state in a volume of 1 m<sup>3</sup> to the maximum possible amount at a given temperature. Relative humidity is expressed in%:

$\varphi = E / E_{\text{max}} \cdot 100\%$  e- amount of water in 1 m<sup>3</sup>. E is the maximum ability of air to trap water vapor.

Relative humidity determines how much water vapor is in the air at a given temperature. Air's ability to trap water vapor to its maximum depends on temperature. Condensing temperature is defined as the temperature at which condensation forms during the subsequent cooling process. The body of building materials and external barrier structures are naturally and to a certain extent influenced by the bulk density, thermophysical and other properties of this building material. It is known that the higher the moisture content of the building material, the greater its thermal conductivity. Therefore, when designing external enclosing structures, it is necessary to take measures to protect them from the effects of natural external moisture, as well as to use building materials with low humidity, that is, with low moisture absorption, not only thermal, but also physical and moist. taken into account. need to get. Building materials with high humidity are also considered sanitary. First of all, this material, along with an increase in the humidity of the air in the room, creates wet spots and mold on the surface of the two roofs of the walls. This leads to spoilage of food, the spread of various diseases. Secondly, the strength of these building materials is low, they are not resistant to external influences and are not durable for a long time. To carry out an engineering calculation of the moisture content of external enclosing structures and in the process of using these building materials to ensure moderate climatic conditions, it is necessary to determine the reasons for the state of moisture in them.

The reasons for the appearance of moisture in the building material:

1. Technological moisture in construction is moisture generated during the preparation of building materials and the restoration of a building or equipment.
2. Moisture passes through the floor. This moisture passes through the soil through the capillary draft into the walls. This humidity can rise 2-2.5 m above ground level in the wall. An example of this is the architectural monuments built in Samarkand in the IV century, including the Rukhabod mosque. If the walls and foundation are well covered with a moisture-proof layer, the moisture in the soil will not affect the moisture in the walls.
3. Moisture passing through the atmosphere. This moisture, along with exposure to wind from blindness and rain, affects the outer barrier structures. To prevent this effect of moisture, it is

necessary to build a protective layer of low-permeability or moisture-insulating material on the outer surface of the external barrier structures.

4. Humidity due to environmental influences. This moisture is generated during the operation of the building and mainly affects the walls and floors in the case of steam and water in workshops of industrial buildings, domestic utility buildings. To prevent exposure to this moisture, the surface of the walls and floor is protected with a layer of ceramic and glass tiles.

5. Hygroscopic humidity. The process of formation of condensing moisture is inextricably linked with the thermo physical state of external barriers. Condensation moisture often causes an increase in the moisture content of the outer barrier and the building materials in it. One of the conditions for the formation of condensing moisture is that, as is observed in nature, the actual elasticity of water vapor in the body and surfaces of the structure changes with changes in the outside air temperature. As a result of these abrupt changes, the true elasticity of water vapor is equal to the maximum elasticity of water vapor at a given temperature point, and dew drops appear in this short period of time. Water droplets increase the moisture content of the structure. The temperature during the period of time during which water droplets form is called the dew point temperature. If the surface temperature of any building material drops sharply and the surface temperature is below the dew point temperature without changing the air humidity, water droplets similar to dew will form on the surface of that material. This condition is called the condensation humidity condition. Condensing moisture from building material surfaces and external barriers is slowly absorbed by the building material body over time, increasing the relative humidity of the structure. Moisture condensation can be observed with a sharp decrease in the temperature of the surfaces of external barrier structures. This condition is observed in the corners of the outer walls, in the section of the cornice, at the junction of the walls with the plinth and at the junctions of the panel walls with each other, as well as at the junction of the walls with the window. The process of formation of condensation moisture on the surface of external barrier structures depends on the following factors: 1)  $t_{sh} > t_b$  - if condensation moisture forms only in the corner of the external barrier; 2)  $t_i > t_{sh} > t_{min}$  - from time to time condensing moisture forms when the temperature of the inner surface of heat-resistant structures decreases. In winter, condensation moisture can often be observed to form on the outer surface of external barrier structures. The main reason for this is that after a strong cold, the air heats up sharply or the warm air cools down sharply. This situation can be observed on the outer surface of unheated building structures, on the surface of columns, bridge structures and sculptures. The temperature of the inner surface of the barrier, taken into account in the engineering calculation of the moisture state of the outer barrier structures, should not be lower than the dew point temperature. To prevent the formation of condensation on the inner surface of external barriers, it is necessary to dramatically increase air exchange in the room and reduce air humidity. In addition, the temperature of the inner surface of the barriers must be above the dew point temperature. This is achieved by increasing the thermal conductivity of the outer barrier or decreasing the thermal conductivity of its inner surface. If the air humidity in the room is high and approaches 90-100%, it is difficult to prevent the formation of moisture condensation on the inner surface of the outer barrier, etc.) layer.

Housing construction has a long history. From the very beginning of humanity, he built a shelter to protect himself from enemies, predators, cold and heat, and housing was a key factor in a person's rest and work. Over time, the function of housing has improved and expanded. The

architecture of housing has been adapted to the social conditions of society, the spirit of the times and other conditions. From a simple tent or cave to our time, it has turned into a modern dwelling, that is, an object ennobled with modern furniture. From the beginning, it was very difficult to access housing due to the lack of labor and building materials due to the helplessness of the economy. Therefore, then the question arose about the construction of housing and communal services. A special feature of conventional intermediate houses is that this is achieved by placing several families in rooms in the same house. That is, each family is placed in one room through a corridor or corridor. The kitchen, bathroom and toilets were common here. Of course, this type of house is not very comfortable, but these houses partially helped to solve the housing issue during that difficult period. That is, homeless families managed to move into such houses. After the restoration of the national economy, new types of housing were built. That is, ways have been developed to accommodate families not only in rooms, but also in apartments / flats /. At the same time, each family was provided with separate apartments. These houses, unlike the previous ones, had a separate toilet, washbasin and corridors. This has created more amenities for the population than previous common lounges. But here the principle of moving from room to room began to be applied. By 1955, instead of moving apartments from one apartment to another, a separate one-room apartment was created for each family member. Instead of overlapping rooms, structural units of multi-room apartments with separate rooms have been developed. The formation of any housing was greatly influenced by the geographic environment. For example, in northern-built houses, the interior of the apartment was protected from the external environment, because here the main requirement was the opposite - to protect the houses from heat and overheating. It was also necessary to connect the interior of the house with the external environment. Thus, on the basis of conflicting requirements, the structure of the structure of the northern and southern houses arose, which were completely different from each other.

National culture and customs also influence the structure and diversity of housing. Therefore, even if houses in the south with the same climate are similar to each other, they will change in accordance with the history and customs of the locals. Consequently, the Traditional settlements of the Uzbek people were adapted to their climatic conditions, level of culture, customs and artistic traditions.

Housing construction in Uzbekistan has a long tradition.

Basically, these houses are divided into three types: houses built in the style of Bukhara, Fergana and Khiva.

Bukhara houses were very developed during the feudal period and were densely built up, they were built opposite the courtyard. The rooms were one- and two-story. They were built around the courtyard.

The aforementioned national houses have been very well adapted to climatic conditions with simple equipment and methods.

Based on the above factors, we will give an example of the disadvantages and advantages of the orientation of residential buildings.

### **ABSTRACT**

*This paper examines the preparation of a field-effect transistor and how the current is controlled by the gate voltage supplied by the source, which is determined by the value of the current resistance flowing through the channel in a bipolar circuit.*

**KEYWORDS:** *Transistor, field-effect transistor, integral optics, p-n junction, epitaxial structure, gate, stock, bipolar circuit.*

---

### **INTRODUCTION**

The creation of the transistor was one of the most important events of the twentieth century, leading to the rapid development of the field of semiconductor electronics, which began in 1833 with the experiment of the English scientist Michael Faraday with semiconductor material-silver sulfide.

Transistor (English: transfer-transfer and resistor-resistance) is a three-electrode semiconductor device designed to amplify, generate and convert electrical vibrations.

According to the structure, principle of operation and parameters of transistors divided into two: bipolar and field (unipolar) transistors. Bipolar transistors use semiconductors with both types of conductivity (p-type and n-type). A bipolar transistor operates at the expense of a p-n junction located close to each other and directs current through a base-emitter junction. Field-effect transistors are semiconductor devices that are controlled by a change in the electric field in the conduction channel to control the current value, and the input voltage acting on the output

current in the transistors creates an electric field. Only one type in field-effect transistors (n-type or p-type) semiconductors are used.

Two types of primary and non-primary charge carriers play an important role in a bipolar transistor. In field-effect transistors, the current is generated using the main current carriers, and the charge of the non-main current carrier does not play an important role. This is why a field-effect transistor is also called a unipolar transistor. In a bipolar transistor, the output current is controlled by the input current of the base or emitter. The input resistance is small. A bipolar transistor can be used where the input resistance needs to be small. But some circuits require a large input resistance. Current control in field-effect transistors For AC-controlled alternating current and low-frequency alternating currents, the input resistance of the transistor is very large: 10<sup>8</sup>-10<sup>15</sup> Ohms, the field-effect transistor preparation technology is simpler than that of a bipolar transistor. In addition, field-effect transistors occupy a small surface area in chips and consume less current. It therefore allows the generation of several thousand to tens of thousands of transistors and resistors on a small scale. Field-effect transistors are designed to amplify egkdsh udulek signals and power.

In field-effect transistors, unlike bipolar transistors, only one type of charge carrier is involved in current formation: either electrons or cavities. Therefore, they are also called unipolar transistors.

Today, semiconductors play an important role in science and technology. Semiconductor electronic devices are used in various sectors of the economy. Year after year, the hitherto unknown properties of semiconductors are being identified and new devices are being developed from them.

Different types of field-effect transistors are required to increase the reliability of the operation of integrated optics. The issue of stabilizing the parameters of the illuminator (generator) is very important. These parameters are very sensitive to changes in the operating mode and require special electronic circuits. Special current limiters for semiconductor lasers and LEDs are needed, especially if a current source is needed to create accurate measuring devices. The use of field-effect transistors for these purposes simplifies the circuit, unlike bipolar transistors. In this paper, the operation of a current limiter based on a field-effect transistor controlled by a p-n junction is analyzed.

The field-effect transistor under study was prepared based on the epitaxial structure. An n-type conductivity layer has been planted on the bottom of the p-type silicon, which represents the gate area. The length of the channel is 25 μm, width 560 μm, stock and istok contacts width 12 μm. The gradient of the current carrier concentration increases in the channel width in the p-n junction direction.

**Figure 1. Connection of a field-effect transistor to a circuit in current-limiting mode.**

The maximum current of the stock is 6.31 mA, the voltage across the duct is 2.4 V. The current in the form of a bipolar pole is generated by connecting the outputs of the gate with an external resistor. As a result, the automatic shift mode is set (Figure 1).

Such a mode differs from the voltage regimes determined by the common demand connection mode or voltage divider according to the saturation mechanism of the stock current. In this case, the channel modulation process is effective. The dynamic resistance of the channel increases sharply. In automatic displacement, the channel is compressed by the transverse and longitudinal components of the electric field. As can be seen from the circuit diagram of the limiter, the current flowing through the “channel-to-resistor” circuit is determined from the relationship (voltage corresponding to the resistance). At a given voltage, the saturation mode on the volt-ampere line of the stock current corresponds to the value of the external resistance. In addition to the stabilization current, such a stabilizer is characterized by a slope characteristic, saturation voltage, and breakdown voltage in the stabilization field.

In a field-effect transistor, the stock current is controlled by the gate voltage supplied by the source. Also in the two-pole circuit under consideration, the current flowing through the channel is controlled by the value of the resistance. an increase in the value of the resistance leads to a decrease in the stock current (Fig. 2).

The maximum value of the stabilization current is equal to the maximum current of the field-effect transistor at zero displacement. Indeed, from the measurement results, the stabilization current at zero resistance is equal to the maximum current of the field-effect transistor (Table 1).

**TABLE 1 THE DEPENDENCE OF THE STABILIZATION CURRENT ON THE EXTERNAL RESISTANCE**

$R_T, \text{OM}$	$S_{st}, \text{MA}$	$R_T, \text{OM}$	$S_{st}, \text{MA}$
0	6,31	1000	1,27
100	4,40	1500	0,96
200	3,45	2000	0,80
400	2,45	3000	0,53
700	1,70	4000	0,44

**Figure 2. -dependence of stabilization current on external resistance**

As the external resistance increases, the stabilization current decreases. For example, at a resistance of 200 Ohms, the stabilization current is 3.45, which is generated at a closing voltage of 0.8V. At a resistance of 400 Ohms, the current corresponds to a voltage of 0.1V.

The dependence of the stabilizing current on the resistance can be explained as follows: the external resistance of the controller, together with the channel of the field-effect transistor, resembles a voltage divider that closes the channel. As a result, the voltage drops proportional to the value of the resistance, and the current remains controlled according to the value of the resistance. The correspondence of the volt-ampere characteristic lines can be explained by the fact that in both modes the same voltage is present in the circuit.

## “COMPOSITIONAL STRUCTURE AND DESIGN SOLUTION OF ARCHITECTURAL ENSEMBLES AND COMPLEXES OUTSIDE BUKHARA”

Usmonov Erkin Toyirovich\*

\*Assistant,  
Bukhara engineering-technological institute,  
UZBEKISTAN

### ABSTRACT

*In this article, the vertical composition of the city is one of the important components of the historic city complex. The figurative nature of the city, its diversity and uniqueness, in a sense, the richness of the urban silhouette to the dominants, the contrast of the vertical heights and the relationship of the surrounding buildings, how they relate to each other and the towers in the history of the city. studies related to how expressive the towers themselves are with their construction and appearance have been analyzed.*

**KEYWORDS:** *Vertical, Composition, Dynamics, Dominant, Tradition, Silhouette, Dome, Combination, Proportion.*

### INTRODUCTION

#### Vertical composition of historical cities

Considering the spatial structure of historical cities, urban planners of the past understood the importance of its vertical composition and used all means to make it rich and unique. The silhouette of the ancient city was, as usual, rich in high dominants. The location of the original core (e.g., the Ark Fortress in Bukhara), the high elevation, and the accumulation of numerous verticals in the form of a tower adjacent to the blue-domed mosques and madrasas, led to a dominant general hierarchy. This system is filled with the vertical dimensions of the Poyi Kalon complex, the memorial complex of the Ulugbek and Abdulazizkhan madrasas, and the trade domes of the Taqi Zargaron and Abdullahan teams.

Thus, in the general construction of a large number of urban accents, the main and auxiliary parts of the composition are distinguished. The correspondence between the vertical accents and the

location of the historical nodes allows us to get an idea of the history of the city, its history, the location of the leading links and elements of local significance (small areas - residential neighborhood centers, urban neighborhood guzars, streets).

Many of the memorial complexes and neighborhood mosques, especially the prison building, are located in the highlands of the city, which is enhanced by man-made verticals under natural conditions. The vertical composition of the ancient cities has always been dominant and preserved, and in the process of reproduction of ordinary mosques and madrasas through the reconstruction of domes and minarets there was a strong contrast to the surrounding buildings.

Much attention was paid to the completion of vertical structures, because it was their top from the top of the horizon of urban buildings, from long distances that gave an idea of the quality of this or that structure and participated in the formation of urban originality. Here the diversity of shapes of the places of completion (domes, towers and their group combinations, flat-surfaced roofs) and fine proportions (proportions), clear lines are observed. In conclusion, it can be noted that the main features of the vertical composition of ancient cities are observed: the richness of the urban complex to a large number of verticals, the use of topographic conditions for the convenient location of vertical dominants.

Comparing historical data with the current situation, unfortunately, in many cases it is possible to note a number of cases that worsen the condition of the vertical composition of the city complex. This is mainly due to the disruption of a number of historic verticals and the development of modern multi-storey buildings in the historic part of the city. The verticals were destroyed due to the loss of their functions and the lack of understanding and underestimation of their urban role (destruction of mosques and minarets, demolition of castle walls, etc.). Modern construction, carried out without taking into account the role of historical verticals in the complex, led to the flattening and alignment of the urban silhouette.

In historic cities with different levels and different rates of development, the disruption of vertical composition that has historically occurred occurs to varying degrees. Many changes have taken place in large cities, while in small towns the resulting complexes are well preserved. However, in recent times, many of these cities have undergone necessary and inevitable temporary constructions related to social conditions.

This is one of the important problems of the restoration of historic city centers with a rich heritage and can be solved only on the basis of thorough research. The importance of this or that vertical structure in the urban structure does not always correspond to the favorable topographic situation. Therefore, the next stage of research should consist of a direct study of the whole

hierarchy of vertical dominants: their size, mutual position and appearance between them, visual connections.

Perception through the silhouette and visual connections can be manifested in the spatial environment typical of the overall complex of the city, achieved due to the appearance of the emphasis on the urban construction horizon. In this case, researchers are interested in perceptual spatial visual communication when several towers can be seen at the same time, and impressions are accumulated because of their ability to see and remember.

Each dominant has its own field of view and zone of compositional influence. These zones are the basis for determining the order of restoration of the surrounding areas. The boundary of the field of view is determined by searching and recording in nature the edge points of the dominant view in the plan. At the same time, objective factors limiting this zone are determined: relief, ancient plans and buildings, as well as destructive factors - partial destruction of the dominant, subsequent devices made without taking into account the existing dominant, high crops and others. There may also be cases where the field of view is fragmented. Because of the nature of the building, an additional point of view is determined from the ascending part of the site to the dominant side. In such cases, in addition to the main zone, such parts of the site are also recorded in the master plan.

The three-dimensional structure of the architectural complex, the compositional, visual connections and scale relations of the historical city form the architectural unity of all components - natural landscape, schematic diagram, structure (system) of leading volumetric and vertical dominants, main buildings and complexes and public buildings. It lies in each component such features as the external and internal appearance of the complex. The internal structure of the architectural complex, the collection of impressions and the creation of an appropriate image based on it are of particular importance in the daily interaction of the population with the architectural environment.

The structure of the historic city is an open and complete spatial unit. Open space includes artificially organized, organized spatial spaces - streets, sidewalks and natural spaces. The full space includes the dimensions of architectural structures and their complexes, as well as high green areas and other voluminous elements of the landscape.

The basis of the unity of the spatial structure of an architectural ensemble and complex is the inter-compositional relationship of its individual parts and the subordination of the construction of each of them to the overall system. Such interactions are considered in the compositional direction, in the volumetric construction, as in the location of architectural complexes in the city plan. In order to reliably assess the compositional-artistic advantages of architectural complexes and to develop reasonable recommendations for their restoration, it is necessary to understand and disclose these compositional connections in a historical context.

### ABSTRACT

*The article deals with three aspects of determining the skills of a teacher - the personal characteristics of the teacher, his competence and upbringing, the level of knowledge of the subject he teaches. The topic was covered based on the results of experiments and research conducted at the Shahrizabz branch of Tashkent state pedagogical university*

**KEYWORDS:** *Pedagogue, Skill, Competence, Education, Upbringing, Mental Labor, Cerebral Hemisphere, Stress, Mental Labor, Nerve Cells, Fatigue, Knowledge, Enlightenment ...*

*Education is for us life or death, salvation or destruction, whether it is happiness or disaster...*

### INTRODUCTION

Human society has emerged that education and upbringing are one of the main issues that are causing controversy. Alisher Navoi, the Sultan of Poetry, wrote the following about schools and schoolchildren (teachers) in the eighteenth chapter of the first part of Mahbub ul-Qulub (mentioned by the people of Dabiristan):

"Maktabdor begunoh ma'sumlarg'a jafokor. Atfol azobig'a rog'ib va alar ta'dibig'a murtakib. Zoti bemadoro, dimog'i po'lod va ko'ngli xoro. G'azabdin qoshida chin, gunahsizlar bila oyini xashmu kin. Ko'pragida tab' g'ilzati va tama' illati padidor va aql qillatig'a giriftor. Ammo tavsani atfol ta'bini jafo bila rom qilg'uvchi, nohamvor sig'or tavig'a siyosat bila andom

berguvchi. Agarchi xo‘ylari durushluqda namoyondur, ammo atfol nohamvorlig‘i islohig‘a irik suhondur” [Navoi, 1998: 22].

So, according to Navoi, the teacher (schoolboy) is a tormentor, a tormentor to young innocents. He was prone to torture babies and began to discipline them. He (the educator) is uncompromising, beandasha, angry and hard-hearted. His forehead is furious with rage, and his habit with the innocent (young children) is bitterness and enmity. Most were dark, greedy, and mentally retarded. But he is the one who subdues the taste of naughty and rebellious babies by harassing them, and the one who regulates the behavior of disorderly children (cows) with politics.

Therefore, the pedagogue (teacher) is a specialist who carries out educational work with students in secondary schools, academic lyceums and vocational colleges in various fields. Because a teacher influences the formation of members of society, his or her personal qualities are more important than his or her professional qualities. Because it shapes the image of society today and tomorrow. Therefore, it is not enough for a teacher to be professionally mature. His spiritual world must be saturated with the noble human qualities intended to be inculcated in the students.

Modern pedagogy notes that the teacher has such functions as practical, research, organizational, mediating, executive. Only a teacher who fully fulfills these tasks can influence the formation of today's young generation as harmoniously developed individuals. Decision-making of such features in teachers of the independence period is a factor in ensuring the development of the country [Encyclopedia, 2000: 79].

We continue with Navoi's description of teachers:

“Aning ishi odamdin kelmas, qaysi odamki, dev qila olmas, har qattig‘ kishini bir tiftl muhofazati ojiz etar, ul bir surukka ilm va adab o‘rgatgay, anga ne yetar. Oncha borkim, ul qavmning idroku fahmi oz tushar, andoq kishiga yuz muncha mashaqqat ne bushar. Har taqdir bila atfolg‘a haqqi ko‘pdur, agar podshohliqqa yetsa va anga qulluq qilsa xo‘bdur. Shogird agar shayx ul-islom, agar qozidur, agar ustod andin rozidur – Tengri rozidur”[Navoi, 1998: 22].

As you can see, Navoi is pointing out how difficult the teaching profession is. Navoi deserves a description of the profession, saying that not only a strong and energetic man, but also a giant can not stand the hardships of a teacher who introduces black and white to a child who has not yet realized anything. Therefore, a teacher "has a great right to a child with any destiny, and it is good if he reigns and serves him." According to Navoi, a student needs the consent of the teacher no matter what career he or she pursues. The approval of the Master is the approval of God.

Navoi's conclusions on this subject are summarized in the following verse:

Haq yo‘lida kim senga bir harf o‘qutmish ranj ila,

Aylamak bo‘lmas ado oning haqin yuz ganj ila[Navoi, 1998: 22].

Although these definitions of Navoi are almost specific to primary education, they are common to educators at all levels. So, teachers are divided into categories that teach pedagogical subjects and other science teachers. The division into such categories is conditional, resulting in two different approaches to the organization of lessons. A teacher of pedagogy uses science topics as an example in the study of a method or technology, the purpose of which is to reveal the method or technology being studied. Science teachers use pedagogical methods or technologies in

explaining a topic of science, the purpose of which is to reveal information on that topic of science.

Today, the amount of knowledge and skills that a school teacher needs to know and be able to apply is increasing, as the information is updated hour by hour, not day by day. In any case, the teacher should not underestimate his potential in three areas. These are: knowledge of the subject being taught, pedagogical skills and hygienic standards of education. These three indicators are of equal value, and if the performance of any of them decreases, the quality of the course it forms will not be high.

Science is a human activity aimed at developing and systematizing objective knowledge about reality. This activity is accomplished through the collection of facts, their regular updating, systematization, and critical analysis. New knowledge is created based on the observation of nature, social phenomena, and the disclosure or generalization of their interrelationships, which allows for scientific prediction.

The sum of the results obtained by observing these hypotheses is recognized as a law of nature or society, which is proved on the basis of experiments.

Science is a system of knowledge about the world, one of the forms of social consciousness. It includes both the acquisition of new knowledge and the knowledge that forms the basis of the scientific landscape of the universe, the product of that activity; represents some area of human knowledge.

The immediate goal of science is to describe, explain, and predict the processes and events of that reality on the basis of discovering the laws of reality that are the subject of its study. The first buds of science emerged in connection with the emergence of human society. Early knowledge was of a practical nature [Encyclopedia, 2005: 274].

If we look at history, a lot of data has been gathered through observations, investigations, and experiments. In terms of the specificity of this information, they were closely related to each other and divided into groups. In the future, science emerged at the heart of these groups. As a result of the deepening of a particular science, the directions of that science emerged.

The level of knowledge of the educator means the knowledge of the specialist in the field of science, the ability to apply this knowledge in life and awareness of innovations in the field of science. This is assessed on the basis of his knowledge or level of knowledge. Knowledge is a very broad concept and has different interpretations.

Knowledge is the information that people generate about natural and social phenomena; the reflection of reality in human thinking. Such belief is knowledge if we believe in what is in our daily imagination and this belief does not contradict the events and phenomena (rules) we are accustomed to. In order for our knowledge of reality to rise to the level of knowledge, it must meet the following conditions: first, the relevance of that information to reality; second, to be sufficiently convincing; third, this information must be based on evidence. All three conditions together bring the available data to the level of knowledge. In the process of social development, man moves from ignorance to knowledge, from abstract knowledge to the formation of perfect and concrete knowledge. Man's knowledge of the material world is relative, it is constantly evolving. Knowledge is accumulated through daily experience, observation [Encyclopedia, 2000: 29].

---

Knowledge is the result of understanding that can be logically and evidence-based and tested empirically or practically. Knowledge is the evidence-based product of human thinking, according to modern epistemology. When we talk about knowledge, we mean in this process - the reflection of reality in the human mind. Science and its scientific methods play an important role in gaining knowledge about the structure of objects and phenomena, their interdependence.

The potential of the educator in the second direction is pedagogical skill. If a teacher does not have a deep knowledge of his subject as well as pedagogical skills, the level of mastery of teachers will not be high. The high pedagogical skills of the teacher are the basis for the organization of quality lessons.

Pedagogical skill is a feature that defines such personal (childhood, kindness, humanity, kindness, etc.) and professional (knowledge, intelligence, devotion, creativity, erudition, etc.) qualities of a teacher, which deepens his knowledge and comprehensive knowledge, pedagogical-psychological and methodological training, finding and applying in practice the optimal ways of teaching, educating and developing students. Thus, in order to acquire pedagogical skills, a teacher must know his subject in accordance with the requirements of the time, master the disciplines of pedagogy, psychology, methodology, and strive to incorporate humanity and devotion [Ochilov, 1996: 91].

Any forced activity has a negative effect on the body. This effect is caused by the nervous system. In particular, the teaching process itself is a mandatory activity. In order to maintain the health of students during the lesson and at the same time increase their mastery, the teacher should know the requirements of educational hygiene, classroom and classroom equipment. At the same time, it is necessary to have mastered such concepts as the physiological basis of teaching, the ability of students to work, the hygiene of the nervous system of the student.

In order to prevent the disruption of the functional activity of the student's body, it is necessary to properly regulate the alternation of mental and physical activity during the working day, week and quarters of the school year. When one type of activity is replaced by another, the running cells rest. The norm of the load that a teacher gives to a student is determined by his age, state of health, cognitive ability, type of nerve and teaching conditions. When a student is overworked, his brain gets tired, and the younger the child, the faster he gets tired.

Prolonged cessation of muscle movements during the lesson impairs the child's ability to work mentally. As a result, the child's attention is distracted and his muscles begin to relax. Kindergarten children fall asleep when they are tired. When Hadeb engages in the same type of mental activity, the child's interest decreases and he falls asleep. Excessive fatigue or exhaustion can lead to decreased appetite, headaches, lethargy, memory and attention deficits. When a person is severely tired, the functional state of the nervous system changes and braking occurs.

During the course, students are influenced by many external and internal factors. Deviation of any of these factors from the norm becomes a pathogenic factor and harms the health of the student. For example, the height of the desk does not correspond to the height of the student, the lighting in the classroom is below or above the norm (norm 175-350 lux), the temperature is low or high, the air circulation and composition in the classroom is disturbed, the teacher deviates from hygienic norms.

All mental processes are closely related to the neural processes in the large hemispheres of the brain, because at the heart of each mental process are the neural processes: excitation, inhibition, distribution, concentration, dominance, and others. In addition, mental processes are formed on the basis of speech [Sodiqov, 1992: 82].

It is necessary for educators to create and practice all types of internal braking in the education of children and adolescents. It is important to keep in mind that the learning process will only be effective if the methods of comparison and contrast are used. Demonstrating colorful, shiny visual aids in the teaching process can create a dominant focus in the cerebral cortex by stimulating children to an exciting, delightful level, improving attention, and increasing the interest of the learning material. On the contrary, the same effect, the same conditions, the same tone of speech causes children to fall asleep, to lose interest.

Mental work is the result of the activity of cortical cells in the cerebral hemispheres. Therefore, when you work hard mentally, the nerve cells of the brain become exhausted, and the person becomes very tired.

Fatigue is the inhibition of brain cells. Fatigue is manifested by distraction, lethargy, drowsiness. If fatigue is not prevented, it leads to fatigue, in which the child has a headache, dizziness, decreased appetite, or the person becomes very impressionable, speaks in his sleep, wakes up, and so on. The lesson does not enter the brain well, the materials are not very memorable. Fatigue often occurs when the workload is increased, the schedule is disrupted, the child is less in the fresh air, and he does not eat properly.

Workability refers to the ability to do a job over a long period of time without compromising quality. Working ability varies from person to person and depends on age, health, strength, mood, work experience, exercise, team and family relationships, responsible approach to work, and many other factors. The ability to work varies from day to day, week to year, year to year. When the student wakes up from sleep, the ability to work is not so high, the body gradually begins to transition to a state of work. As the work progresses, it gradually increases, reaches a certain peak, then remains in this state, then subsides.

If a person works without getting enough rest on time, he will get very tired. It adversely affects the functions of the body, especially the central nervous system, resulting in deterioration of mood, increased sensitivity, insomnia, decreased interest in work, decreased ability to work.

The student's mental activity in the classroom is divided into 5 periods:

- ✓ Start-up period - lasts a few minutes in the classroom, the student adapts to the working conditions;
- ✓ optimal period of work - a period of stabilization of mental work;
- ✓ full compensation period - the first signs of fatigue begin to appear, but they are compensated by the willpower of the person and do not appear;
- ✓ Unstable compensation period - an increase in fatigue is characterized by a decrease in performance.
- ✓ period of progressive decline in labor activity - this period is characterized by a rapid increase in fatigue, a sharp decrease in labor productivity;

In order to ensure high productivity of mental work in the classroom, to prevent fatigue, it is necessary to carry out the following activities:

- ✓ visit and fill in the journal at the time of commencement of work;
- ✓ Explain the new material when the student has the optimal working ability;
- ✓ In the first half of the lesson, using active methods of teaching, the student explains without keeping his attention on one subject for a long time;
- ✓ change the method of teaching;
- ✓ Extensive use of visual aids, didactic and technical teaching aids in explaining the course material;
- ✓ Conducting physical minutes between lessons;
- ✓ high mood of the teacher when explaining new material, the teacher speaks in different tones [Aripova, 2010: 103].

In conclusion, the knowledge of the teacher means not only the knowledge he has acquired in his subject, but also the ability to convey this knowledge to the student, that is, his knowledge of pedagogical skills and the organization of lessons in accordance with the rules of hygiene is understood as a set of knowledge in the field of health care. Therefore, the disciplines of pedagogy and hygienic standards of education are taught in universities that train teachers.

In the process of preparing the article, we conducted an experiment to determine the knowledge of teachers of the Shahrizabz branch of Tashkent State Pedagogical University named after Nizami. 350 students participated in our experiment. The students commented on the 35 teachers who have been teaching them. The experiment (student response) was based on a questionnaire survey. In our questionnaire for teacher evaluation, the following four qualities of a teacher were highlighted:

1. Personal characteristics of the teacher.
2. Competence and education of the teacher.
3. The level of knowledge of the subject taught by the teacher.
4. Knowledge of educational hygiene.

The first quality is the personal characteristics of the educator. This teacher's voice timbre, temperament, majesty and so on ...

The second quality is the competence and upbringing of the teacher. The following were used to study these traits:

1. To what extent can the teacher organize lessons?
2. Teacher's pedagogical skills.
3. Level of audience management.
4. Fluency of speech (speech without parasitic words).
5. Justice during supervision.

6. Level of knowledge of ICT.
7. Graduality of speech.
8. The level of organization of lessons ...

The third characteristic is the level of knowledge of the subject taught by the educator himself. This quality of the teacher was determined on the basis of the following parameters:

1. The level of knowledge of the teacher of his subject.
2. The level of ability to apply knowledge in practice.

And finally, the teacher's knowledge of educational hygiene. This quality was determined by:

1. Sanitary condition of the classroom.
2. Suitability of equipment for student height.
3. Conduct the lesson in a high mood.
4. Ability to keep students from getting tired during class.
5. Features such as distraction skills when signs of fatigue appeared were reflected in the questionnaire.

Our experience based on this questionnaire, as we have noted, was organized within the framework of the activities of 35 professors and teachers. However, as part of the article, we divided them into three categories (associate professors, senior lecturers, and teachers).

The result is as follows:

Position	Qualities	Excellent	Good	Medium	Unsatisfactory
Associate professors	Personal characteristics of the teacher	59%	27%	9%	5%
	Teacher's competence and education	68%	18%	9%	5%
	The level of knowledge of the subject taught by the teacher	86%	9%	5%	0%
	Knowledge of educational hygiene	68%	27%	5%	0%
Senior teachers	Personal characteristics of the teacher	19%	49%	25%	7%
	Teacher's competence and education	10%	56%	32%	2%
	The level of knowledge of the subject taught by the teacher	29%	51%	17%	3%
	Knowledge of educational hygiene	32%	54%	12%	2%
Teachers	Personal characteristics of	3%	53%	27%	17%

	the teacher				
	Teacher's competence and education	10%	43%	24%	23%
	The level of knowledge of the subject taught by the teacher	13%	43%	20%	34%
	Knowledge of educational hygiene	33%	40%	14%	13%

The conclusion of our experience on associate professors is that 59% of students gave a grade of "5" to the personal characteristics of the teacher; 27 percent of students received a "4" grade; 9% of students received a grade of "3" and 5% of students received a grade of "2". It is obvious that the percentage of students who gave associate professors a grade of "5" in all four areas of the questionnaire was high.

Our summary of senior teachers is as follows:

19% of students rated the teacher's personal characteristics as "5"; 49 percent of students received a "4" grade; 25% of students received a grade of "3" and 7% of students received a grade of "2". As you can see, the percentage of students who gave senior teachers a "4" in all four areas of the questionnaire was high.

Our conclusion on teachers is as follows:

10% of students rated the teacher's personal characteristics as "5"; 53 percent of students received a "4" grade; 27% of students received a grade of "3" and 17% of students received a grade of "2". As it is known, the percentage of students who gave "4" marks to teachers in all four directions of the questionnaire was high, but we can see that the percentage of students who gave "3" and "2" marks was relatively high.

Also, during the experiment, we tried to clarify the average pedagogical experience of associate professors, senior lecturers and teachers and how many times they improved their skills. As a result, the indicators of the participating professors and teachers in this area are as follows:

Scientific position	Average pedagogical experience	Pedagogical experience in higher education	Average training
Associate Professors	20	16	5 times
Senior teacher	12	11	2 times
Teacher	3	2	Unqualified

The data in these tables show that the majority of those who are highly rated by students are professors and teachers with many years of teaching experience and academic titles. So, as a result of our research, it can be seen that a teacher with scientific potential has proven to be a quality teacher. He analyzes the material throughout the lesson, shapes it in his imagination, and digests it himself. The effectiveness of the lessons organized by such educators will be high.

Our observations also found that teachers with no academic degree had a relatively low level of analysis and synthesis of materials around the topic. They are accustomed to accepting material as it is in the scientific literature. The result casts a shadow over the full scope of the subject. Lessons organized by a teacher in this category may have some degree of shortcomings. This has a negative impact on lesson effectiveness.

Another important aspect of our experience is that teachers have the opportunity to learn about the achievements and shortcomings of university professors based on the assessment given by students, and to discuss this information individually with their participation.

So, the discussion based on the results of the experiment with the participation of professors and teachers gave good results. Participating professors understood and tried to work on what aspects of themselves they needed more.

This experience has proven to be a catalyst for professors to work on themselves. After all, there is no doubt that only experienced teachers will be able to develop experienced and talented teachers in the future.

### **INTRODUCTION**

From the point of view of modern development trends aimed at modernization of higher education and humanization, the problem of preparing future professionals for creative activity in the Technical University is important.

Pedagogical experience shows that the learning process does not involve the direct participation of students in the formation of generalized types of knowledge and activities in the construction of the learning process by traditional methods. Such reading does not stimulate the student's learning activity in the process of acquiring knowledge, skills and qualifications, does not allow for independent learning, development and self-expression.

The effectiveness of the learning process in relation to the acquisition of knowledge and creative development is determined by the fact that the student is focused on the correct organization of personal learning activities.

The problem of effective learning is not new to the science of teaching theory. This problem has been studied in the scientific works of I.G. Pestalotsi, K.D. Ushinsky and a number of similar scientists. Scholars such as SI Arkhangelsky, AP Arkhipov, B.C. Merlin, VA Sukhomlinsky and G.I. Shchukin also contributed to the coverage of this issue. They theoretically substantiated that the achievement in the process of learning increases the activity of learning and mastery, leading to the manifestation of important aspects of intelligence.

The tendency to improve the quality of education of future professionals and, at the same time, the constant decline of the graphic sciences requires the professor to look for new ways to improve the educational process.

The dramatic changes in the education system pose a number of challenges for teachers and students of technical colleges to think carefully about their activities.

While the main type of student activity is learning activity, for the professor-teacher it is educational work. Of course, the success of these two goals of the teacher and the student of the higher education system depends on their joint cooperation in improving the learning process. This collaboration will ultimately lead to an increase in learning.

There are a number of features that lead to a decrease in the performance of graphics in higher technical education:

- The low level of school readiness of those entering the technical university requires both teachers and students to engage in additional educational activities;
- Lack of psychological preparation of the student to master this course due to irresponsible attitude to the subject "Drawing" when entering the technical university;
- The novelty of the subject "Descriptive Geometry" for students, its unusual for the student, such as mathematics and physics, requires additional mental and willpower in their work;
- Lack of knowledge and skills in graphic work requires additional effort and a lot of time to learn the rules of drawing from the student;
- The teaching of graphic sciences coincides with the period of adaptation of the student to the educational process in the higher education system, the period of transition to the conditions of the higher education system, which differs significantly from the school environment.

It would be expedient to consider the above problems not only in the educational process at the Fergana Polytechnic Institute, but also as a global problem that exists in higher education institutions throughout the country.

Life itself requires the study of the problem of activating the student's learning, knowledge and its social, psychological, methodological and other causes.

At present, various forms of determining student knowledge are used in the educational process. In particular, test-type control works are used during intermediate, current and final tests.

Drawing geometry is one of the branches of geometry, which deals with the study of the geometric basis of the construction of images of objects in the plane, the methods of solving spatial geometric problems through images. The generality of methods in mathematics is also characteristic of this science. Drawing geometry is the theoretical basis for solving technical drawing problems.

The part of descriptive geometry of the subject "Descriptive Geometry and Engineering Graphics" in the curriculum is taught mainly in the 1st semester of the academic semester in most areas. The number of tests compiled from this section was more than 200 and was initially tested in the Mytest system. The questions included in it were unofficial and did not allow to reveal the full essence of science. In the Mytest program there is an opportunity to ask questions in the form of pictures. However, their capabilities are limited. Due to this, the level of knowledge detection is insufficient.

The solution of the above limitations in the Isrping software complex has provided an opportunity to take advantage of the latest advances in information and communication technologies. Thus, versions of test programs on the subject "ChG and MG" created in the software complex Isrping Quizmaker were developed. New pedagogical technologies have been introduced, "Learning" and "Testing" programs have been introduced into the educational process, including 12 different forms of test questions.

The program includes test questions "correct-incorrect", "1 correct choice", "many correct choices", "fill in the blanks", "compatibility", "arrangement", "enter the number", "missing word", "summary answers"., The presence of such types as "vocabulary", "active space" allowed to effectively use the questions in the form of graphics.

In the "Learn" option of the test, immediately after selecting the correct answer, a message will appear stating that the answer is correct or incorrect. It contains the messages "correct", "incorrect" and "partially correct". In the "Learn" version of the test, all the answers come in sequence. The variation option is disabled and the student has the opportunity to explore questions on topics that are consistent with the sequence in the science plan.

Previously, theoretical and practical questions were asked in written tests in midterm examinations. Practical questions were answered by students by drawing sketches. When theoretical answers were given in writing, they were mostly copied, either directly from a book or by telephone. As a result, the student's grade did not match his or her real knowledge.

With the introduction of the test program, the participation of the "human factor" in determining the student's grade will be reduced, which will be determined by computer.

An important role in the research work carried out at the department to improve the educational process is played by the management of independent work of students. Among the various types of modern technologies of pedagogical control, special attention is paid to test methods.

This method activates memory, activity, thinking, attention in the student. The inevitability of passing a test-based test control creates a motivating force in the student. Increases his activity related to reading and learning.

However, the main part of the existing tests in graphic arts at the present time is intended for use only in the intermediate and final controls and does not meet the requirements of the student's independent reading and learning activities.

Almost no research has been done on involving students in the preparation of pedagogical test assignments. Ways to improve this process in technical universities have not been sufficiently analyzed and substantiated. Lack of standards for assessing the level of knowledge, skills and competencies in special disciplines of modern technical education leads to a breakdown of feedback between teacher and student. The student is unable to reflect on the knowledge he or she is acquiring, to correct the teaching, and to determine the path to the main goal - successful learning and creative development.

To find ways and means to increase the learning and cognitive activity of first-year students during the period of adaptation to the educational process, based on the study of the experience of higher and secondary schools, analysis of philosophical, sociological and psychological-pedagogical literature is an important challenge. To study the contradiction between the growing public demand for the creative activity of the future engineer and the need to increase his professional and creative training in this regard is the main direction of our research.

Problems of increasing students activity in the classroom are not sufficiently developed pedagogically, theoretically and methodologically - the lack of science-based test assignments to assess the quality of teaching students in engineering graphics and increase their learning activity is also a major part of the problem.

It is necessary to develop a new approach to the issue of directing students from stressful situations to positive activities, which will increase their interest in the topic studied during the period of adaptation to the learning process. Research in this area shows that the use of pedagogical tests increases the quality of student learning and learning.

To do this, it will be necessary to involve the student in the following activities:

- use a specially designed bank of experimental test assignments;
- perform knowledge testing on a regular basis;
- involving students in the preparation of test assignments independently;
- creating conditions for pedagogical testing and ensuring that students have a deep penetration into the subject.

## DETAILED DESCRIPTION OF LEXICAL ITEMS IN “STRONG ARGUMENT”

**Nurullaeva Zarina Hasanovna\***

\*Teacher of SSU,  
UZBEKISTAN

---

### ABSTRACT

*The article provides useful theoretical information on the appropriateness of the use of the term interpretation to express the meaning of words in lexicography, and explains the two principles of word interpretation with examples from ancient and modern dictionaries. There is also a detailed interpretation of lexical words in "Burhoni Qote" in comparison with "Ghiyas-ul-lugat".*

**KEYWORDS:** *Culture, Philological Cultures, Commentary, Terminology, Sema, Free Expressions, Phraseological Expressions.*

---

### INTRODUCTION

In interpretive cultures, the interpretation of lexical units (words and structures) is one of the most important and topical issues of lexicography, because the primary task of cultural studies is the interpretation of words and phrases to be explained. For complete and complete coverage of the lexical structure of the language, the fund of card indexes-separate sheets, with examples from the existing written literature, plays an important role. Without addressing these issues, it is impossible to compile modern explanatory dictionaries: to define the semantic boundaries of words and their semantic nuances, to reveal the meaning of artificial and complex words, to explain free and phraseological expressions, and finally to identify different ways of interpreting words, which the lexicographer deals with.

Today in the Tajik literary language the term of interpretation is used to express the meaning of words in lexicography, which, in our opinion, is more appropriate in all respects. In recent years, a number of works and articles have been written by scholars of the former fraternal republics and foreign scholars to clarify such important and topical issues of lexicography and lexicology. These works and articles are interesting in every way and are undoubtedly used as a theoretical guide for lexicography. For example, in the introductory part of his article A.P. Evgenyeva addresses the issue of clarifying the meaning of words, noting that in lexicography the terms

"definition", "explanation", "interpretation" are used. Among these terms, he prefers to use the term "commentary" as a lexicographical term, as "definition" and "explanation" have other meanings as well.

In Russian and foreign lexicography there are basically two principles in the interpretation of the meaning of words. One is that well-known words are not interpreted; only their semantic nuances and underused and rare words are interpreted. Another is that all words, including those that people have learned since childhood, are included in dictionaries and interpreted. Dictionaries that take into account the first trend in interpretation are designed for a certain range of readers: feel the nuances of it and are able to practice analyzing the semantic nuances of words.

If we look at the history of Tajik and Persian culture from the first point of view, we can see its components in some of our ancient dictionaries. For example, in "Burhani Qote" and "Ghiyas-ul-Lughat" the words are not given common meanings, but are satisfied only with the words "well-known" and "famous". In these cultures the figurative and homonymous meanings of words are more recorded. Here are a few examples:

Otash//otish آتش ma'ruf ast; va ba arabi nor xonand...BQ. I , 41.

Ob آب ma'ruf ast ... BQ. I, 34; ser - سير ma'ruf ast, ki naqizi gurusna boshad: BQ. II, 188.

Fire // fire آتش is popular; and read in Arabic ... I, 41. Water is popular ... I, 34; Sir - Sir is known to be a hungry rapper: BQ. II, 188.

Sol سال -bar vazni mol; ma'ruf ast. BQ. II, 135.

SHab شب -ma'ruf ast ba arabi layl xonand... BQ. II, 204.

SHona شانه - bar vazni chona; ma'ruf ast... BQ. II, 199.

Xar خر hayvoni ma'ruf. G'l. II, 299.

Simurg' سيمرغ - qonvarest mashhur ... G'l. I, 447.

ear by year - by weight of goods; is popular. Software. II, 135. Shab شب is popularly known as Layl in Arabic ... II, 204. Comb شانه - on the weight of the comb; is known... Software. II, 199. Every famous animal. Gl. II, 299. Simurgh Simurgh is a famous animal ... I, 447.

The task of lexicography is to reflect the lexical structure of a given language, and all words and structures must be included. In the commentary cultures, the lexical structure of the language of a certain historical period should be collected in a certain order and interpreted with examples from the literature and the written press.

Explanatory dictionaries mainly explain the original and figurative meanings of words, and they completely or partially lose their meaning in the composition of phraseological units. In the culture of "Burhoni Qote" the style of detailed interpretation plays an important role and it is based on the principle of the author's work. At the same time, these lexical articles can be seen, in which the nature of encyclopedic dictionaries is clearly seen. Authors of earlier cultures, in particular, "Burhoni Qote" and "Ghiyas-ul-Lughat" in lexical articles sometimes go beyond philological culture and bring some different myths and legends and prose and verse fragments, which have a kind of logical connection with the meaning of the key word. They bring some

customs and traditions that are related to the meaning of the same word and have an ethnographic character and express the customs of the peoples of India, Iran and Central Asia.

In the detailed interpretation of words and phrases, their original meanings and figurative meanings are written in detail, and a witness must be brought to confirm them. However, Burhan does not provide an example to confirm the meaning of this or that explanatory word, and as the author points out in the introduction, most of the sources he uses are reference dictionaries. Here are a few examples to illustrate the point:

Dand دند bar vazni chand; ustuxoni pahlu boshad; va darvesh va miskin va bechoraro niz go'yand; va ba ma'nii ablah va nodon; va bebok; va xudkom ast va duzd va bediyonatro niz guftaand; va afzore boshad qo'lohagonro –va on cho`best dandona –dandona ba arzi porcha, ki mebofand va az har dandonai on tore meguzaronand; va ba ma'nii dandon ham omadaast, ki ba arabi sinn xonand; va har chize nafis, ki dahonro biyafshurad, monandi mozu va po`sti anor va amsoli on; va xirva'i chiniro niz go'yand va onro habbulxatoi va habbussalotin xonand; bidon, ki on mushili rutubot boshad; va nomi giyohe ham hast; va qisme az gadoyon boshand, ki shoxi go'sfande bar yak dast va shonai go'sfande bar dasti digar girifta bar dari xona va peshi dukkoni mardumon oyand va shoxro bad-on shona ba unvone bikashand, ki az on sadoi g'aribe baroyad va chize talab kunand. Agar ahyonon dar dodan ehmoie voqe' shavad, ba kord a'zoi xudro maqro`h sozand va shoxshona in ma'ni dorad... BQ.II,39.

Dand دند on the weight of a few; lateral bones; and the poor and the needy and the needy; and in the sense of foolish and ignorant; and childless; and the thief, and the ungodly. and as for a piece of wood, which is a piece of wood, it is woven into a piece of cloth, and a net is passed through each tooth. and also means tooth, to read in Arabic age; and all that is sweet to the mouth, such as the skin of a pomegranate, and the like thereof; and they shall also call the Chinese khirwa, and shall call it habbulxatoi and habbussalotin; know that it is a moisturizer; and there is also the name of the plant; and some of the beggars, having a sheep's horn in one hand and a sheep's comb in the other, come to the door of the house and to the store of the people, and draw the horn to the comb in the name of a strange voice, and demand something. If there is a rare case of giving, they will injure their limbs with a knife, and royal means this ... BK.II, 39.

In the Tajik Language Dictionary, the word "dand" is interpreted as follows: Dand I دند 1. stupid, idiot, ignorant.

And there was a great uproar in this city.

Everyone is stupid and ignorant.

Andar in shahr base nokas barxostaand,  
Hama xartab'u hama ahmaqu bedonishu dand.

Labibi

2. a thief; atheism Read it when the jeweler, Neighbors also have a few bodies. duzd; bediyonat:

Bixond on gahe zargari dandro,  
Zi hamsoyagon ham tane chandro.

Abushakuri of Balkh

3. Something that makes a person's mouth sting and squeezes, such as pomegranate peel, etc. Take the sugar out of him, get rid of the poison, Whatever is best for your soul in the end, it is pleasing.

Chize, ki dahani insonro qoq mekunad va meafshurad, az qabili po`sti anor.

Qand ҷudo kun az vay, dur shav az zahri dand,

Har chi ba oxir beh ast ҷoni turo, on pisand!

Rudaki

Dand II دند see. tooth. FZT.I. 321. In the "Interpretive Dictionary of the Tajik language" "dand" is described as follows:

Dand I bookish. stupid, foolish, ignorant. 2. the thief. 3. something that dries and squeezes a person's mouth; toothpick (such as raw dates).

Dand II bookish. a grain of unripe Chinese fruit, which resembles a pistachio and has medicinal properties. FTZT.I, 421.

This word (dand) is also mentioned in the "Culture of Hope" and its initial homonymous meaning corresponds to the superstitious cultures, but its II meaning is more detailed:

Dand is the fruit of a tree, the size of a small pistachio, all three of which are in a shell and initially green and then yellow or black in color. it grows in China and India, the leaves are similar to eggplant leaves and the flowers are yellow and reach a height of three meters. FA.490-491. If we divide the word "dand" according to modern culture in terms of meaning, such a division can be made. Dand I. 1.Kit.stupid, stupid; ignorant; 2. a thief; atheism.

Dand II. 1. دند lateral bone, rib; 2. Some beggars take a sheep's horn in one hand and a sheep's comb in the other and come to the door of the house of the people and pull the horn on the comb in the name of a strange sound and demand something. If it is seldom given, the knife is used to injure the limbs, and royal means this. Dand III. 1. A tool made by weavers and it is a piece of wood with a toothpick that weaves and passes a net through each tooth. 2. The teeth and say in Arabic age. Dand IV everything that a human mouth can swallow, like pomegranate peel and raw dates. Dand V is a small Chinese dentist; medicinal plant.

In the explanation of this word in "Farhangi Amid" and "Burhoni Qote" there are components of encyclopedic interpretation.

They are separated by proximity and homonymy. Let's look at another issue:

Rang رنگ bar vazni sang; chand ma'ni dorad:1.ma'ruf ast va ba arabi lavn go'yand. 2.Hissa va qismat va nasib buvad; 3.Aybu orro go'yand; 4. Mehnat va ozor va ranç boshad; 5.Zo`r va quvvat va tuvonoj; 6. Ro`h va ҷonro go'yand; 7. SHuture qavi, ki az bahri natoç nigoh dorand; 8.Molu zar va asbobro go'yand; 9.Naf` va foida boshad; 10. Jandae, ki darveshon po`shand; 11.Tarz va ravish va sirat va qoida va qonun boshad; 12.Misl va monand va nazir va shabehro go'yand; 13. Naxçir va buzi ko`hi va govi dashti; 14. Makr va hilla va dag`o; 15. Rustan va ro`idan boshad, chi xudrang va ma'nii xudro` va rangidan ba ma'nii ro`idan boshad; 16. Xubi va latofat; 17. Xushi va xushholi va tandurusti; 18. Xiçolat va sharmandagi; 19. Xunro go'yand va on ba arabi dam xonand; 20. Rivoç va ravnaqi kor; 21. Moyai andak va qalil; 22. Zaru simi duzdi; 23. Qimor va hosili qimor; 24. Xudovand va voli va sohib; 25. Badro go'yand, ki naqizi

xub ast; 26. SHaxsi ahvalro go`yand; 27. Kinoya az axz va qar boshad; chunonki kase az kase tama` va tavaqqo`e dorad. Go`yad "range ba ro` nadori", ya`ne axzu qare nametavon kard; 28. Xole va nuqtai siyohe, ki bar qoe guzorand; 29 shirinxori, ya`ne masdari fe`li xub shudan; 30. qalochili doyra; 31. Xashmi bo xiqolat omexta 32. SHarmu hayo; 33. Norosti va xiyonat. BQ.II, 74-75.

Color رنگ on the weight of the stone; It has several meanings:

1. It is well-known and is called Lawn in Arabic. 2. To have a share and a share and a share; 3. Blame it; 4. Labor and harassment and suffering; 5. Strength and power and might; 6. Say the spirit and the soul; 7. A strong camel that protects from the sea; 8. Say goods and gold; 9. Benefit and benefit; 10. The one who covers the poor; 11. The manner and manner of life and the rules and the law; 12. Say the like, and the like, and the like. 13. Nahjir and mountain goat and steppe cow; 14. Deceit and trickery and deceit; 15. Growth and growth, what is self-color and the meaning of self and coloring is the meaning of growth; 16. Goodness and grace; 17. Happiness and happiness and health; 18. Embarrassment and shame; 19. Say the blood and recite it in Arabic; 20. Development and prosperity of work; 21. Small and thick milk; 22. Stealing wires; 23. Gambling and gambling yields; 24. The Lord and Guardian and Lord; 25. They say evil is good. 26. Tell the person the situation; 27. An allusion to the ahz and the jar. as one desires and desires from another. It says, "You have no color," that is, you can't do anything; 28. A black dot and a dot. 29 sweetness, that is, the infinitive of being a good verb; 30. the circle of the circle; 31. Anger mixed with embarrassment 32. Shame; 33. Injustice and betrayal. BK.II, 74-75.

When the reader has more than 33 meanings of the word "color", he is convinced that the text is used to confirm these meanings.

The following meanings of this word are mentioned in phraseology:

Rang I. گنر 1.gun; heat. The mother was separated from the male peacock, To each mouse over clean another color. Rang I. رنگ 1.gun, lavn; tobish.

Zi modar qudo shud chu tovusi nar,

Ba har mo`sh bar toza range digar.

Ferdowsi.

2. refreshing, water-resistant: Not many come to this house, That's the color of spring. tarovat, obu tob:

Base barnayomad bar in ro`zgor,

Ki rang andaromad ba xurram bahor.

Ferdowsi.

3. tricks:

It's all about his return, Sharang is drunk and his face is yellow. hilla, makr, tazvin:

Hama ba tunbalu rang ast bozgashtani o` ,

SHarang no`shomeg` astu ro`y zarandud.

Rudaki

4. benefit, interest, fortune, court, profit:

When I saw the flowers, they had no color. After all, I was satisfied with the smell. manfiat, bahra, nasib, sud, foida:

CHun az visoli on gul didam, ki nest range,  
Oxir ba sad zarurat qone' shudam ba bo`yash.

Hiloli.

5. style, procedure, approach, rule: I don't know why the color isn't familiar, Black-eyed peas? tarz, tartib, ravish, qoida:

Nadonam az chi sabab rangi oshnoi nest,  
Sahiqadoni siyahchashmi mohsimoro?

Hafiz.

6. gold: My long red night I got to dust, The wine melts like a dye. Manuchehr. zar, tillo:

Shabe daroz man surx man girifta ba chang,  
Mae ba soni aqiqu gudoxta chun rang.

Color II رنگ mountain goat color. FZT, II, 119.

In the "Interpretive Dictionary of the Tajik language" the word "color I" has the following meanings: 1. The appearance of anything that catches the eye of the viewer white, red, green, etc. looks like; 2. Mineral, chemical, and herbal dyes mixed with oil to give things a different color; 3. Black for writing; 4. Shape, type. 5. Style, approach. FTZT.II, 147.

In the "Culture of Hope", color is described as follows: what appears and can be seen from the appearance of green and red and yellow and black and its appearance. It also means deceit and trickery and judgment and benefit, suffering and hard work, and it also means hirqa and mountain goat and camel, which are kept for the birth of a child. FA, 535.

From these comparisons it can be concluded that some authors do not agree on defining the semantic boundaries of words. From the materials "FZT", "FTZT", "FA" it can be concluded that the word "color" has 5-6 meanings, and through this word a number of free and stable phrases are formed. We do not comment on the meaning of the word "color", as Burhan 33 has shown, but it is not easy to say what such a word means and to name them one by one. We are sure that "Farhangi Jahangiri", "Latoif-ul-Lughat" and "Burhoni Qote", which the author of "Ghiyas-ul-Lughat" gives in the explanation of this word, and even he mentions some superfluous meanings in this word. Therefore, the text (document) has a special place in the commentary cultures. Since the Interpretive Dictionary of the Tajik Language (Vol. 1, 2008; Vol. II, 2015) does not provide examples to confirm the meaning of a word or phrase, the Rudaki Institute of Language and Literature of the Academy of Sciences of Tajikistan decided to promote the full culture of the Tajik language. Hence, defining the semantic boundaries and semantic nuances of words is of particular importance for a lexicographer and requires a comprehensive knowledge of the lexicographer, the ability to "feel" the nuances of language.

From the various texts, especially in polysemantic words, finding the general meaning of words and arranging them requires special attention and hard work. Explaining the meaning of monosemantic words is relatively simple. Glossary dictionaries should not only show the semantic development of words and phrases, but also the popular meanings of words, as cultures are designed not only for philologists, who deal more with the history of the origin and gradual development of word meanings, but also for the general public. . Each word has its own historical course and changes its form and meaning over time. The lexicographer deals with all these meanings of the word and reflects them in the dictionary. From this it follows that the usage of words is determined only in the text. In dictionaries, it is necessary to give a general and usable meaning to a certain system of words.

In dictionaries, the lexical composition of a language in a certain historical period is reflected to some extent. If we look at the previous cultures, we can see that each culture, along with the use of previous cultures, has made a significant contribution to the science of cultural studies. For example, Muhammad Hussain Burhan in “Burhoni Qote”, which is a relatively general dictionary, puts the information about a word into a certain format and in some cases expresses his opinion, especially the words and phrases that are originally Tajik in the culture. recorded. Some lexical items have detailed explanations and include their original and figurative meanings.

In “Burhani Qote” mainly national and quotation vocabulary is explained. The author has tried to explain the meaning of this or that word in the best possible way, using previous dictionaries. However, the dictionary article does not list them all, but the cultures used are mentioned in the introduction.

**ABSTRACT**

*Neuroprotective therapy refers to measures preventing damage to neurons in the retina and optic nerve. It should be carried out when the damage to the nervous tissue has not yet become irreversible [2, 3, 7, 8]. We examined 60 patients (120 eyes) with POAG I, II and III stages with the duration of glaucoma from 5 to 15 years. IOP was compensated by selective laser trabeculoplasty (SLT) surgery or local hypotensive therapy treated at the Central Polyclinic of JSC "UZBEKISTON TEMIR YULLARI", Tashkent. The patients were divided into 2 groups: group 1 (control) – 30 patients (60 eyes), who received only traditional medication therapy for glaucoma. Group 2 (main) consisted of 30 patients (60 eyes) who received OMK 2 in 1 drop 3 times a day for 1 month along with traditional medical treatment. All patients underwent the following ophthalmic examination methods with OCT, which was carried out on the device "3D OCT-1" by "Maestro 2". In this study, structural and functional progression in the control group was accompanied by a decrease in the thickness of the RNFL, GCC and the volume of the NRR. In the main group, these parameters were stable during the observation period or had a positive trend, which indicates the neuroretinoprotective effect of OMK 2. Thus, the use of OMK 2 allows improving the functional characteristics in patients with POAG. The positive effect is presumably associated with IOP control and neuroprotective properties of the medicine.*

**KEYWORDS:** Primary Open-Angle Glaucoma, Neuroprotective Therapy, Optical Coherence Tomography, Citicoline (CDP-Choline).

## INTRODUCTION

Primary open-angle glaucoma (POAG) is a chronic, progressive optical neuropathy in which morphological parameters in the optic nerve head and nerve fiber layer change in the form of retinal ganglion cell apoptosis and narrowing of the visual fields (European Guidelines for Glaucoma) in the absence of other eye diseases and congenital anomalies [6,8].

Apoptosis is a naturally regulated, ongoing, genetically programmed physiological process in which the death of single cells is observed, and then they are phagocytosed with the help of macrophages [2,3,15]. In pathological conditions, cells may die or as a result of necrosis – when a large amount of cells die under the influence of the violent actions of damaging (pathogenic) factors [4,8].

Neuroprotective therapy refers to measures preventing damage to neurons in the retina and optic nerve. It should be carried out when the damage to the nervous tissue has not yet become irreversible [2, 3, 7, 8].

To date, the choice of the optimal metabolic drug [5,15] for the treatment of glaucomatous optic neuropathy (GON), which should affect cell metabolism and ionic homeostasis, as well as have membrane stabilizing and antiapoptotic effects [8,9,10], remains relevant. A number of foreign studies show [11,13] a positive effect of citicoline (CDP-choline) on GON, by activating the biosynthesis of structural phospholipids of neuronal membranes, thereby increasing the synthesis of phosphatidylcholine and cerebral metabolism [14,18].

To ensure early detection of GON, as well as to assess the dynamics of glaucoma treatment, an incomparable role is played by one of the objective diagnostic methods of research – optical coherence tomography (OCT), which assesses the state of the optic nerve head (ONH) (optic nerve disc (OND)) and the retinal nerve fiber layer (RNFL)) [12,16].

This method makes it possible to estimate the magnitude and depth of the light signal, as well as to detect RNFL defects in the zones corresponding to changes in the visual fields using a beam of coherent infrared (IR) radiation with a wavelength of 820 nm, reflected from tissues of different optical properties, which determines the echo delay of the reflected light waves by measuring the intensity and depth of the signal [1,17]. When a light beam is focused on the target tissue, it is scattered and partially reflected from internal microstructures at different depths [19].

The diagnostic accuracy of measuring the thickness of the nerve fiber layer reaches more than 90% with a specificity of the study of 90%, therefore, the measurement of the thickness of the nerve fiber layer is mandatory when performing OCT for diagnostic purposes if glaucoma is suspected, as well as when observing patients with glaucoma. Theoretically, the thickness of the retinal nerve fiber layer, to a greater extent than the neuroretinal rim, reflects the state of the ganglion cells, since the volume of the latter, in addition to the nerve fibers, is largely filled by connective tissue and glial cells [1,19].

### Objective

To evaluate the effectiveness of citicoline on optic nerve (ON) morphometric parameters in POAG with a stabilized level of intraocular pressure (IOP) using the OCT method.

## MATERIALS AND METHODS

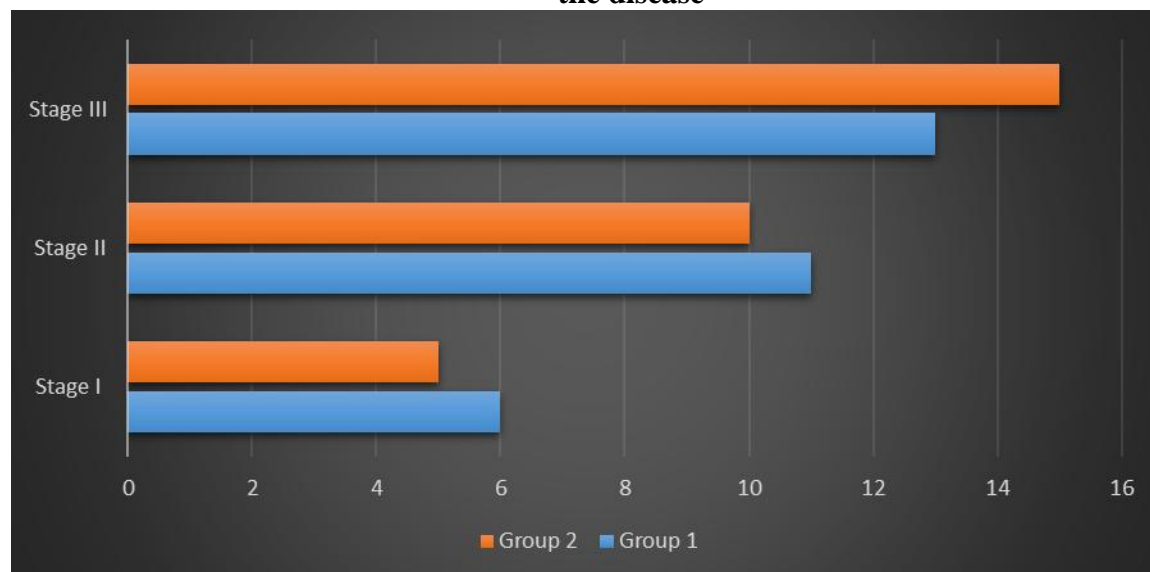

We examined 60 patients (120 eyes) with POAG I, II and III stages with the duration of glaucoma from 5 to 15 years. IOP was compensated by selective laser trabeculoplasty (SLT) surgery or local hypotensive therapy treated at the Central Polyclinic of JSC "UZBEKISTON TEMIR YULLARI", Tashkent.

The age of the patients ranged from 40 to 85 years. As the stage of the disease increased (stages II and III), the patients of more advanced age (over 60 years) were more frequent. The average age of the patients was  $69.7 \pm 5.3$  years.

*Figure 1: Distribution of patients with POAG by age*

*Figure 2: Distribution of patients with POAG in the study groups depending on the stage of the disease*

The patients were divided into 2 groups depending on the type of treatment: group 1 (control) – 30 patients (60 eyes), who received only traditional medication therapy for glaucoma in a day hospital: 1% emoxipin solution at a dose of 0.5 ml 10 days (parabulbarly); 10% solution of piracetam at a dose of 5.0 ml (intravenously); 5% solution of pyridoxine hydrochloride at a dose of 1.0 ml, 5% solution of ascorbic acid at a dose of 2.0 ml intramuscularly for 10 days; cyanocobalamin 100 mg/day (intramuscularly), and cavinton 1 tab. 3 times a day, aevit 1 dragee 3 times a day for 1 month.

Group 2 (main) consisted of 30 patients (60 eyes) who received OMK 2 in 1 drop 3 times a day for 1 month along with traditional medical treatment. All patients underwent the following ophthalmic examination methods: visiometry with correction, perimetry, biomicroscopy, gonioscopy, ophthalmoscopy, tonometry, tonography according to A.P. Nesterov, also OCT, which was carried out on the device "3D OCT-1" by "Maestro 2".

Optic disc scanning was performed using the Optical Disc scanning protocol. The Optic Nerve Head analysis protocol is applied to this protocol. This program allows to determine the size of the optic nerve head, its excavation, parameters of the neuroretinal rim (NRR, rim volume), the ratio of the dimensions of the excavation and the disc, the average width of the nerve in the disc area and other parameters necessary for the diagnosis of glaucoma.

Statistical processing of the obtained results was performed by using standard methods of variation statistics with the use of Student's t-test to assess the reliability of differences on the Statgraphics software on an Intel computer, PentiumCore 2 Duo model, using MicrosoftExcel software.

Dynamic observation and control examination with OCT was performed before treatment and 6 months later in the course of therapy.

Dynamic observation and control examination with OCT was performed before treatment and 6 months later in the course of therapy.

## Results

OCT in patients with POAG stages I, II and III was used to assess the state of average NRR volume, dynamics of average retinal nerve fiber layer thickness (RNFL thickness), average thickness of retinal ganglion cell complex (GCC thickness).

The study revealed a decrease in the thickness of the retina in the macular region (Table 1). The analysis of the findings of the retinal ganglion cell complex showed that in both groups there was a thinning of this layer of varying severity depending on the stage of glaucoma.

An identical topography of ganglion cells (GC) layer was detected in both groups: the minimum thickness of the GCC in the foveal and parafoveal zones (from the temporal side, the gradient of the drop towards decreasing was significantly higher), the maximum thickness of the GCC – in perifovea.

The change in the GCC thickness during scanning with the transition from the parafoveal to the perifoveal and foveal zones was smooth. At the same time, in the upper half of the macula, the GCC thickness was significantly higher than in the inferior temporal and inferior nasal regions.

The dynamics of RNFL in the main group with the inclusion of patients was  $82.32 \pm 13.12 \mu\text{m}$ . During 6-month observation there were no significant changes –  $84.33 \pm 14.12 \mu\text{m}$ . In the control group, the RNFL thickness also did not change considerably; before treatment, it was  $81.40 \pm 12.16 \mu\text{m}$ ; after 6 months it became  $81.42 \pm 11.10 \mu\text{m}$ .

Objective registration of the NRR volume did not show any significant progressive reduction of the rim within 6 months of continuation of treatment. The average volume of the NRR in the main group was  $0.09 \pm 0.09 \text{ mm}^3$  before the study, after 6 months of observation it became  $0.11 \pm 0.09 \text{ mm}^3$ .

In the control group, the NRR volume when included in the study was  $0.10 \pm 0.07 \text{ mm}^3$ , and by the end of the six months of observation it became  $0.10 \pm 0.08 \text{ mm}^3$ . As a result of the analysis, no statistically significant changes in the dynamics of NRR were found in the control group.

Analysis of data on the assessment of global loss of volume (GVL) revealed a slight decrease in the GCC thickness in patients in the main group, including the three inner retinal layers that most susceptible to damage in glaucoma, in this group was almost unchanged.

Statistical analysis demonstrated statistically significant stabilization throughout the entire observation period ( $76.56 \pm 2.65 \mu\text{m}$  before treatment, at the end of observation  $77.99 \pm 2.67 \mu\text{m}$ ).

In the control group, GCC thickness remarkably decreased during the course of the study ( $78.57 \pm 1.98 \mu\text{m}$  before treatment, at the end of observation -  $75.65 \pm 2.78 \mu\text{m}$ ).

## CONCLUSION

In this study, structural and functional progression in the control group was accompanied by a decrease in the thickness of the RNFL, GCC and the volume of the NRR. In the main group, these parameters were stable during the observation period or had a positive trend, which indicates the neuroretinoprotective effect of OMK 2.

Including the applications of OMK 2 medications were relatively sensitive GCC parameters, and demonstrated statistically significant stabilization.

Thus, the use of OMK 2 allows improving the functional characteristics in patients with POAG. The positive effect is presumably associated with IOP control and neuroprotective properties of the medicine.

### ABSTRACT

*The core purpose of financial management is the maximization of shareholders' wealth with three core decisions namely, dividend, financing and investment decisions. In simple words dividend is that percentage of net profit of a company which is distributed among the shareholders. The research gap we identified for this study is that, a comparison of different industries dividend policy impact on the Indian Capital Market and the samples drawn from the National stock Exchange (NSE) India. The main objective of this project is to study the influence of dividend policy on the market price of selected company's scrip in NSE. The researcher has chosen Empirical study to prove the hypothesis and 15 companies balance sheet for 10 years (2007-2016) were collected from the respected companies websites and the following ratios have been calculated to test the hypothesis, net profit ratio, gross profit ratio, earning per share, dividend yield, dividend payout ratio, return on equity and the market price of share. The analyses conducted, the parameter estimates are then viewed within AMOS graphics and it displays the standardized parameter estimates. The regression analysis model revealed that the significant impact of the above said independent variables on the market price of share. The*

## 1. INTRODUCTION

Dividend policy is a guiding principles a company uses to decide how much portion of its earnings it will pay out to shareholders or shows that weather the company go for either to pay dividend to its owners or to retain a share out of profits to plough back in the firm or at the end of each year, company have to decide whether and how much cash they will return to their stockholders in the form of dividends. Mainly there are three types of dividend they are stock dividend which increase the number of share outstanding and generally reduce the price per share. Second, the dividend can be a regular dividend, which is paid in the form of regular intervals (quarterly, semi-annually, or annually). Third one is special dividend, which is paid in addition to the regular dividend.

There are three main dividend policies are using by the companies: residual dividend policy, stability dividend policy and hybrid dividend policy. These policies chosen by them based on their growth opportunities. If the company have great opportunity to grow then they should retain more. For that the company reduce their dividend pay-out rate. The capital market is the place where the company can raise the capital. Same time the investors can invest in the company's capital. Share price is one of the important component that really influence investors to purchase of shares. The share price of the companies will always shows volatility because the impacts of some factors. The dividend policy is the one of the factor that impacts the stock market price of the company. But the real impact on the dividend policy in stock market is still in the controversy. So this study will analyses the real relationship between the dividend policy and stock market price. The variables like net profit ratio, gross profit ratio, earning per share, dividend yield, dividend payout ratio, return on equity and the market price of share are used here for analyzing the impact level.

## 2. LITERATURE REVIEW

Md. Abdullah Al- Hasan<sup>1</sup>, Md. Asaduzzaman and Rashed al Karim<sup>3</sup> (IOSR Journal of Economics and Finance 2013) conducted a study on The Effect of Dividend Policy on Share Price. The study has mainly pointing at evaluating the effect of dividend policy on market price of share in the context of Bangladesh. For the analysis of data they used tools like Dividend policy, Market price per share, Earning per share Correlation and multiple regression models. Finally, it concludes that the findings over the effect of dividend policy on market price supports the relevant theory of dividend policy.

Adnan Ali, Farzand Ali Jan and Ilyas Sharif (Business & Management Studies: An International Journal 2015) were analyzed the effect of dividend policy on stock prices. They analyzed 45 non-financial companies listed on KSE-100 index that have earned profits and paid dividend for a period of twelve year w.e.f. 2001. And they used Profit after tax, Earning per share and Return on Equity are the three control variables. Some of findings of this study were profit retention by

firms will result in a decrease in the value of the stock market prices and dividend pay-out have positive impact on the share prices of respected stocks.

Stephen Bassey Duke, Nneji Ikenna D and Nkamare S.E (Archives of Business Research 2015) conducted a study on Impact of Dividend Policy on Share Price Valuation with respect to Nigerian Banks. The researchers were utilized data on two banks operating in the Nigerian economy, GT Bank and United Bank for Africa. The study found that dividend policy had a positive effect on shareholders wealth. And the right dividend policy helped to the growth of the banks and also the Nigerian economy.

Byson B. Majanga (Accounting and Finance Research 2015) did a study on the topic of The Dividend Effect on Stock Price. The study conducted by the author with refer to the Listed Companies of Malawi. The variables used by the researchers were Stock price, Dividend per share, retention ratio, return on equity, earnings per share and net profit after tax. The study was conducted over the seven years and it shows a positive association between stock prices. The result found that there is a strong positive relationship between a firm's dividends and its stock price on the stock market.

### 2.1 Research Problem:

I M Pandey (11<sup>th</sup> edition of Financial Management) Evaluated dividend policy determinants and its impact on market value of scrip. Many authors says, dividend policy has insignificant impact on the market value of the firm but the dividend policy determined based on the investment opportunities available for the company. The present study aims to find the impact of identified dividend policy determinants on the market price of the firm.

### 2.2 Objective of the Study:

The study is focused on achievement of following objectives:

- To study relationship between dividend policy determinants
- To find the impact of dividend policy determinants on the market price.
- To evaluate the dependency of dividend policy determinants on market price of various industries.

### 2.3 Need and scope of the Study:

The study covers the companies listed in the National Stock Exchange (NSE) and spanned a period from 2007 to 2016 and the data used for the analysis is secondary in nature. The Variables which are used for this project are; Dividend Yield, Retention Ratio, Return on Equity, Dividend Pay-out Ratio, Market Price, Earnings per Share. The study help to control the stock price variance happen because of the dividend policy by using effective dividend policy.

### 3. Research Methodology

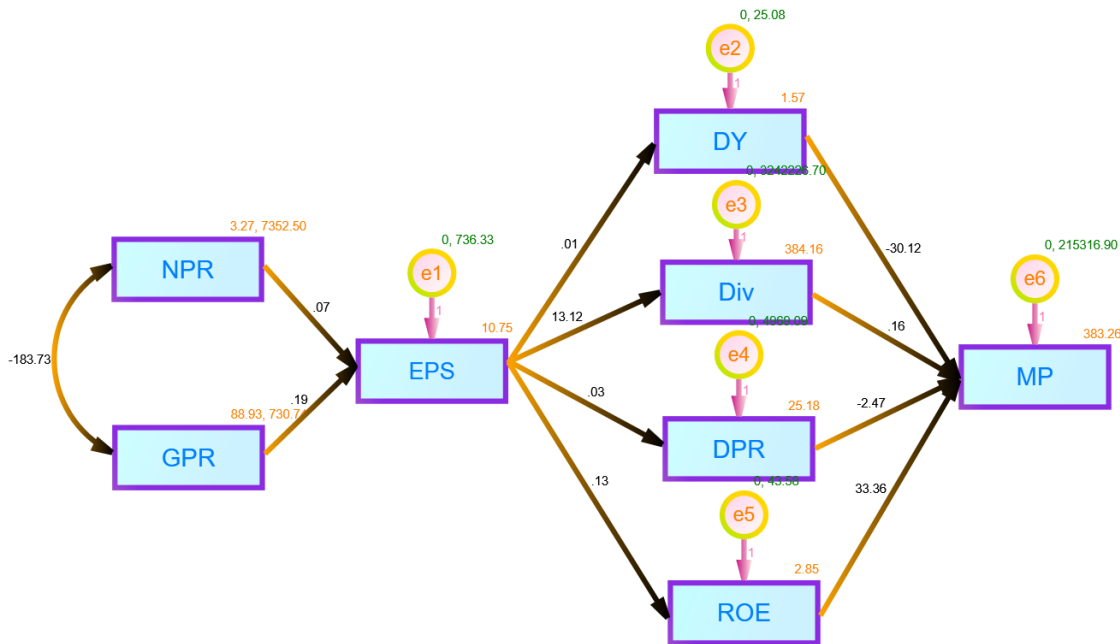

The researcher chosen empirical study to test the impact of dividend policy determinants on Indian capital market. The present study involves a sample of 150 balance sheet and profit and loss account from three industries for the period of 2007 to 2016. The variables were empirically tested with the hierarchical regression on the companies from three industry such as **pharmaceutical, Energy, and Media. From each industry taken five companies and thus a total of 15 companies are selected. The companies which include are Sun Pharma, Cipla,**

Glenmark Pharma, Dr.Reddys Laboratory, Lupin, Reliance, Gail,BPCL, ONGC, Tata Power, Network 18, Sun TV, PVR, ZEEL, and TV Today Network. The analyses conducted, the parameter estimates are then viewed within AMOS graphics and it displays the standardized parameter estimates. The regression analysis revealed that how much the factors of dividend policy such as Net Profit Ratio, Gross Profit Ratio, Earnings per share, Dividend yield, Dividend, Dividend pay-out ratio, and Return on equity influence the market price. The estimated p-value of the model can be used to test the hypothesis. If the values are significant at 5% significance level (i.e.) less than 0.05 then the alternate hypothesis are proved to be true, otherwise the null hypothesis is selected.

**4. Analysis:**

In hierarchical regression, the predictor variables are entered in sets of variables according to a pre-determined order that may infer some causal or potentially mediating relationships between the predictors and the dependent variable (Francis, 2003). Such situations are frequently of interest in the social sciences. The logic involved in hypothesizing mediating relationships is that “the independent variable influences the mediator which, in turn, influences the outcome” (Holmbeck, 1997). However, an important pre-condition for examining correlational relationships is that the independent variable is significantly associated with the dependent variable prior to testing any model for mediating variables (Holmbeck, 1997).

DPR	.000
Div	.040
DY	.001
MP	.504

As per the analysis, the P value of the Fig. 4.1., shows the impact level of independent variables on dependent variables. The Gross profit ratio is significant to Earnings per share (.023), Net profit ratio is significant to Earnings per share (.010), Earnings per share is insignificant to

Dividend yield (.669), Earnings per share is significant to Dividend (.012), Earnings per share is insignificant to Dividend pay-out ratio (.884), Earnings per share is highly significant to Return on equity (.000), and the independent variables like Return on equity, Dividend pay-out ratio, Dividend, Dividend Yield ratio is highly significant to Market price (.000), Here the result shows that the dividend highly influence the market price.

The R square value shows that the overall model explaining the market is about 50.4%, the dependent variables such as Net profit ratio and Gross profit ratio is impact the Earnings per share by 6.8% and the other factors impact Earnings per share as per the R square value is, Return on equity by 23%, Dividend by 4% and Dividend pay-out ratio and Dividend yield are very meager.

**TABLE: 4.4: COMPARISON OF INDUSTRY VALUES:**

PATH	Pharma	Energy	Media
EPS < --- NPR	<b>.086</b>	.001	***
EPS < --- GPR	<b>.075</b>	***	<b>.371</b>
Div < --- EPS	<b>.373</b>	<b>.978</b>	***
DY < --- EPS	.039	<b>.098</b>	.002
ROE < --- EPS	***	***	***
DPR < --- EPS	<b>.123</b>	.018	<b>.070</b>
MP < --- Div	***	.018	***
MP < --- DY	***	***	***
MP < --- ROE	<b>.542</b>	***	***
MP < --- DPR	***	<b>.150</b>	<b>.661</b>

The above table shows the comparison of regression analysis of the pharma, Energy, and Media industry. The Dividend and Dividend yield are highly significant to Market price and also the Earnings per share is highly significant to Return on equity with respect to all three industries. In Energy and Media the Net profit ratio is highly significant to Earnings per share, but the pharma is slightly varying (.086). Gross profit ratio to Earnings per share only Energy have the significance and other two industries are shows insignificant. Earnings per share to Dividend, the Media is highly significant and other two are insignificant. Earnings per share to Dividend yield except Energy other two industries are significant and Earnings per share to Dividend pay-out ratio only Energy have significance and other two are insignificant. The Return on equity to Market price, except Pharma other two industries are significant and Dividend pay-out ratio to Market price only Pharma have significance.

### 5. Managerial Implication:

According to our study we found that the investor should consider more on Dividend, Dividend yield, and Return on equity before they invest in securities because these variables are highly significant to Market price. The overall model shows more than 50% R square value which means the dependent variables have a clear impact on Market price. So the investors should consider these variables before they invest in any securities for a better return.

**CONCLUSION:**

As mentioned early the dividend policy is the one of the factor that impacts the market price of the company in Indian Stock market. But the real impact on the dividend policy in stock market is still in the controversy. After this study we analyzed that the Dividend policy have an impact on Market Price.

### ABSTRACT

*This article is about strategies of teaching listening skill. And about preparing the learners for listening by setting the scene, introducing the characters, pre-teaching vocabulary, checking the answers to this task, playing the recording again if necessary, making the recording, and the tasks, as 'authentic' as possible.*

**KEYWORDS:** *Recording, Practice, Listeners, LI (Native Speakers)*

---

### INTRODUCTION

One aspect of language which is particularly crucial to listening skills is pronunciation, but this receptive side of pronunciation is still rather neglected in comparison with the productive side. This is perhaps where recordings – recordings of speakers with different accents – in conjunction with transcripts, can be particularly valuable, in providing material for the study of what spoken English actually sounds like: regional variations in vowel sounds, the compression and reduction of unstressed syllables, elision and assimilation, intonation patterns and so on.

There is a lot to be said for these approaches, and they have certainly been very helpful in spreading a concern for supporting the development of learners' listening skills, rather than just testing them. But they should not be accepted unquestioningly, or used to the exclusion of other approaches.

#### **Use plenty of recorded material**

There are certainly plenty of good reasons for using recordings. It is a way of bringing different voices into the classroom: male and female, different ages, different accents, different voice qualities and so on. It means you can present dialogue as well as monologue. If the recording isn't scripted and rehearsed, it means you've got 'authentic' material – see suggestion 7 below. A

recording can be played as many times as you like, and will sound exactly the same every time. These can all be advantages.

But there are also some disadvantages and limitations. In practice, the range of accents on commercially available listening material is fairly narrow. In particular, accents which are close to British and American standard ones predominate, and non-native accents are neglected, which is a serious shortcoming in view of the fact that most learners of English nowadays are more likely to interact with other 'non-native' speakers than with 'natives'. Ideally, listening work in the classroom should try to equip learners with the flexibility to deal with a wide range of accents.

Recordings are particularly suitable for practicing the kind of listening where the listener has no opportunity to interact with the speaker: listening to the radio, listening to public announcements at airports, stations etc., or eavesdropping on strangers' conversations. But this probably only accounts for a small proportion of the listening that most people actually do. More typically, listening happens in the context of interactions such as conversations and meetings, where both (or all) the participants act both as speakers and as listeners, and, in the listener role, have the opportunity to give feedback to the speaker, or to interrupt the speaker to signal understanding, lack of understanding, need for repetition or reformulation, etc.

This suggests it would be helpful to give learners more opportunity to listen to 'live' voices – visitors to the class, if feasible, or, most obviously, the teacher. This, of course, goes against recommendations to 'reduce teacher talking time'. But the teacher's voice is a neglected resource in providing listening practice in which the speaker can continuously monitor the listeners' interest, attention and apparent comprehension, adding any necessary repetitions, reformulations and explanations, and where the listeners can give the speaker signals both non-verbal (e.g. nodding, frowning) and verbal (e.g. "I see", "So, do you mean ....?", "I'm not sure what you mean by ....") – so that the listener is not just a passive, more or less successful, receiver, but understanding is mutually constructed.

Even for the 'eavesdropping' kind of listening, it would probably be more helpful, and more realistic, to make more use of video recordings rather than purely audio ones, since we can usually see people we're listening to – whether we're listening to them 'live' or on film or television. The visual component provides a wealth of information about the setting, the characters and the relationship between them, without which a listener is severely disadvantaged. In fact, by depriving learners of this visual information, we're actually contributing to their feeling that listening is inordinately difficult.

Furthermore, there can be a substantial loss of acoustic information in the processes of recording and, especially, playback, and this can also add considerably to the difficulty of listening. Of course, listeners do sometimes need to deal with less-than-ideal acoustic conditions, but it seems unfair to add too much too soon to the difficult task that learners have to face when they start listening to a foreign language.

**Prepare the learners for listening by setting the scene, introducing the characters, pre-teaching vocabulary etc.**

This makes a lot of sense, particularly because it helps to compensate for the lack of a visual element, and because when we listen, we normally have some prior knowledge, expectations and predictions about what we're going to hear. In other words, it helps listeners to establish a

'schema' which they can use to interpret what they hear. On the other hand, though, there are also occasions when we start listening without the benefit of such a schema, and have to patch together our understanding of what we're listening to as we go along. For instance, we might switch the radio on at random and hear something that sounds kind of interesting, although it isn't immediately apparent exactly what's going on. Or we might ask someone a question and receive an answer so completely at odds with our expectations that we can't immediately interpret what we're being told. It would seem useful to prepare learners to deal with this kind of situation. In the classroom, this might mean letting them listen for a short time without any preparation, then asking questions like "Who / Where are the people?", "What are they talking about?", "What are they doing?", etc., then letting them hear a bit more before asking the same questions again, and so on; the purpose of the questions, then, is to help them piece together their understanding bit by bit, on the basis of the gradually accumulating evidence of what they hear.

**Before the learners listen, set a listening task which directs them to an overall 'gist' understanding of the passage.**

The idea of this is to support and direct learners' listening, and the comments about preparation for listening under 2 above are relevant here. Also, gist understanding doesn't necessarily precede detailed understanding; the 'gist' sometimes only emerges from a prior understanding of details. Teachers often tell learners that they don't have to understand everything, just the main points or the key words, but it could be argued that you sometimes need to understand everything in order to know what the main points or key words are! And in any case learners, as listeners, might find a different interest in listening from what the teacher or materials writer thinks is the 'gist'.

**Check the answers to this task, playing the recording again if necessary.**

Re-playing a recording – perhaps several times – is fine as a pedagogic device. But remember that outside the classroom people sometimes only have one opportunity to hear something, and have to be satisfied with whatever understanding they can glean from that single exposure. On other occasions, they can request a repeat listening from a live speaker, but with the expectation that the speaker will not merely repeat, but clarify, paraphrase and simplify.

**Set a further task, or tasks, which direct learners to a more detailed understanding.**

As with any teacher-imposed or materials-imposed task, there is a risk of disrespecting the learners' own motivation and interest in what they're listening to. Very often, they will be able to come up with their own listening tasks – and very often these will be to do with language rather than content (see 7 below).

**Only use the typescript (if there is one!) as a last resort.**

In L1 (first language; native language) listening, it's unusual to read a transcript of what we listen to – whether before, during or after listening. And clearly learners need to gain experience and confidence in listening without the support of the written word. But this is a gradual process, and there's no reason why that process shouldn't include, especially in the early stages:

- listening once, then using a transcript to clarify points of confusion before listening again.
- reading before listening, to establish understanding of content, before listening to what that content actually sounds like.

- reading and listening simultaneously, tracking the relationship between the spoken and written forms of the language.

**Make the recording, and the tasks, as 'authentic' as possible.**

The notion of 'authenticity' is a complex one and has been widely commented on from various points of view. Some points that seem relevant here include the following:

- A recorded (or written) text loses its authenticity when it's exported out of the context in which it was created. For example, a conversation in a restaurant may be authentic for the participants in that conversation, but not for a group of language learners listening to it in a classroom thousands of miles away and years later.

- Authentic recorded material is particularly likely to suffer from poor recording quality.
- Even if the technical quality is fine, it may be too culture-bound for learners, or simply not interesting.
- Even with very careful preparation and unambitious listening tasks, some learners may perceive authentic recordings to be inordinately difficult, and this can have a devastating effect on confidence.
- Tasks that simulate out-of-classroom listening activities may not necessarily seem very relevant or motivating to learners. If you are in Britain or Canada for example, and you are weighing up a number of alternative activities for the coming weekend, then listening to a weather forecast, paying attention to the outlook for your particular region and making plans accordingly is a real listening activity. But if you're in China, you might not feel fully enthusiastic about imagining yourself into that scenario. You might think it is more interesting to listen out for the tense forms and modals used to describe a current weather situation and make predictions; this could actually be a more truly authentic task for someone who's listening as part of the process of learning the language. In other words, it might be more interesting to pay attention to language rather than content.

### ABSTRACT

*The article covers that we consider the own axisymmetric torsional vibrations of an infinitely long cylindrical shell in an elastic inertial medium. The dependences of the first shell oscillation frequency in an elastic medium on the dimensionless wavelength are obtained.*

**KEYWORDS:** *Natural Torsional Vibrations, Axisymmetric Vibrations, Cylindrical Shell, Vibration Frequency.*

### INTRODUCTION

Axisymmetric natural torsional vibrations of an infinitely long cylindrical shell in an elastic inertial medium are investigated. The movement of the shell and the mass is described by the dynamic equations of the theory of elasticity.

The equation of motion of the Kirchhoff - Love shell, taking into account the response of the array, can be written in the form.

$$\frac{\partial^2 \vartheta}{\partial x^2} - \frac{P}{G} \frac{\partial^2 \vartheta}{\partial t^2} = \frac{1}{Gh} q_c \quad (1)$$

Taking into account that only shear waves are excited for a torsional load, we obtain the equation of motion of the medium.

$$\frac{\partial^2 u_0}{\partial r^2} - \frac{l}{r} \frac{\partial u_0}{\partial r} - \frac{u_0}{r^2} + \frac{\partial^2 u_0}{\partial x^2} = \frac{P_c}{G_c} \frac{\partial u_0}{\partial t^2} \quad (2)$$

The values of nonzero components of the stress tensor in the medium are determined through tangential displacements by the formulas

$$\sigma_{r0} = G_c \left( \frac{\partial u_0}{\partial r} - \frac{u_0}{r} \right); \quad \sigma_{x0} = G_c \frac{\partial u_0}{\partial x} \quad (3)$$

The boundary conditions of the problem at  $r = R$  have the form

$$u_0 = v, \sigma_{r0} = -q_c; \quad (4)$$

Considering the axisymmetric vibrations of the shell, we find solutions to equations (1) and (2):

$$(\vartheta, u_0, q_c) = \{\vartheta_0, U(r), q_{c0}\} \cos m x e^{-i\omega t} \quad (5)$$

where  $\pi/m$  is the wavelength along the generatrix;  $\omega$  is the circular frequency of natural vibrations.

Substituting expression (5) into (1), we obtain the relationship between the amplitudes of the array reaction, and the displacements of the shell

$$q_{c0} = G x^2 (x^2 \omega^2 - \delta^2) U_0; \quad x = \frac{h}{R}, \quad \delta = mR; \\ \omega^2 = \frac{\rho R^2}{G x^2} \omega^2; \quad U_0 = U_0/h; \quad (6)$$

Dependences (6) allow the boundary condition for the medium at  $r = R$  to be written in the form

$$\sigma_{r0}^0 = -G x^2 (x^2 \omega^2 - \delta^2) U_0 \quad (7)$$

Substituting expression (5) into (2), we obtain

$$\frac{d^2 U_0}{d\bar{r}^2} + \frac{1}{\bar{r}} \frac{dU_0}{d\bar{r}} - \frac{U_0}{\bar{r}^2} - (\delta^2 - \alpha^2) U_0 = 0 \quad (8)$$

$$\text{where } \bar{r} = \frac{r}{R}; \quad U_0 = \frac{U}{h}; \quad \alpha^2 = \frac{x^2 \gamma}{\rho \omega^2}; \quad \gamma = \frac{G}{G_c}; \quad \rho = \rho/\rho_c$$

Solving equations (8) taking into account the condition of damping of oscillations at infinity, we have

$$U_0 = AK_1(\beta r^*); \quad \alpha < \delta; \quad U_0 = A/r; \quad \alpha = \delta; \quad (9a)$$

$$U_0 = AH_1^{(2)}(\bar{\beta} r); \quad \alpha > \delta; \quad (9b)$$

$$\text{Here } \beta = \sqrt{\delta^2 - \alpha^2}; \quad \bar{\beta} = \sqrt{\alpha^2 - \delta^2}$$

$$K_1(x); \quad H_1^{(2)}(x) \text{- Macdonald and Hankel functions.}$$

If we do not take into account the inertia of the medium, then  $\rho_c = 0$  ( $\alpha = 0$ ) and the solution to equation (8) will be the equality

$$U_0 = AK_1(\delta r^*) \quad (10)$$

Substituting solutions (9) into (3) taking into account the boundary condition (7), we obtain the characteristic equation:

$$x\gamma(\delta^2 - x^2\omega^2) + 2 - \bar{\beta} \frac{H_0^{(2)}(\bar{\beta})}{H_1^{(2)}(\bar{\beta})} = 0, \quad \alpha > \delta \quad (11)$$

For  $\alpha < \delta$  in equation (11), instead of the last term, it is necessary to insert with a plus sign the expression  $\frac{\beta K_0(\beta)}{K_1(\beta)}$

The condition  $\alpha = \delta$  is satisfied for  $\rho^* = \gamma + 2/x\delta^2$ .

This case is of no practical interest, since for most materials  $\rho^* < \gamma$ .

Note that the vibration frequency of the shell in vacuum ( $\gamma = \infty$ )

$$\omega^* = \delta/x \quad (12)$$

In a non-inertial environment

$$\omega^2 = (x\gamma\delta^2 + 2 + \delta K_0(\delta)/K_1(\delta))/x^3\gamma \quad (13)$$

For a shell in an inertial medium, the natural vibration frequencies are determined by solving the transcendental equation (11) on a computer.

2. Let us describe the vibrations of the shell by equations of the Timoshenko type. Then for axisymmetric torsional motion we have:

$$\frac{\partial^2 \vartheta}{\partial x^2} - \frac{K^2}{R} \beta - \frac{P}{G} \frac{\partial^2 \vartheta}{\partial t^2} = \frac{1}{Gh} q_c$$

$$\frac{\partial^2 \beta}{\partial x^2} - 12 \frac{k^2}{h^2} \beta - \frac{P}{G} \frac{\partial^2 \beta}{\partial t^2} = \frac{6}{Gh^2} q_c \quad (14)$$

Here  $\beta$  is the angle of rotation of the normal in the tangential direction,  $k_2$  is the Timoshenko coefficient.

The boundary conditions for the medium at  $r = R$  are as follows:

$$u_0 = r + \frac{h}{2}\beta; \sigma_{r0} = -q_c \quad (15)$$

Representing the solution of equations (14) in the form (5), we determine the parameters  $q_c, \alpha_0$  through the displacements  $v_0$

$$q_{c0} = Gx^3 \frac{\alpha_1 \alpha_2}{Gk^2 + x\alpha_1} \bar{\vartheta}_0; \alpha_0 = G\gamma \frac{\alpha_2}{GR^2 + x\alpha_1} \bar{\vartheta}_0$$

$$\alpha_1 = x^2\omega^2 - \delta^2 - 12 \frac{k^2}{x^2}; \alpha_2 = x^2\omega^2 - \delta^2 \quad (16)$$

Taking into account expression (16), we transform the boundary condition for the medium.

$$\text{For } r=1 \quad \sigma_{r0}^2 = -Gx^2 \frac{a_2}{a_3 a_4} U_0$$

$$\text{where } a_3 = 1 + \frac{k^2}{x} \frac{6}{a_1}, \quad a_4 = 1 + \left( \frac{3a_2}{a_1 a_3} \right) \quad (17)$$

Since the solution of the equation of motion of the medium does not depend on the adopted shell model, the further derivation of the equations is similar to that considered above for the

Kirchhoff-Love shell. The choice of the shell model affects only the form of the boundary conditions (17).

Instead of the characteristic equation (11), we write equations of the form:

$$xy^{\frac{\alpha_2}{\alpha_3\alpha_4}} + 2 - \bar{\beta} \frac{H_0^{(2)}(\bar{\beta})}{H_1^{(2)}(\bar{\beta})} = 0 \alpha > \delta \quad (18)$$

For the case  $\rho_c = 0$  ( $\alpha = 0$ ), we obtain the characteristic equation for the Timoshenko shell in an inertial-free medium. At  $G_c = 0$ , we find the frequencies of torsional vibrations of the Timoshenko shell in vacuum

$$\omega_* = \delta/x; \omega_2_* = \frac{1}{x} \sqrt{\delta^2 + 12 \frac{k^2}{x^2}} \quad (19)$$

The first frequency, as for the Kirchhoff-Love shell, corresponds to the rotation of the section like a ring, the second to the form of vibrations caused by the rotation of the normal in the tangential direction.

The first frequency, as for the Kirchhoff-Love shell, corresponds to the rotation of the section like a ring, the second to the form of vibrations caused by the rotation of the normal in the tangential direction.

Putting in equations (11), (18)  $h = 0$  ( $\alpha = 0$ ) and introducing the dimensionless frequency  $\omega^2 = \frac{\rho_c R^2 \omega^2}{G_c}$ , we obtain the characteristic equation for the natural axisymmetric torsional vibrations of an elastic inertial mass with a cylindrical cavity.

$$\bar{\beta}_2 H_0^{(2)}(\bar{\beta}_2) - 2H_1^{(2)}(\bar{\beta}_2) = 0 \quad (20)$$

$$\text{Moreover, } \omega > \delta, \bar{\beta}_2 = \sqrt{\omega^2 - \delta^2}$$

3. Let us obtain the exact solution of the problem for the case when the motion of the shell is described by equation (2). Then the boundary conditions will be as follows:

$$\text{For } r = Ru_\theta^{(1)} = u_\theta; \sigma_{r0}^{(1)} = \sigma_{r0}$$

$$\text{for } r = R - h \sigma_{r0}^{(1)} = 0; \quad (21)$$

Here, index 1 denotes a shell.

We write the general solution of the equations of motion of a cylindrical layer in the form

$$U_0^{(1)} = A_1 K_1(\beta_1 r) + \beta_1 I_1(\beta_1 r); x\omega < \delta;$$

$$U_0^{(1)} = A_1 \frac{1}{r} + \beta_1 r \quad x\omega = \delta;$$

$$U_0^{(1)} = A_1 Y_1(\bar{\beta}_2 r) + \beta_1 J_1(\bar{\beta}_2 r); \quad x\omega > \delta; \quad (22)$$

Where  $\beta_1 = \sqrt{\delta^2 - \omega^2}$ ;  $\bar{\beta}_2 = \sqrt{\omega^2 - \delta^2}$

$J_1(x)$ ,  $Y_1(x)$  are the Bessel functions of the first and second kind.

Substituting expression (22), (9) into (3) and satisfying boundary conditions (21), we obtain the characteristic equation

$$\det \|a_{ij}\| = 0, \quad i, j = 1, 2, 3 \quad (23)$$

Determinant elements:

For  $\sqrt{\frac{\rho}{\gamma}}\delta, \sqrt{\frac{\rho}{\gamma}}\delta < x\omega < \delta, \delta < x\omega$  has a different form.

For example, for the third case:

$$\begin{aligned} a_{11} &= Y_1(\bar{\beta}_1); a_{12} = J_1(\bar{\beta}_1) a_{13} = -H_1^{(2)}(\bar{\beta}_1) \\ a_{21} &= \bar{\beta}_1 Y_0(\bar{\beta}_1) - 2Y_1(\bar{\beta}_1); \quad a_{22} = \bar{\beta}_1 J_0(\bar{\beta}_1) - 2J_1(\bar{\beta}_1) \\ a_{23} &= -\left(\frac{1}{Y}\right) \left(\bar{\beta} H_0^{(2)}(\bar{\beta})\right) - 2H_1^{(2)}(\bar{\beta}); \quad a_{31} = \bar{\beta}_1 Y_0(\bar{\beta}_1 \varepsilon) - \left(\frac{2}{\varepsilon}\right) Y_1(\bar{\beta}_1 \varepsilon); \\ a_{32} &= \bar{\beta}_1 J_0(\bar{\beta}_1 \varepsilon) - \left(\frac{2}{\varepsilon}\right) J_1(\bar{\beta}_1 \varepsilon); \quad a_{33} = 0; \quad \varepsilon = 1 - x; \end{aligned}$$

4. For all considered types of the equation of motion of the shell, numerical results are obtained. Figure 1 shows the dependence of the dimensionless frequency of torsional vibrations on the relative thickness of the shell. Calculation 1 is carried out for  $\delta=3, \gamma=30, \rho=4, k^2=2/3$ .

Curve 1 corresponds to the first mode of movement, 2-to the second. 3-rd third. The solid line marks the shell in the inertial mass, the dashed line - in the inertial-free medium, and the dotted line - in the vacuum.

Calculations have shown that for the first mode of motion, the results for all three theories practically coincide, and the effect of the medium on the vibration frequency is especially significant for relatively thin shells ( $x < 0.03$ ). If the inertia of the medium is not taken into account, the value of the first frequency is overestimated. The third frequency (the second for the Timoshenko shell) is almost unaffected by the medium. Thus, for a shell with a thickness of  $x < 0.07$ , the obtained frequency values practically coincide with the exact ones.

If the shell motions are described by the equations of the theory of elasticity, a second mode appears (curve 2), associated with the uneven twisting of the cylinder along the thickness, caused by the presence of an elastic mass.

Thus, to determine the first vibration frequency of the shell in an elastic medium, it is necessary to use equations (11), (formula (13) gives overestimated values), for higher vibration frequencies - equation (23).

The dependence of the first vibration frequency of the shell in an elastic medium on the dimensionless wavelength for different relative rigidity of the array is shown in Fig. 2. ( $x = 0.01$ ). For curves

$$1 - \gamma = 120, \quad \rho = 4; \quad 2 - \gamma = 30, \quad \rho = 4; \quad 3 - \gamma = 5, \quad \rho = 1$$

The solid line shows the oscillation frequencies of the shell in the inertial array, the dashed line - inertia-free, the dash-dotted line - in the vacuum. As seen from Fig. 2. with an increase in the rigidity of the array, the error increases, which is introduced without taking into account the inertia of the medium (especially in the region of short waves). Using asymptotic representations

of cylindrical functions, we obtain formulas for the first frequency of natural oscillations in the case of long waves  $\omega^2 = \frac{\bar{\rho}}{x^2\gamma} (a + \sqrt{a^2 + b})$

$$\text{There } a = \frac{64x\gamma\delta^2 + 96 - 9x\bar{\rho}}{128x\bar{\rho}}; b = \frac{9(2+x\gamma\delta^2)}{64x\bar{\rho}}$$

If we do not take into account the inertia of the array  $\bar{\omega}_0^2 = \frac{(x\gamma+1)\delta^2+2}{x^3\gamma}$

Then on  $1.5\delta \leq 1$ , the results by asymptotic formulas practically coincide with the exact solution.

In conclusion, to determine the first vibration frequency of the shell in an elastic medium, it is necessary to use the equation of motion of the Kirchhoff - Love shell; for higher vibration frequencies, the equation of motion of the theory of elasticity.

**ABSTRACT**

*Introductory are words that are not grammatically related to the members of the sentence, are not members of the sentence and express the attitude of the speaker to the expressed thought, characterizing the way in which it is designed, etc. Introductory words are inherent in the intonation of introductory, expressed in a decrease in voice and their faster pronunciation compared to the rest of the sentence and in a kind of unstressed.*

**KEYWORDS:** *Introductory Words, Modal Meaning, Assessment, Plug-In Constructs, Parenthesis.*

**INTRODUCTION**

Introductory words may refer either to the whole sentence or to individual members.

The speaker's attitude to the content of the statement, his assessment, additional emotional and expressive connotations of the meaning express not only individual words, but also introductory phrases.

By their expressed value, introductory words and combinations are divided into several digits:

The big group is made by the parentheses and phrases with modal value expressing assessment telling degrees of reliability reported (confidence, the assumption, doubt, uncertainty, etc.): of course, undoubtedly, certainly, it is indisputable, obvious, without any doubt probably most likely, as a matter of fact, certainly, needless to say, maybe, probably, perhaps, apparently, it has to be valid, etc.

Assessment of the reported facts in terms of their commonness is expressed by such parenthesis's as: happens, sometimes, as usual, as always, as usual, on custom, etc.

The emotional assessment of the reported is given by introductory words and phrases expressing the feelings of the speaker (joy, pleasure, regret, surprise, indignation, etc.): fortunately, to joy, to pleasure, unfortunately, to unhappiness, to surprise, to amazement, to sadness, to regret, to annoyance, strange deed, uneven hour, which is good, as on purpose.

Parentheses can specify assessment of a measure of what it is reported about (the most bigger, the most smaller, at least, etc.) and also to have other values expressing the relation speaking to the idea introduced by it.

As introductory words, either words specifically intended for this purpose are used (however, please say, therefore, etc.), or words of various parts of speech in cases where they express the above meanings (the overwhelming number of introductory words).

Without being syntactically linked to the members of the sentence, the introductory words nevertheless, in some cases, serve a constructive role and are necessary for the structure of the sentence. For example: He will take a platoon, or maybe a company (Schip). In these cases, the function of introductory words is close to the function of unions (dividing, opposing, joining, etc.).

Thus, the repeating introductory word "may" (possibly) serve to express dividing relations. For example: I do not know where Opanas's bones are buried: maybe under the rakita bush, maybe in the graveyard (Bagr.) (cf. Either... or).

The introductory words "however, opposite," etc., serve to express opposing relations. For example: The weather was windy, the wind, however, was not quite the same (Gonch.) (Wed and the wind...; wind...).

The introductory word "truth" can serve as a concession. For example: True, his lunch consisted of two or three dishes made by a retired soldier, but champagne was poured on the river (P.) (cf. Although... but...).

On morphological expression the parentheses in the vast majority correspond either to names, or to verbs, or to adverbs.

Parentheses of personalized type are expressed:

- a) Nouns (without pretext or with a pretext), for example: the truth, say, undoubtedly, fortunately, on a trouble, according to the legend;
- b) The adjectives (substantivized), for example: generally, by the way, most important;
- c) Pronouns (in combination with a pretext), for example: besides, opposite to that.

Parentheses of adverbial type are correlative with adverbs, for example: possibly, probably, undoubtedly rather is shorter, by the way, at last. Introductory words of the verb type are expressed:

- a) personal forms of the verb, for example: see, imagine, I think, they say, tell (introductory constructions of this type are on the line between introductory words and introductory sentences, since words of the type "I think, we believe" can be considered as single-component certain-

personal sentences, and words of the type say, tell - as single-component indeterminate-personal sentences);

b) Infinitives or infinitive combinations, for example: to see, to confess, by the way, to say the truth;

c) depraptions (in combination with a noun or name), for example: more precisely, to put it mildly, speaking the truth, speaking in conscience.

### **Introductory sentences**

The meanings inherent in introductory words and phrases can be expressed in whole sentences that preserve the intonational features of introductory constructions.

In terms of structure, introductory proposals can be:

Two-part proposals.

Single-component (most often uncertain-personal or impersonal).

Introductory sentences can join the main sentence either without the help of unions (examples see above), or with the help of unions (union words).

### **Plug-in constructs**

Words, phrases and sentences that provide additional information to the main sentence, accompanying comments, clarifications, explanations, amendments, etc.

Like introductory constructions, insert constructions are usually not syntactically related to the main sentence, within which they are even more intonationally isolated by significant pauses characteristic of the so-called inclusion intonation.

Unlike the introductory constructions, the insert constructions do not express the attitude of the speaker to the thought expressed, do not contain an assessment of the message, an indication of its source, communication with other messages, etc. In addition, if the introductory constructions may take place at the beginning, middle and end of the main sentence, then the insertive constructions may be located only at the middle and, less often, at the end of the main sentence, but not at the beginning.

Insert words and phrases in some cases take the form of sentence members.

In other cases, insertion words and phrases are not framed as members of a sentence.

An insert sentence can be combined with the main sentence either without unions, or with the help of unions (compositional or subordinate), as well as allied words.

Insert constructions, on the one hand, are common in oral speech, and on the other, are widely used in the language of fiction.

### **Plug-in constructs**

The plug-in constructs I have encountered can be classified into three main categories:

. Explanation Value

. Date

. The value of the application.

And also:

in the value of the introductory constructions.

Consider everything in order. The largest group is inserted constructs in the meaning of explanation. For example:

He announced that for each killed he would pay twelve thousand dinarii (about five thousand rubles in gold).

"About five thousand rubles in gold" - insert. As we see, it is completely devoid of structural connection with the proposal and has an additional character - explains what was said earlier.

The price per head was really set amazingly high - twenty-five thousand dinarii (about eight thousand rubles).

"About eight thousand rubles" - insert. Again, the meaning of the explanation. There is an adaptation of the text, Zoshchenko seems to confirm that he writes for everyone, simply and understandably, the style of his speech gravitates to the colloquial.

Here he got damn rich (and it was at the beginning of the nep) and, rich, began, of course, to acquire various valuable things, different paintings, carpets, lamps, blankets.

"And it was at the beginning of the nep" - an inset sentence. If in the first two examples the insert constructions were at the end of the sentence, here in the middle. N.S. Valgina writes that "they cannot begin a sentence, unlike introductory words, combinations and sentences." Here also the meaning of the explanation, the author refers us to a certain period to emphasize the reliability of the reported.

And if at the same time (that is, during torture) the convict dies or is injured, or if bleeding or self-harm follows, then this happened through his fault, because he did not want to confess and tell the truth.

"That is, when tortured" - insert. Explanation of the indicative pronoun, giving the author's speech a colloquial character.

The compiler writes about the execution in this style: "The latter (that is, persevering) went with strange pale in their face, with their eyes darkened and, as it were, erupting flames, with the appearance that they seemed obsessed with demons...."

"That is, persevering" - insert. As in the previous example, explains what was written earlier. Not without a structural connection with the proposal, but, rather, even draws closer to its members functionally and syntactically. According to N.S. Valgin, "their specificity consists only in the inset character, in the violation of the syntactic straightforwardness of the sentence."

One Swedish officer who was present at the treasury by a quarter of the traitor Patkul (under Charles XII) shot this criminal.

"Under Charles XII" - insert. Explains the duration of the action reported by the author.

The next group of inserts, at least numerous, are inserts with a date value. For example:

It is curious that the tsarist government appointed a very large amount for the head of the Russian provocateur Degaev (1874).

By the way, there was a famous case when the bandit, speculator and the most shameless adventurer, the Scottish Lowe (1716), who made several million by dark means, was appointed Controller General of Finance in France.

For example, there was such a famous case: the Kaluga governor Lopukhin (1819) for bribes terminated all cases in the province entrusted to him.

He was extradited to the French and shot by them (1810).

History has preserved this infrequently curious document - a letter from P. Tolstoy (dated June 10, 1706).

All of them are additional in nature, give the said shade of reliability. There is no structural connection with the proposals, although they could be revealed in sufficient time/involved turnover. For example:

History has preserved this infrequently curious document - a letter from P. Tolstoy, which was written on June 10, 1706.

History has preserved this infrequently curious document - a letter from P. Tolstoy, written on June 10, 1706.

But at the same time, the meaning of the proposal changes somewhat. Zoshchenko is not so important the time when this letter was written, he simply states this information, tells us the facts for, as already written above, giving credibility.

The third group is inserts in the meaning of the explanatory application.

However, there were bad prices out of hand: If they kill a smerd (peasant) - five hryvnias.

The law was not alien to humane considerations: Who will kill the breadwinner (uncle) - twelve hryvnias.

The Persian king Cambiz (son of the famous Cyrus) proposed to the daughter of the Egyptian pharaoh Amasis II (529 BC).

Poet Leonid Semenov (a friend of Blok) for revolutionary activity was beaten to death by city police.

The worker (weaver) revolutionary Pyotr Alekseev (1849-1891), sentenced to ten years of hard labor, made famous speech at the trial.

In all of them the syntactic link remains. Applications are issued by the author in the form of plug-in designs for creation of effect of a live conversation with the reader. Zoshchenko kind of interrupts himself, seeking to report as much as possible new and interesting to the reader.

Also in the book there are plug-in designs with value introduction, for example:

This high price so worked on imagination of citizens that (the history tells) "murderers hourly entered Sula's house, carrying the chopped-off heads in hands".

"The history tells" - the plug-in offer, value introduction as information source.

And those gala days when it isn't aren't absolutely clear to us (it is ashamed to admit).

"It is ashamed to admit" - a plug-in design, value introduction, points out the expressional nature of a statement.

Having investigated materials of this book, having reviewed various examples, having tried to find out their value, we will try to draw conclusions from everything above-written now.

Plug-in and parenthetical constructions enrich his work, making this story very picturesque and brought closer to real life.

Unlike other writers, Zoshchenko remains faithful in the stories to one functional style, namely colloquial everyday which it peculiar transforms and uses for characteristic not only typical for the era, but also the most this era

In an interview with I. Eventov, the writer reveals the secret of the language of works as follows: "I try to bring language closer to the living speech that I encounter in everyday life. The evening does not pass so that I do not put any word in the notebook, a fragment of the phrase, a street shout, a fragment of the future plot. Then in the manuscript I seam, try to make the speech natural, smooth. "

How do the insertion and introduction structures contribute to this?

By examining this book by writing out examples and classifying them according to the meaning, we can see that, filling work with all kinds of inserts and introductory expressions, Zoshchenko leads a conversation with the reader, supporting the conversation using these constructions, as, for example, here:

And we, sorry, do not believe that now this is not happening at all like it happened before.

In addition, as Kulakovsky notes, "imitation of dialogue with the reader allows you to create a special comic atmosphere of the work."

Using introductory with the meaning of modality gives us the opportunity to feel the author's irony:

Well, of course, love.

The insert constructions also give the text a colloquial character. So you hear live speech, interrupted at times by the author to explain some detail, for example, the time of what is happening:

But once, half a century later (43 BC), when the price for the head accidentally jumped even higher, such a massacre occurred that it seems that the world did not know anything like that.

Reading the book, we have the feeling that we are sitting with the author in the kitchen, and he tells us with the inherent irony of various stories from life over a cup of tea. And just to create the effect of comic, the writer uses introductory and insertion constructions:

And everything else flowed, of course, in the wonderful light of serene existence.

This high price so affected the imagination of citizens that (the story tells) "the killers hourly entered Sulla's house, carrying their heads chopped off in their hands."

With all the seemingly simplicity of the Zoshchenko language, we can see that his work is read easily and with interest, it is saturated, rich in expressions (belonging to the colloquial style). Introductory and insertion constructions help the writer express attitude to the narrative, to make the author feel, his sparkling irony, his lively dialogue with the reader. The use of introductory constructions sometimes where it seems not necessary, also contributes to the creation of a comic effect and a relaxed atmosphere.

### ABSTRACT

*This article tackle with exploring valence properties of the verb and its polyfunctionity. Moreover, in this research the basic functions of the verb in terms of context is presented. These functions are explained by means of examples, as well as some comparisons.*

**KEYWORDS:** *Valence Properties, Combination, Lexico-Semantic, Morphological Features, Verb.*

### INTRODUCTION

The fact that the combined possibilities of a word are primarily determined by its belonging to a part of speech is generally accepted and without doubt.

In such distributive models as NV, VD, VprpN, VN, V'Ving, V'V=, one and all meaning-bearing verbs meet.

On the other hand, the surroundings of a word are largely determined by its meaning.

As noted by many authors [7, c.21; 11, s.20], the semantic structure of the leading word of the phrase predeterminates the appearance in the sentence of certain classes of words, i.e., a surface structure. Since there is considerable commonality in the values of words belonging to one lexico-semantic group (LSG), a number of combination features characterizing the group as a whole in terms of the development of poly functionity can be assumed.

The semantic capacity and broad design capabilities of the verb put the problem of studying its combinability first.

The verb is more than the other part of speech, able to diagnose its surroundings. Directed action verbs have an "open structure," meaning that there is an object, destination, or direction circumstance of the action in the sentence.

Every sentence is built around a predictive element, which is accompanied by usually named elements, the composition of these elements is dictated by the semantic structure of the verb.

Thus, a verb is the constructive core of a sentence, and knowledge of its deep (semantic) structure is necessary to understand the polyfunctional processes that result in a particular surface structure of the sentence.

By examining the valence of the verb, we distinguish between its compulsory and optional surroundings. The former is determinable, dictated by a particular verb, the latter only potentiated by them due to the inherent class of verbs of syntax combinability.

The realization of potential combination capabilities depends on the content of the speech. Since optional elements can be included in the surroundings of almost every verb, that is, they are characterized by a low degree of selectivity, their presence or absence cannot be a relevant distribution property of the verb.

Cp: I never thought of you as one. [106, page 155]

It was a fixed principle with him never to allude to June [109, c.45].

You will notice, never gives himself away [108, c.117].

It would be a mistake, however, to consider any regional environment irrelevant. The fact is that the lexical filling of the L element in the VD model is largely determined by the semantics of the verb itself, so comparing the adverbs found in the surroundings of different verbs helps to reveal the peculiarities of the sense structure of each of them.

In the real division we try to show the connection between the meaning structure of the word and its combination. At the same time, we believe that differences in the syntax behavior of words always signal the presence of semantic differences between them, that is, a certain type of environment indicates the type of value of the control word.

Six verbs of visual perception were selected for the study, which are part of the first thousand most frequency significant words see, notice, look, watch, regard, obsession.

All these verbs are part of a class combined by the lexical meaning "passive - active perception.

The verbs we have selected fall into two groups:

- 1) arbitrary action verbs (look, watch, regard) and
- 2) verbs of involuntary action (see, notice).

The verb observe- occupies a special position, as it can denote both an involuntary act of vision and an inproizvol observation of an object. Therefore, in the following we will talk about observe1 with the value of the involuntary action and observe2 with the agenative value [indicating the producer of the action].

Features of verbs of the see group allow to call them experiential. These verbs denote processes and need to be supplemented. However, it is hardly possible to consider the relationship between words in a Tomsawasnake sentence as a relationship between figure, action, and object.

Subject to verbs of this group names not a figure, but a person whose mindset or mental processes are exposed. Additions to this group 's verbs do not denote the subject being actively affected, but the subject affecting our memory, vision and hearing. To offers with eksperiyentsialny verbs it is possible to raise the question whathappened? and newhatdidtomdo?

In sentences with verbs of type look, the person to be is a purposeful action agent. Therefore, the question of Tomlookedatasnakeis whatdidTomdo?

Verbs considered in this work are also differentiated by the "realized/unrealized act of vision."

The verbs of the see (notice, observe1) group denote the implemented act of vision. The verbs of the look group (watch, regard, observe2) are heterogeneous. The "realized possibility of vision" seed is part of the sense structure of the verbs watch, look, regard, observe2, but is not mandatory in the structure of the verb look.

So we meet suggestions like

He looked at the grand piano and noticed the music on the rack [106, c.88].

He looked up in order to see if she was still crying [108, c.110]

Predlozheniyazhetipa:

"\* He saw the piano and noticed" or "\* He watched in order to see is not English language.

Consider in more detail the morphological and syntax features of verbs in order to test the correctness of preliminary remarks about differences and similarities in their semantic structure.

Verb see

The most common form is the general type of apparent inclination. In the form of a command inclination, the verb met us only 2 times:

1. Come with me, and see what the world is really like [107, c.160].
2. See the hunchback marching in Miss Amelia's footsteps when on a red winter morning they set out for the pinewoods to hunt. See them working on her properties [106, c.172].

Apparently, in the first of these offers of see "learn, get acquainted" matters, and in the second - "to imagine, present mentally".

The almost complete absence of a command inclination with a verbomsee is a formal indicator that seeexamination of an involuntary action that is not performed at the request of the Iliprikazu.

The significant prevalence of the general form over the long form is due to the fact that the speaker 's attention is not concentrated on the process of vision, but on its object.

The most frequency models registered with verbs are VN, VNV "≡, VNVing, VD, VcnjS, VS, VO, VprnN.

A characteristic feature of the verb see is its use with both direct and proposed addition. And the same pretexts prevail as after the usual verbs of motion when pointing to distance, the limit of motion is -into, along, behind, through, to (Sr.thebirdflewbehindatree = the bird flew place behind tree).

The same meaning these pretexts convey in combination with the see- limit of what can be discerned by the eye.

That is why in the "seeprpN" model, see almost always acts with the verb can.

John shrank back and stood where he could see into the hall [106, c.219]

The grass was so tall, that even from their horses the two men could not see over it [108, c.259].

In the VD model, time adverbs (often, frequently, never, etc.) are the most used, as well as adverbs indicating the degree of clarity of vision (perfectly, plainly, clearly).

She slid over on to the sofa until she could see plainly into the studio [109, c.128].

The adverbs of the way of action, common in agentive verbs, with the verb see do not combine.

The VcnjS model is dominated by the union that, which also emphasizes the importance of "the act of seeing an object."

Speaking of the VO model, we consider it necessary to distinguish between cases of absolute use of the verb see, when the supplement is omitted and easily restored from context, and cases of use of it as a non-transient verb with the meaning "to have the ability to see."

Cp: 1.know some of my work is good if only people could see[107, c.145].

2. I can't see...It's a black – quite black [107, c.149].

Thus, the morphological features of the verb see and its combinability are the means of actualizing the major components of its semantic structure:

- (1) Ability to see;
- (2) Realized object vision act;
- (3) Neproizvolnostprotessa of vision;
- (4) Visibility limit,

Verb notice

Its distribution is similar to that of the verb see. The exception is the Vprp N model, in which the verb notice is not registered. The absence of this model seems to be an indicator of the absence of the "limit of vision" seed in the meaning structure of the verb notice. Tiny, notice does not possess a seed "ability to see," which finds reflections of the impossibility of its non-transient use.

The main seeds of the content structure notice are:

- (1) The failure of an act of vision;
- (2) The surprise and short-term nature of this act.

Analysers allocated this is, on the one hand high the chastotnosttakikh of models as V N, V cnjS (especially about soyuzomthat), on the other hand - lack of modal verbs in its environment, impossibility to use notice in the form of a long look and an imperative mood.

The VD model is not as frequency for notice as it is for see, because it only meets time adverbs (suddenly, never, frequentlyetc).

Thus, being very close in meaning words, see and notice nevertheless have a number of differences in depth structure, which is signaled by their morphology and syntax in functioning.

Verb look

It is an agenerative verb, that is, a verb denoting arbitrary facial action.

Hence a number of features of its use. First of all, it is easily combined with adverbs of the way of action (carefully, intently, indignantly, curiouslyetc.)

She stared at the window and then slowly looked at him [108, c.297].

In addition, it is regularly found in the form of a command inclination and is easily combined with any modal verb, for example, Lookatmyface, Dick, andtellmewhatyousee. - Dickdarednotlookather [107, c.161].

Look is most common in the Vprp N model, with the at pretext being particularly common. Usage: to, towards, along, over, across, down, into.

Of the pretexts listed, only at and towards are not found with the verb see. The other pretexts are used after both verbs. If with the verb see they denote the limit of vision, then with the verb look they call the general direction of view, like the same pretexts with verbs of movement:

Cp: The hunchback stood leaning against the banister of the porch, looking down the empty road[109, c.112].

Hewwent down the road to the house where he had been raised[107, c.139].

A comparison of the following examples is also illustrative:

1. By turning their heads they could see,through another window, along an alleyway...and into the back door of Groff's bakery [108, c.44].

2. After that she did not look along the alleyway any more[108, c.45].

The first example is that the character of the story could see from the window, what was the limit of yeopole vision.

In the second example, the author talks about the hero 's decision not to look towards the alley.

If the speaker does not specify in which direction the view moves (through, over, inside, etc.), but only in general terms transmits the idea of direction, the pretext at. (Cp. Its use in the same meaning with verbs of movement such as throw. rush, jump).

Consequently, the ability of pretexts over, across, along, etc., to combine with both look and see is due to the dual nature of their semantics: they call both the limit and the direction.

The component "direction of view" in the semantic structure of the verb lockactualized also by numerous adverbs indicating the direction: down, round, about, up, etc.

For example: Not willing to the mill and looked inside [106, c.148].

They leaned to look out[109, c.249].

In many cases, there is a combination of the at pretext, which conveys the general meaning of the direction, with the adverb, which specifies this direction.

For example: Henry Macu locked up at the corner of the ceiling [108, c.102].

Unlike the verb see, which denotes the vision of the subject, lockno contains the mandatory component "vision" as in the following example: Not looked up but did not see the dark sky [108, c.104].

Thus, in the semantic structure, the seeds "the arbitrariness of the viewing process" and "the direction of the view" are separated, that is, the components of the semantic structures see and look are in the position of additional distribution, as shown in the following diagram:

Семы	see	look
1. The general sposobnost to see	+	-
2. Realizovankny act videkniya	+	-
3. Direction of a look	-	+
4. Any process	-	+
5. Vision limit	+	-

#### Verb watch

It is an agenative verb, like look, but, unlike it, has a "realized act of vision" component in its semantic structure, which brings it closer about the verb see.

This feature of the sense structure watch is reflected in its morphology and syntax.

The verb watch forms a phrase with the same models as see (VN, VNV =, VNVing, VcnjS), but, unlike the latter, does not combine with the proposed turnovers. It demonstrates lack of a sema at it "betrayed visions". The verb watch is not combined also with subordinate clauses, the entered union of that as the VthatS model assumes value of suddenness, unexpectedness of vision of an object.

Drugiyesintaksicheskiyeosobennostisblizhayutwatchsglagolomlook.

Thus, the verb is easy to understand - must, san, dareidr.

For example: Hewatchedherfacekeenly [106, page 177].

Helikedtowatchothershardatwork [109, c.202].

The morphological behavior of watch also brings eroclook- both often appear in the forms of continued species and command inclination.

For example, She was always watching him [106, c.251].

Watchme, Daddy![107, c.88].

Thus, the grammatical features of the verb watch reflect the presence in its sense structure of both the components of the semantics of the verb look and the components characterizing the verb see.

#### Verb regard

It 's close in importance to watch.

Cp. She regarded him steadily [109, c.188].

She watched him face steadily [108, c.214].

The main model in which regard acts as the lead is VN, as for the verb watch.

It is as wide as watch, combined with adverbs of time and way of action (always, steadily, keely, closely).

However, unlike the verb watch, regard is not registered in the models VNVing, VNV "=", VcnjS, it does not meet and in the absolutive use.

The morphological properties of the regard are the same as those of watch: it is widely used both in the form of a general and a form of a long-term species, as well as in the form of a command inclination.

For example: Massiewasstillregardingthesea [106, c.228].

Comparative analysis of nouns included in models watchN and regardN makes it possible to make the assumption that there is a certain semantic difference between verbs -watch easily combined with features, designating objects, faces, activities (a person, parade, work, processing, etc.); Regardwatch with nouns denoting fixed objects or abstract concepts (face, house, year, feeling, conducting, etc.).

It seems that in the semantic structure regardvoditcomponent "to consider mentally," to reflect, "and in the semantic structure watch- component" to consider moving objects. "

It is this distinction that can explain the absence of complexes with infinitive and herundium after the verb regard.

#### Verb observe

It has in its semantic structure a component common with the verb se- "realized act of object vision" and the verb component watch "object observation."

Cp.: The forked veins in his temples throbbing plainly enough to be observed across the room [109, c.259].

Observethevirtuoushorrorofthelions [106, c.123].

As a synonym for ssee, the verb obsession is usually combined with s- adverbs like plainly, clearly and with the modal verb can, and as a synonym of watch, it is combined with adverbs of the way of action and is used in the form of a command inclination, that is, behaves like an agenative verb.

The study of six verbs of visual perception allows to draw the following conclusions:

1. These verbs have a set of common distributive properties, primarily due to the presence of common components in their semantic structure.
2. The greater the similarity between the syntax and morphological properties of verbs, the more common we observe in their semantics.
3. Each of the verbs considered has its own set of syntax means, distinguishing it from other verbs of the given group and signaling the peculiarities of its semantic structure

### ABSTRACT

*This paper is about poly functionality of a word in the context of speech. On the top of that, examples are presented to justify the research. The outcomes are implemented in compliance with analysis.*

**KEYWORDS:** *Speech, Word, Poly functionality, Literature, Context, Sentences.*

### INTRODUCTION

Non-direct speech is a stylistic technique that consists in combining the subjective plans of the author and the hero. The speech is on behalf of the author, but its content, intonation, lexical and syntactic features indicate her belonging to the hero [7, c.22].

With the help of non-direct speech, the author introduces the reader into the inner world of the hero, depicts his thoughts, feelings, and his attitude to various phenomena of reality. Its content can be both internal and external speech.

In English and American literature, non-direct speech was most developed in the 20th century in the works of Golsworthy, Dreiser, Game, Malz, Cronin and other writers [114]. Despite the presence of common features characteristic of non-direct speech in English, each writer has his own individual-artistic manner of using this technique, which often changes with the growth of his skill [28, c.112].

From the point of view of the polyfunctionality of the word, we highlight the following issues:

- 1) Decoration unit of non-direct speech;
- 2) Means for recognizing non-direct speech;
- 3) Means of combining non-direct speech with the author's speech and the hero's speech;
- 4) The order of non-direct speech;

5) Use of non-direct speech as a form of transmission of internal and external speech of the hero [8, c.128].

Most often, non-direct speech in the language of works of English literature is found in the form of one or more independent sentences.

Examples:

1. "Oh! Denis, how can you say such a thing!" cried Mary indignantly. But she gazed doubtfully at the suggestive angle of the yachting cap. Was it merely sausy, or was its purpose more profoundly significant? [106, p.54].
2. She shuddered at the recollection of her visit to the doctor, but firmly she blotted out from her mind the odious experiences of the last two hours. She would be brave for Denis! [106, p.155].
3. Peter Perry's chance remark had given her the solution she had been blindly seeking, and it was that which now impelled her in this contrary direction. She would go and see a doctor. Doctors were wise, trustworthy, kind; they healed, advised, comforted, yet respected one's confidence. Immediately she thought of the only practitioner she knew, Dr. Lawrie... [107, pp.130-131].
4. As her eyes met his, he could see that she meant absolutely very grim word she uttered, and he pressed her arm again, tenderly. How could he, even for an instant, have considered leaving this lovely, defenceless creature who, but for him, would still have been a virgin and who now, because of him, was soon to be a mother. And how passionately attached to him she was! It thrilled him with a fierce joy to see her complete dependence upon him and her submission to his will. [108, p.154].

Often, non-direct speech is equal in volume to part of a complex sentence.

1. Angrily he thrust this from him, suring himself, in his own axiom that it was the man, not the money that mattered, and with a quick gesture, he swaggered his way through the imposing portals [109, p.260].
2. ...he touched the parcel under his arm, exploded into activity before this peculiar lady might regain her sanity, and vanished like a puff of smoke down the street [109, p.145].
3. He was now aware that he would have to bond his house ... No one would know, he would go secretly to a lawyer in Glasgow who would arrange everything, but already, he felt dully as if his own house did not belong to him [108, pp.237-238].
4. His vague allusions had shocked her; she must know more, be at all costs reassured [108, p.247]

The non-direct speech, presented as part of a complex sentence, is sometimes followed by another independent sentence:

1. He looked at her quersly, asking himself if the old girl thought he was still at her apron strings. Perhaps he had been too unguarded with her [107, p.246].

2. He was proud of his achievement, and felt in agreeable anticipation that he would do even better next time, that Mamma must have a tidy sum tucked away in a safe place. It would be his for the asking! [107, p.278].

The non-direct speech, presented as part of a complex sentence, is sometimes followed by another independent sentence:

1. Well! she must see her name – the name of Nessie Brodie. That, surely, was no hardship – to view for one moment her own name. That moment had come! [108, p.148].
2. Why, she asked herself, did she enjoy herself always so exquisitely with him? Why did he seem, in his kindness, generosity, and tolerance, so different from anyone she had known? Why should the upward curl of his mouth and the lights in his hair, the poise of his head, make her heart turn with happiness in her breast? [107, p.110].

In the author's narrative, elements of non-actual direct speech are often found - individual words and phrases that are characteristic of the hero's speech, but not framed as speech. Examples:

1. He knew the value of these sudden departures, felt the restrained dignity of his leaving the sodden dogs to sing and rant in the fashion that fitted them, whilst he departed at the moment when he could so retire with majesty and honour [108, p.295].
2. Brodie was beginning to become enraged; the fact that he could not beat down this young sprig's eyes, nor yet provoke him to temper, annoyed him [108, p.161].
3. His attitude repudiated the idea of such sour wizened apples as she might obtain for him in this unproductive land; he waved his hand eloquently... [109, p.262].

In the first two examples, elements of non-direct speech respectively reflect the point of view of James Brody, his opinion about some members of the Livenford Club and the groom of his daughter Mary. In the third passage, the words this unproductive land belong to Matthew Brody, who, after returning from India, treats everything with neglect.

### **ABSTRACT**

*The article is devoted to researching the problem and improving the use of distance learning in higher education. One of these challenges is the full introduction of distance learning opportunities in the educational process, the formation of its normative framework, including the development and implementation of a unified methodological approach to the full coverage of the process, its development and implementation opportunities related to.*

**KEYWORDS:** *Distance Learning Opportunities, New Solutions in Education, Innovation In Education, ZOOM Platform, Coronavirus Pandemic.*

### **INTRODUCTION**

The introduction of modern information and communication technologies in the educational process has led to the creation of a new form of teaching - distance learning, in addition to traditional teaching methods. In particular, the Coronavirus pandemic has changed the way education is taught around the world. Thousands of students have lost access to traditional education. At the forefront of the coronavirus pandemic, first of all, medical staff can be imagined, and in the second part, the active participation of thousands of professors and teachers of general secondary schools in the process of overcoming its consequences. The sudden move of yesterday's classroom lessons to the online platform was also a great experimental school for educators.

According to the order of the Minister of Higher and Secondary Special Education of the Republic of Uzbekistan dated March 27, 2020 No 233 "On the introduction of distance learning in higher education institutions" teaching in higher education institutions was transferred to distance learning [1].

In the context of the epidemiological situation in our country, online classes have been launched in a very short period of time in all educational institutions of the country. Initially, these changes undoubtedly caused certain inconveniences, but the changes observed due to the pandemic and new solutions in education have led to the introduction of innovations in the field of education, which are necessary for the modern era [2].

## **MATERIALS AND METHODS**

Indeed, what is distance learning and how can it be used in a continuing education system. What shapes and models does it have? At the end of the twentieth century, humanity faced several problems, which are directly related to the significant changes in the field of information telecommunications, in particular, the rapid development of information technology. New means of information and communication began to enter various spheres of education, production and human society. The development of the global computer network of the Internet has led to the opening of new directions for the improvement of the education system around the world. First, the drastic change in the technical equipment of educational institutions, the wide access to secular information resources has led to the need to use new forms and methods of teaching [2-4].

The introduction of modern information and communication technologies in the educational process has led to the creation of a new form of teaching - distance learning, in addition to traditional teaching methods. In distance education, the student and the teacher are in constant communication with each other using spatially separated training courses, forms of control, electronic communication and other technologies of the Internet.

Distance learning based on the use of Internet technology provides access to the global information education network, performs several important new functions with the principle of integration and interaction. Distance learning provides an opportunity for all those who want to learn to continuously improve their skills. In the process of such teaching, the student learns independent teaching materials in an interactive mode, undergoes supervision, carries out control work under the direct guidance of the teacher and interacts with other "vertical learning group" students in the group.

For obvious reasons, distance learning is a convenient form of education for those who do not have the opportunity to study in full-time departments of educational institutions, for example, do not require health, intends to change their profession or are older, intend to improve their skills. Different information and communication technologies are used in distance learning, that is, each technology depends on the purpose and nature of the problem [2-5].

For example, while traditional print-based teaching aids (textbooks, manuals) are based on introducing students to new material, interactive audio and video conferencing is designed to interact over a period of time, sending and receiving e-mail directly and back. While pre-taped video lectures allow students to listen and watch lectures, facsimile communication, messages, and the rapid exchange of assignments over the network allow students to learn through feedback. Based on the above, we give a description and definitions of some of the terms that are currently being mentioned repeatedly in the educational process. Distance learning is education based on distance learning.

Distance learning is a relationship between a student and a teacher based on the purpose, content, method, organizational forms and teaching methods - Internet technology or other interactive methods and components of all learning processes at a certain distance from each other [6-8].

A distance learning system is a training system based on the conditions of distance learning. Like all education systems, the distance learning system has its own structural purpose, content, methods, tools and organizational forms. Pedagogical technologies of distance learning is a set of teaching methods and techniques that provide the educational process of distance learning based on the selected teaching concept. Case technology is such a method of organizing distance learning, which is based on the use of a set of textual, audio-visual and multimedia (case) teaching materials in distance learning. TV technology is a method of organizing distance learning, which serves to convey educational and methodological information to students through television and is based on the installation of one of the optional interactive methods of external communication.

Currently, online classes are organized through the ZOOM platform, where every professor of the university evaluates students' knowledge in a timely manner, including video lectures, the text of lectures, presentation materials on the topics, independent work, open and closed tests. An online lesson is a new style and radically different from a traditional lesson. This means that every teacher now has to partially forget the approaches in the classroom and adapt to virtual audiences because these lessons also have their own serious requirements and conditions. Through online classes, students will be able to work more independently, engage in scientific creativity, and read books. Teachers, on the other hand, participate in online videoconferences with the participation of foreign scientists and strive to work regularly to develop their professional skills.

At present, there is an objective basis for a qualitatively rapid transition to new technologies of teaching and education, as innovative processes in economic and social life require radical changes in self-education as well. No teacher-educator can be left out of this process sooner or later. In the context of modern globalization, the quality of education is expected to further increase as a result of the enrichment of online teaching methods in higher education with modern media. In this regard, the method of distance learning is of particular importance, as it has several advantages for both teachers and students. The current situation makes it necessary to develop computer programs based on the necessary teaching materials and manuals for students. After all, distance learning provides an opportunity to obtain and summarize the methodological literature of the world educational centres, modern and up-to-date information in any field.

## **RESULTS AND DISCUSSION**

With the large-scale introduction of technology in our country, online teaching can also facilitate the solution of several socially significant issues. The need of the republic for qualified and competitive specialists will be met by creating conditions for meeting the needs of students in the field of education. It is also possible to increase the social and professional activity of students. It creates favourable conditions for students studying in part-time departments, especially for young people studying in isolation from production.

Training on the basis of this method plays an important role in the training of future professionals and serves to strengthen the active participation of working people in society and enrich their worldview. This puts the task of implementing priority plans, such as strengthening

the economic potential of the country, with the scientific achievements accumulated in higher education institutions, specialists and their participation. In this regard, it should be noted that the meetings of scientific and technical councils under the Ministry of Innovation Development are also held online these days. Online meetings not only allow you to use your time more efficiently but also optimize the meeting preparation process. Based on the general requirements for the formation and implementation of the state order for research projects in accordance with the Regulations on the state order for research, the establishment of an online system of work based on the criteria for evaluating scientific expertise on projects. encourages a more responsible approach.

## CONCLUSION

Summarizing the above, it can be said that the introduction of the distance learning complex in higher education institutions will bring all-around benefits. The higher education system has all the conditions for the introduction of this complex. All higher education institutions in the country are well equipped with computers, information and communication technologies. They are all connected to the Internet. The widespread introduction of these technologies in the education system will help to solve many problems facing higher education institutions in a timely manner. Nowadays, the teaching of sciences using computers is becoming more important. The opportunities of computer technology can be effectively used in the development of students' personality-oriented development, creative abilities. Educators use the computer not only in the preparation of methodical materials for the lesson but also in the use of computer programs necessary for teaching science, as well as in the process of individual work with students.

**INFORMATION TECHNOLOGIES IN TEACHING PHYSICS IN A  
TECHNICAL HIGHER EDUCATION INSTITUTION**

**Irkabaev Djumanali Usmanovich\***

\*Almalyk Branch of Tashkent State Technical University named after Islam Karimov,  
UZBEKISTAN

**ABSTRACT**

*The article discusses current issues related to the methodology of teaching physics in technical universities. The prospects of information technology in the modernization of the educational process in physics, as well as in solving a number of methodological problems were discussed.*

**KEYWORDS:** *Innovative Approach To Teaching, Information Technology, E-Learning Resources, Experimental Modelling, Multimedia, Distance Learning.*

**INTRODUCTION**

Physics is one of the priority subjects in the educational process in the training of engineers in higher education institutions. It is the basis for the study of special disciplines, explaining the basic laws of physical phenomena and processes, as well as shaping the worldview and thinking skills of future professionals. For many years, the traditional system of teaching physics has been preserved. This system includes lectures, laboratory and practice problem-solving. The curriculum in general physics has hardly changed over the years, which means that in its time it was considered to meet the requirements of engineering training. At the same time, the achievements of fundamental research in physics in recent years, the demand for human resources in production, the need to modernize technological processes, new opportunities for modern information technology and the need to revise curricula.

The growing role of nanotechnology in various fields of modern production has led to the need for students to study in detail the basics of quantum physics, solid-state physics because the behaviour of nanoparticles is governed by specific laws of quantum mechanics. The physics program is divided into three different levels of complexity depending on the type of engineering major. However, even in the simplest version, it is so wide that it is very difficult to fully master it in the hours allotted for training. In addition, one of the major challenges in modernizing the teaching process of physics in higher education is related to outdated laboratory equipment that

has not been updated since the 1970s. Old devices that have been repaired many times are used during the presentation of the lecture-demonstration. As for educational films designed to show specific physical phenomena, it can be said that they are manually and materially obsolete.

## **MATERIALS AND METHODS**

There is no doubt that the endless possibilities of modern information technologies can make a great contribution to solving many of the listed problems and modernizing the educational process in physics. However, auxiliary computers and information technology tools in the learning process cannot completely replace the physical equipment in the training laboratory rooms. Due to the high cost of new, modern physical equipment, their purchase remains a topical issue. In recent years, many foreign and domestic companies are producing modern training laboratory equipment.

Many leading engineering universities, taking the long-awaited funding independence, are giving preference to manufacturers in Western Europe, primarily PHYWE (Germany, Göttingen), when purchasing training laboratory equipment. The worthy popularity of the equipment of this company is mainly due to the scientific tradition of the University of Göttingen, which has awarded 44 Nobel Prizes to the world. The equipment manufactured by PHYWE is visual, methodologically well designed and reliable in performance. The creative initiatives of advanced educators to modernize the physics course are diverse and undoubtedly innovative, as reflected in the fact that many ideas have already been implemented in educational institutions, in the materials of many conferences each year on physical problems [2].

Computer-assisted modelling of physical experiments, use of the Internet information environment in laboratory classes, multimedia presentations in lectures, remote laboratory practice by a researcher or student - this is an incomplete list of innovative innovations that contribute to solving more complex methodological problems. The physics program covers several complex topics. The most effective way to discuss such issues is to demonstrate these physical phenomena on real equipment. Unfortunately, it is not always possible to demonstrate a complex experiment in a training laboratory. In such cases, computer-simulated virtual experiments become a good methodological aid for the teacher in organizing the learning process in explaining complex processes to students. The fears of opponents of computerization in the teaching of physics are also not unfounded.

An excessive passion for computerization can sometimes turn out to be not only beneficial but also detrimental to shaping the knowledge of future engineers. An example of such problems is when students blindly download materials from Internet sites while preparing topics, coursework, and abstracts for independent work without understanding the essence of the issue. Even to perform simple arithmetic operations, many students turn to a computer without understanding the meaning of the task or the purpose of the actions being performed. An analysis of the methodological problems associated with the use of information technology suggests that the most appropriate approach is to conclude that it is a method that rationally combines traditional and information education technologies. It turns out that a virtual experiment performed on computers cannot completely replace a real experiment, and it should only be involved when necessary. Before the introduction of information technology in the educational process, a lot of hard work is done, such as creating the necessary computer programs on the topics based on the curriculum, as well as the purchase of licensed e-learning products. In

addition, the methodological and organizational aspects of the lessons should be well thought out, the computer classroom should be equipped with the necessary technical equipment, e-learning manuals should be available.

Traditionally, a lecture course in physics provides coverage of the material being studied through lecture presentations. In this context, it is information technology that can provide the necessary methodological assistance in creating presentation materials for lectures. At the same time, the information resources of the global Internet are a useful source of information in the selection of audio and video materials for a physics lecture course. The procedure for developing e-learning products, creating multimedia materials, videotaping demonstration experiments for a physics course is a very expensive and laborious task [1].

A presentation of lectures in electronic form has been developed for reading lectures on the full course of physics. Presentation slides prepared in MO PowerPoint program allow displaying formulas, drawings, graphics in animated mode.

The course of electronic lectures includes videos of real physical experiments taken from the Internet [4], video assignments (author prof. A.I. Fishman), animations from the site "Physics in animation" [2], as well as materials "Open Physics 1.1" [3].

The constant addition of such videos to the electronic lecture course allows supplementing it with necessary and useful materials [5]. During the presentation, the working slides of the electronic abstract are filled with formulas, pictures, and graphics in animation mode. That is, as the presentation continues, the material is broken into pieces. During the lesson, the speaker will give the necessary explanations orally, as well as use the board in the classroom. Clear images displayed on the screen allow students to record high-quality recordings of the material being studied. At the same time, the speaker takes the time to explain, explaining the most difficult issues. Formulas, diagrams, graphs, drawings in electronic form are easier to understand than those drawn by hand on the board. One of the main advantages of such a lecture course is the opportunity to improve it, to fill it with new materials. The achieved quality of the e-lecture course made it possible to start designing it in the form of a compact multimedia disc. The main work plan is to create a multimedia product for a full course of physics, which should help students and teachers in their work, both in reading lectures and in students' independent work. The disc project includes theoretical materials on this topic, along with video experiments, reviews. The disk contains attachments in the form of pdf-files, which provide a detailed description of the material provided. These attachments are copied from the slide so as not to confuse the viewing area with large amounts of text. The advantage of this multimedia product is its clarity, informative content and the ability to constantly improve it. At this stage, the structure of the future disk was developed, part of the work on its filling was completed.

## CONCLUSION

In conclusion, the introduction of information technology in the modernization of the educational process in physics, taking into account the organizational components of the working program in the teaching of physics in technical higher education institutions, is a promising method.

### ABSTRACT

*Vocabulary is indispensable in improving learners' language abilities which are reading, writing, speaking and listening. English competency level is administered by the expansiveness and profundity of learners' vocabulary knowledge. Having an enormous load of vocabulary particularly academic and specialized vocabulary is extremely fundamental for building up the language capability and preparing students to get by in the academic world. Nonetheless, learning vocabulary requires viable and key vocabulary learning methodologies (VLM). This research checked on writing on the VLM utilized among learners in tertiary organizations. Learners' prosperity rate in learning vocabulary is related to address the utilization of jargon learning methodologies that are advantageous in helping the learners' advancement in their learning.*

**KEYWORDS:** *Language Skills, English Proficiency, Foreign Language Learning, Vocabulary Knowledge, Vocabulary Learning Methodologies.*

### INTRODUCTION

English is perceived as quite possibly the most preferred dialects worldwide because of the way that it is utilized in numerous exchanges like an overall exchange, admission to science and innovation, and the unremarkable teaching method inside schools and organizations (Sun, Yin, and Brien, 2017). Harmon, Antuna, Juarez, and Wood (2018) claim that due to various content-area texts, literacy of English as a foreign language has been accentuated and consideration has additionally been given intensely onto the learners, prompting innumerable arising proficiency methodologies that emphatically have influenced learners' interaction of learning. This is because the more learners know the words and their construction, the better they could be (Susanto and

Halim, 2017). During the time spent dominating a foreign language, students ought to have more comprehension of each word and their design so learners would utilize it effectively, in any circumstances.

Great English language learners are needed to have a great vocabulary in their munitions stockpile as vocabulary is the establishment of English and its job is crucial. Without knowing the parts of vocabulary, a language learner will discover trouble to convey, read, write or fathom a foreign language (Schmitt, 2010). The stress on the imperativeness of the roles played by vocabulary is featured plainly through the explanation.

Easterbrook (2013) claims that jargon is characterized in two unique manners, which are orthographically (as a free language thing which holds meaning) or phonologically (the blend of autonomous things that are known as the multiword which is identified with morphological instruments, for example, affixes or etymological parts). Consequently, it is perceived that vocabulary is the language thing that is identified with phonological, morphological and grammatical structure. Then again, knowing vocabulary is known as various highlights of a term or phrasing that ought to be considered in term of having the thing and framework structures (Nation, 2015). To ensure that learning interaction of vocabulary can happen easily, even though there appears to be a separation which gives off an impression of being of two unique methods of learning; generally and exceptional vocabulary learning procedures, learners are more encouraged to give up the customary techniques and start to apply the various vocabulary learning methodologies that are found by the unmistakable specialists (Aziz and Hossain, 2010).

In the present life, because of globalization and modernization, vocabulary is considered to be a significant part of correspondence which may prevent the declaration of thoughts and encoding data in the event that it is trifled with that lead to issues over the long run. This implies that if students of a subsequent language partake yet idly during learning measure, they are really overlooking the main issue that to be phenomenal clients of English, it is required to have an expansive width of vocabulary information. This case is additionally upheld by Khalid and Almuslimi (2016) saying that meanings of arising words are purposely stressed, regardless of whether in composing books or during classroom learning measure. Subsequently, the part of vocabulary is irrefutably fundamental and should be given more opportunity for contemplating and dominating at it.

Nonetheless, for students of English as a foreign language, the pressure of learning another information can't be denied. Learning another language is troublesome on the grounds that it includes students' first language which is their native language and it is demonstrated through numerous explores completed before (Marin, 2006). For instance, when learners are getting the hold of the standards and guidelines of the recently educated English language; the vocabulary, elocution and syntax rules of their first language come in the manner and meddle with their learning cycle (Mohd Noor, Nik Yusoff, Md. Yasim, and Kamarudin, 2016). The investigation shows that learners, who are learning a cognitive language, think that its hard to dominate the punctuation rules since they are having the obstruction with their local dialects just as well as the first language. As they are learning, they erroneously apply the vocabulary of their initial language into the foreign language, along these lines driving them to linguistically wrong arrangements and reacts.

Other than that, investigations refer to that among urban and provincial secondary schools learners, there are tremendous differentiates that show the degrees of capability between them. Urban school learners are discovered to be of a more significant level of capability whenever contrasted with their partners, which are the provincial school learners. Urban school learners are better achievers since they are utilizing the more suitable methodology in learning, and it makes unmistakable contrasts from the lower achievers in provincial schools.

Furthermore, picking incorrectly language learning methodologies is additionally the greatest supporter of the absence of progress during the learning of a specific language (Gillies, 2016). This statement is demonstrated genuine in light of the fact that the investigation shows that learners who adapt separately and autonomously, perform essentially ineffectively if a correlation is made with learners who learn two by two, bunch or can be said as helpfully. Adapting agreeably permits learners to have a more dynamic job during the learning cycle and it can diminish the language pressure just as nervousness (Khalid and Almuslimi, 2016). Hence, if students of English as a foreign language apply the correct language learning methodologies, they have a superior possibility of improving outcome, in altogether less time.

Subsequently, numerous issues wait around vocabulary and its job. Students of a foreign language are meddled by their first language, approaches used to gain proficiency with a language and the methodologies applied during the learning cycle. Every one of these issues should be survived if the students are intending to improve over the long haul. This paper intends to audit the various methodologies that have been applied by learners in dominating vocabulary.

### **THE IMPORTANCE OF LEARNING VOCABULARY**

Cheon and Ma (2016) refer to that the width of vocabulary knowledge isn't simply essential to demonstrate one's capacity and capability of a foreign language. For as far back as a couple of years, numerous examinations have been done with respect to vocabulary learning and individuals realize that learning vocabulary is significant for the individuals who need to utilize the foreign language absolutely (Cohen and Wang, 2018). It is showed that the centre is given onto the learning methodologies and it is on the grounds that the right methodologies should be executed so vocabulary learning can happen effortlessly. Be that as it may, albeit numerous examinations have been led before, they are thought to be deluding because innumerable inquiries are still can't be replied to. Moreover, these investigations are completed to recognize the talk types, grammatical structure and lexical information that are important to be applied pedagogically to give better knowledge among language and its substance (Vaish, 2018). Through these investigations, students can separate and have a more clear vision of the language that they are learning. There is a lot of reasons why students ought to be giving their best in attempting to dominate the vocabulary of English. Students ought to give their best for they are attempting to master a language.

Vocabulary knowledge permits students to completely use the language that they are adapting yet it isn't right if understudies' capability is resolved exclusively dependent on their vocabulary knowledge and their authority (Nation, 2001). In any case, the significance of vocabulary learning will not be ignored. Alqahtani (2015) refers to that open competency is made up of great vocabulary information. The correspondences are fruitful on the grounds that students are reacting great during the association with the subsequent language. They can process the

messages that are conveyed to them and give answers to them. Along these lines, jargon is demonstrated to be essential for fruitful correspondence (Teng, 2014).

Besides, students' capacity to peruse appreciation will improve amazingly in the event that they have satisfactory vocabulary information. When the learners have improved over the learning cycle, they have become educated learners of English and can process their readings effortlessly. The readings can be of any materials like academic compositions, diaries, amusements and numerous others. The students are not, at this point expected to peruse the materials that are in their first language. This case can be additionally upheld by an investigation made by Rojananak and Vitayapirak (2015) expressing that great students can peruse materials that are converted into the second language better than the frail students since they have more extensive jargon information and their statement tallies are higher. In this manner, to comprehend and understanding the material, it is important to learn and infer every one of the linguistic guidelines.

In contrast, there are cases whereby the first language meddles with the learning of a foreign language. In any case, late examinations show that learning the subsequent language prompts an upgrade of the main language authority (Lam and Chen, 2018). This implies that a few principles of the subsequent language can be applied to the primary language, making the students utilize a more exact and exact first language. The first language is typically procured normally from the guardians, though foreign language expects students to learn it officially (Gu and Johnson, 1996). A normally procured first language isn't learned as correctly as the foreign language, making it be utilized incorrectly. By learning and applying the syntax rules of a foreign language, it permits students to utilize the primary language all the more precisely.

All in all, learning the vocabulary of English is significant for students as it improves them from various perspectives. Truth be told, the learning interaction ought to be treated all the more appropriately with the goal that students can dominate it in a more limited timeframe.

### **VOCABULARY LEARNING METHODOLOGIES**

Vocabulary learning methodologies have become a significant worry for some analysts and language experts as of late (Cohen and Wang, 2018). This assertion shows that for students to improve step by step, they are needed to apply the correct learning methodologies which are useful in making their learning methodologies goes effortlessly. This case is additionally expounded through an examination made by Kafipour and Naveh (2011), showing that through the utilization of learning methodologies, any space of learning or any points can be dealt with effectively and students are destined for success in getting great English as second language students. Until this point, it is tracked down that different methodologies have been set up and it is demonstrated to be advantageous for the students over the long haul. For instance, the pioneers of language learning methodologies are O'Malley and Chamot (1990) and Oxford (1990) which guarantees that learning methodologies are isolated into four unique classes which are metacognitive, psychological, social, and effective (Zhang and Lu, 2015).

Essentially, there are countless procedures to be recorded. Sanaoui (1995) claims that in grown-ups' jargon learning measure, two methodologies have been uncovered which are organized and unstructured. An examination that is made by Xie (2009), shows that organized learning is considered to be more gainful and unstructured learning gets surplus all through the learning cycle. This is on the grounds that organized learning offers a more efficient path in getting sorted

---

out and taking care of things. In another examination, it is perceived that there are six various types of methodologies which are speculating, alluding to word reference, practice, encoding and actuation – along with two partner factors which are convictions of vocabulary learning and metacognitive guideline (Gu and Johnson, 1996).

## CONCLUSION

English is a significant language that everybody ought to consider in learning. Great English language clients accompany great jargon information. One's jargon information goes about as the marker of their degree of capability. Students of English as a foreign language ought to apply and execute the correct language learning procedures so they can concentrate effortlessly and dominate essentially. There are numerous methodologies that a student can apply in their interaction of improving the authority of English. When the English language is dominated, students will improve in any part of public activity.

### ABSTRACT

*It is no exaggeration to say that the widespread introduction of modern information and communication technologies in our economy, in turn, has brought the interaction between consumers and producers to a new level. Today, the country has introduced and effectively used interactive services for customers in the banking sector through electronic payments, the global Internet and mobile communications. It provides a sufficient basis for the effective use of electronic payments and e-commerce opportunities by businesses, including small businesses and entrepreneurs, in the course of their activities, strengthening their competitiveness and achieving high economic results. The article discusses e-commerce opportunities and their importance in the modern business system.*

**KEYWORDS:** *Small Business And Entrepreneurship, A Global Network Of Internet, E-Commerce Opportunities, The Consumer.*

### INTRODUCTION

During the years of independence, small business and private entrepreneurship have become a leading force in our country. Artificial barriers to free enterprise have been removed. To this end, effective measures have been taken. The widespread introduction of trade and services through the use of information and communication technologies is an important factor in the development of business, as well as the creation of a favourable business environment. This, in turn, will increase the competitiveness and quality of products and services produced by entrepreneurs in the global market. The development of science and technology has necessitated the emergence of several new areas in social life. In particular, the development of information and communication technologies has led to radical changes not only in social life but also in

business [1-3]. The reason for the emergence and development of e-commerce also depends on the rapid development of information and communication technologies. The use of information and communication technologies (ICT) in business has created a revolution in the direct relations of companies with consumers. An important issue today is to take a strategic position, identify the opportunities available to firms and reach the highest level of profitability through the effective use of opportunities based on a simple, businesslike and viable e-commerce strategy in the information age and the new economic environment [4-7]. At the same time, the scope of e-commerce has expanded. Initially, e-commerce was an economic transaction through the Internet, but now, with the development of ICT and the expansion of e-commerce opportunities, e-commerce is now an entrepreneurial activity involving the sale of goods, works and services using information systems. Nowadays, not only the Internet but also other networks - local area network, virtual local area network, corporate network, regional networks are widely used to increase e-economic activity.

## **MATERIALS AND METHODS**

Currently, along with the growing global trend in the use of modern information and communication technologies in the banking and financial sector, the growth of bank plastic cards and the development of electronic payments and e-commerce, the implementation of several projects in e-payments and e-commerce. Banking and financial institutions of our country provide their customers with remote electronic services such as electronic payments, SMS-banking, Mobilbanking through the global Internet and mobile networks.

It should be noted that the relevant regulatory framework for regulating e-commerce has been created in the country. In particular, the Law "On Electronic Commerce", the Law "On Informatization", the Law "On Electronic Payments", the Law "On Electronic Digital Signature" and a number of other normative documents [4-9].

However, the current level of development of information technology and commerce requires a more thorough regulation of relations in the field of e-commerce. Participants in the e-commerce market can be companies, consumers, government, administration, ie government agencies, investors.

The e-commerce market is divided into several main sectors depending on the electronic interaction of the e-market participants. These are business for business, business for consumer, business for government, consumer for consumer, government for consumer and mobile commerce. Of these e-commerce market sectors, the combined share of business sectors for business and business sectors for consumers is close to 90%. The development of e-commerce is influenced by technological factors, market factors, economic factors. Alternatively, businesses that integrate their activities with e-commerce may have the following advantages and opportunities:

- reducing the cost of maintaining business infrastructure,
- reduction of the price of goods as a result of reduction of advertising costs,
- save time on receipt and execution of orders, control over all orders,
- increase the number of potential customers, conduct their business on a global scale.

In developed countries, the use of e-commerce, its widespread use in all spheres of life is highly developed. This is due to the environment that promotes the development of e-commerce - the general infrastructure that promotes the development of computer science, the level of development of information and communication technologies (ICT), the availability of information networks (Internet) and access to these networks for each citizen. Level of provision, the level of use of ICT in society is provided at a high level.

However, in developed countries, there are various barriers that prevent e-commerce from taking full advantage of opportunities. These are language barriers, infringements of intellectual property rights, different tax and value-added tax (VAT) systems, different currencies, different technical standards used in e-commerce, and more. But for developing countries, the use of e-commerce opportunities is much more beneficial. These are:

- Facilitates the access of large and small businesses to world markets,
- E-commerce leads to the development of international tourism in developing countries,
- E-commerce facilitates international marketing of agricultural products in developing countries,
- facilitates access of small businesses in developing countries to the network of suppliers of raw materials in international B2B and B2G markets;
- E-commerce has expanded the range of services of service companies in developing countries, etc.

E-commerce, like traditional economics, is an area that needs to be managed and regulated. However, as e-commerce is a new field, government management tools have not yet been developed in this area. Alternatively, states do not have enough experience to manage these relationships. The regulation and support of e-commerce depend on the level of development of countries. The legal framework governing e-economic activity in Uzbekistan is sufficiently developed. A total of 17 laws and regulations have been developed in the Republic of Uzbekistan to regulate ICT and e-commerce. These are the law on electronic signatures, the law on electronic document management, the law on electronic commerce, the law on electronic payments, and so on [7-10]. At the same time, the legal framework for the development of e-commerce in Uzbekistan should be improved in the following areas.

These are the development of a sequence of legal regulation of online services for the population and business, the strengthening of the specifics of certain types of services in e-commerce, the establishment of procedures for appeals to the law on e-commerce, standardization of electronic documents used in e-commerce, e-commerce issues of determining the procedure for licensing the activities of participants.

## **RESULTS AND DISCUSSION**

In Uzbekistan, the process of implementing e-government as a branch of e-commerce has begun. The first steps in this area began with the process of equipping government agencies with information technology. Later, the single Internet portal of the Republic of Uzbekistan [www.gov.uz](http://www.gov.uz) was created.

Today, all public authorities and administration have their own websites. At the same time, the rate of paperless paperwork between government agencies is growing. It should be noted that in

addition to the implementation of e-commerce in Uzbekistan, there are also problems. These are psychological factors (our population still can not clearly imagine trading in a virtual environment), insufficiently developed information and communication infrastructure, the inability of entrepreneurs to clearly imagine the possibilities of e-commerce, low computer literacy among middle-aged and older people, banks in the Internet non-establishment of payment services (internet-banking), etc.

Despite the above obstacles, the prospects for e-commerce in Uzbekistan are bright. Because ICT indicators in our country are growing rapidly. And the number of Internet users is growing rapidly.

## CONCLUSION

1. It is necessary to further develop the ICT infrastructure in our country. Because the current ICT infrastructure does not allow us to take full advantage of e-commerce opportunities. The development of ICT infrastructure will accelerate the implementation of e-commerce in our country.
2. The legal framework for the development of e-commerce in Uzbekistan should be improved in the following areas. These are the development of a sequence of legal regulation of online services for the population and business, the strict strengthening of the specifics of certain types of e-commerce services in the law, the procedure for applying to the law on e-commerce, standardization of electronic documents used in e-commerce, licensing e-commerce participants issues of determining the order of the process.
3. Along with the development of ICT infrastructure, it is necessary to increase the computer literacy of the population. To do this, it is necessary to ensure the use of information technology by the younger generation and the deepening of their knowledge in this area.
4. It is necessary to ensure the abandonment of conservative views of banks in working with electronic payments and further development of SMS banking.
5. It is necessary to develop the necessary incentive government programs for entrepreneurs to use e-commerce opportunities and increase their e-economic activity.

## ABOUT THE ONE METHOD OF CREATION OF ELECTRONIC TEXTBOOKS

**R. Raxmonkulov\***; **K.K. Toshtemirov\*\***; **G.A. Toshtemirov\*\*\***

<sup>1,3</sup>Almalyk Branch of Tashkent State Technical University named after Islam Karimov,  
UZBEKISTAN

### ABSTRACT

*In this work, one of the tasks of the methodology for creating an electronic textbook is considered, in the example of teaching the subject "the basics of programming for machine tools with programmed control". The basic concepts of file organization have been developed, which are required to reveal the essence of the studied subject using an electronic textbook by the power of a teacher.*

**KEYWORDS:** *Electronic Textbook, CAD, CAM, CAE, Traditional Algorithmic Languages, Video Files, Frame.*

### INTRODUCTION

Modern education is unthinkable without modern teaching aids. Among them are electronic resources, in particular, electronic manuals reproduced on a computer.

### LITERATURE REVIVE

The study of electronic textbooks is presented in the works of O.B. Tyschenko, V.P. Bepalko, N.V. Apatova, N.N. Bulgakov, A.A. Verbitsky, A.M. Podkovyrova, G.K. Selevko, B.S. Gershunsky, M.V. Druzhinin, L.I. Korneeva, I.M. Kurdyumova, K.M. Levitan, T.S. Serova, E.V. Tkachenko, D.A. Toropov and others. Combining the opinions of these authors, we can conclude:

The use of various IT (multimedia, hypertext, diagrams, tables) in electronic textbooks provides significant didactic advantages of an electronic textbook in comparison with a printed one:

- A learning environment appears in multimedia technology with an interesting and visual presentation of information, which undoubtedly attracts the attention of listeners;

- The use of hyperlinks simplifies navigation and provides an opportunity to choose an individual scheme for studying the material;
- Application of modelling of the learning process, allows you to supplement the textbook with texts, track and adjust the trajectory of learning the material, and thus provide feedback.

Taking into account the theoretical analysis of the literature on the topic, the following didactic functions of a modern electronic textbook can be distinguished:

- Increases and stimulates the interest of listeners through multimedia;
- Activates mental activity and the effectiveness of memorizing material due to interactivity;
- Allows you to simulate and visualize processes for presentation in reality;
- allows you to individualize learning by speed, the pace of learning the material, as well as by logic and type of perception;
- Allows you to organize distance learning by correspondence or emergency training;
- Simplicity and ease of handling;
- Ability to update the resource of the electronic textbook;
- Automation of the educational process and an increase in the speed of providing educational services;
- Completeness of the transmitted information.

Such an innovative teaching technology as the use of electronic textbooks has not yet been sufficiently studied, although among the researchers of the role of electronic textbooks in the learning process it is advisable to note various scientists: A.A. Kuznetsov, A.A. Grechikhin, T.M. Lepsova, E.S. Polat, V.A. Wool, V.M. Gasov, A.M. Tsyganenko, V.N. Ageev, M.M. Subbotin, Yu.M. Tsivenkov, E.Yu. Semenov and others [2, p. 53].

The use of the aforementioned electronic textbook in English classes will contribute to the study of this issue. The process of creating and introducing modern electronic textbooks is going on all over the world; many countries have already started using e-textbooks in educational practice. The library and textbooks, where one could find answers to all relevant questions, were replaced by the epochs of the "electronic" version of books, magazines and articles.

Since 2007, the "Electronic Textbook" program has been operating in South Korea and a virtual interactive book has been used, i.e. 3D tutorial using so-called "augmented reality". The results of the experiment showed that academic performance in general increased by 30%.

In February 2012, the US launched the state initiative "The Digital Textbook Collaborative", within the framework of which, in the near future, it is planned to provide every American student with modern electronic textbooks.

In Russia, the introduction of ES was planned within the framework of the national initiative "New School". Under this program, in September 2015, in a number of schools in Moscow, students began to use ES in their lessons [1,3]. Tools for creating electronic textbooks can be divided into groups, for example, using a complex criterion that includes indicators such as

purpose and functions performed, requirements for technical support, and application features. According to this criterion, the following classification is possible:

- Traditional algorithmic languages;
- General-purpose tools;
- Multimedia tools;
- Hypertext and hypermedia tools;

As a technical base, in the future, we mean IBM compatible computers, as the most common in our country and available to educational institutions.

## MATERIALS AND METHODS

This article examines, on the basis of the above classification, the creation of an e-book for teaching students in the direction of "mechanical engineering" at the university. For example, you can take the subject "Programming machine tools with numerical control". It should be noted that at present there are many CAD, CAM, CAE systems that can automatically output the NC program applicable for machine tools with numerical control programs. But using a ready-made control program, he does not understand how to correct a failed situation, or create a new control program, in the event of a change in the technical tool.

This leads to the fact that the user should be sufficiently familiar with the program that he uses. Because of this, students are taught the subject of Numerical Control Machine Programming.

The theoretical description of a part of the subject is not difficult. But to understand all the keywords involved in the program, without the participation of the movement of the cutting element of the machine, in the processing of workpieces. Using traditional algorithmic languages, you can solve this problem. For example, the movement of a cutting tool may be directed by three Cartesian coordinates (up to a maximum of 9 coordinates). This movement cannot be shown using PowerPoint or other programs, which control the movement is based on the frame. Since taking into account any situation, the movement of the cutting tool is either very laborious, or it is not possible. Traditional algorithmic languages, for example, Delphi 7 (C ++, Java, etc.) easily solve the problem. Below is a program is written in this language:

Unit Unit1;

Interface

Uses

Windows, Messages, SysUtils, Variants, Classes, Graphics, Controls, Forms,

Dialogs, ExtCtrls, StdCtrls, Buttons;

type

TForm1 = class (TForm)

Image1: TImage; Image2: TImage; Image3: TImage; Image4: TImage;

rasm[6,4]:=image6.Width;
rasm[7,1]:=image7.Height; rasm[7,2]:=image7.Left; rasm[7,3]:=image7.Top;
rasm[7,4]:=image7.Width;
```

---

```

scrollbar2.Position:=scrollbar2.Max;
end;
procedure TForm1.ScrollBar1Change(Sender: TObject);
begin xn:=scrollbar1.Position; image3.Left:=xn+rasm[3,2]; image7.Left:=xn+rasm[7,2];
end;
procedure TForm1.ScrollBar2Change(Sender: TObject);
begin yn:=scrollbar2.Position; image7.Left:=xn+rasm[7,2]; image7.Top:=yn+rasm[7,3]; end;
procedure TForm1.ScrollBar3Change(Sender: TObject);
begin
zn:=scrollbar3.Position; image3.Left:=xn+trunc(zn*cos(pi/3));
image3.Top:=yn-trunc(zn*sin(pi/3)); image7.Left:=xn+trunc(zn*cos(pi/3)); image7.Top:=yn-
trunc(zn*sin(pi/3));
end;

```

With the help of this program, you can show the listeners an infinite number of positions of the cutting tool of the executing organ of programmed machines (Fig. 1). At the same time, you can explain the setting of the executive element of the machine to the beginning of the processing of work pieces. It is then easy to show machining using linear or circular cutter interpolation. It is enough to understand the essence of the block and the commands G00, G01, G02, G03.

Figure 1.

Figure 2.

Using traditional algorithmic languages, it is easy to compose a program illustrating the movement of the organs of a machine tool with numerical control, which is shown in Figure 2 and this program is shown next to the figures. We think everyone knows general-purpose tools in the operating system and it is not required to stop over this split.

Multimedia is now used very often thanks to modern electronic technology. Currently, using the Internet, you can find a lot of different types of videos showing one or another technological process. But these videos show the process that these producers planned to show (Fig. 4).

Figure 3.

Figure 3 shows a commercial for the manufacture of complex machine parts on numerically controlled machines.

Figure 4.

Figure 4 shows the work of the executive bodies of 9-coordinate machine tools with programmed numerical control. Hypertext links are used to open the necessary files related to the subject. At the same time, it is advisable to use a slinging window, which allows you to correctly redirect the opening of the necessary files. In addition, you can use the speech accompaniment of the lesson.

## CONCLUSION

During the course of classes on subjects, the abacus widely uses modern computer technology. To that end, benefit from the latest advances in this technology. To widely use traditional algorithmic languages, which gives a deeper understanding of the essence of the process, especially required by technical personnel. To save files that are used for explanations of topics, use a separate folder, which makes it easier to organize links to execution files.

### ABSTRACT

*Any achievement of science and technology must serve the progress of mankind. At the heart of the state programs aimed at the development of artificial intelligence in our country is the noble goal of improving the quality of services provided to the population, saving time and money of citizens, as well as the developing of the industry at world standards. Economic growth in most countries of the world has slowed in the last decade, caused by structural changes and imbalances in the global economy as a whole. At the present stage, the problems of finding fundamentally new sources of economic development and growth have become actualized, which in the future would determine the success of individual countries and companies in the competition in the world market. The article discusses the main aspects of the use of artificial intelligence technologies in conjunction with the need to ensure sustainable development of the modern world economy.*

**KEYWORDS:** *Economic Development And Growth, Artificial Intelligence, Digital Technologies, Structural Imbalances.*

## INTRODUCTION

In accordance with the Strategy "Digital Uzbekistan - 2030" and in order to accelerate the introduction and widespread use of artificial intelligence technologies in our country, to provide access to digital data and their high quality, to create favourable conditions for training in this field, "Accelerated introduction of artificial intelligence technologies Resolution of the President of the Republic of Uzbekistan No. PP-4996 of February 17, 2021 "On measures to create conditions for the introduction of artificial intelligence technologies in our country, their widespread use, expanding the use of digital data, training of qualified personnel in this field" in other words, many tasks aimed at developing the industry at the level of world requirements have been identified.

Today, "Smart Clocks", which measure our blood pressure, calculate our steps and energy expenditure, "Smart Maps", which guide us by GPS, and various data processing programs are becoming our companions every day. It is noteworthy that the efforts to develop these areas are intensifying in our country. The expanding IT parks, Million Programmers, and Youth Technoparks give hope for the future of the industry. Strategies for the development of artificial intelligence have been adopted in more than 30 countries, including the United States, Germany, Japan, France, Korea, and Canada. The resolution of the President "On measures to create conditions for the accelerated introduction of artificial intelligence technologies" is also in line with the strategy "Digital Uzbekistan - 2030" and the rapid introduction of artificial intelligence technologies and their widespread use in the country, expanding the use of digital data. was accepted for training [1-3].

## MATERIALS AND METHODS

In accordance with the above decision, first of all, financial mechanisms will be developed for the development of the field of artificial intelligence. For this purpose, a special account will be opened in the Fund for Support of Innovative Development and Innovative Ideas under the Ministry of Innovative Development, which will be used to finance artificial intelligence projects. Measures will also be taken to develop mechanisms for financing startup projects.

Artificial intelligence is a technology that focuses on thinking and acting like humans on computers. Artificial intelligence requires high-powered computers, data, artificial intelligence algorithms to work [4-6]. It helps to automate an arbitrary field, analyze big data, and achieve great things. This decision approved a program of measures for the study and introduction of artificial intelligence technologies in 2021-2022. The program identifies several tasks related to the development of artificial intelligence development strategy and regulatory framework, its widespread use in improving the quality of public services, the creation of a local ecosystem of innovative developments in the field and the development of international cooperation.

The resolution also approved a list of pilot projects for the introduction of artificial intelligence technologies in 2021-2022. These projects cover 9 economic and social projects such as agriculture, finance, banking, taxation, energy, healthcare. According to the resolution, the Ministry of Information Technologies and Communications will create technological conditions for the development and implementation of software products. The Ministry of Innovative Development is responsible for supporting scientific and technical research and innovation in the field of artificial intelligence.

According to the resolution, a research institute for the development of digital technologies and artificial intelligence will be established. Also, the organization of research aimed at implementing the strategy "Digital Uzbekistan - 2030" and the development of models, algorithms and software for the introduction of artificial intelligence technologies in the economy, social sphere and public administration, based on which to automate management and production processes. is responsible for functions such as output. According to the decision, a "Joint Union" for the development of artificial intelligence in government agencies, commercial banks and large industrial enterprises is being established. This union will serve for the rapid and joint implementation of priority projects for the introduction of artificial intelligence technologies in the economy and the social sphere, public administration, optimization of costs for their development, dissemination of best practices in this area among government agencies and bodies. By September 1, 2021, a digital data platform will be created for the population and the necessary users to use artificial intelligence-based software and other data.

At the present stage of development of the economies of foreign countries, especially developed ones, ensuring sustainable economic growth remains an urgent problem, since its traditional sources have already been exhausted. The growth of the world economy is mainly due to the high rates of development of developing countries, primarily China. At the same time, even medium-term forecasts show that the world economy will face another imbalance in the coming years, which is generally due to the continuation of the relative strengthening of the competitive positions of some subjects of the world economy. A cursory analysis of these forecasts shows that, for example, by 2022, a decrease in the intensity of economic growth is expected not only in the United States and Japan but also in some developing countries [12].

## RESULTS AND DISCUSSION

The growing risk of the global economy falling into the "slow growth trap" once again testifies to a large volume of problems and imbalances that have accumulated in it. Many national economies remain stable, but at the same time they become ineffective systems, and in this case, this is already a consequence of global institutional traps. Meanwhile, the slowdown in economic growth is largely due to a decrease in labour productivity in individual national economies (although it is obvious that since the 1970s, under the influence of scientific and technological progress, this indicator has been steadily increasing). Thus, recent studies show that over the past two decades in 30 out of 31 developed countries there has been a decrease in labour productivity (for example, if in the United States the average annual value of this indicator was 2.5% in 1995-2005, then in 2005-2015 it was 2.5%). - already less than 1%) [3].

Recently, imbalances in the world economy have been commonly associated with structural imbalances in the financial sector (which is reflected in the growth in the volume of derivative financial instruments, the separation of the financial sector from the real, etc.).

Obviously, this factor has a significant impact, but we tend to associate the imbalances of the modern world economy, first of all, with the different possibilities of the real sectors of national economies for self-growth. The latter, in particular, is associated with such factors as technological readiness, the maturity of the country's innovation system, leadership in the latest technologies and knowledge. Artificial intelligence (AI), analysed in the framework of this article, is considered by us as a fundamental attribute of the development of the world economy,

which, even if it does not contribute to the elimination of these imbalances, will definitely contribute to its self-growth as a whole.

The expansion and deepening of AI technologies can have an even greater positive impact on economic growth. Foreign experts predict that based on the introduction of artificial intelligence (AI) technologies by 2035, it is possible to double the rate of economic growth and increase labour productivity by 40% in developed countries [5].

At the same time, the positive impact of AI on the world economy for the next decade is estimated in the range of 1.49-2.95 trillion, dollars, while in the group of high-income countries GDP due to the use of AI will increase by \$ 296.5-657.7 billion [4].

At the same time, one should take into account the direct impact of AI on GDP, when GDP growth is achieved due to the growth of sectors producing AI technologies, and indirect (when labour productivity increases in traditional industries using AI). According to PwC forecasts, by 2030, as a result of the use of AI, global GDP growth will be 14% higher, which will add an additional \$ 15.7 billion to the world economy in added value. At the same time, the benefits from the use of AI will be distributed unevenly: for example, the corresponding GDP growth in China will be 26%, in Europe - 9%, developed countries in Asia - 12%, and in general for the group of developing countries - less than 6% [2].

Thus, the use of AI will further enhance the uneven development of individual countries, which, paradoxically, will in the long term be the main factor in the growth of the world economy as a whole. What are the effects of AI on global economic growth? It is possible that the ongoing automation and intellectualization of production will offset the contribution of population growth to the exponential growth of the world economy, as AI contributes to an ever greater replacement of human labour. Theoretically, according to the researchers, AI can contribute to "... the creation of infinite income in a finite period of time" [1].

For the economies of countries such as China, the problem of leadership in the global AI market is most acute. In 2017, the growth rate of the Chinese economy is expected to slow down to 6.7% (by 2022 - to 5.8%) [8]. China is gradually losing its traditional drivers of economic growth: only two of them survived - the country's active foreign investment in infrastructure projects and the creation of fundamentally new technologies based on AI. That is why the country's leadership is pursuing a policy of achieving leadership in the field of intellectual development, gradually catching up with the United States in many ways. Analysts at the Boston Consulting Group (BCG) expect that 415 million new jobs will be created in the digital sectors of the Chinese economy by 2035, and the share of the digital economy in GDP will reach 48% [9].

The last aspect is fundamentally important: the economy of any country, introducing AI technologies, refuses a certain number of jobs, gradually replacing human labour.

However, in the economies of developing countries, where the branches of the digital economy have not yet been essentially created, the use of AI, on the contrary, leads to their creation, thereby contributing to increased employment.

Therefore, the idea that the development of AI systems and technologies negatively affects labour markets is not well-founded, especially when it comes to emerging markets.

---

What is the key implication of human labour replacement for economic growth?

The fact is that the massive replacement of labour as a factor of production will inevitably lead to a decrease in income in the respective national economies (if only because all employed people receive a certain income), and this already leads to a decrease in demand. Restrictions on demand in the context of a large aggregate supply of goods and services in the world economy will lead to even greater overproduction.

Despite the fact that earlier we indicated a slowdown in the growth of the world economy, nevertheless, in accordance with the available forecasts, in the long term, it is a group of key developing countries in terms of the volume of GDP created that will lead in comparison with developed countries [11, p. nine].

We considered two groups of countries - E7 (Emerging 7 - a group of leading developing countries: China, India, Brazil, Mexico, Russia, Indonesia, Turkey) and G7 (G7 countries: USA, Japan, Germany, France, Great Britain, Italy, Canada).

This leadership will strengthen in favour of the former (from the standpoint of our analysis, this is the same gap, but in favour of another group of countries, leading to another imbalance in the world economy).

In this regard, we believe that in the group of developed countries the use of AI technologies will be increasingly socially oriented, while in developing countries, on the contrary, it will be determined by the requirements of the development of industrial sectors.

It should be added that active participation in international trade for any country is also a significant factor in economic growth. Modern international trade is increasingly "digitalized": the export of information and communication services for the period 2010-2015 increased by 40%. The volume of e-commerce trade reached \$ 25.3 trillion, while the United Nations Conference on Trade and Development (UNCTAD) estimates cross-border deliveries using the "business-to-consumer" system (English - B2C - bussines4o-cusloter) at 189 bills. Dollars (7% of all e-commerce), while almost 42% of these supplies fall on only two countries - the United States and China [7]. The positive impact of AI on international trade lies primarily in increasing its mobility through ensuring more flexible operation of global supply chains, saving time for logistics and sales, introducing smart contracts into business practices, and increasing the availability of loans for trade finance.

The world is gradually witnessing a transition from traditional trade (starting in the 1920s) to e-commerce and further to trading using AI technologies [10].

At the same time, the growth of international trade mobility will inevitably lead to increased international competition, which, in turn, will increase the technological superiority of some countries and lag behind others. On the other hand, due to the limited use of AI in certain industries (for example, in the extractive industries, the requirements for technologies are not as great as in the manufacturing industries), international competition will reach the greatest extent in the service and high-tech industries. At the same time, the assessment of the involvement of different groups of countries in the world market of AI systems will remain an interesting object of special scientific research. We are talking about different countries not in terms of the level of their socio-economic development, but in terms of, for example, the capacity of markets (small

and large in terms of the territory and population of the country), the presence of “niche” industries in the national economy (for example, in the countries of Northern Europe).

## CONCLUSION

Analysing the role of AI as a new factor of production, one should identify the degree of its impact on national economies, assess its effects on internal economic growth. Equally important is the assessment of the implications of AI for assessing (and re-evaluating) the gains of countries from participation in international trade and its distribution among countries.

Another important aspect from the standpoint of economic growth: since AI is objectively a new category, this means that new goods and services can be created on its basis. This, in turn, shows that the volume of markets and the world economy as a whole can be expanded (although in the course of their evolution, markets have been constantly expanding, which was due to the influence of scientific and technological progress). If we compare the growth rates of the world market of AI systems and technologies and the growth of effective demand in the world economy, then the former is significantly superior to the latter. Considering that in the structure of world consumer demand there is an increasing substitution of traditional goods created based on AI, it should be understood that, in principle, the conditions for such substitution are still extremely limited. This alignment shows that the supply of goods and services based on AI will inevitably grow faster than demand.

And this is another limiting factor in the context of considering the role of AI in economic the growth of the world economy (i.e. in the long term, despite the rapid development of the global AI market, restrictions on this growth will remain).

### ABSTRACT

*This article reflects the complex issues of the effectiveness of the use of the credit module system in the higher education system and the introduction of the credit module system in higher education. Its purpose is to provide the necessary information on the organization of educational processes in the credit-module system of higher education. The article introduces and briefly explains the terms of the credit-module system, which allows getting acquainted with the basic concepts of the new system, to explain the education policy in different countries and the transition to a single multi-level international program.*

**KEYWORDS:** *Credit, System, Compulsory Subjects, Elective Subjects, Independent Study, Working Hours, Study Hours, Independent Work.*

### INTRODUCTION

In the system of "credit module" of education, which is gradually entering the system of higher education of the Republic of Uzbekistan, higher education institutions can develop catalogues (booklets) for each bachelor's or master's program and which subjects can be studied transparently by students, who teaches these subjects, giving detailed information about what knowledge, skills and abilities will be acquired during the program, after which the start of the academic year is one of its positive aspects. As part of the integration of the national education system into the global educational environment, the Government of the Republic of Uzbekistan and the Ministry of Higher and Secondary Special Education have developed strategic plans to ensure the comprehensive transition of our higher education system to the Bologna process. came out. . The concept of development of the higher education system of the Republic of Uzbekistan until 2030 has a special place in these processes [1-3].

At present, the credit-module system is being formed as one of the mechanisms for the integration of the higher education system of the Republic of Uzbekistan into the international educational environment. One of the unique features of this system is that it emphasizes the independent learning of students, which in turn shapes the lifelong learning skills of future professionals. Therefore, the next stages of modernization of higher education in the Republic of Uzbekistan are aimed at testing the credit-module system as a basis for the organization of the international academic education system [4,5].

## **MATERIALS AND METHODS**

The educational process in higher education is a complex process that includes many aspects, such as the development of organizational, managerial, educational activities for the preparation of highly qualified specialists.

The learning process consisted mainly of training sessions and monitoring processes. Courses include all types of academic preparation, student self-study and practice. The control processes show how well the students have mastered the curriculum.

The planning of the educational process is one of the important elements of the management of the educational activities of the university. It is carried out in the following stages:

- Initially, during the academic year, an academic calendar will be created, reflecting the main educational processes and the timing of their implementation;
- In addition to the standard curriculum, a list of optional subjects will be formed;
- After a typical curriculum and a list of optional subjects for each student, an individual curriculum is formed under the supervision of the registration office and the dean with the help of consultants;
- working curricula have been developed;
- working curricula of disciplines have been developed;
- After the working curricula of areas and specialities, the workload of departments is planned and the staff of the teaching staff and the loans allocated to them are approved;
- The program is designed in accordance with academic directions and groups.

The standard bachelor's program consists of 4 blocks:

- a) block of humanities and natural sciences;
- b) a block of general professional disciplines;
- c) block of special sciences;
- d) additional scientific block

The standard master's program consists of 3 blocks:

- a) block of general methodological sciences;
- b) a block of special sciences;
- c) block of elective sciences.

Disciplines in scientific blocks can be compulsory and optional. Compulsory subjects include the topics specified in the qualification requirements that must be mastered. Optional subjects include topics provided by the university at the request of staff.

Compulsory subjects are included in standard curricula along with credits assigned to them. Credits for elective subjects are determined independently by higher education institutions. Working curricula of the direction and specialization are developed on the basis of individual curricula of the largest contingent of students in order to optimize costs. Adaptation of the working curriculum to a wide contingent, which will fully cover the future professional activities of students, will increase the effectiveness of the educational process.

In the system of credit training, the volume of educational work is determined by the volume of training materials and is measured by credits[5-7].

Credit is a unit of measure for academic workload, which can be equal to 30 academic hours (in a 15-week semester). At the same time, the number of classrooms and independent study hours at the bachelor's and master's level can be 1: 1.

The size of each item is represented by the total number of credits. Considering that the average number of subjects does not exceed 40, each subject can be allocated on average  $240/40 = 6$  credits, and for subjects, there may be more or fewer credits. The share of classroom lessons in the working curriculum (lecture, practical, laboratory, etc.) is determined by the scientific and methodological council of the university based on the conclusion of the commission based on the methodology of teaching the subject. Each subject in the curriculum must have a unique name. At the bachelor's level, it is desirable that the number of subjects is small and the volume is large. When determining the share of compulsory and optional subjects in the curriculum, it is advisable to take into account the requirements for the level of teaching, the content of subjects and learning outcomes, the structure of disciplines and their interdependence and the degree of unification.

All types of internships and theses are carried out under the program of additional natural science education and are included in the total amount of credits. In the final semester, 15 credits for internship and 15 credits for postgraduate study are recommended. It is advisable to teach physical education in sports sections at the expense of additional subjects.

The total weekly workload is 60 hours at the undergraduate level, of which 30 hours are allocated for the classroom and 30 hours for self-study of students, including 8-14 hours of independent work under the guidance of a teacher. According to table 1, the student's time budget is as follows: theoretical lessons -  $240 \times 30 = 7200$  hours, including in classrooms -  $15 \times 240 = 3600$  hours, for independent work -  $15 \times 240 = 3600$  hours.

As you can see, the student's workload per semester is 30 credits and is a 1: 1 sum and an independent study load (240 credits: 8 semesters = 30 credits). The credit system of education provides for the planning of educational activities of teachers and students according to an individual educational trajectory for the current academic year.

At the heart of any educational process is an individual curriculum, which is developed by a student before the start of the educational process on the recommendation of a consultant. The basis for its development will be a standard curriculum, including compulsory and optional subjects specified in the qualification requirements. Individualized study programs should reflect

the needs of the labour market, the needs of employers and the interests of students. At the same time, they contribute to the formation of general literacy, socio-economic, organizational and managerial, general scientific, professional and specialized skills so that bachelors can freely find their place in the labour market and continue their studies in the future. Accordingly, when developing individual curricula in certain areas and specialities of higher education, a list of disciplines is recommended that will allow students to fully master the professional skills set out in state educational standards, and qualification requirements are given. For example, a Bachelor of Engineering provides general technical knowledge in the natural sciences, information technology, and engineering graphics. Accordingly, it is advisable to include subjects that are the basis of professional activity in the optional part of the general education block. Working curricula are based on the approved individual curriculum for all students. At the same time, it is very important to create conditions for a conscious approach for students. The level of professional training of a future specialist depends on how carefully thought out and improved the educational trajectory of students. Consequently, higher education institutions will have to organize consulting services in their organizational structures. The consultants can be both experienced teachers of specialized departments, whose students have the opportunity to formulate individual curricula and specialists of the enterprise who replace it. When drawing up an individual curriculum, the student must take into account the study of subjects in the amount of 30 credits per semester, which must include compulsory subjects in the standard curriculum.

The student also has the right to choose science teachers. Students must provide information on the academic level and status of teachers, as well as on the educational and regulatory documents they have developed. In order to create conditions for pupils to choose a teacher, there will be open lessons for teachers who want to teach science in the first week of the semester, the teachers' lessons must be scheduled at different times. One of the most important issues of educational activity is planning the workload of universities and departments. The norms of the pedagogical load must be approved before the planning of educational work. Currently, the norms of the teaching load are recommended by the Ministry of Higher and Secondary Specialized Education. In the current conditions of globalization and reforms in the field of higher education, several factors are on the agenda that determine the ranking of higher education institutions.

Therefore, it is advisable for each university to take them into account and make adjustments to the norms of the pedagogical load in terms of increasing its rating and organizing the educational process in a modern way. The provision of such opportunities to higher education institutions by the Ministry of Higher and Secondary Specialized Education creates a solid foundation for improving the efficiency of teachers and raising the ranking of higher education institutions.

Planning the workload of the department and the staffing of the department of higher education should be based on the working curricula of the bachelor's and master's degrees. In this case, the calculation of the study load is based on credits. Planning workloads in the context of a credit education system also depend on the number of academic streams and their capabilities. In the credit education system, academic streams and groups are formed depending on the number of students admitted to study subjects. In this case, in the first week of the academic semester, all candidates recommended for the study of the subject study on the basis of voluntary student participation, and the process ends with the enrollment of students in the subject of their choice. From next week, academic streams and groups will be formed based on the selection of students.

To determine the number of academic streams and groups, the university must determine in advance the permissible limits for the number of students for lecture, practical and laboratory classes in subjects.

The number of teachers will depend on the type of training load for the positions. The hierarchy of associate professors should be revised in connection with the transfer of all teaching positions to the credit training system. As a rule, the speaker can be a professor or associate professor, a tutor - assistants. In this case, the composition of speakers and teachers is determined based on the ratio of lectures and other types of lessons. The ratio of the total workload of a university to the number of professors determines the average workload per professor. The number of professors and teachers in higher education faculties is traditionally determined by dividing the workload by the average workload per teacher and rounding the result to 0.25.

## RESULTS AND DISCUSSION

It is advisable to differentiate the average workload of teachers of the department according to the positions of professors, associate professors and assistants. After that, the departments begin to plan and distribute the teaching staff based on the established workload. It is recommended that topics corresponding to a one-day teacher per semester are 3-6 in the faculties of the speciality.

The general pedagogical load of teachers includes all classroom loads (lecture, practical, laboratory, etc.), independent types of student work under the guidance of a teacher (accounting work, course work, thesis, master's work), qualification practice and others.

The planning process for the school year ends with the development of lesson plans, copies of which are distributed to teachers and students. When scheduling lessons, it is recommended to evenly distribute the workload of the teacher and students throughout the week.

The educational process is organized on the basis of approved curricula, academic calendar, staffing table, academic flow and groups, lesson schedule and independent work of students under the guidance of a teacher. All information on the organization of the educational process is posted in the windows of faculties and departments, as well as on the university website.

Higher Education Institutions operating in the credit system of education must create the most favourable conditions for their students to master special subjects within the framework of state educational standards and qualification requirements, as well as to complete their studies and obtain an academic degree. In this case, the university is responsible for the methodological support of the educational process. For this purpose, the following will be developed:

- a) information and instruction for each student;
- b) curricula for each subject (working curricula);
- c) teaching materials for classroom studies in subjects (lecture notes, descriptions of practical and laboratory classes, interactive handouts, multimedia applications, etc.);
- d) materials for independent work of students under the guidance of a teacher (homework and assignments, control materials for self-assessment, abstracts and term papers (projects) and methodological materials for their implementation, electronic teaching materials);

- e) materials for testing knowledge (written test assignments, written and electronic tests, exam tickets);
- f) materials used in qualification practice (plans and training programs, diaries, forms of reporting documents);
- g) materials for independent work of students (digests, frequently asked questions), curricula, platforms for distance learning and forums.

An important aspect of the educational process is the organization of students' enrollment in subjects (selection of teachers). To do this, students choose subjects under the guidance of a dean and the guidance of an advisor. In the first week of the semester, teachers are selected by attending classes and analyzing them.

Registration of students in the disciplines is carried out by the Registrar's Office (RO) in the following order:

1. A new student receives a working curriculum for the 1st year from the dean's office in August before the start of the course. After consulting with the Adviser and selecting subjects, he or she enrolls in the subjects of his or her choice during the first week of study, forms a personalized curriculum for his or her academic year, and meets science teachers by attending classes, answers questions of interest, and selects science teachers. After that, it is not allowed to change the individual curriculum for the current academic year.
2. In the first week of November of the fall semester and April of the spring semester, students select subjects for the next semester and make adjustments to their individual work plans. The amended individual curriculum is signed by the student and submitted to the RO.
3. The RO, in agreement with the deans, determines the minimum number of students studying in the disciplines, and for each teacher - the maximum number of students studying in the academic stream (group).
4. If less than the prescribed number of students are enrolled in an elective subject, that subject will not be opened and it will not be included in the working curriculum. The RO will announce this within a week in the information window and on the faculty page on the university's website. A student enrolled in a cancelled elective subject must re-select the subjects within one week of the announcement and apply them to the RO for changes to the individual curriculum. In shaping the student's personal educational trajectory and enrolling in elective subjects, the student's study of the underlying subjects (prerequisites) is taken into account, otherwise, the student will not have the right to choose this subject. It is also important for the student to know which subject (post requisites) will be the basis for the subject of his/her choice in the future.

The summer semester is one of the important components of the curriculum in the context of the credit education system. It is organized on a paid basis at the initiative of the student to obtain additional knowledge, transfer academic debts, and eliminate differences in the educational program.

The duration of the summer semester is determined based on the academic calendar by areas, specialities, and courses.

Studying in the summer semester is allowed in the following cases:

- Students with “good” and “excellent” grades (for additional education);
- students who did not pass the exam on the results of rating-control (for full mastery of the subject);
- students who have academic debts for previous academic periods (to apply for academic debts);
- Students who are recovering, transferring and returning from academic leave (so that they can eliminate differences in subjects).

The RO must take into account the GPA level of the students when allowing them to study in the summer semester. For example, a GPA of 3 or higher (B) allows you to study up to 4 subjects, and a GPA of 2.0-3 allows you to study up to 3 subjects.

The summer semester is organized according to the following regulations:

- before the start of the summer semester, the student applies to the RO with an application stating the reasons and interests of his / her study in the summer semester;
- RO reviews student applications;
- At the end of the spring session, the RO decides on the admission of students to the summer semester;
- The RO draws up a course schedule for the summer semester and submits it to the Vice-Rector for Academic Affairs after the student has paid the tuition fee. The course schedule is based on the free time of lecturers and tutors involved in the summer semester;
- The summer semester is organized according to the current system of assessment and the principle of independent assessment of students; In addition to the curriculum, the final assessments in the subjects organized based on students' interests can be carried out by lecturers and tutors who taught in the summer semester;
- RO is responsible for timely payments for the summer semester.
- The results of the examinations mastered in the summer semester in the disciplines of specialization curricula determine the level of GPA for the next academic year.

## CONCLUSION

Particular attention is paid to providing the educational process with normative and methodological working documents. It reveals the content and importance of new educational-methodical documents for students, for example, educational-methodical complexes of specialities and disciplines, catalogues of elective subjects.

The organization of educational processes in the credit-module system ensures the transparency of all types and stages of educational activities in higher education. The selectivity of education, the freedom to choose the individual educational trajectory, the regular monitoring and recording of students' mastery and achievements increase his interest in learning, his constant research and reading, self-improvement and engages in an independent study.

Thus, the proposed credit-module system, based on a comparative analysis of traditional and new approaches to the organization of the educational process, has the following advantages:

---

- increase the level of academic freedom (independent choice of subjects, setting deadlines, selection of teachers);
- the share of independent learning in the educational activities of students will increase (at least 50%);
- Ease of converting lesson schedules into a 5-day system (30 hours per week, 6 hours per day);
- the emergence of a developmental environment in the teaching activities of teachers (counselling classes, independent work of students under the guidance of a teacher);
- Decrease in the share of theoretical knowledge and increase the measurable practical skills of the student (criteria for the introduction of various interactive teaching methods, the continuation of practical training in independent teaching and their assessment through concrete activities);
- educational activities of students focused on independent research (study on the trajectory of individual education of their choice);
- to teach students to be independent in life, to allow them to study in different academic groups each semester;

**ABSTRACT**

*The article presents the results of research on the development of effective compositions of thermo-salt-resistant composite chemical reagents using local and secondary materials. Due to the high salinity of the reservoir water for the preparation of drilling fluids, water is brought from long distances and costs increase significantly. Based on the conducted research, we propose to introduce 3-20% (depending on the amount) of the KHR-R reagent to the composition of the drilling mud as an acid-soluble additive when opening fractured oil and gas reservoirs.*

**KEYWORDS:** *Composition, Chemical Reagent, Drilling Fluids.*

## INTRODUCTION

The big problem today facing the drillers of the oil and gas industry of our republic is the creation of reliable and affordable chemical reagents and drilling fluids that are resistant to the aggressive effects of high-pressure, highly mineralized water during rapaproyavlenie, used when drilling the salt-bearing strata of fairly stable rocks. The thickness of the rapaproyavleniya is from 500 to 1500 meters at the depth of the well 1500-3000 meters.

Brine consists mainly of melts of magnesium chloride ( $MgCl_2$ ) and magnesium sulfate ( $MgSO_4$ ) salts. When drilling salt deposits, the melt of these salts under reservoir pressure begins to push the working drilling fluid out of the well. As the upper zones of the borehole are reached, the melt cools and, when mixed with the working drilling fluid, crystallizes, which leads to the capture of the drilling tool. Most often, drilling operations are stopped and this well is preserved. Currently, there are several dozen such preserved wells in the western fields of Uzbekistan (Beshkent, Kultak, Zevasi, Pamuk), for which multimillion-dollar financial resources have been spent {1}.

The composite chemical reagents and drilling fluids based on them developed by us will be heat-resistant, will allow to deconservate the above-mentioned wells and accelerate the opening of productive horizons in these fields.

Another important problem is the use of reservoir water for the preparation of drilling fluids. Due to the high salinity of the reservoir water for the preparation of drilling fluids, water is brought from long distances and costs increase significantly. The composite chemical reagents developed by us will make it possible to obtain rapa-resistant drilling fluids using highly mineralized reservoir waters.

Thus, the development of technology for the production of composite chemical reagents for the preparation of rapa-resistant drilling fluids using highly mineralized reservoir waters is a very urgent problem {1-3}.

**Research objects.** The objects of research are caustic and soda ash, carboxymethylcellulose-CMC, polyacrylamide (PAA) and some inorganic mineral ingredients. Recently, in the course of carrying out research work on the development of effective composite chemical reagents for clay-free drilling fluids, we have chosen the composite chemical reagent-rapaproyavleniya (KHR-R) as the object of research.

**Research methods.** In determining the physical, chemical and operational characteristics of the developed composite materials, as well as organic and inorganic ingredients, methods, devices and installations were used in accordance with the relevant GOST standards adopted in the CIS.

**The results of the study.** The steady increase in the share of deep exploration drilling in the total volume of drilling operations constantly requires the creation and introduction of highly effective, cheap and affordable chemical reagents – stabilizers of drilling fluids.

Currently, when drilling oil and gas wells, a wide variety of chemicals necessary for drilling fluids, both domestic and foreign production, such as CMC, K-4, K-9, GIPAN, SSB, CSSB, NaOH,  $CaCO_3$ , USHR and others, are used, which are expensive and many of them are imported to Uzbekistan from abroad. However, these reagents do not always meet the requirements for reagents used in the complicated geological and technical conditions of Uzbekistan {4-5}.

We have developed composite chemical reagents for drilling in saline and chemical aggressive environments since it is stable to cations in polyvalent salts ( $Mg^{++}$ ,  $Ca^{++}$ ,  $Na^+$ ,  $K^+$ ). When developing new composite chemical reagents, we used local raw materials, waste from food production and waste from non-ferrous metallurgy. The main physical and chemical properties of the composite chemical reagent KHR-R (composite chemical reagent-rapaproyavleniya) are given in Table № 1.

**TABLE №1 PHYSICO-CHEMICAL PROPERTIES OF THE COMPOSITE CHEMICAL REAGENT-RAPOPROYAVLENIE (KHR-R)**

№	Name of indicators	Characteristics of the norm
1	Color	from light brown to brown
2	Consistency	Solid powder
3	Specific gravity, g/cm <sup>3</sup>	1,10
4	Solubility in water, %	97
5	Main substance, %	75
6	Mass fraction of total fat to the mass of KHR-R, %, not less	5,5
7	Conditional viscosity of 10 % solution, s	24
8	Acidity, 10% solution	11
9	Humidity, %	5

From Tables No. 1, it can be seen that the composite chemical reagent-rapoprevention has qualitative characteristics when used for drilling fluids, such as high acidity, water solubility, and partially affects the filtration of solutions.

At the suggestion of JSC "Uzgeoburneftegaz", laboratory tests were carried out in the Service Service for drilling and cement solutions of JSC "Neftegazispytanie" to obtain a weighted drilling mud based on the developed composite chemical reagent-rapaproyavlenie (KHR-R). The results of laboratory tests to obtain a formulation of weighted drilling mud based on the chemical agent KHR-R are shown in Table No. 2.

**TABLE № 2 TECHNOLOGICAL PARAMETERS OF WEIGHTED DRILLING MUD BASED ON KHR-R AND BARIT (UZBEKISTAN)**

№	Composition of weighted drilling mud	$\rho$ , g/sm <sup>3</sup>	T <sub>500</sub> , s	F, sm <sup>3</sup> /30 min	T <sub>10</sub> , mm	pH
1.	1000 ml R-Solution (Chulkuvar 39)	1,34	52	10	1,2	9
2.	No. 1 r-r + 100 g NaCl	1,38	64	12	1,5	7
3.	No. 2 r-r +60 g KHR-R	1,32	69	8	1,0	9
4.	No. 3 r-r +100 ml Oil	1,34	72	8	1,0	9
5	No. 4 r-r +1000 g barit (Uzbekistan)	1,81	195	8	1,0	9
6	After heating at 80 °C	1,81	90	8	1,0	9
7	No. 4 r-r + 5 g CMC 80°C	1,81	148	5,5	0,8	9

Table 2 shows that it is possible to obtain a weighted drilling mud with a density of 1.81 g/sm<sup>3</sup> based on the chemical agent KHR-R and CMC of Namangan production. The acidity of the weighted drilling mud based on the chemical agent KHR-P is reached to 9 without the addition of caustic or soda ash.

The composite chemical reagent-rapoprevention (CCR-R) also has a positive effect on the filtration properties as it has decreased from 12 sm<sup>3</sup>/30 min to 8 sm<sup>3</sup>/30 min. According to the results of the conducted laboratory tests, a production test was recommended at the fields No. 39 Chulkuvar of Uzgeoburneftegaz.

In well No. 39 Chulkuvar, production tests of weighted drilling mud based on composite chemical reagent-rapaproyavleniya (KHR-R) and CMC of Namangan production (CarboNam) were carried out. The well uses a rotary type of drilling design depth of 3600 m, salt-anhydrite strata from 2800 to 3200 m drilled with weighted drilling fluids based on the chemical agent KHR-R and CMC (CarboNam). The results of the production tests carried out in the well No. 39 Chulkuvar are shown in Table № 3.

**TABLE № 3 TECHNOLOGICAL PARAMETERS OF WEIGHTED DRILLING MUD  
BASED ON THE COMPOSITE CHEMICAL REAGENT KHR-R**

№	Date	Go deep on, m	Composition of treated weighted drilling mud	Specific gravity, g/sm <sup>3</sup>	Viscosit, T,s	Water recoil, sm <sup>3</sup> /30 min	pH	Crust, mm
1	4.03	2808	Initial clay solution	1,34	52	10	8	1,2
2	5.03	2808	Initial Solution + KHR-R (5%) + Oil (5%) + CMC (0.5%) + NaCl (2%) + Barite (40%)	1,60	56	8	9	1,0
3	6.03	2808	Initial solution + KHR-R (4%) + Oil (4%) + CMC (0.5%) + NaCl (2%) + Barite (30%)	1,76	58	8	9	0,8
4	7.03	2808-2812	Initial solution + KHR-R (2%) + Oil (1%) + CMC (0.4%) + NaCl (2) + Barite (10%)	1,80	61	7	9	0,7
5	8.03	2812-2864	Working solution + KHR-R (1%) + Oil (1%) + CMC (0.4%) + Barite (4%)	1,81	62	6	9	0,7
6	9.03	2864-2920	Working solution + KHR-R (1%) + Oil (1%) + CMC (0.4%) + Barite (4%)	1,82	63	6	9	0,6
7	10.03	2920-3092	Working solution + Na <sub>2</sub> CO <sub>3</sub> (0.5%) + CMC (0.4%) + CarboPac (0.1% kg) + NaOH (0.1%) + Barite(4%)	1,83	65	5	9	0,5
8	11.03	3092-3200	Working solution + Na <sub>2</sub> CO <sub>3</sub> (0.5%) + CarboPac (0.2%) + NaOH (0.1%) + Barite (4%)	1,84	68	5	9	0,5

After conducting a production test of the composite chemical reagent-rapaproyavlenie (KHR-R) at well No. 39 Chulkuvar to obtain weighted drilling mud, it can be seen that all the technological parameters of the drilling mud meet the standards specified in the GTN. With increasing concentration (KHR-R), the alkalinity of the solution increases, the filtration of the solution decreases, and the specific gravity steadily increases to the required value, since from 1.34 to 1.84 g/sm<sup>3</sup>.

## CONCLUSIONS

Thus, the KHR-R reagent developed by us allows us to comprehensively solve these problems and fully meets the requirements that are imposed on drilling fluids used in complicated geological conditions and in areas with highly mineralized reservoir waters and rapaproyav leniyami. The KHR-R reagent developed by us with the use of waste from various industries and local raw materials contributes to solving this problem and intensifying oil and gas production, hence increasing their production volume. Based on the conducted studies, a good compatibility of KHR-R with widely used chemical reagents (YSHR, K-4, CMC i gipan) in the composition of drilling fluids was revealed. Based on the conducted research, we propose to introduce 3-20% (depending on the amount) of the KHR-R reagent to the composition of the drilling mud as an acid-soluble additive when opening fractured oil and gas reservoirs. The addition of KHR-R to the drilling fluid composition will prevent irreversible blockage of cracks and pores of the productive formation with clay and the solid phase of the solution, will help preserve the natural permeability of oil and gas reservoirs, reduce the time of well development and lead to an increase in oil production. According to the positive technological parameters of the weighted drilling mud based on the composite chemical reagent-rapaproyavlenie (KHR-R) is recommended for drilling wells with salt-anhydrite deposits in the fields of JSC "Uzgeoburneftegaz".

**ABSTRACT**

*The objective of the article is to examine the marketing strategies of textile companies and improving the organization of textile production based on marketing research. The issues of marketing research methodology, especially the problems of pricing, have received considerable attention in recent years in the domestic literature. However, some aspects of the issue under study have not yet received sufficient coverage. The practical significance of the work lies in the possibility of applying to the use of refined methods for calculating prices and volumes of demand and supply at enterprises engaged in the production of an assortment of fabrics for consumer use.*

**KEYWORDS:** *Marketing Strategies, Textile Industry, Production, Market Environment.*

**INTRODUCTION**

With the transition of the domestic economy to market relations, the textile industry faced many problems, the main of which are: insufficient development of their own raw material base, lack of necessary information about the population's demand for fabrics, rising prices for factors of production and, as a consequence of all of the above, difficulties in strategic planning of financial and economic activities. The activity of an enterprise in a market environment requires a revision of the very function and planning tasks. The issues of marketing research methodology, especially the problems of pricing, have received considerable attention in recent years in the domestic literature. However, some aspects of the issue under study have not yet received sufficient coverage. These are practical calculations of the equilibrium prices of fabrics for consumer use and raw material factors, assessing the influence of various factors on the equilibrium price, and forecasting consumer demand for fabrics.

### **The main results and findings**

Particular attention should be paid to the problem of production forecasting as an effective method of conducting marketing research. A feature of production forecasting is that it encourages enterprise managers to analyze future changes in the external environment and the consequences to which these changes may lead. It should be borne in mind that due to a number of circumstances, namely: fluctuations in the economic environment, the instability of the situation in the commodity and financial markets, changes in the economic conditions of activity, etc., forecasting has become especially difficult.

The above problems of the topic under study confirm its relevance, determine the need for deepening research. Purpose of the study: development of organizational and methodological support for the automated workplace of the textile marketer.

In accordance with the set goal, the following tasks are formulated in the work:

- Study of the theory and generalization of the practice of organizational and methodological support of the marketing services of textile enterprises;
- analysis of the state of the markets for raw materials and products of textile production, identifying general patterns and trends in the domestic market for consumer textiles, world and domestic raw materials bases;
- Analysis of the use of flax fiber in the production of blended fabrics in our country and abroad;
- Development of methodological support for the AWP of the marketer of textile production;
- Research of the theoretical and methodological foundations of the formation of demand and supply of fabrics from natural fibers, demand and supply of raw materials for these fabrics;
- Development of recommendations for improving the determination of the forecast of the equilibrium price for fabrics and the raw material factor; ...
- Formation of the structure of the databases necessary for the functioning of the regional marketing center;
- Development of methodological support for forecasting the effective demand of the population for fabrics;
- Development of principles for the classification of human behavior options when buying fabrics;
- Refinement of the algorithm for determining the supply of fabrics and the algorithm for determining trends in the equilibrium price for flax fiber;
- Development of software for the automated workplace of a marketer of textile production for forecasting the market situation for fabrics and raw materials.
- Verification of the developed methodological support of the automated workplace of the marketer of textile production;

The subject of the research is the organizational and methodological support of the automated workplace of the textile marketer.

The object of research in the dissertation is the consumer fabrics market and the factors of production market (raw materials market). In the dissertation work, industry-specific methodological and regulatory materials on this issue were used, as well as materials from state statistics and statistics of enterprises in the textile and processing industries. The research was carried out using economic and statistical methods, a software package in the Pascal language was developed for processing initial data on personal computers.

The practical significance of the work lies in the possibility of applying to the use of refined methods for calculating prices and volumes of demand and supply at enterprises engaged in the production of an assortment of fabrics for consumer use. The workstation of a marketer of textile production will allow textile enterprises to respond more quickly to changes occurring in the domestic and world markets, and will increase the quality and efficiency of their work.

*Scientific novelty of the research.* In the process of performing the work, the following results were obtained with scientific novelty:

- 1) The tendencies in the change in the structure of the raw material base of the textile industry were revealed, which made it possible to determine the sequence of calculations to determine the equilibrium price for raw materials and finished products of the textile industry.
- 2) The composition and structure of the databank for the automated workplace of the textile marketer have been determined, including the architectonics of the databank, the source of statistical data, the determination of the time period for research and forecast.
- 3) When forecasting the price of flax fiber, the need to take into account such factors as the demand for flax in the cotton and woolen sectors of the textile industry is substantiated.
- 4) The methodological support of the AWP of the marketer of textile production has been developed, which includes:
  - A methodology for forecasting the demand for fabrics for consumer use;
  - An algorithm for determining the supply of tissues;
  - An algorithm for determining the generated demand for flax fiber in the textile industry;
  - An algorithm for determining the equilibrium price for flaxseed raw materials.

A distinctive feature of this technique is the ability to differentiate the effective demand of the population by income groups. The developed methodology provides the following methodological principles:

- The use of flax fiber in various branches of the textile industry;
- Real technological capabilities in various industries;
- The unity of the functional purpose of the products;
- Dependence of consumer behavior options on the size of the consumer budget.

- 5) The proposed method for forecasting demand uses a graphical-analytical approach to calculating the forecast of demand for fabrics, it includes three stages:

- Determination of the volume and price of consumption. The calculation is carried out according to the proposed dynamic parametric model, which takes into account the ratio of income and expenses growth. Depending on this ratio, a consumer behavior option is selected;
  - Construction of a demand curve based on the data obtained on the ratio of income levels of the population, prices and consumption of fabrics;
  - Determination of the forecast of demand for fabrics by the graphic-analytical method.
- 6) The equilibrium price for flax fiber has been determined, taking into account its use in the cotton and woolen industries.

The first chapter examines the theoretical and methodological aspects of the organizational and methodological support of the marketing services of textile enterprises, described in domestic and foreign literature, an analysis of the state of textile production at all stages of the process from processing of raw materials to the production of finished products is given, methodological foundations of forecasting prices for raw materials are developed, which made it possible to resolve the issues discussed in the subsequent chapters of the work.

The second chapter provides a methodological rationale for calculating the effective demand of the population for consumer fabrics, taking into account income differentiation, clarifies the methodological approach to developing the supply of fabric by textile factories in conditions of inflation, analyzes the specifics of determining the equilibrium price for finished products and for raw materials, taking into account the peculiarities of textile production.

The problems of the theory and practice of forecasting the demand for fabrics for consumer use, prices for fabrics made of natural fibers, prices for raw materials considered in the work allow us to draw some conclusions and make proposals for determining the price of flax fiber, provided it is used in various sectors of the textile industry.

The problems of improving the organization of textile production on the basis of a marketing approach using the forecasting method considered in the dissertation work allow us to draw appropriate conclusions and make proposals for the organization of marketing services on the basis of textile enterprises.

## CONCLUSION

1. The importance of the marketing approach to the process of improving the organization of textile production has been substantiated.
2. Analyzed the problems of theory and practice of organizing the activities of industrial enterprises on the principles of marketing, which made it possible to substantiate the need to use forecasting methods in marketing research.
3. The market for the sale of textile products has been analyzed, which has shown the need for close cooperation between the marketing services of manufacturing enterprises and consumers of their products in order to obtain objective information about consumer demand for textile products.
4. The necessity of studying the elasticity of demand for fabrics in view of the variability of the income level of their consumers has been substantiated.

5. Applied the method of forecasting demand based on the study of its elasticity in the implementation of marketing research.
6. Questionnaires have been developed for conducting sociological research among consumers of consumer goods, as well as among employees of organizations selling textile products.
7. The algorithm of the activity of a marketer of a textile enterprise is presented, which is based on the method of studying the elasticity of demand for fabrics.
8. A method for studying the elasticity of demand has been developed, which makes it possible to predict the demand for fabrics for consumer use using the graphic-analytical method. This technique allows:
  - to determine the existing demand for fabrics of consumers with different income levels and a certain type of behavior;
  - to determine the degree of influence of various factors on the behavior of the elasticity function of demand for tissue;
  - to determine the projected demand for fabrics in accordance with the needs of consumers and the capabilities of the enterprise.
9. A classification of factors influencing the elasticity of demand is proposed, which can be used in the organization of production in the implementation of forecasting in any industries producing consumer goods.
10. The algorithm for assessing the risk of the marketing activities of a textile enterprise has been refined.
11. Revealed the reasons that hinder the introduction of marketing services at textile enterprises.
12. The structural diagram of the organization of the marketing service at a textile enterprise is proposed, which is based on a functional segment orientation, with the designation of the directions of the main information flows.

#### ABSTRACT

*Microfinance is the provision of thrift, saving, credit and financial services and products of very small amount to the poor in rural, semi-urban and urban areas for enabling them to raise their income levels and improve their standard of living. (Sen., 2008). In numerous studies done across the world, it is generally believed that various microfinance initiatives have been able to make a difference in the target populations lives. However, increasing doubts have been raised over the financial sustainability of microfinance institutions. MFIs need to be economically viable and sustainable in the long run but economic implications of long term sustainability are not being considered (Srinivasan et al., 2006). Microfinance collectively refers to the supply of loans, savings accounts, and other basic financial services like insurance, to the poor. About one billion people globally live in households with per capita incomes of one dollar per day (Morduch J. 1999). Microfinance Institutions (MFIs) are special financial institutions. They have both a social nature and a for-profit nature. Their performance has been traditionally measured by means of financial ratios. The context of the study is to analyze the prospects of micro finance industry in Jaffna District special reference to MPCSC Co-operative Rural Bank. This study examines the relationship between efficiency of co-operative rural banks with its financial sustainability. The objective of the study is to evaluate efficiency and financial sustainability of microfinance institution in relates with its rate of interest, operating revenue, administration & operating expenditure, administrative, operating, and financial and staff efficiency. 10 rural banks were selected in Jaffna district using stratified random sampling method. Research hypothesis were formulated that there is an impact of efficiencies on financial sustainability and operational and financial efficiencies are significant impact in determining the financial*

---

*sustainability. Ratio analysis was used to evaluate the efficiencies of the rural banks. Findings say that there is a relationship exists between efficiency and financial sustainability.*

**KEYWORDS:** *Micro finance Institutions, Efficiency, and Financial Sustainability.*

---

## **INTRODUCTION**

Microfinance collectively refers to the supply of loans, savings, and other basic financial services like insurance, to the poor. As the poor people cannot avail these financial services from the formal commercial banks (because of the collateral requirements), microfinance tends to provide to them exclusive of these conditions. For these financial services, the poor people are willing to pay for because of the added advantage they receive for not collateralizing anything. The term also refers to the practice of sustainably delivering such services. More broadly, it is a movement that envisions a world in which as many poor and near poor households as possible have permanent access to an appropriate range of high quality financial services, including not just credit but also savings, insurance, and fund transfers (Christen, R. P., Rosenberg, R., and Jayadeva, V., 2004).

Microfinance institutions focus on providing credit to the poor who have no access to commercial banks. While microfinance institutions try to be financially sustainable, they appear to be often loss making. Nevertheless, they succeed in lending to domestic small companies and poor agents since Western donors and NGOs are still willing to provide financial support against below market interest rates. Recently, however, there seems to be a shift from microfinance institutions to a further focus on financial sustainability and efficiency. Financial sustainability and efficiency of microfinance institutions is obviously very important for a well-functioning financial system in developing countries.

### **Background and Significance of the study**

Microfinance began as a financial system to provide assistance to poor families in order to help them to begin and sustain income-generating activities. Micro credit arose in the 1970s, through the efforts of Mohammed Yunus, a microfinance pioneer and founder of the Grameen bank of Bangladesh.

Microfinance has evolved as an economic development approach intended to benefit low income groups. Asian Development Bank (ADB) has defined Microfinance as “the provision of a broad range of financial service such as deposits, loans, payment services and insurances to the poor and low income households and their Micro enterprises”. In this regard, Microfinance activities usually involve small loans, typically for working capital, informal appraisal of brewers and investments to repeats and larger loans based on debt capacity and repayment performance steam lined-loan disbursement and monitoring secure serving products.

The typically microfinance clients are low income persons that do not have access to formal financial institutions. Microfinance clients are typically self employed often house hold based entrepreneurs. In rural areas they are usually small farmers and others who are engaged in small income generating activities such as food processing and petty trade. In urban areas Microfinance activities are mire device and include shop keepers, service providers, artisans, street vendors etc.

The earlier paradigm was that Microfinance was an act of charity as lending for micro enterprises and the poor were not profitable. There were many deficiencies in such lending. That is repayments rates were low, unintended beneficiaries were large, inefficient operations and funds were often not used for the purpose for which they were given and the total outreach was not significant. Due to these reasons MFIs became unable to sustain in their operations. If MFIs should be sustainable it must be financially self-sufficient.

Even though microfinance institutions try to be financially sustainable, they appear to be often loss-making. Nevertheless, they succeed in lending to domestic small companies and poor agents since western donors and (Non Government Organizations) NGOs are still willing to provide financial support against below market interest rate. Recently, however, there seems to be a shift from microfinance institutions to a further focus on financial efficiency and sustainability. Financial efficiency and sustainability of microfinance institutions is obviously very important for well-functioning financial systems in developing countries.

### **Significance of the Study**

Microfinance is a well-integrated broad range of financial services provided to the poor and low income persons who are excluded from availing themselves of similar services from formal financial institutions. Thus policy makers have paid increasing attention to rural development as an important element of the national development strategy. They have recognized the need for providing financial services at micro level for achieving sustainable rural development and economic empowerment of the poor, which account for a very high proportion of the rural population.

Since, Microfinance can increase the availability of capital for developing income-generating micro enterprises and rural agriculture while providing savings and other financial products at village level for increasing the financial security of the poor and low income persons (A.S.Jeyawardene-2003). Due to this microfinance has emerged as a major instrument to provide financial facilities to low income group clients including the small entrepreneurs. Because of this, in recent times there is a huge demand for microfinance activities all over the world especially in developing countries like Sri Lanka. This reflected in rapid growth of the number of institutions engaged in microfinance activities.

If the microfinance institutions are financially sufficient, they will increase their capital base. This would in turn increase their capacity to expand the scale of their operation. Therefore,

- Finding of this research will help the institutions to find out the relationship between the efficiency of the operation and achievement of financial sustainability.
- Finding of this research will highlight the present situation of the co-operative rural banks in Jaffna district.
- Findings of this research will help the institutions to identify the factors which determine the efficiency of their operation and could help the institution to carry out their operation efficiently as well.
- Findings of this research will also help further research questions for further investigation in the future on financial sustainability of any MFIs in Jaffna and Sri Lanka.

### **Objectives of the Study**

The researcher has planned to carry out this study on the efficiency and financial sustainability of the microfinance. The objectives of the research are;

- To identify the relationship between efficiency and financial sustainability of co-operative rural banks.
- To find out the impact of efficiency on financial sustainability of selected cooperative rural banks.
- To find out the factors which determine the efficiency and financial sustainability.
- To evaluate the trend on efficiency and financial sustainability during the years of 2007, 2008, 2009, 2010 & 2011.
- To suggest the co-operative rural banks to improve or develop the operation in efficient manner in order to uplift the financial sustainability in its operation.

### **Research Problem**

The research aims to study the relationship between efficiency of co-operative rural banks and its financial sustainability. ‘ A financially self - sufficient credit institution must cover its operating expenses, loan losses and the cost of funds with the income earned from charging fees and interest (Jan Evers, Stefanie Jack, Adriaan Loef & Hedwing Siewertsen ,2000). Therefore the research problems are as follows;

1. Why efficiency of cooperative rural banks is low?
2. Do the rural banks perform their activities towards financial sustainability?

### **Literature and Hypothesis development**

The term “ Microfinance” pertains to the lending of extremely small amounts of capital to poor entrepreneurs in order to create a mechanism to alleviate poverty by providing the poor and destitute with resources that are available to the wealthy, albeit at a smaller scale. This particular form of lending has existed in the world for quite some time, though formalized by Mohammed Yunus in Bangladesh during the 1970’s. Yunus won the Nobel Peace Prize in 2006 for his efforts in combating poverty and resources to the poor via the Grameen bank and the microfinance model.

According to Otero (1999) Microfinance is “the provision of financial services to low income poor and very poor self-employed people”. These financial services according to Joanna Ledgerwood (2000) generally include savings and credit but can also include other financial services such as insurance and payment services.

Schreiner and Colombet (2001) define microfinance as “the attempt to improve access to small deposits and small loans for poor households neglected by banks.” Therefore, microfinance involves the provision of financial services such as savings, loans and insurance to poor People living in both urban and rural settings who are unable to obtain such services from the formal financial sector.

According to common definition of Asian Development Bank (ADB, 2000) “microfinance is the provision of a broad range of financial services such as credit, saving, insurance and money transfer for low income individuals or households”. The term low income used in the definition of microfinance is a relative concept; it varies from countries to countries or even among different areas within a country.

Microfinance is the provision of financial services to the poor who do not have access to capital and financial services (Kosiura, 2001). Financial services can include one or any combination of the following: lending, savings, insurance, pension/retirement and payment services. Increasingly mature MFIs also provide diverse products-housing loans (primarily improvements, repair and maintenance), insurance (both health and life insurance), and private pensions. Microfinance is also frequently combined with the provision of social and business development services, such as literacy training, education on health issues, management or accounting training.

The role of microfinance for development efforts around the world, particularly for poverty alleviation has been significant. Providing poor people with access to financial services are seen to reduce capital market distortions to exclude the poor, reduce vulnerability by providing the poor with financial resources when needed, and opportunities for income-generating activities. Microfinance enables clients to protect, diversify and increase their income, as well as to accumulate assets, reducing their vulnerability to income and consumption shocks (Robinson, 2002).

Similarly, microfinance refers to as “the provision of loans, savings, payments and other basic financial services to low income populations. Microfinance activities involve small loans, employ collateral substitutes, streamline procedures and offer swift and frequent access. Their clients cover typically self-employed, low income entrepreneur and households in both rural and urban areas” (Imboden, 2005).

### **Efficiency**

Efficiency ratio provides information about the rate at which microfinance institutions generate revenue to cover their expenses. Efficiency refers to the cost per unit (Joanna Ledger wood, 2000). Efficiency measures how well the available resources are utilized to maximized output (Monica brand, 2000).

Efficiency is defined here as the amount of outputs per unit of cost. Costs are defined as expenses recorded in the organizations accounts a long with any unrecorded expenses or implicit Subsidies. Outputs of a microfinance organization may be the amount of the loan portfolio or the number of loans outstanding or the number and amount of loan disbursed. (Claudio Gonzalex - Vega, Mark Schreiner, Richard L. Mayer, Jorge Rodriguez & Serigo Navajas, 1996).

A number of accounting variables reflect the efficiency of the microfinance institutions. These accounting variables are administrative expense ratio, number of loans per loan officer and loan officers to total staff, portfolio size, loan size, lending methodology, source of funds and salary structure as the efficiency drivers and hence as the measurements for MFI efficiency.(Todd Forrington, 2000)

### **Studies Related to Efficiency**

Avishay braver and Monica brand (1991) argues that purely supply driven credit schemes must be transformed into self sustainable systems and rural financial intermediaries must become viable and self carrying agents. Intervention in rural financial markets of developing countries should focus on re-structuring and strengthening rural financial institutions and remove obstacles to the efficient functioning of rural credit markets.

Reinhard schmid (1994) found that credit technology also one of the determinants of cost minimization process or institution's sustainability. The study discloses individual based credit technology giving benefits to the borrower in the form of reduced transaction costs.

USAID (1995) in this study they argue the prerequisites to operational efficiency appear to include the adaptation of an effective service delivery methodology and significant institutional competence in such areas as delinquency control information management and staff development.

Hume David and Paul Mosley (1996) pointed out that operational efficiency is of paramount significance as it has a direct bearing on the quality of lending and the rate of defaults. The rate of defaults is the single most important factor in cost as the interest rate has to be enhanced considerably to off-set the amount of defaults, other cost, remaining the same.

Cecile Lapenu [1999] conducted a study which relates to efficiency of the MFIs, as Distribution, Growth, and performance of MFIs in Africa, Asia and Latin America. The study reveals that by continent Asia accounts for the largest volume of savings and loans. It employs the largest number of MFI staff, but has lower personnel costs than Africa and Latin America. At the same time staff productivity in Africa is low as the continent still faces the constraints of poor infrastructure, undiversified economies and high transaction costs as well as poverty and illiteracy among potential Clients. All of this limits transaction volume per staff member.

David Richardson (2000) describes that the achievement of the efficiency in the operation is the vital condition. He prescribed the seven doctrines of success for micro lenders or micro lending institutions. One of his doctrines emphasizes that "by broadening base, increase loan size, and revaluating salary and incentive structures on micro lending institutions can continue to provide high quality services to their clients while lowering its operating expenses".

The study of USAID (2001) based on operation efficiency of the MFIs. According to the study, its success in holding down administrative cost plus loses from bad loans strongly affects its overall financial suitability. Further the study argues that attainable level of operational efficiency differ according to local performances, the methodology pursued by the MFIs and the target group that rural financial intermediation is very expensive less attention has been directed towards microfinance programs operate efficiently.

Todd Forrington (2000) in his study rightly pointed out that improving efficiency is an effective way of reducing the interest rate charged to borrowers. Based on his Latin American MFIs study, MFIs can wring significant efficiencies from operating process and systems. The study highlights some efficiency innovations employed by leading Latin American MFIs. They are easy access to information is must essential client information also enhances efficiency, specialized products for low risk borrowers can reward repayment performance and simultaneously lower administrative expenses specialized loan officers also can improve

efficiency, borrow per screening and geographic concentration of loan officers in specific zones is efficient and it reduces credit risk.

Craig Churchill and Dan Coaster (2001) argue that efficiency remains one of the greatest challenges for MFIs. It reflects an organization ability to manage costs per unit of output and thus is directly affected by both cost control and level of outreach. Inefficient MFIs waste resources and ultimately provide clients with poor services and products as the cost of these inefficiencies are ultimately passed on to clients through higher interest rates and higher client transaction costs.

Monica brand and Julie Gerschick (2001) argue that high level of operating efficiencies in microfinance is unfortunately the exception rather than the rule. The reason is twofold. First many MFIs have not fully exploited the minimum economies of scales required to improve efficiencies. There are many small MFIs serving to few clients to operate efficiently. Second many MFIs still operate in non competitive environment where there is little pressure to improve efficiency given that high operating costs often can be covered by charging higher interest rates. Further they argue that MFIs can improve efficiency in three ways;

1. Increase the number of clients to achieve greater economies of scale.
2. Stream line system to improve productivity and
3. Cut costs, the first two goals are closely related both seek to increase the no of clients, or units of output.

The MFIs serves by having staff work harder or preferably smarter. In MFI that are not managed in a businesslike manner, employees often have excess capacity. Third goal addresses cost side of the equation. Administrative cost including salaries and other operating expenses, represent the greatest component of the cost structure of an MFI. Reducing the delivery costs associated with providing financial services improves operating efficiency. If these costs can be reduced the savings can be passed on to clients through more competitively priced products, ultimately improving customer satisfaction. Improving efficiency should however be of paramount importance to MFIs from a social as well as a financial perspective. Competition market saturation will prevent many MFIs from charging undifferentiated high interest rates in perpetuity for inefficient MFIs facing these conditions that only way to maintain self-sufficiency is via larger loan which are typically not well suited to lower market segments and thus may conflict with the designed social mission. Thus efficiency is critical for a MFI to remain agile competitive and responsive to client needs.

Indrani Hettiarachchi (2003) argues that sustainability of MFI in any country depends on their ability to operate efficiency and gain the confidence of the community as reliable institution capable of providing the required services. This depends on the acceptability of MFIs by the clients, funding organizations, and the regulatory mechanism of the country.

### **Financial Sustainability**

Financial sustainability is defined as the ability of microfinance institutions to cover actual operating expenses as well as adjustments for inflation and subsidies with adjusted income generated through its financial services operations. Financial sustainability implies commercial leverage for donors and repeat use for customers (Mark Schreiner, 1996).

Financial sustainability refers to the ability of an MFI to develop a diverse resources based on that it could continue its institutional structure and production of benefits for intended clients' population after support cessation of donor financial support (Naser Abdelkarim, 2002). The concept of financial sustainability means that a program must meet its operational expenses entirely of out of the income generated by the services it offers to its clients. That is an institution should be maintained by its clients not by donors (Robert Peck Christen, 1997).

Full financial sustainability measures how well a MFI can cover its costs taking into account a number of adjustments to operating revenues and expenses. The purpose of most these adjustments is to model how well the MFI could cover its costs if its operation were unsubsidized and it was funding its expansion with commercial cost liabilities. Financial sustainability can be gauged by an organization's net income (the surplus of revenues over expenses); liquidity (the cash available to pay bills); and solvency (the relationship of assets and debt or liabilities). Again, this manual promotes a broad, interdisciplinary role for financial management, as one component of overall sustainability.

Many factors influence the financial sustainability of an organization, including the operating environment, national and local politics and policy, the activities of other organizations, the availability of skilled personnel, Institutional innovations, Strong commitment and political support for change, Learning and experimentation, New products appropriate for the poor, Long term banking relationship, Procedural simplification, Enabling macroeconomic environment and Reforming a government bank to reach the poor. Understanding the nature and impact of these influences on the organization and programs is critical because it better prepares to anticipate and respond to changes in the external environment in order to generate sufficient resources to consistently meet the clients' needs.

There are varying degrees of sustainability, and therefore some organizations are more sustainable than others. The "starting point" is different for each organization: each has strengths that can be enhanced and weaknesses that can be improved upon. For example, some organizations always require international donor funding, while others may be able to generate sufficient funds through cost recovery and local donations.

### **Studies Related to Financial Sustainability**

Berenbach and Guzman (1992) in their study revealed that lending methodology also one of the Determinants factors for the sustainability of the MFI since a dysfunctional methodology may produce various manifestation of weakness, such as poor quality portfolio, high clients' desertion, and difficulty enforcing contracts, the inability to reduce cost sufficiently or to achieve sustainability. Further he pointed out that to become sustainable MFI may change their methodology to increase scale and improve efficiency since decision to modify product pricing costs and increase staff productivity have significant ramifications on the lending methodology.

Claudio Gonzalez- Vega (1994) explains that the sustainability generates compatible incentives for all those with an interest in its survival, such as clients, managers, and the staff because it underpins of the microfinance organization's permanency.

Claudio Gonzalez – Vega, Mark Schreiner, Richard L. Mayer, Jorge Rodriguez & Serigio Navajas(1996) conducted a case study about a microfinance institution in Bolivia, in their study they reveal that organizational design and technological development also contribute financial

sustainability of an institution. Leaders' attitudes about sustainability gradually lead through a process of search for formalization to self sustainability. According to them, this concern will also reflect among other things. Such as adoption of interest rate policies those seek to cover the costs of lending and in a resolute attitude toward loan collection. Further their lending technologies always appropriate its market niche. The study pointed out that success of on the development of a microfinance program rests on the accumulation of knowledge and experience about the environment in which it operates relevant features of the clientele it series, the individual credit worthiness of heterogeneous clients, this success requires constant time- turning and adjustment of the technology to varied local circumstances. In this way, the particular institution always in line with these concepts. Payton (1997) conducted a study as outreach and sustainability, comparative analysis of savings first vs. credit – a comparative analysis of eight MFI in Africa. In his study he argues “ability to reach large number of clients with financial services in the long run is a function of their financial viability is necessary to reach the poor”. However, he pointed out that “a program that reaches the very poor”. But relies on donor fund is wasteful in several ways.

Mark Schrenier (1997) revealed sustainable MFI helps a lot of poor people through a time frame. At the same time understandable MFI helps just a few people through a short time frame. He argues that this sustainability requires profit since profit perfect the permanency. That is when the donors leave this will protect the institution. But, sustainability requires more than just financial sustainability from profit. According to his argument, are you of high profit and strong performance do not mean a MFI is sustainable. Therefore he places several conditions. If financial sustainability last in the long run. Such as structure of the rules and incentives and the system of organization prompt. He emphasizes that sustainability is meeting goals now and in the long term with subsidized funds replaced with market funds.

Jan Evers, Stefanie Jack, Adriaan Loef, Hedwing Siewertsen (2000) according their book the sustainability is divided into four different levels;

1. High subsidized programs grants and soft loans cover operating expenses and establish the revolving loan fund. The fund erodes due to loan losses and inflation. There is a permanent need for subsidies and grants.
2. Fully revolving fund interest earned covers the cost of funds and some operating expenses. Grants are required to finance some operational expenses.
3. Operational sustainability income covers cost of funds and operational expenses. However, some element of subsidy remains due to the financial cost of maintaining the value of a revolving loan fund in a high inflationary environment or of paying commercial rates of refinancing cost.
4. Financial sustainability or FSS: all costs are covered with interest and fees charge by the organizations and funds are raised at commercial rates from formal financial institutions.

Moreover, institutions that do not cover 100 percent of their operational costs will remain dependent on donations or government subsidies to maintain their current activity level. A drop in subsidies would automatically deplete loan capital and result in a reduction in the number of borrowers using the institution. Institutions that cover more than 100% of their operational costs

but do require funds for lending. Institutions that cover operational & financial costs are fully sustainable.

Paul (1997) in his study point out transaction costs of lending and borrowing are major barrier to providing access to micro credit services for the poor on a sustainable basis.

Mohsmmst Mazirwam (2003) argues that strengthening institutional capacity is one of the key issues for the sustainability of the microfinance sector. String institutions together with good governance will be able to provide good quality financial services to the poor increase their outreach significantly and achieve financial sustainability.

Otero (1999) argues to be successful financial intermediaries that provide services and generate domestic resources must have the capacity to meet high performance standards. They must achieve excellent repayments and provide access to clients and they must build forward operating and financial sustainability. According to the study, in order to do so MFIs need to find ways also to broader their resources base.

Canadian International Development Agency (1999) in their reference guide clearly pointed out that gradually changing has as more MFIs decrease their donor dependence. Some became totally non-dependent to maintain their non-operations. They further revealed that this being done by contribution of changes including;

- Increasing scale of operations.
- Improving the efficiency of delivery of the financial service.
- Setting appropriate interest rate policy.

All these build up the institution to become sustainable.

David Richardson (2000) states that to achievement of the efficiency in the operations is the vital condition. He prescribed seven doctrines of success for micro lenders or micro lending institutions. One of his doctrines emphasized that by broadening base increase loan size and re-evaluating salary and incentive structures on micro lending institution can continue to provide high quality services to their clients while lowering its operating expenses.

### **Methodology**

When the research population is seen large or in extreme, the researchers mostly use samples of research because it is difficult to take as a whole for the research. Jaffna's microfinance sector is served by a diverse range of institutions. These can be segregated into the following broad categories,

- ✓ Co-operative rural banks and other co-operatives
- ✓ Thrift and credit co-operative societies (TCCSs/ sanasa societies)
- ✓ Samurdhi bank societies (SBSs)
- ✓ Non government organizations (TRRO, etc)
- ✓ Licensed specialized banks
- ✓ Other financial institutions (commercial banks, registered finance companies,etc)

Regarding the research, there are several microfinance institutions in Jaffna district. But all MFIs have not properly provided or maintain the data in microfinance activities. So, co-operative rural banks were selected for this research. In the case of co-operative rural banks, there are 31 rural banks which are functioning under 23 MPCs in Jaffna district. For the purpose of this research 10 rural banks were selected under 10 AGA's division or DS's division by using stratified random sampling method.

### Hypotheses

Based on the conceptual model and the research question the following hypotheses are taken in this research;

H<sub>1</sub>: There is a relationship between efficiency and financial sustainability of co-operative rural banks.

H<sub>2</sub>: There is an impact of efficiencies on financial sustainability of co-operative rural banks.

H<sub>3</sub>: Operating and Financial efficiencies have significant impact on financial sustainability of co-operative rural banks.

### Data Analysis

The efficiency and financial sustainability which is based on the calculated ratios are presented in the form of statistical output.

**TABLE 1: CORRELATIONS MATRIX FOR RURAL BANKS**

	Administrative efficiency	Operating efficiency	Financial efficiency	Staff efficiency	Financial sustainability
Administrative efficiency	1				
Operating efficiency	.084	1			
Financial efficiency	-.228	-.497	1		
Staff efficiency	-.281	.261	.220	1	
Financial sustainability	-.200	-.691*	.651*	.256	1

\*. Correlation is significant at the 0.05 level (2-tailed).

Table 1 describes the correlation between efficiencies and financial sustainability for cooperative rural banks. The value of correlation between administrative efficiency and financial sustainability of rural banks is -.200 which is not significant at 0.05 levels, represent weak negative relationship between administrative efficiency and financial sustainability of rural banks.

The value of correlation between operating efficiency and financial sustainability of rural banks is -.691\* which is significant at 0.05 levels; represent strong negative relationship between operating efficiency and financial sustainability of rural banks. Therefore, when operating expenses reduces financial sustainability of cooperative rural banks in Jaffna district increases.

The value of correlation between financial efficiency and financial sustainability of rural banks is .651\* which is significant at 0.05 levels; represent strong positive relationship between financial efficiency and financial sustainability of rural banks. Therefore, when financial revenue from loan portfolio increases financial sustainability of cooperative rural banks in Jaffna district increases.

The value of correlation between staff efficiency and financial sustainability of rural banks is .256 which is not significant at 0.05 levels; represent weak positive relationship between staff efficiency and financial sustainability of rural banks.

### The Impact of Efficiency on Financial Sustainability

Efficiency and financial sustainability of microfinance institutions is very important for a well functioning financial system in developing countries, financial sustainability is equally important for any microfinance institutions as is wide outreach. Here multiple regressions are used to identify the relationship between efficiency and financial sustainability.

**TABLE 2 REGRESSION ANALYSIS FOR RURAL BANKS**

Dependent variable	Independent variable	Beta	Standard error	R <sup>2</sup>	t	Sig
Financial sustainability	Administrative efficiency	.064	4.589	.852	.348	.742
	Operating efficiency	-.772	3.525		-3.492	.017
	Financial efficiency	.583	.054		2.876	.035
	Staff efficiency	.154	8.923		.703	.513

Table 2 reveals the multiple regression summaries. In this model the specification of four variables (administrative efficiency, operating efficiency, financial efficiency and staff efficiency) revealed the ability to predict financial sustainability ( $R^2=.852$ ). Respective  $R^2$  value of 0.852 denotes that 85.2 percent of the observed variability in financial sustainability can be explained by the differences in four independent variables namely administrative efficiency, operating efficiency, financial efficiency and staff efficiency. The remaining 14.8 percent is not explained which means that the remaining 14.8 percent of the variance in financial sustainability is related to other variables not depicted in this model (such as environmental factors, competitors etc). In the above table 4.16, t values are significant for independent variables namely financial efficiency and operating efficiency. (p value < 0.05).operating efficiency has negative correlation as well as financial efficiency has positive correlation which means financial sustainability increases with increasing level of financial efficiency and decreasing level of operating expenses.

### Hypotheses Testing

**H1: There is a relationship between efficiency and financial sustainability of co-operative rural banks.**

This hypothesis is subdivided into three because; efficiency includes Administrative efficiency, operating efficiency, financial efficiency and Staff efficiency.

**H1<sub>a</sub>: There is a negative relationship between Administrative efficiency and financial sustainability of co-operative rural banks.**

When considering the above table 4.15, correlation value between administrative efficiency and financial sustainability is -.200. so there is a weak negative correlation between them. This implies that when administrative expenses decreases financial sustainability can increase in a small level. Because it is not significant at 0.05 levels. So H1<sub>a</sub> is accepted.

**H1<sub>b</sub>: There is a negative relationship between operating efficiency and financial sustainability of co-operative rural banks.**

When considering the above table 4.15, correlation value between operating efficiency and financial sustainability is -0.691\*. so there is a strong negative correlation between them. This implies that when operating expenses decreases financial sustainability can increase in a larger level. Because it is significant at 0.05 levels. So H1<sub>b</sub> is accepted.

**H1<sub>c</sub>: There is a positive relationship between financial efficiency and financial sustainability of co-operative rural banks.**

When considering the above table 4.15, correlation value between financial efficiency and financial sustainability is +0.651\*. So there is a strong positive correlation between them. This implies that when financial revenue increases financial sustainability can increase in a larger level. Because it is significant at 0.05 levels. So H1<sub>c</sub> is accepted.

**H1<sub>d</sub>: There is a positive relationship between staff efficiency and financial sustainability of co-operative rural banks.**

When considering the above table 4.15, correlation value between staff efficiency and financial sustainability is +0.256. So there is a weak positive correlation between them. This implies that when staff efficiency increases financial sustainability can increase in a small level. Because it is not significant at 0.05 levels. So H1<sub>d</sub> is accepted.

**H2: There is an impact of efficiencies on financial sustainability of co-operative rural banks.**

According to the table 4.16 administrative, operating, financial and staff efficiencies have greater impact ( $R^2 = 0.852$  OR 85.2%) on Financial sustainability of co-operative rural banks. so H<sub>2</sub> is accepted.

**H3: Operating and Financial efficiencies have significant impact on financial sustainability of co-operative rural banks.**

According to the table 4.16, both operating efficiency and financial efficiency have high beta value of 0.772 & 0.583 are respectively. At the same time both are significant at 0.05 levels. Because P value of operating efficiency is .017 ( $p < 0.05$ ) and financial efficiency is 0.035 ( $p < 0.05$ ). so H3 is accepted.

**Findings of the Study**

Any research is carried out to find out truth. Based on the presented data and data analysis, findings are identified. To conducting this research four different types of efficiencies were considered. Then how these efficiencies impact on financial sustainability was analyzed by using

statistical tools. Based on the correlation and regression analysis many findings related to the relationship between efficiency and financial sustainability is identified.

The value of correlation between administrative efficiency and financial sustainability of rural banks is -0.200 which is not significant at 0.05 levels, representing a weak negative correlation between the administrative efficiency and financial sustainability of rural banks. The value of correlation between operating efficiency and financial sustainability I of rural bank is -0.691\* which is significant at 0.05 levels, represents a strong negative relationship between the operating efficiency and financial sustainability of rural banks.

The value of correlation between financial efficiency and financial sustainability of rural banks is +0.651\* which is significant at 0.05 levels, representing a strong positive correlation between the financial efficiency and financial sustainability of rural banks. The value of correlation between staff efficiency and financial sustainability of rural banks is +0.256 which is not significant at 0.05 levels, representing a weak positive correlation between the staff efficiency and financial sustainability of rural banks. 85.2 % of the observed variability in financial sustainability can be explained by the differences in four independent variables namely administrative efficiency, operating efficiency, financial efficiency and staff efficiency. The remaining 14.8% is not explained which means that the remaining 14.8% of the variance in financial sustainability is related to other variables.

### **Overall Findings of the Research**

- Rural bank of MPCs utilizes its retail earnings to the portfolio investment (outstanding).
- Financial assets of the rural banks of MPCs are utilized efficiently every year.
- There is not enough staff for rural banks to carry out their activities.
- There is a high level of gearing or leverage and which trend is in on increasing manner every year.
- There is an increasing trend of administrative expenses and operating expenses over the year's from 2007 to 2011.
- Major revenue source of more rural bank is interest income from direct investment in head office and banks.

### **Suggestions and Recommendations**

Suggestion to manage rural banks' efficiency and to increase their financial sustainability. In this analysis, it is given that how efficiency deals with sustainability. So, suggestions are presented to manage the efficiency and to increase sustainability. Some suggestions are given to manage the microfinance institution's efficiency. They are;

- The management of microfinance institutions should reduce their administrative and operating expense. Then only they can provide more loans to existing customers by extending maximum loan limit and they can attract new customers.(increasing efficiency)
- The management of MFIs increases the loan to borrower through reducing the interest rate.
- For sustainable development of rural banks, a mechanism must be there to help the poor farmers or borrowers instantly and quickly in the event of any emergency need.

- The office layout system is very poor in public sector. Therefore, department head should establish proper layout system in their office.
- A rigorous and deeper investigation is required to find out the ways to prevent the misuse or inappropriate use of credit by borrowers and encourage the clients to settle the loan quickly.
- Operating income should be increased for set off the transaction cost of rural banks. Therefore, interest rate structure should be reviewed, and appropriate interest rate should be determined scientifically.
- Rural banks should maintain their records properly. For this, they should completely computerize their activities quickly and very accurately.
- When they introducing new loan system or work scheme, they should provide proper training to their loan officers for loan recovery and group decision making should be encouraged.
- Importantly, the rural banks should recruit new loan officers and staff for providing their services to the clients effectively and staff for providing their services to the clients effectively and staff should work at office from 9 am to 4 pm.
- The co-operative rural banks should follow flexible conditions for getting the loans. They should encourage clients to invest in important sectors to develop our country.
- MFIs officers should not do in same work continuously. They should transfer another subject to every two or three years, by which they can't feel degradation among their work.

### **Suggestions for Future Research**

- This research has been done, taking the Jaffna district as a sample. But, future researcher should take other districts as samples.
- There are 31 rural banks which are functioning under 23 MPCs in Jaffna district. This research has taken only 10 rural banks as sample. But, the future research should take more than 20 rural banks as sample.
- This research was carried out based on only give years from 2007 to 2011.this types of research require long rue period.

UZBEKISTAN

### **ABSTRACT**

*This article discusses the prospects for the development of small business and private entrepreneurship in Uzbekistan, based on the achievements of advanced science and innovative technologies, the development of small business and private entrepreneurship. Private entrepreneurship can be active only in certain areas, so it is necessary to create the necessary conditions for the development of small business. For this, in our opinion, it is necessary to create financial funds. This shows that there are great opportunities for the development of entrepreneurship in rural areas. At the same time, it is necessary to redistribute the surplus labor force engaged in agricultural production to service, processing and so on.*

**KEYWORDS:** *Private Entrepreneurship, Small Business, Prospects, Development, Market Economy.*

### **INTRODUCTION**

One of the essential goals of building a socially oriented market economy in Uzbekistan is the priority development of small business and private entrepreneurship in the country. To achieve this goal, economic reforms have been carried out, and large institutional frameworks have been created to enhance its role. These include legal and regulatory documents governing the organization of entrepreneurial activity, non-governmental organizations and enterprises that assist entrepreneurs. The establishment of a complex of private entrepreneurship and small business in Uzbekistan is successfully underway.

### **The main results and findings**

The main factor in the sustainable development of our economy is innovation. With the help of innovative technologies, it is possible to deep restructure small businesses and private entrepreneurship and further increase productivity. It is known that today small business and private entrepreneurship play a leading role not only in accelerating the growth of the national economy, but also in addressing the issues of employment and improving living standards, which are relevant today.

The compactness and mobility of small business, its ability to adapt to changes in market conditions and consumer needs will help it to overcome the negative effects of the global financial crisis and create new jobs and increase incomes in the context of sustainable post-crisis economic development.

Indeed, by ensuring the consistent development of small business and private entrepreneurship, our country is achieving the formation and strengthening of the middle class, which is the socio-political support and foundation of our society. Therefore, we must now not only increase the number of small businesses, but also develop them, first of all, qualitatively, in this regard, we must pay special attention to the transition from simple production to complex, high-tech production focused on domestic and foreign markets.

In our opinion, the development of small business and private entrepreneurship in Uzbekistan based on advanced scientific achievements and innovative technologies and increase its efficiency is an important necessity due to the following factors:

- ❖ first, the fact that small businesses have the ability to adapt to changes in market conditions and consumer needs has a positive effect on the introduction of innovative technologies in terms of low risk compared to large enterprises;
- ❖ secondly, the introduction of innovative technologies in the activities of small businesses will reduce their high transaction costs and increase profitability;
- ❖ third, the potential of small businesses to absorb innovations quickly allows them to earn high returns from the commercialization of innovations;
- ❖ fourth, the introduction of innovative management technologies in the activities of small businesses will increase their export potential and competitiveness by reducing the cost of their products, increasing the range of goods and services, expanding sales of new types of goods and developing promising markets for products.

Small businesses can create jobs independently of the state, that is, without large capital investments, reduce the shortage of temporary goods, and even eliminate this shortage completely. In today's society, it is necessary to direct the activities of small businesses to meet the needs of individuals. This is evident in the field of consumer services and consumer goods. Small businesses also play an important role in introducing technological innovations.

The number of small businesses and private entrepreneurs in our country and the volume of their products is growing every year. Laws of the Republic of Uzbekistan "On Enterprises", "On Property", "On Guarantees of Free Entrepreneurship", Presidential Decrees, Resolutions of the Cabinet of Ministers and others it is organized on the basis of supporting documents.

In the context of scientific and technological development, small business and private entrepreneurship are increasingly finding their place in the transition of leading industries to new technologies. They demonstrate the basic connective quality of the whole system, which provides the work process with new ideas and improvements in production, the introduction of new information technologies.

Today, small business and private entrepreneurship operate in all sectors of the economy, in the production of machinery, consumer goods, agriculture and food, and other areas.

The products produced by small businesses and private enterprises differ from the products produced by state-owned enterprises in terms of quality and, in some cases, even higher. 60-70% of the activities of small business and private entrepreneurship in the country are directly related to production, they are farmers, industrialists and processors of agricultural products, etc.

Compared to large companies, small enterprises adapt quickly to market conditions and have a number of advantages in ensuring the success of their products in the market. This is due to the fact that small businesses are quickly adapting their activities to narrow production programs, advanced technology, the production of low-demand science-intensive products, and quickly master the basics of the market.

According to the forms of ownership, the following types of small enterprises can be distinguished:

- State-owned small businesses
- Small businesses based on community ownership
- Small businesses that operate on an individual basis based on the property of citizens
- Rental businesses
- Small joint ventures.

There has been a steady increase in the number of small businesses in the country in all sectors of the economy, including transport, communications, healthcare and other non-manufacturing sectors.

Small business and private entrepreneurship are also gradually developing in the field of foreign economic activity. The main exports of small businesses are agricultural, textile, processing, electrical products and handicrafts.

The above analysis shows that in recent years in the Republic of Uzbekistan, enterprises engaged in private entrepreneurship, small business are being established in all sectors of the economy. At the same time, the role and importance of small businesses in the economy is growing. The role of private entrepreneurship and small business in the development of the national economy is characterized by:

- ✚ private entrepreneurship provides the necessary speed in a market economy, creates deep specialization and branched cooperation in production, without which high efficiency is impossible;
- ✚ creates the necessary competitive environment for the market and is characterized by the ability to quickly change the type of production in response to changing market demands;

✚ it is able to quickly fill the gaps in the consumer sector and quickly recoup the investment made using the latest machinery and technology.

Small business and private entrepreneurship and everything connected with it are an important and integral part of the organizational structure of modern social production. Therefore, small business and private entrepreneurship play an important role in the development of the state economy and are supported by the state.

Private entrepreneurship and small business are finding their place in the context of accelerating the development of science and technology, the transition to new technologies in advanced industries. Such entrepreneurship is an integral part of the whole system, which provides work with new information technologies, new ideas and modernization of production. In addition, small businesses are one of the preferred forms of production in high-risk conditions.

Small businesses also play an important role in introducing technological innovations. Small businesses, which adopt new technological ideas faster than large enterprises, have less risk and can get things done faster than large-scale production. This can contribute to the development of scientific and technological progress in our conditions.

While acknowledging the positive role of small business and private entrepreneurship in the development of the economy, it is also wrong to overestimate its importance. Private entrepreneurship can be active only in certain areas, so it is necessary to create the necessary conditions for the development of small business. For this, in our opinion, it is necessary to create financial funds. These funds should guarantee entrepreneurs to obtain soft loans in commercial banks, serve as a source of subsidies, including non-repayable subsidies (for the development of enterprises in certain priority sectors of the economy).

Improving the system of financial support for small businesses in Uzbekistan should be aimed at stimulating the activities of banks, funds, investments and insurance companies that provide services to small businesses and private entrepreneurship. In the Republic of Uzbekistan, as in other countries, the company can receive soft loans if it participates in the priority state program (creation of new equipment, development of remote areas, etc.). At the same time, the minimum interest rate and long-term repayment are the main conditions for lending.

## CONCLUSION

Deepening economic reforms, development of small business and private entrepreneurship is one of the main directions of economic reforms in the country. This requires the development of economic competition, filling the consumer market with goods and services, as well as the creation of a wide range of private entrepreneurs. With this in mind, today the Republic needs to address the following issues:

- introduction of a wide range of the population to market activity, elimination of their dependence, consumer psychology, arousal of the population's desire to be actively engaged in private entrepreneurship, small business;
- radical renewal of economic relations in agriculture, further development and increase in the number of farmers and farms, the creation of small businesses in the regions to provide additional jobs for the temporarily unemployed;

- acceleration of market relations and infrastructure in the region, creation of conditions for the development of economic competition;
- creation of economic and social conditions that will fully meet the growing needs of the population of the republic;
- sharply increase the range and scope of services provided, ensure a high level of organization of banking, auditing, consulting and various intermediary activities on the basis of modern science and technology;
- creation of conditions for increasing the efficiency of management of enterprises, ensuring their economic independence;
- introduction of small enterprises that can produce goods for export, filling the consumer market with goods that can easily adapt the types and volume of products produced locally to market requirements.

It is known that more than 65% of the able-bodied populations in the country live in rural areas. This shows that there are great opportunities for the development of entrepreneurship in rural areas. At the same time, it is necessary to redistribute the surplus labor force engaged in agricultural production to service, processing and so on. Addressing organizational and economic issues at various levels of government related to the development of entrepreneurship and its small businesses in rural areas is one of the priorities.

## MILITARY REFORMS AND MILITARY TRAINING IN THE REPUBLIC OF UZBEKISTAN

**Ravshan Siddikov\***

\*Assistant Professor, Candidate Of Historical Sciences,  
National University Of Uzbekistan, Named After Mirzo Ulugbek,  
Tashkent, UZBEKISTAN

### ABSTRACT

*In article it is examined many-sided activity of country for reform of armed forces of the Republic of Uzbekistan, corresponding modern demands and processes of becoming mobile, scanty, good armed modern army, and also problems of formation of the system of highly qualified national officer specialists and development of higher military education on the base of practical learning of achievements and experience of foreign countries.*

**KEYWORDS:** *Armed Force Of The Republic Of Uzbekistan, Modern Army, Reforms In Military Sphere, National Military Specialists, The Higher Military Institutions, And Military Education.*

### INTRODUCTION

From the first days of independence, the First President of the Republic of Uzbekistan Islam Karimov - Commander-in-Chief of the Armed Forces, has always paid great attention to the reform of the Armed Forces and its modernization in line with modern requirements [1]. It is known that the main goal of military reforms is to create an army that is modern, small, mobile, well-armed, able to effectively address strategic and tactical tasks and protect the country's sovereignty, security and territorial integrity, as well as peace and stability from any aggression. To this end, a long-term program of building and organizing the Armed Forces on a completely new basis, taking into account the rapidly changing socio-political situation in the world, based on the "Concept of National Security of the Republic of Uzbekistan" adopted on August 29, 1997 by the Decree of the First President Islam Karimov. developed. [2]. At the initial stage of the formation of the Armed Forces of the Republic of Uzbekistan, the main focus was on organizational and structural issues, primarily the creation of military districts, border and military units in key areas. Also, the composition of the Armed Forces was optimized by

combining the Military Air Force and air defense troops into a single center. At a later stage, in order to improve the military system, the United States was newly formed-the Armed Forces, capable of solving operational and strategic tasks, embodying the defense force of the country, which is subordinated to a single center, which unites the important joints of all Armed Forces on the basis of the General Staff.

### **The main results and findings**

In order to ensure the potential of the military personnel of the Armed Forces of Uzbekistan at the modern level, schools of training of sergeants in all military districts began their activity. On a planned basis, the composition of the Armed Forces was replenished on a contractual basis. In recent years, the combat readiness of military units of the Armed Forces of Uzbekistan has been steadily increasing. As a result of the reforms, the transition to a professional army on a contract basis is almost complete. Over the past period, the material and technical and educational base of military schools and sergeant training schools have been strengthened and modernized, as well as equipped with modern computers, the introduction of information and communication technologies in the educational process. As a result, it is possible to train and educate a new generation of highly qualified national military personnel.

At the same time, the Government of the Republic of Uzbekistan pays constant attention to the provision of the Armed Forces with modern weapons and military equipment. At the same time, close military-technical cooperation with leading countries, including the Russian Federation, the People's Republic of China and others. established.

In military construction, special attention was paid to the social protection of servicemen of the Armed Forces and their families, and the issues of providing them with housing and medical care were implemented on the basis of targeted programs. Today, Uzbekistan has a small modern army and plays an important role in maintaining peace and stability in Central Asia.

It should be noted that in a short historical period, as a result of gradual reforms, the Armed Forces of the Republic of Uzbekistan has acquired the most potential, well-trained army in the region, equipped with modern equipment.

Today, great attention is paid to increasing the combat readiness of the Armed Forces, strengthening its organizational structure and further improving the joint action of all military districts and types of troops. The increase in the share of sergeants and contract servicemen in the army, the reduction of military service by one year has led to a radical change in the morale of the Armed Forces and the morale of the military.

As a result of gradual reforms and modernization based on the adopted Military Doctrine and a comprehensive long-term program, modern standards of command and control of the Armed Forces, and possibly a theater of military action, take into account the peculiarities of the rapidly changing world situation. , a new system based on the practical mastery of the experience and achievements of foreign countries has been formed.

An entirely new organizational structure of the Armed Forces and its main combat units were introduced. As a result, the speed, mobility and combat readiness of military units have been increased. Most importantly, the independence and responsibility of commanders at all levels has been increased. Operational special units of the Armed Forces have also been established in key

strategic areas. Much attention was paid to the preparation of special units, their provision with modern weapons.

The fact that special forces played a key role in the suppression of international terrorist groups that invaded the mountainous areas of Surkhandarya and Tashkent regions proved the correctness of the chosen path. One of the most pressing issues in the process of formation of the Armed Forces of the Republic of Uzbekistan - the training of military personnel and the improvement of military education is one of the main directions of the system of the Ministry of Defense. Theoretical foundations of the formation of the military management system and training of military personnel in Uzbekistan were presented by the First President of the Republic of Uzbekistan Islam Karimov. developed in his works entitled.

Indeed, in order to form a system of training national military personnel, in accordance with the Resolution of the Supreme Council of the Republic of Uzbekistan "On military units and military educational institutions located in the territory of the Republic of Uzbekistan" on January 14, 1992. The existing military schools were also taken over by the Republic of Uzbekistan.

The first president of the Republic of Uzbekistan Islam Abduganievich Karimov addressed the problems in the field of military construction in the early years of independence in his work "our National Army is a strong guarantee of our independence, peaceful and peaceful life": "the most difficult problem we faced in this regard was the issue of personnel in the army. At that time, there were very few local personnel in the ranks of the military. In 1990, local officers insisted that only 0.6% of the migrants in our country were in the military presence in the country, and 4% were in the military presence in the country.

In order to solve this problem, the military education system has been radically reformed. A number of higher military educational institutions have been set up to train military personnel with sufficient military service potential. Currently, the Tashkent Higher Military Command, Chirchik Higher Tank Command-Engineering, Jizzakh Higher Military Aviation Schools, Tashkent University of Information Technologies are preparing highly qualified personnel in various military fields.

In 1995, on the initiative of the First President of the Republic of Uzbekistan Islam Karimov, the Academy of the Armed Forces of the Republic of Uzbekistan, the only one in Central Asia, was established. This institution is tasked with training and retraining of qualified officers, as well as coordinating modern, innovative scientific and practical research and development in the military sphere, the development of military education in our country. In 2012, the Faculty of Military Medicine was established at the Tashkent Medical Academy. Training of highly qualified medical officers, reserve and reserve officers with high intellectual potential, regular increase and retraining of military and professional training of medical personnel of the Armed Forces, deepening of special knowledge and skills, conducting research in the field of military medicine. defined as the direction of activity.

Today, the higher military educational institutions of the Ministry of Defense of the Republic of Uzbekistan are training highly qualified officers for our Armed Forces in about 30 areas. An effective system of training, retraining and advanced training of officers and sergeants has been created in the country. Higher courses and the Academy of the Armed Forces of the Republic of Uzbekistan. These educational institutions provide servicemen with the opportunity to improve

their professional, theoretical and practical knowledge, experience and skills in military activities.

In accordance with the Decree of the First President of the Republic of Uzbekistan Islam Karimov dated April 19, 2005 "On additional measures to improve the system of military education in the Republic of Uzbekistan" [5], largescale reforms were carried out in all military educational institutions. This allowed young military specialists to improve their professional skills and improve their training process. All conditions have been created for future officers to receive a thorough knowledge of martial arts and academic sciences on the basis of modern training programs. In this regard, it is necessary to dwell on the activities of the Tashkent Higher Military Command School. Indeed, the Tashkent Higher Military Command School, the first of the modern military educational institutions in the Republic of Uzbekistan, has a rich history and now plays an important role in the training of highly qualified officers with higher special military education. Today, this educational institution is one of the leading institutions of higher military education, which trains highly qualified officers to fill the command and tactical units of the general and border units of the Armed Forces. Since 1992, more than 6,000 officers have graduated from this higher military education institution. 500 of them graduated with honors. Due to its rich material and technical base and high intellectual potential of cadets, Tashkent Higher Military Command School won the competition "The most advanced higher military educational institution" of the Ministry of Defense of the Republic of Uzbekistan for the fifth time [6].

The Military Doctrine of the Republic of Uzbekistan pays special attention to improving special military education, taking into account global threats and the threat of religious extremism and terrorism in the world. For this purpose, the faculty of training specialists in counter-terrorism and special operations was opened at the Chirchik Higher Military School of Command and Engineering [7].

To date, the military academy has trained tank and airborne units, as well as commanders of anti-aircraft missile units and engineers of tank units.

Thus, as the first president of the Republic of Uzbekistan Islam Karimov said in the festive greeting to The Defenders of Vatan on the occasion of the 24th anniversary of the establishment of the Armed Forces of the Republic of Uzbekistan "the development of a new co-operation in the field of military construction in the organization of the modern Armed Forces of It should be noted that this conciliation is based on the comprehensive consideration of the peculiarities of the old, the passing of its life, the complete rejection of decisions in one mould, perhaps the theater of military actions under arrest, as well as the rapidly changing situation around us, near and far, as well as on the practical assimilation of the experiences and achievements. In short, as a result of the reforms carried out in the military sphere in the Republic of Uzbekistan, the Army was restored, capable of protecting the country's security and peace League from any aggression, modern, well-armed, fast-paced and highly qualified officers, meeting the requirements of the globalisation period.

## CONCLUSION

It is known that the Law on Defense Doctrine of the Republic of Uzbekistan, adopted on December 18, 2017, defines the principles and approaches to ensuring the national security of the Republic of Uzbekistan in the military sphere, which confirms the doctrinal nature of the

doctrine □ 9 □ . This, of course, is a sign that Uzbekistan is committed to a peaceloving policy. In 2021, the Armed Forces of Uzbekistan took 51st place in the Global Firepower Index, one of the most prestigious rankings in the world. Of the neighboring Central Asian states, the Republic of Kazakhstan ranks 62nd. In total, the list includes 138 countries, whose military strength is assessed on the basis of more than fifty factors. The Uzbek army is recognized by the authoritative publication as the strongest in Central Asia and one of the strongest in the CIS [10]. Of course, this recognition is a high assessment of the reforms carried out in the military sphere in recent years under the leadership of the President of the Republic of Uzbekistan, Commander-in-Chief of the Armed Forces Shavkat Mirziyoyev.

## THE ROLE OF THE TEACHER IN ENSURING THE QUALITY OF EDUCATION

**Shaniyazova Dilafruz Sabirovna\***

\*Senior Lecturer,  
 Department of Pedagogy,  
 Psychology and Education Management of Kashakadarya,  
 UZBEKISTAN

### ABSTRACT

*This article deals with the importance of the teaching profession in society, the attention paid to it and the growth of the status, honor and dignity of teachers in our country. Although he was a disciple of Aristotle, known throughout the world as the first teacher, he acknowledged the wisdom of the elders and learned much from our people. During the years of independence, raising the prestige of the work of coaches, the main executor of education, the prestige of teachers has also become one of the important issues within the government. In this process, the teacher suffers a lot, experiences hardships. That is why students should feel indebted to the teacher for life. Even if a student achieves a royal position, it is worthwhile to serve the teacher.*

**KEYWORDS:** *Aristotle, Hardships, Independence*

### INTRODUCTION

The teaching profession has been glorified since ancient times, and the scholars of the East, in their invaluable spiritual heritage, have shown boundless respect and reverence for the Master and embodied in their image the image of a perfect man who can be an example to all. At the same time, there are a number of requirements for these professionals, including the following requirements for teacher etiquette in Navoi's Mahbub-ul-qulub:

- The teacher should not treat children according to the position and wealth of their parents;
- The teacher should teach children what they know, not try to teach what they do not know;
- Defects such as arrogance, pride, greed, ignorance are qualities that are alien to the teacher's ethics;

- The teacher must stay away from bad deeds, impurity;
- Teachers, who are considered scientists in the eyes of the people, should be able to refrain from bad deeds and corruption.

One of the oldest manuscripts in the world, the Book of Avesto, which was created on our soil 30 centuries ago, reads: Education should be the most important pillar of life. It is necessary to bring up every young person in such a way that he first rises to the highest level by organizing good reading and songwriting.

According to Greek historians, Alexander the Great had a conversation with the elders of the people when he was shooting from a country between two rivers. Although he was a disciple of Aristotle, known throughout the world as the first teacher, he acknowledged the wisdom of the elders and learned much from our people. One day, when Alexander was asked why he valued his teacher more than his father, he replied: My father raised my body and brought it down from heaven to earth. My Master, on the other hand, nurtured my spirit and raised it from earth to heaven.

Indeed, the role of teachers in the development of great scholars is invaluable. The minister and scholar Abu Nasr ibn Iraq saw a boy on the outskirts of the city, immediately noticing his talent and raising him. Abu Nasr shows paternal love to the child and teaches him as a teacher. This child grows up and is known to the world as an encyclopedic scholar Abu Rayhan Beruni.

The teacher-student Mirzo Ulugbek and Ali Kushchi embody many wisdom of life. Mirzo Ulugbek, Ali Kushchi was dedicated to growing up as a leading scientist, and the student showed dedication in promoting his teacher's scientific heritage to the world.

Yes, when we say a teacher, we mean a radiant image of selfless people who bring up people who contribute to the peace of the country, the prosperity of the Motherland and the well-being of the people. Thankfully, thanks to the services of such teachers, a harmoniously developed generation is growing up in our country, laying the foundation stones for the great future of Uzbekistan. During the years of independence, raising the prestige of the work of coaches, the main executor of education, the prestige of teachers has also become one of the important issues within the government. This has expanded the ranks of dedicated teachers, inspiring the teaching community to creative endeavors. Thanks to the hard work of our teachers, today's schools in Uzbekistan are becoming the cradle of true virtues, the threshold of recruitment to greatness.

Many talented students of our country take high places in international science Olympiads, music and art festivals, sports competitions. Teachers of such students, who spread the fame of our country to the world, deserve the Hero of Uzbekistan, People's Teacher and other high awards of our Motherland.

After all, the President of the Republic of Uzbekistan Sh. Mirziyoyev, while giving the necessary instructions to raise the prestige of the teacher, said in a video conference on June 21, 2018 that I do not respect those who do not respect the teacher. Such attention to the teacher will definitely serve the development and prosperity of the country.

Following the adoption of the Presidential Decree No. PQ-3931 of September 5, 2018 on measures to introduce new principles of governance in the public education system, the law No. ID-1852 on the status of a teacher was adopted in accordance with this decision. It is safe to say

that the fact that the law guarantees the honor and dignity of teachers has encouraged teachers in our country to work more diligently, not to lag behind the requirements of the times, and to help their students to become full-fledged adults in the future.

In addition, the increase in teachers' salaries by an average of 2.5 times over the past three years, the introduction of additional incentives for teachers working in remote areas, serve to increase the willingness of dedicated teachers to work harder and achieve greater success in education.

From the above considerations, it is clear that the teaching profession is not only difficult but also honorable. At this point, the question arises as to what is his hardship and what is his honor. We found it necessary to answer this question with the following thoughts of Navoi, that is, in his opinion, sometimes one person is unable to bring up one child, and the teacher teaches science to several children. In this process, the teacher suffers a lot, experiences hardships. That is why students should feel indebted to the teacher for life. Even if a student achieves a royal position, it is worthwhile to serve the teacher.

From this point of view, a person who loves his profession and enjoys his work is truly happy. Awakening every morning with the desire to see a few disciples, to contribute to the upbringing of the next generation, and to send compassion to innocent hearts is the pinnacle of happiness.

## LINGUODIDACTIC BASES OF TEACHING OF THE TOURISM TERMS IN ENGLISH LANGUAGE AT EDUCATIONAL SYSTEM OF UZBEKISTAN

**Nishanova Khafiza Vafokulovna\***

\*A Researcher of Uzbekistan State World Languages University,  
 UZBEKISTAN

Email id: hanifa\_81@mail.ru

### ABSTRACT

*In this scientific article it is described that the problem of teaching students to linguodidactic bases of terms. Linguodidactics as a general theory of foreign languages learning, in the process of teaching terms about tourism specialty requests taking into consideration the linguistic peculiarities of those terms. Thus, the purpose of studying the terms related to tourism in English is to increase the vocabulary of students in the profession and to form their skills in working with texts related to tourism in English. It is necessary to take into account the achievements of modern linguistics, to generalize the modern perception of terms by students in English and to provide continuous training to future professionals, as well as the need to create a new generation of textbooks on terminology.*

**KEYWORDS:** *Method, Methodology, Linguistics, Tourism, Tourism Industry, Didactics, Vocabulary, Technology, English, Uzbek, Language, A Principle Bases, Foreign, Term.*

### INTRODUCTION

Resolution of the President of the Republic of Uzbekistan dated December 10, 2012 No PR-1875 "On measures to further improve the system of learning foreign languages" increasing the demand for common culture, the formation of readiness for international and intercultural cooperation [1].

Resolution of the President of the Republic of Uzbekistan dated August 13, 2019 No PR-1875 "On measures to further develop the tourism industry in the Republic of Uzbekistan" provides for further development of tourism in the Republic of Uzbekistan and training of qualified personnel in this field [2].

Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. RCM-433 of July 10, 2020 "On measures to create favorable conditions for the restoration and development of tourism in the Republic of Uzbekistan" also states that licenses for entrepreneurs engaged in tourism are written in at least two languages. indicates the need for a thorough study of terms in the field [3].

According to above mentioned facts, in present days successful results of the sciences that are connected with teaching methods of foreign languages are causing to develop significantly foreign language educational methods. The status of the foreign languages has changed in our society, the function of foreign languages is getting wider, we can observe this situation while preparing the students for any special professions. Nowadays one of the important problems on all stages of educational system, such as on higher educational system is to research new methods and techniques of teaching of foreign language, because it is being paid significant attention to develop teaching process.

Didactics is a theory of teaching, and in a wider sense, a theory and practical application of teaching and learning. In demarcation from "mathetics" (the science of learning), didactics refers only to the science of teaching. This theory might be contrasted with open learning, also known as experimental learning, in which people can learn by themselves, in an unstructured manner, on topics of interest. The theory of didactic learning methods focuses on the baseline knowledge students possess and seeks to improve upon and convey this information. It also refers to the foundation or starting point in a lesson plan, where the overall goal is knowledge. A teacher or educator functions in this role as an authoritative figure, but also as both a guide and a resource for students [4]. Methodology of teaching foreign language is inseparable part of the lingo-didactics.

Linguodidactics – a branch of science studying the patterns of students' evolution with a new language and culture in conjunction with their native language and culture [5].

In present days English language is one of the dominance languages that is being used in the world. Science, technics, culture, education, social and economic sciences as well other types of subjects cannot be imagined. Furthermore, the demand of the modern world is that every specialists and employees must have knowledge and experience about English skills. Especially, future employees of the tourism industry have to know specific tourism terms. Because, while they will have a conversation with tourists, of course they use English language.

Terms and tourism branches are two social phenomenon that depend on each other. Modern society cannot be imagined without tourism industry. Tourism industry is one of the important drivers to increase gross domestic production (GDP) of the country. Representatives of tourism industry describe and attract their clients, tourists, guests and visitors by the help of means of language. So, language is important means that provides collaboration between social, cultural and economic branches.

While using the language it is not always possible to describe the meaning of objects, phenomenon and their situations by the help of one word only. Therefore, sometimes the objects, phenomenon and their situations should be described with joining of two or more than collocations of terms.

People analyze their life experience that they achieved of course with word. Because, every happened phenomenon is described by the help of specific words. A word describes

understandings as a part of language. The collections of terms in language consist of tourism terms as a system of words. Teaching of tourism terms consists of base of the teaching languages.

The most important elements in topics about tourism industry are exactly terms. About this Catrin E. Morris mentioned that “Tourism is a multi-billion dollar business with hundreds of millions of travelers arriving in destinations across the world every year, but there’s a lot more to tourism than just the tourists” [6].

“*Tourism Studies and the Social Sciences* is based upon a multi-disciplinary social science approach to understand the significance and role of tourism in contemporary society. It introduces social science disciplines to the reader and applies relevant theories to the understanding of tourism.” [7].

It is an important issue to divide the differences between terminological part of philological science and understandings of nomenclature for learning new terms. The word “Terminology” was created from Latin word “terminus” and Greek word “logos”. It means “a science that is about specific terms” [8].

As A.A. Reformatskiy mentioned, the main function of terms is to name things and phenomenon. So, in functions of terms mainly nouns are used [9]. Also, R. Doniyorov said that, “The terms that consists of only nouns can be object of terminology” [10]. Also, F.S. Abdullayva mentioned that Linguodidactic basis of legal terms teaching in English consist of mainly nouns [11].

## **MATERIALS AND METHODS**

Students should have knowledge and experience about properties of tourism terms, namely their creating methods. Therefore, during the lessons of course it is necessary to pay attention to linguistic properties while teaching terms in English. Because, every term is inseparable part of all literature vocabulary of language.

## **RESULTS AND DISCUSSIONS**

While teaching English language linguistic properties of terms should be paid attention as followings:

- In English main terms consist of alone lexicon collocations, they are not divided to meaningful morphemes. For example: tour-qisqa sayohat, travel-uzoq masofali sayohat, hotel-mehmonxona, ticket-chipta, sightseeing-diqqatga sazovor joy, tourist-sayohatchi, guide-yo'l ko'rsatuvchi, etc.;
- while teaching terms about tourism, we should pay attention that might be multi-component terms;
- according to construction collocated terms, they might consist of two, three or multi-component tokens: cultural tourism-madaniy turizm, gap-year tourism-maktab yoki oliy ta'lim yoshlari biror masofaga borib ko'ngilli bo'lib, ham ishlab ham sayohat qilishlari, low environmental impact-past darajali muhit ta'siri, five-star hotel-besh yulduzli mehmonxona, etc.;

- although one component terms are not many, they are described as soft terms and they mean differently and they are mainly created by prefix: uncleared-tozalanmagan, unpaid-to'lanmagan, unconvertable-o'zgarmaydigan, etc.

While working with topics about tourism, learning lexical materials is performed by two steps:

1. Learning new vocabulary.
2. Starting to use the terms in the process of speech (it is a period to make perfect primarily the materials).

During the step of learning new vocabulary, the information of term is explained about its form, meaning and using position. Explaining the meaning of term (systemizing) is traditional method, in functional methodology it is not described as specific stage. Before presentation of term in learning language, the information is presented about term in students' mother tongue.

It was defined that teaching method with comparing Uzbek and English terms is more effective according to results of experiments about teaching tourism terms at tourism faculties of Universities. When terms in English language and Uzbek language were compared, their properties were defined as following:

- Partly suitable to terms in Uzbek language of terms in English language;
- Terms about tourism industry that are not met in Uzbek vocabulary;
- Pronunciation of English word is not suitable to pronunciation of Uzbek word;
- There are multi-component terms in Uzbek language too like in English language;
- There is a difference between the meaning of words that were transferred from English language to Uzbek language and etc.

While teaching terms about tourism in English language the experience of students about language should be paid attention. Because, students' language experience about tourism terms in Uzbek language influences to teaching process of pronunciation, reading, writing of tourism terms in English language. This influence can be positive and negative, as a results of negative influence "interference" might be appeared.

Students' experience in their mother tongue influences effectively when they learn English tourism terms as following two situations:

- Students can make some sentences by using terms as if their mother tongue when they describe their opinion, because the position of terms in English sentence is suitable to Uzbek language;
- Students learn how to use methods of terms in English language with paying attention to linguistic properties of tourism terms in English and Uzbek language

It is difficult for students to remember tourism terms in English, as a consequence that students do not know well terms using for tourism in their mother tongue. They can use to remember the meaning of new terms of tourism as following two forms, namely –it is performed without translation or with means of translation.

The non-translational method uses two categories, namely internal and external exhibitions. The methodological methods used in acquiring the meaning of new lexical units depend on the following factors: the nature of the term; belonging to the term active / passive; educational stage and student level; the presented form of the new term (hearing or reading comprehension); a place to introduce a new unit (lesson, textbook, dictionary), etc.

The presentation process is organized as follows. When a new word is taught in a non-translational way, it is broadcast, demonstrated in narration, picture, text, audiotape, and given approximately the following tasks:

- Understand the meaning of the term;
- translate;
- use in a sentence, etc.

Getting acquainted with the meaning of a lexical unit is the first printed educational step on the way to mastering it. The study of the compounding properties of a new word requires a special second stage. At this stage, exercises for repetition of terms, application in live speech are performed.

There are two ways to use a lexical unit in an exercise to gain access to a skill: the word being studied is used with different units in one place, or a lexical skill is formed by performing exercises using new phrases or changing places in different places.

Lexical exercises consist of informational and operational parts. The first part is an example of shwa performance since instruction, consisting of intermediate exercises that combine language rules as well as speech practice.

The task of the educational objectives is to achieve the level of application of the term tourism, which is the final work in the process of developing skills in the process of teaching foreign language tourism terms.

The use of the term is the final stage in the formation of a skill, and the free use of the term in the speech process, the meaning of which is revealed and begins to be used in speech, corresponds to the period of transition from skill to skill. Stepping from exercise to speech practice is understood to use the term tourism without the involvement of the mind in expressing ideas.

Prospective employees of the tourism industry must have the following skills in learning English:

- Oral and written translation of moderately difficult translation materials from English into Uzbek or from Uzbek into English;
- correct use of dictionaries and information on special terminology in the field of tourism;
- to find alternatives in the native language of lexical, grammatical phenomena in English;
- express the same terms using different language tools;
- to use a dictionary of terms in the field of tourism.

One of the directions of interdisciplinary communication in teaching English is the creation of bilingual dictionaries on various branches of tourism. This in itself enriches the vocabulary of lexical terms related to students' professional speech.

An indicator of mastery is the free use or recognition of speech in the field of tourism. Mastering means knowing at the skill level. The control of the level of mastery of the term is carried out in direct speech activity, not by deliberate inquiry, special inquiry.

The following principles are followed in the teaching of terms in the process of professional training:

1. The principle of reasonable limitation of the use of vocabulary in learning a foreign language.
2. The presentation of lexical units in language teaching is goal-oriented: the units used to reinforce lexical operation are designed to develop a specific skill and are used in conjunction with other units.
3. Taking into account the linguistic features of lexical units and the psychological aspects associated with their acquisition: lexical units are presented in the presentation and practice periods by describing abstract concepts, lexical units by visualization, lexical units by comparison and grouping, and functional (auxiliary) terms in context.
4. The principle of taking into account the didactic and lingo didactic laws of education: each lexical unit is gradually expanded in the stages of presentation, practice and application, namely the scope of meaning, sound and writing symbols and various combinations, context and group use are taught consistently.
5. The principle of combining the development of speaking skills and the acquisition of the term tourism in the process: the process of acquisition of the term implies the acquisition of material and the development of skills.

Based on the experience of the university, it can be noted that these principles are applied in the teaching of English terms.

## **CONCLUSION**

Thus, the purpose of studying the terms related to tourism in English is to increase the vocabulary of students in the profession and to form their skills in working with texts related to tourism in English.

It is necessary to take into account the achievements of modern linguistics, to generalize the modern perception of terms by students in English and to provide continuous training to future professionals, as well as the need to create a new generation of textbooks on terminology.

In conclusion, the following should be noted:

- When teaching English, it is necessary to take into account the linguistic features of the terms;
- In terms of teaching terms, it is effective to compare them with terms in English and Uzbek;
- When teaching the term tourism in English, it is necessary to take into account the language experience of students from Uzbek and English;
- It is advisable to develop lexical skills through exercises.

### ABSTRACT

*When obtaining seeds from sugar beet, the maternity depends directly on the timing of sowing the tubers and the thickness of the seedlings. Germination at 10.09 days (third term) Germination started on the 5th day after sowing and full germination was achieved in 5 days. During the last sowing period, there were some difficulties in germination. In conclusion, it can be said that in the Fergana Valley, the mother tubers, which are prepared for seeding from sugar beets, should be sown in the twentieth and thirtieth days of August and buried in the soil to minimize exposure to cold.*

**KEYWORDS:** *Sugar Beet, Seed Yield, Agrotechnical Measure, Repeated Crop, Economic Efficiency.*

### INTRODUCTION

In agriculture, seeds are the main factor in obtaining high and quality crops. The higher the quality of the seed, the higher the efficiency of the agro-technical measures taken to obtain the harvest. Today, the world's growing population requires increasing the efficiency of land use. To do this, it is important to constantly increase the share of crops per hectare, while achieving high quality. This problem exists in our country as the population grows. Based on the above

considerations, one of the most pressing issues to date is the efficient use of vacant areas of wheat, that is, the planting of secondary crops, which is also useful when sowing.

S.S. According to Makarova [pp. 3,26-27], the quality of sugar beet seeds in the black soil regions of Russia leads to an increase in yield by 50g60 ts / ha.

M.A. Belousov [1] According to the experience of Uzbekistan in the conditions of gray soils, the germination of sugar beet seeds is 98%, purity 94planting at a purity of 94% ensures that its root yield is 650 ts / ha.

D. According to Shpaar [4, p. 28], thickening of seedlings to obtain seed from sugar beet leads to rhizomania disease. As a result, seed germination decreases sharply.

Although sugar beet was first cultivated in Uzbekistan in the 1940s and 1950s, little research has been done (only Golodkovsky and Belousov). But he was not engaged in seed at all. The required amount of seed material was imported. It should be noted that because sugar beet is a biennial plant, in the first year the root crop is harvested, in the second year the root crop is planted and the seed crop is harvested.

In our experiment, V.A. Dospekhov [2] 's "Methodology of field opyta." based on the methodology, we defined the experimental system as follows (Table 1).

When growing mother tubers for seed, each variant has a width of 4.8 m, length - 50 m, total area - 240 m<sup>2</sup>. The experiment consisted of 4 repetitions of 10 options, with a total area of 960 m<sup>2</sup> for each option and a total area of 9660 m<sup>2</sup> for the experiment.

In the experiment, ammonium nitrate (34% N), urea (46% N), superphosphate (17-20% P<sub>2</sub>O<sub>5</sub>) and potassium chloride (51-60% K<sub>2</sub>O) are used as mineral fertilizers.

Experiments, phenological observations, soil and plant sampling were carried out in accordance with the manuals "Methodology polevqxopqtov" (Dospekhov, 1985), "Methodika Gosudarstvennogosortaispqtaniyaselskokhozyaystvennqxkultur" (1964) and "Methods of field experiments" (2007). Quantities of humus, general and mobile species of NPK in soil samples are carried out according to the methods "Methods of agrochemical, agrophysical and microbiological research in pollinated cotton fields" (1963) and "Methods of agrochemical analysis of soil and plants of Central Asia" (1977).

**TABLE 1 EXPERIMENTAL SYSTEM**

options	Sowing method	Sowing time	Method of winter storage of roots
1	Ordinary (sugar beet is planted as a mother root)		In winter, the mother tubers are stored in a warehouse
2	New method (seeds are sown to get maternal roots)	20.08	In winter, the mother root is stored in the field
3			In winter, the mother tubers are kept covered with soil in the field
4		30.08	Asinoption 2
5			Asinoption 3
6		10.09	Asinoption 2
7			Asinoption 3

8		20.09	Asinoption 2
9			Asinoption 3

In the experiment, we took into account the germination and thickness of seedlings of sugar beet seeds sown to obtain maternal roots. According to him, when studying the germination of seeds, the best performance was observed in 2-3 variants sown in the first period (20.08). In these variants, germination of beet seeds started on the 4th day after sowing, germination was completed within 4 days, and normal seedling thickness was achieved. When planted in the next period (30.08), germination was slightly different from the previous sowing period, according to which, although there was no difference in germination, germination duration lasted one day longer than the previous period. Germination at 10.09 days (third term) Germination started on the 5th day after sowing and full germination was achieved in 5 days. During the last sowing period, there were some difficulties in germination. A sharp drop in weather affected the germination time of the seed, which ensured the appearance of the first shoots in just 7 days, and the germination duration increased to 7 days. The resulting plants did not form a weak, flat.

In the experiment, we also studied the effect of planting times on the seedlings to achieve flatness in the options. At the same time, we found that the tumors survived after winter. We can also see this data from Table 2 below.

**TABLE 2 THE ACTUAL SEEDLING THICKNESS OF SUGAR BEET IN THE EXPERIMENTAL OPTIONS, AT THE EXPENSE OF A THOUSAND PIECES**

Bap.	Sowing method	Sowing time	How to store tubers for the winter	Pre-winter seedling thickness	Post-winter seedling thickness	Number of seedlings killed
2	New method (seeds are sown to get maternal roots)	20.08	In winter, the mother root is stored in the field	54	51.2	2.8
3			In winter, the mother tubers are kept covered with soil in the field	54	53.1	0.9
4		30.08	There are 2. suchas	54.5	50.1	4.4
5			There are 3. suchas	54.2	53.2	1.0
6		10.09	There are 2. suchas	53.8	49.2	4.6
7			There are 3. suchas	53.6	52.3	1.3
8		20.09	There are 2. suchas	52.3	46.8	5.5
9			There are 3. suchas	52.4	48.1	4.3

The early timing of planting ensures that the seedlings will be a flat, vigorous. This leads to a reduction in plant mortality during the winter. In our experiment, too, the thickness of the seedlings was determined before the onset of winter when the sugar beet root was grown for seed production the following year. According to him, it was observed that the thickness of seedlings formed in the early planting periods (20.08 and 30.08) was relatively high. It was found that from 54.0 thousand to 54.5 thousand units. When the remaining sowing periods were late (10.09 and 20.09), this figure was 52.4 and 53.8 thousand, respectively.

When we determine the actual seedling thickness in the field options after wintering in early spring, we observe that most seedlings die late, i.e., when planted at 20.09, and the tubers are left in the field in the normal way. At the same time, 5.5 thousand seedlings died when left in the normal way, and 4.3 thousand seedlings when covered with soil. The lowest seedling variant was planted in 20.08 and 30.08, and the topsoil-covered variant was obtained, with only 0.9 and 1.0 thousand seedlings killed, respectively.

In conclusion, it can be said that in the Fergana Valley, the mother tubers, which are prepared for seeding from sugar beets, should be sown in the twentieth and thirtieth days of August and buried in the soil to minimize exposure to cold. This leads to a relatively low frost tolerance of seedlings. This resulted in the death of an average of 0.9-1.0 thousand seedlings per hectare.

**THE ROLE AND IMPORTANCE OF PROBLEMS IN THE THINKING OF  
 PRIMARY SCHOOL STUDENTS**

**Dilfuza Tashpulatova\***

\*Teacher,

Shakhrisabz branch of Tashkent State Pedagogical University named after Nizami,  
 UZBEKISTAN

**ABSTRACT**

*The article focuses on the role and importance of issues in primary school, their educational aspect, and their positive aspects related to other subjects. In the development of the student's creative ideas, the secular knowledge of the teacher of mathematics is also reflected. For example, he has to make a mock-up of a moving ship. Let's say that three ships sailing opposite the three ships on the river came to a standstill. Of course, this also depends on the skill of the math teacher. The teacher should not only refer to complex examples, but also use pictorial, interesting, philosophical, confusing issues. The mastery of a teacher depends on his knowledge of the world and his mastery of other sciences.*

**KEYWORDS:** *Historical Sources, Swimmer Learns, Philosophical, Arithmetic*

**INTRODUCTION**

Since the basis of the human point of view is first of all connected with ideas, he sees all his goals in a precise way. Estimates, measures, calculates. Hence, the "accountant" of our way of life are also mathematical elements. When a child with a pencil for the first time tries to express the word mother, he estimates the roundness of the surroundings, the shape of the house in which he lives with a mathematical expression.

This means that mathematics is one of the main subjects studied after the motherland. If we turn our attention to the first-grade mathematics textbook, first of all the big, small, large and small qualities in it, we will encounter problems with the participation of numbers in the second stage of the school year. A teenager who used to do things now starts to tie it to issues.

Well, why does the swimmer need issues? The question naturally arises as to how important they are in mathematics.

Our goal is to study the educational and scientific impact of both problems and logical problems on the student. Historical sources also state that the issue is to clarify this puzzle. For example, there were two sparrows on a tree branch. Two more birds flew by. We simply threw the question among the primary school swimmers to find out how many birds there were. This means that if a swimmer simply adds two numbers to two in the first step, that is, in the example, the second step is to try to solve the problem by adding the number of birds to the problem.

So the problem is not just the answer to the example, it solves the bird puzzle. It should be noted that the issues are related to other disciplines and provide additional knowledge to the swimmer. For example, with the science of nature, the swimmer begins to understand the family to which birds belong, not on land, but in the sky, not in the water. The above information gives him an additional source, knowledge. If we look at the problem in the third number on page 42 of the Grade 1 math textbook, we have a picture on the table with four apples on each side and two apples on the other side of the plate.

With this issue, the swimmer learns to speak as if it were a native language subject. That is why the first grade textbook is formed by the end of the school year with pictorial questions. This will help the child to fluent in speech, to communicate, to think deeply, to be responsive, and especially to speak, to increase vocabulary so that he or she can move on to the next grade.

The educational significance of the issues is also immeasurable. For example, Laziz asked his grandmother about the age of his youngest grandson. Her grandmother said, "My youngest grandson is as old as I am. "How old are you?" Laziz said, a little confused. Her grandmother said, "If you add my age with my grandson, it will be 65. How old is my granddaughter? Laziz's grandmother is now sixty and her granddaughter is five. So, this lesson taught young Laziz that the younger ones should respect the older ones and the older ones should respect the younger ones.

In this case, the role of a few chups increases not only the child's future home, but also his devotion to his family, homeland and community. For example, change the position of the Three Chups so that the house facing left is facing left. By changing the position of the child chups, he develops the qualities of proper and quality home-building and increases his responsibility to the family. With these issues, he begins to realize from a young age that the belt of the family budget depends on it in the future, that it must be managed by accurate calculations and actions.

Another important aspect of the issues is that it helps the child to develop new innovative ideas. Adding a "soul" to a piece of paper is also a way of putting it into action. For example, he has to make a mock-up of a moving ship. Let's say that three ships sailing opposite the three ships on the river came to a standstill. The river was so narrow that it could not hold two ships side by side, but there was a bay that could hold one ship. How can these ships continue their voyages?

It is in this process that the prospective explorer approaches the essence of the problem, using intersections. He invents methods that allow not only ships, but also new bays and oceans to multiply. Or new ships moving in such short corridors are discovered.

It should be noted that a brother, a sister, two sons and two nephews went fishing. His brother said, "I taught you to fish, and he caught 18 fish. The swimmer, who understands the total number of points when he catches twice as many points as the others, also notices that the unity

of the swimming force, the combined break, and every action taken from one side gives good results.

In the same way, when the number of fathers, mothers, brothers, and sisters in the family is "calculated", the infidelity in the family begins to be understood at this age. Issues involving animals, plants, and beasts teach us to love and respect nature, while issues involving roads, cities, and countries develop his diplomatic views.

In addition, the issues at stake are also important. The difference between them and a simple problem is that we both enjoy and enjoy the process of solving it and finding the answer. Puzzles teach the child to be alert and resourceful, to develop the ability to concentrate, to think broadly, to compare a large number of facts with each other and to distinguish between what is needed.

In conclusion, the importance of mathematics in primary school is great. The issues help the student to understand both secular and philosophical views as a teenager, to digest these sciences. Of course, this also depends on the skill of the math teacher. The teacher should not only refer to complex examples, but also use pictorial, interesting, philosophical, confusing issues. The mastery of a teacher depends on his knowledge of the world and his mastery of other sciences. If you know arithmetic, if you don't know other subjects, your lesson will be boring, and your swimmer's mastery will be poor.

## EDUCATION IN PRESCHOOL EDUCATIONAL ORGANIZATIONS - THE IMPORTANCE OF USING THE MARIA MONTESSOR METHOD IN THE PROCESS OF EDUCATION

**Boboqulova Nazokat Yusufvna\***

Faculty of Preschool Education Lecturer,  
Department of Preschool Education Methods,  
Termez State University, UZBEKISTAN

### ABSTRACT

*Modern educational space is "impregnated" with ideas of humanization and personality-oriented concept. In this regard, it becomes necessary to study and understand the potential of those pedagogical systems and techniques of a personal orientation that have taken their solid place in the educational space, having proved their importance, efficiency and productivity. One of the most striking representatives of ideas with a humanistic focus is the Italian teacher, psychologist, founder of the method of scientific pedagogy M. Montessori. The article discusses the positive and negative aspects of the developing method of M. Montessori.*

**KEYWORDS:** *Montessori, Pedagogy, Primary School, Psychology.*

### INTRODUCTION

Civilized society has great experience in the field of education. It tries to organize the child to develop as comfortable as possible and to obtain the necessary knowledge, skills and skills for professional formation in society. Education is an important area of society, as education depends on the development of the whole country and even the world. For this reason the modern pedagogics reinterprets problems of training, education and personal development of the person, analyzing changes in a new sociocultural situation and considering new requirements to formation of the personality. Modern education is increasingly seeking humanization and anthropization, which proves the relevance of M. Montessori 's ideas in the modern pedagogical process, because it is in Maria Montessori 's ideas that «freedom» «self-development» and «creation »are key words.

Unfortunately, many parents who have sent their children to Montessori schools or special groups are not well acquainted with the Montessori methodology. A lack of awareness has given

rise to many myths about this learning system. We will analyze the shortcomings of the Western system introduced in Russia and consider the most popular myths.

One of the most popular misconceptions regarding Montessori's pedagogy is the opinion that this is a "silent" technique. Maria Montessori herself wrote for teachers working with children: "Keep an account of your words." She did not mean that the teacher should completely limit himself in contact with the pupil, but that he should not interfere with him and be imposed. Do not do what the child can do by himself. Experience with children shows that comments at the time of the implementation of the activity prevent the child from concentrating. The teacher comes to the rescue when the student asks him about it. Irina Isaeva, chairman of the Interregional Montessori Association, says, "Montessori is suitable for all children." It is impossible not to support disagreement in this, because, based on their own life observations, there are children with inborn shyness and inactivity in communication, and such a child may just be shy to ask for help from the teacher, hence the development of isolation is quite possible. It seems to me that such children will be better suited to the teaching methodology in which the teacher will be the first to take the initiative in contacting the child.

Another common myth about M. Montessori's pedagogical system: it is difficult for children who have completed pre-school education on this system to adapt in an ordinary traditional school and obey its rules. According to the ideas of humanistic pedagogy, freedom is not permissiveness, but the right of independent choice. Montessori schools also have rules that pupils willingly obey, because they are taught that rules help, not interfere. Many educational institutions that have received natives of Montessori schools characterize such children as disciplined, eager to make contact with adults and peers, independent and consciously accepting the rules of the educational institution.

### **Method**

The following misconception relates to the pedagogical process of the Montessori system: there are no games in it, although the game is one of the main activities of preschoolers. Maria Montessori did not deny the game, she only attributed them not to the main activity, but to rest. In the main time, children should learn the real world around them. "The child is exiled to the world of toys, removed from the affairs that he needs for internal development," said the humanist educator. Where it is better to give the child real dishes, instead of plastic toys, so he will have the opportunity to satisfy his needs and to know the real world around him. Many are also mistaken in saying that it is impossible to work in a group with children of different ages. And this is how not only the kindergarten is arranged, but also the M. Montessori school. It is difficult to agree with this, because a group of different ages reminds me of a large family in which younger children are taught respect for elders, and older ones help and support babies, set an example for them and motivate them to learn. Such an experience will certainly be useful for children in adapting to a new team in the future.

Having delved into the theoretical and methodological foundations of Montessori pedagogy, as well as having studied the practical experience of other Montessori teachers, we can highlight, in addition to the pluses, some negative aspects of such a training system. Since the M. Montessori system has begun to gain popularity recently, training in such centers is quite expensive and is even considered elite. For example, tuition at a Montessori school in Moscow ranges from 20 to 200 thousand rubles, which not every parent can afford. The downside of this pedagogy is that

there is no place for fairy tales in it. Maria Montessori wrote that fairy tales immerse the child in a non-existent world, while he must know the real one. She believed that it was better to tell real things to children: for example, how life processes occur on Earth, why the sun shines, etc., instead of telling fictional stories. One cannot disagree with the fact that fairy tales primarily develop fantasy and imagination in children, and also many fairy tales contain a huge amount of instructive information, therefore fairy tales are necessary for children. Another disadvantage of the Montessori system is that the teachers who teach children in this program lose their authority in some way. This applies specifically to Russia, because traditionally here teachers are looked upon as leaders who indicate what to do, and not as observers and assistants.

From January 1, 2014, textbooks and teaching aids according to the new Federal State General Educational Standard were received in secondary schools. The new standard introduces more and more humanistic ideas. Many teachers who do not have competence in the pedagogical system of M. Montessori do not know how to implement the program by all the usual methods and help the child in the formation of personality. Without Montessori's pedagogy, this is difficult to achieve, and the formation of a Montessori teacher is a rather lengthy process. In addition, the current examination system is completely contrary to the ideas of humanistic education. Standardized test exams significantly affect the psyche of children and the quality of education in general. Many criticize the Unified State Exam and do not consider it an indicator of graduate knowledge. Preparing for such an exam forms children's skills in automatically completing test tasks, and this has nothing to do with knowledge.

## Results

What are the ideas behind Montessori childcare? There are two main ideas: First, children create their own sense of 'self' through interaction with their environment. Rather than sitting at a desk and being lectured, children are encouraged to *do* things. Play with a selection of toys, explore a selection of areas; try out new things and see what works for them on an individual level.

Second, that children have their own innate path towards healthy psychological development. It is only by following this highly personal path to psychological development that they can reach a healthy end point, and not everyone's path is the same.

However, Maria Montessori and her son, Mario, did identify a series of universal characteristics which they went on to call 'human tendencies'. They are as follows:

- Abstraction
- Activity
- Communication
- Exactness
- Exploration
- Manipulation of Environment
- Order
- Orientation
- Repetition

- Self-Perfection
- Workor ‘purposeful activity’

The philosophy instructs that education should be built up around these principles in order to best facilitate a healthy psychological development – ideally with the intention of developing independence in all of the listed areas.

As they are ‘universal’ tendencies, it can be reasonably assumed that education systems established with a healthy respect for these characteristics will find it easier to establish a base or foundation, from which they can build their more individualistic ‘ad hoc’ instructions.

What is the Montessori approach to early childhood education?

There is a strict emphasis on learning through interaction with environment, in this philosophy.

It encourages what it terms ‘free activity’ within an established ‘prepared environment’. What this activity may be, and even what kind of an environment is required, is up to the individual teacher – and in part, should be inspired by the individual needs of the student.

The philosophy does provide some guidance as to what these environments should look like, and recommends that teachers hit a few key notes:

- An arrangement that facilitates movement and activity
- Beauty and harmony, cleanliness of environment
- Construction in proportion to the child and her/his needs
- Limitation of materials, so that only material that supports the child's development is included
- Order
- Nature in the classroom and outside of the classroom

The Montessori pedagogical system is good and has many advantages, but do not forget about the cons. We can conclude that the Montessori methodology training should be better defined for additional education and combined with the usual traditional in order to compensate for these same disadvantages. In general, the effectiveness of Montessori pedagogy has been proven more than once and should, at least partially, be used in traditional pedagogical practice, because, in my opinion, the idea of free, but controlled education is in line with modern society.

What about Montessori homeschooling? Montessori philosophy is easily transferred into the home. As a consequence of the advocated ‘freedom’ in regards to lessons and activities, a classroom is not required.

Each of the lessons proscribed by a Montessori approach can be replicated within the home, but the child will struggle to develop upon the social aspects of the philosophy while lacking contemporaries. This may prove to be an issue once the student develops into the Elementary stages of schooling.

What would a Montessori Elementary experience look like? These classes serve students between the ages of six and nine years old, but it’s not uncommon to see classes with an age bracket of six to twelve.

There is still a strong emphasis on independent choice, and following their own interests within the class. At this stage of development, a student can expect to be introduced to topics like history and biology – and be encouraged to further explore whichever one is most appealing to them. These are referred to within the philosophy as ‘Great Lessons’.

They will be introduced at the beginning of the school term, and the student will dive deeper into the subject as the term progresses.

What does a Middle School look like when done in a Montessori style? The education at this level is less well-developed than in earlier stages.

With more emphasis on earlier childcare, the philosophy is somewhat vague when extended to older students.

Maria Montessori did not develop a program for adolescents in her lifetime, but a number of schools have tried to extend the teachings to teens.

The common consensus between these schools is that the philosophy works best when applied in rural areas, suggesting that it may be better for students to leave busier towns and cities in order to study in the countryside.

What is a Maria Montessori education centre?

A Maria Montessori education centre is simply a school which teaches in accordance with the Montessori philosophy. There are many such facilities all across the world.

These should not be confused with THE Maria Montessori Education Centre, the foremost centre for Montessori teaching. Located in Canada, it’s essentially ‘the main one’ in terms of Montessori schools.

What does Montessori teacher training entail?

The training can be received in three different formats:

A Diploma course is available for those looking to become proficient in all age groups, and can be taken in one or two-year courses. This is the only option for those looking to become a fully-fledged Montessori-style teacher.

A Certificate course is a shorter, part time evening course which takes place during the spring term. It specialises in producing assistants, but is insufficient training for those looking to lead the classroom as a teacher.

A Lecture series is provided for those who simply wish to learn more about the approach without taking a formal course of study. This is not a qualification and will not constitute ‘teacher training’.

So how can this be applied in my classroom? Even without taking the time to become a fully qualified Montessori teacher, it might be worth taking to heart her thoughts on free choice and physical interaction.

It’s obviously of greater use to those of you teaching English to younger children, and if you take large classes then you’re going to struggle to apply the theory to each child individually, as the philosophy instructs.

If you're teaching English to students over the age of eighteen then you're going to struggle to find any use for this philosophy. As indicated above, the research into Montessori education for older students is almost non-existent. The philosophy is about developing them into a more rounded person – if your student is twenty five years old then they're probably already pretty developed...

But those of you teaching to students between the ages of six and fifteen, which I suspect is most of you, then you may find something worth taking away from all of this.

### **CONCLUSION**

The Montessori pedagogical system is good and has many advantages, but do not forget about the cons. We can conclude that the Montessori methodology training should be better defined for additional education and combined with the usual traditional in order to compensate for these same disadvantages. In general, the effectiveness of Montessori pedagogy has been proven more than once and should, at least partially, be used in traditional pedagogical practice, because, in my opinion, the idea of free, but controlled education is in line with modern society.

## INTRODUCTION

In 2019, world wheat production was 762.2 million tons, an increase of 3.9% over the 2018 season. Wheat production in the world reached its highest level in 2017 - 773 million tons [1, 2, 5].

Looking at last year's list of the most advanced wheat-growing countries, China (134 million tons), India (102 million tons) and Russia (75 million tons) are among the top three countries with the highest wheat production in 2019. together it accounts for 41 percent of world production. These countries are followed by the United States, France, Canada, Ukraine, Pakistan, Australia, Turkey, Germany and Argentina, which together account for 34% of world production [11, 22].

When creating the best varieties of bread wheat on irrigated lands, the early maturing properties of the variety, the composition of the grain and its quality indicators, the external environment and agronomic measures have a strong influence [3, 6, 7].

Wheat can be exposed to heat at any stage of the growing cycle. The average air temperature for the growth and development of wheat is 18 - 25 °C, and when it exceeds 32 °C it begins to have a negative effect. An increase in air temperature above 32 °C has a strong effect on the reproductive organs, having a major negative effect on the process of grain filling in the middle and late stages of developmental phases [4, 10, 12].

There are important rules on the selection donor varieties. In the practice of synthetic breeding for the creation breeding material first of all parenting pairs are selected by hybridization. The success of hybridization depends on how properly the parent pairs are selected [8, 9, 13].

In turn, high-yield selection leads to a decrease in resistance to adverse external factors i.e. abiotic and biotic influences, so a comprehensive approach to the creation of competitive varieties is required. One of the decisive factors in achieving an increase in productivity and resistance to adverse conditions in selection is the correct planning of the selection process, i.e. the choice of research direction and methods. This task can be performed only with a complete understanding of the exact state of productivity in the conditions of the area where the selection work is carried out [14, 18, 20].

The productivity of wheat grain is studied in relation to the elements of yield. The analysis of yield elements allows breeders to take a conscious approach to the synthetic selection of varieties. Selection is a final and relatively responsible component in obtaining valuable forms in the selection process. Therefore, it is especially important for the breeder to know the relationship between the characteristics of the selection work, as well as the characteristics of the plant. When the selection work is carried out using correlation, it creates the basis for a relatively efficient work [15, 17].

In the process to create new varieties with high yield, the crossing is carried out to take an attention of productivity features of plants. For example, for the wheat they are the quantity of productive plants, a grain size, a weight of 1000 grains, a yield of variety and etc [16, 19].

The weight of 1000 grains is an indicator of the size and fullness of the grain. This is a sign of diversity, and at the same time emphasizes that the climate during the period of strong saturation depends on the conditions. It has been scientifically determined that the size of a grain of wheat depends on the duration of the growth period, in particular, on the elongation period of maturing [21, 26].

The amount of protein in wheat grain is one of the main elements of quality indicators and is closely related not only to its nutritional value, but also to its technological quality [24, 25, 36].

Today, 15-20 percent of the wheat grown in the world meets the demand for strong wheat, while the quality of grain is 50-55 percent of weak wheat. This weak wheat can give quality bread only if 20-40 percent strong wheat is added to it [23, 27].

Wheat yield depends on plant structure, metabolism, and substances in the grain. Every physiological phenomenon can change under the influence of genotype and environment, and there is an inextricable link between genotype and environment [28, 30, 34].

The variability and heredity of quantitative traits are not uniformly covered in the literature. A characteristic feature of this is that it depends on the external environmental conditions, which poses a great difficulty in selection. The most important thing in selection is a specific genotype or homo- and heterozygous and other indicators of productivity is what genetic potential it has [27, 29].

These two factors depend on the selection of the best genotypes from hybrid mixtures in hybridization. Dilmurodov et al. stressed the need for a comprehensive study of complex primary forms in order to properly apply genetic theory in the selection process [31, 33, 38].

The duration of vegetation stages are used for the selection of pairs and creation varieties with early maturity. Moreover, for this, in the crossing process a vegetation stage of a pair should be shorter, on the second pair not exactly this vegetation period, but another one should be short. Only then, it could be for the purpose of what was focused [32, 35, 37].

## **MATERIALS AND METHODS**

On the nursery of the selection of primary source and donors for the breeding 165 varieties and lines were selected and researched which belonged to different ecological and geographical regions. The varieties and lines were placed on 1 m<sup>2</sup> with 1 replications. In research a placement scheme of the field experiment was based on the “Alpha lattice design” of the program Genestat 3. A placement of the experiment and during the research a phenological observation, a calculation and analysis were based on the method of Union Institute of Plant Breeding (UIP,1984), and biometric analysis were based on the methods of the Commission of the State variety testing of agricultural crops (1985, 1989). Mathematical and statistical analysis of the experiment were committed according to the developed guide by B.A. Dospekhov (the Method of field experiment, 1985).

## RESULTS AND DISCUSSION

Experiments of winter cereal crops the seeds were sown on October 22 in 2017-2018 seasons. Of these studied varieties and lines, 18 varieties and lines were selected mainly according to drought, early maturing, yield and 1000 grain weight and other valuable economic characteristics. During phenological observations of varieties and lines, the sown seeds germinated on November 5-6 after irrigation, and in the experiment it was noted that the varieties and lines entered the harvesting phase on December 5-8.

While the tubing phase of the varieties and lines was observed from 28 February to 5 March, it was found that early on BEZOSTAYA, BiII98 varieties and lines were 2 and that these lines entered the tubing phase on 28 February. Varieties and lines such as KACHU / SOLALA, OGOSTA / SE 7/7 / 91-142 ..., PASTOR / MILAN / 7 / Z .., ESPADA / KARAHAN, PRL / 2 \* PASTOR // PB ... body and entered the tube phase on March 1-5.

When analyzing the days from germination to germination, it became clear that the germination period of the studied varieties and lines was 155-177 days. In the Gozgon variety, which was taken as a standard variety, this period was 163 days, while in 89 varieties and lines, the germination period was shorter.

It was noted that out of 18 selected varieties and lines, 9 varieties and lines entered the mating phase in 155-158 days, 8 varieties and lines in 158-169 days, and the remaining 2 varieties and lines in 170-176 days.

In the experiment, the transition of varieties and lines to the full maturing phase took place from 25 May to 6 June. It was observed that the variety Gozgan entered the full maturing phase on June 2, and the number of varieties and lines that entered the maturing phase in a shorter period of time than the standard was 125. It was noted that 29 of the studied varieties and lines entered the full maturing phase on 25 May and were identified as early maturing lines.

**Figure 1. Number of varieties and lines according to the period of growth, day (Karshi, 2017-2018).**

The growing period of the studied varieties and lines was 200-213 days at the time of determination. The Gozgon variety, taken as a local check, was found to have entered the full maturing phase in 207 days.

It was noted that the plant height of the studied varieties and lines ranged from 59 to 115 cm before analysis. In the selection of the variety and lines, attention was paid to the selection of lines resistant to medium-sized deposition. When the relationship between plant height and yield was studied, it was found that there was a positive correlation between  $r = 0.33$  and  $r = 0.21$  per 1000 grain weight.

**Figure 2. Selected varieties and lines plant height indicator, cm (Karshi, 2017-2018).**

In the experiment, the final joint length of the cultivar and lines was also determined. The main purpose of this is that the length of peduncle in years of drought indicates drought tolerance. It was noted that the length of peduncle in varieties and lines was 25 - 54 cm. In the Gozgan variety, planted as a standard variety, the length of peduncle was 35 cm, while in 68 varieties and lines, this figure was found to be higher than the standard variety. The number of lines with a final peduncle length of 40 cm and a height of 33 cm was 33.

Spike length has a positive effect on the yield of varieties and lines. In the experiment, it was noted that the spike length index ranged from 7 to 13 cm. In the Anzoda variety, this figure was 12 cm. The number of varieties and lines with spike lengths of 10 cm and above was 82.

It was noted that the number of spikes in the spike ranged from 10 to 22. The number of spikes in the standard Gozgan variety was 20. It was found that there were 5 lines with a higher number of spikes than the standard variety.

It was noted that the weight value per 1000 grains of the studied varieties and lines ranged from 23.8 to 49 g. While the sample Gozgon variety had a grain weight of 39.4 g per 1000 grains, this figure was found to be higher in 33 varieties and lines. The number of varieties and lines weighing 40 g and above per 1000 grains was 30.

When the correlation of 1000 grain weights with the yield index was studied, it was found that  $r = 0.25$  had a positive correlation.

The yield of varieties and lines was determined to be 14 - 90 c / ha. While the standard Gozgon variety showed a yield of 51 c / ha, 47 varieties and lines were found to be superior to the standard.

Based on the results of the study of all the valuable properties of the studied lines, 8 lines were selected for testing in the selection nursery next year.

## CONCLUSION

In the observatory collection nursery of optional and winter wheat, 8 lines with all valuable properties were selected and transferred to the breeding nursery.

### **ABSTRACT**

*The article presents a review of the literature on the metabolism of the amino acid homocysteine, the emergence of risks for the development of a number of diseases due to excessive accumulation of homocysteine in the human body, and possible ways of correcting hyperhomocysteinemia.*

**KEYWORDS:** *Homocysteine, Homocysteine Metabolism, Hyperhomocysteinemia, Hemocoagulation, DNA Dimethylization, Oxidative Stress, Vitamins Of Group B.*

### **INTRODUCTION**

It is known that modern science is interested in the search for biochemical markers that could reflect the risks of development and the nature of the course of various diseases, as well as predict their outcome ... In recent years, many compounds have been discovered that can reflect and influence the biochemical profile of the body. The metabolic product of methionine, homocysteine, is one of them and attracts the attention of many researchers of various specializations.

## Homocysteine. Basic information

Homocysteine ( ) is a sulfur-containing non-protein compound that is synthesized in the body during methionine catabolism. This compound is necessary for the body, but in excess, it can cause oxidative stress, cause genetic mutations, induce cell apoptosis, promote the development of atherosclerosis, regardless of the presence of other atherogenic factors.

### Homocysteine Synthesis and Utilization Pathway

Homocysteine is synthesized from methionine in the liver to form SAM, which is a methyl group donor in transmethylation reactions. The optimal concentration of homocysteine in the blood is 5–16  $\mu\text{mol} / \text{L}$  and is maintained at this level by two main metabolic pathways: transsulfuration with the formation of cysteine or remethylation, ie, the conversion of homocysteine to methionine under the action of the enzyme methionine synthase.

For these reactions to occur, vitamins B6, B12 and folic acid are required (Fig. 1). It is the deficiency of these substances that can lead to hyperhomocysteinemia.

Fig. 1. Simplified scheme of homocysteine metabolism: enzymes: 1 - methionine adenosyltransferase; 2 - s-adenyl-L-homocysteine hydrolase; 3 - cystathion  $\beta$ -synthase; 4 - cystathionine  $\gamma$ -lyase; 5 - methionine synthase reductase; 6 - methionine synthase; 7 - dihydrofolate reductase; 8 - serine hydroxymethyltransferase; 9 - methylene tetrahydrofolate reductase

Hyperhomocysteinemia Hyperhomocysteinemia is a condition characterized by elevated levels of homocysteine in the blood.

Causes of hyperhomocysteinemia:

- ❖ hereditary fermentopathies;
- ❖ lack of folic acid and B vitamins in the body;

- ❖ gene polymorphism;
- ❖ smoking and drinking alcohol;
- ❖ hormone-dependent diseases;
- ❖ excessive consumption of coffee;
- ❖ impaired renal function;
- ❖ sedentary lifestyle.

Homocysteine increases the risk of thrombosis, causes DNA methylation and oxidative stress, and damages nerve cells and mitochondria (Fig. 2).

Fig. 2. Mechanism of action of homocysteine

According to the literature, hyperhomocysteinemia can cause resistance of factor V to the action of activated protein C due to the binding of factor V to homocysteine. Homocysteine also blocks the interaction of thrombomodulin with thrombin, which prevents the activation of protein C. Along with this, homocysteine disrupts the binding of antithrombin III with heparan sulfate, which is located on the vascular endothelium, leading to an even greater suppression of the anticoagulant system (Fig. 3)

Fig. 3. Influence of homocysteine on the process of hemocoagulation

Normally, annexin II stabilizes the plasminogen receptor S100A10 and facilitates its movement to the cell surface, where the receptor binds to plasminogen and regulates the formation of plasmin. Homocysteine, binding to one of the annexin II domains, blocks the activation of plasminogen, which contributes to the formation of strong blood clots resistant to lysis, as well as an increase in the risk of thrombosis.

Moreover, according to McCullyKS studies, homocysteine damages the endothelium of arteries, initiating the process of activation of cytokines, cyclins and other mediators of inflammation and cell proliferation.

Under the action of homocysteine, reactive oxygen species are formed, which have an oxidative effect on LDL and lipids of endothelial cell membranes, leading to their destruction. An increase in homocysteine concentration can lead to dimethylation of the CpG gene and thus suppress the activity of methyl-CpG-binding protein. As a result, the activity of histone cytylase decreases and the acetylation of histones H3, H4 occurs, which leads to a decrease in gene expression. These processes occur in relation to passive transcriptional chromatin, a change in conformation of which can increase binding by repressor proteins and suppress transcription.

At low glycine concentrations, homocysteine acts as a partial antagonist for the N-glutamate receptor, resulting in hypofunction of glutamatergic transmission, leading to depressive disorders (Fig. 4).

Fig. 4. Interaction of homocysteine with glutamate receptors

**Prevention of the damaging action of homocysteine** Paraoxonase plays a special role in protecting endothelial cells from the damaging action of homocysteine. This enzyme is localized on HDL and has lactonase activity, which prevents lipoprotein oxidation and detoxifies proteins that have undergone a reaction with homocysteine. B vitamins and folic acid, which are present in sufficient quantities in the body and supplied with food such as greens, cereals, nuts, whole grain bread, the liver participate in the metabolism of homocysteine, catalyzing the reactions of converting it into non-toxic products, and thus prevent the development of hyperhomocysteinemia ...

**Prospects for research** Already at this stage of the study, the effect of homocysteine on biochemical and pathophysiological processes in the human body is unconditional. It has been proven that hyperhomocysteinemia can indicate disorders in the course of many metabolic pathways and be a risk factor for the occurrence of diseases such as Alzheimer's disease, dementia, myocardial infarction, heart failure, renal failure, atherosclerosis and other diseases associated with vascular damage and tissue ischemia. However, the mechanism of the damaging effect of this compound on mitochondria and on nerve cells is not sufficiently understood, which is an urgent topic for further research.

**ABSTRACT**

*Many lead and especially lead-zinc ores contain copper. The copper content in lead concentrates obtained by enriching such ores with flotation is significant (3.5%). The presence of copper in lead concentrates reduces the extraction of lead during metallurgical alteration, and also complicates and increases the cost of lead smelting, and, in addition, creates difficult working conditions for workers in metallurgical workshops. In practical terms, the task of separating lead-copper concentrates by selective flotation is one of the most difficult. Researchers in recent years have been able to significantly develop and improve the technology for the separation of*

*lead-copper concentrates, due to which a number of factories have reduced the copper content in lead concentrates and increased lead extraction. However, this issue has not yet reached its radical solution, due to the difference in ores of different deposits in its chemical, mineralogical composition and other features.*

**KEYWORDS:** *Selection, Desorption, Depression, Extraction, Product Output, Content, Ammophos, Mineralogical Composition, Phase Analysis, Polymetallic Ores, Qualitatively Quantitative Scheme.*

## INTRODUCTION

Uzbekistan in the proven reserves of gold, copper, lead, zinc, uranium and other metals occupies a leading place among the CIS countries. In the conditions of independence of the republic, the mining and metallurgical industry faced a whole complex of complex problems. This is primarily an increase in environmental requirements, an increase in the need for non-ferrous metals, including copper and lead, a shortage of flotation agents, requirements for the cleanliness of the resulting product, and the problem of waste disposal.

The task of creating a rational and integrated technology for the processing of technologically advanced polymetallic industrial products is very relevant.

Increased production of lead and zinc requires the involvement of new deposits, off-balance sheet ores, and waste from concentration plants.

Improving the technology of enrichment of polymetallic ores and methods of separation of collective concentrates can significantly increase the production of copper, lead, zinc, rare and noble metals without high costs.

### Main part

Material-complicated polymetallic ores are processed at most concentration plants according to various technological schemes.

Polymetallic sulfide ores are enriched according to the collective selective flotation scheme with a collective concentrate. Then the collective concentrate is sent for selection.

Preliminary search experiments showed the positive effect of ammophos as a depressor, however, the reproducibility of the results was unstable. Therefore, we put experiments to determine the optimal parameters of the flotation separation of lead-copper concentrate.

The experiments caused by the consumption of ammophos (0-10 kg/t) without preliminary desorption of reagents from the surface of lead-copper concentrate did not give stable positive results, there was a significant transition of halenite to the foam product, and with an increase in the consumption of ammophos of more than 10 kg/t concentrate and copper minerals are noticeably depressed. The selection was successful in some cases and not with a fresh concentrate. This is due to the fact that particles of minerals are covered with films of flotation reagents (Xantogenate, foaming agent, T-92, etc.). These films do not allow the interaction of ammophos with the surface of particles.

The process of desorption of collective concentrate was carried out in the following order: a certain amount of collective concentrate was mixed with a solution of sodium sulfate for 15-20

minutes, then the pulp was diluted with tap water to H: L - 1: 20, mixed, defended and drained the illuminated part to solid content in a condensed pulp equal to 50%.

The effect of the duration of contact of the pulp with sulfur sodium and the number of collective concentrate was studied on the degree of separation of lead-copper concentrates. Further experiments conducted preliminary desorption of reagents with sulfur sodium.

An increase in the number of launderers slightly improves the separation of copper and lead minerals. However, this improvement was not highly effective. Therefore, when conducting further experiments, we produce one washout using water dilution to H: L = 1:20.

Experiments have shown that in order to remove flotoreagettes from the surface of particles, it is necessary to contact the concentrate with a solution of sodium sulfate for 15 minutes. when the last 6-8 kg/t is consumed.

The collective concentrate cleared of flotation reagents was subject to flotation separation. The dependence of the degree of separation of copper was studied

and lead during flotation from ammophos consumption from the duration of contact with ammophos, from pH of medium.

The results of experiments on the effect of ammophos consumption on the degree of separation of copper and lead showed that a fairly complete separation occurs when ammophos 2.5-3 kg/t is consumed. concentrate. With fewer ammophos, it is apparently not enough to cover all particles of ammophos with film, and at high costs ammophos depression and copper minerals begin. The effect of the duration of mixing collective concentrate with ammophos after desorption and washing was also studied. Agitation in various experiments lasted from 15 to 60 minutes. Ammophos consumption was 2.5 kg/t. The results of the experiments are presented in the table.1

**TABLE 1 DEPENDENCE OF THE DEGREE OF EXTRACTION OF COPPER AND LEAD DURING FLOTATION ON THE CONSUMPTION OF AMMOPHOS.**

Name product	Exit, %	Content, %		Extraction, %		Consumption ammof.kg/t concentrate

Ex. Pb - Cu concentrate.	100,0	3,35	51,30	100,00	100,00	

In the presence of ammophos with an increase in the duration of agitation, the lead content in copper concentrate is reduced.

When campaigning for 15-30 minutes, incomplete depression of halenite occurs and the flotation of chalcopirit is deteriorating. When campaigning for 45 minutes, satisfactory results were achieved.

When campaigning for more than 45 minutes, copper minerals are partially depressed and the copper content in copper concentrate decreases.

Experience in determining the effect of pH in which lead-copper concentrate with ammophos was mixed (45 min., consumption 2.5 kg/t) were carried out by adding a solution of soda ash. The results of the experiments are given in table 2.

These experiments have shown that creating an alkaline environment (pH 8.9 and higher) negatively affects breeding. If with pH from 6.4 to 8.2 the lead content in copper concentrate was 25.7% - 28.9%, then with pH = 8.9 this content increased sharply to 38.1%.

This is because the depression of lead minerals is associated with the displacement of xanthogenate ions with phosphate ions from its surface.

With low pH formed  $PbHRO_4$ , which shows a deterioration in the separation of lead-copper concentrate. With a higher pH = 9-10, the balance shifts towards education  $Pb_3(PO_4)_2$ . Therefore, we can conclude that at pH = 8.5, hydrophilization of the surface of halenite occurs and HP ions are formed.  $bO^{-2}RO_4^{-3} 4ON^{-}$  due to what positive results obtained. Therefore, depression should be carried out at pH not more than 8.2.

Thus, the following conditions of copper-pig breeding were determined from laboratory experiments: the pulp of the original lead-copper concentrate is mixed with 15 min with sodium sulfate (cost 6-8 kg/t) at H: L = 1: 3. Then follows water dilution to H: L = 1:20, sucks and draining of the illuminated part to the solid content in the condensed pulp, equal to 50%.

Galenite depression is carried out by 45 minutes when mixed with washed collective concentrate with ammophos (cost 2.5 kg/t), then basic copper flotation and four copper concentrate reins in an open cycle. According to this technology, various experiments produced copper concentrate with a copper content of 18-30% (extract of 50-81%), lead - 2.3-3.4% (extract from 0.2-0.7%) .

When breeding lead-copper concentrate, metal losses in mixed concentrates are inevitable. Losses of lead with copper concentrate can be reduced by introducing an additional lead-free operation of copper concentrate.

**TABLE 2 THE EFFECT OF PH ON THE SELECTION OF LEAD-COPPER CONCENTRATE**

Name product	Exit, %	Content, %		Extraction, %		pH at agitation with ammophos
		Cu	Pb	Cu	Pb	
Copper concentrate.	30,0	11,62	28,9	95,0	15,6	6,4 Without soda
Tails are copper.flotation	70,0	0,30	67,1	5,0	84,4	
Ex.Pb-Cu concentrate.	100,0	3,70	55,4	100,0	100,0	
Copper concentrate.	23,1	12,36	25,7	96,0	13,1	7,6
Tails are copper.flotation	76,9	0,20	66,9	4,0	86,9	
Ex.Pb-Cu concentrate.	100,0	3,70	55,4	100,0	100,0	
Copper concentrate.	30,0	11,72	28,6	90,0	15,5	8,2
Tails are copper.flotation	70,0	0,20	66,8	10,0	84,5	
Ex.Pb-Cu concentrate.	100,0	3,70	55,4	100,0	100,0	
Copper concentrate.	35,2	10,19	38,1	95,7	23,1	8,9
Tails are copper.flotation	64,8	0,25	55,5	4,3	76,9	
Ex.Pb-Cu concentrate.	100,0	3,70	55,4	100,0	100,0	

The operation of desalination of copper concentrate, as is known from the practice of domestic and foreign factories, is carried out by depression of copper minerals with cyanide and before flotation of lead minerals into the foam product. An overhanging operation can take place without prior desorption of reagents from the surface of minerals if copper minerals are represented by chalcopyrite.

Experience in debating copper concentrate IV miscalculations were carried out at cyanide consumption from 0.2 to 2 kg/t of the initial lead concentrate. The duration of the contact (10 minutes) was selected experimentally, the flotation time was 5 minutes.

Copper losses in lead concentrate of do flotation were 5.4% of the original product, or 7.5% of the operation. The content in copper lead concentrate is reduced to 1.25%.

Since the output of the lead product after lead is insignificant, it can be sent directly to the finished lead concentrate.

To obtain the final version of the technological scheme for the separation of lead-copper concentrates, two identical experiences were set: desorption of reagents with sulfur-sodium for 15 minutes, at pH = 8.5 agitation with ammophos 45 minutes, ammophos consumption 2.5 kg/t of concentrate and four stripping with brass concentration at optimal parameters with an open and closed cycle. Based on the results of these experiments, we can conclude that the results of the experiments in the closed cycle are more real and the copper content in the copper concentrate is high. (Table 3)

The results of experiments in the open cycle of separation of lead-copper concentrate allow us to conclude that when used as a depressor of lead minerals of ammophos (2.5 kg/t of concentrate) and the introduction of the operation of desalination of copper concentrate (cyanide consumption 1.0 -1.5 kg/t), a copper concentrate with high rates is possible. The concentrate contains 30.3 % copper, 1.6% lead when 56.8 % copper and 0.24 % lead are extracted into it.

The results of the experiments were close and can be considered quite satisfactory in all respects. A copper concentrate with a copper content of 32.6 % and a extraction of -90.45 % were obtained.

**TABLE 3 RESULTS OF EXPERIMENTS IN A CLOSED CYCLE**

Product Name	Exit, %	Content, %		Extraction, %	
		Cu	Pb	Cu	Pb
Copper concentrate.	8,2	32,60	1,70	90,45	0,22
Pb concentrate.	91,8	0,31	70,10	9,55	99,78
Ex.copper-plumbum.concent	100,0	2,96	64,34	100,00	100,00

With him, 0.2-0.22% of lead was lost. The quality of lead concentrate increased by 5-5.76 %. The foam product of copper concentrate had a yield of 1.4-1.6 % and contained 13.7-17.2 % copper, 2.1-7.2% lead and 2.4 % zinc. This technology has been recommended for industrial testing.

## DISCUSSION

Accelerating scientific and technological progress requires increasing the complexity of ore processing, the completeness of the extraction of valuable metals from them. Decisions of the Government of the Republic of Uzbekistan provide for a significant increase in the production of non-ferrous metals. At this is given special attention to the development of poor and complex deposits through the development of new technologies and reagent regimes, the wide automation of technological enrichment processes. The task of creating a rational and integrated technology for the processing of technologically advanced polymetallic industrial products is very relevant.

Increased production of lead and zinc requires the involvement of new deposits, off-balance sheet ores, and waste from concentration plants.

As a result of the studies, the mechanism of action of ammophos on the surface of copper and lead minerals has been comprehensively studied and disclosed, and it has been proven that ammophos is an effective depression of lead minerals when dividing lead-copper concentrates.

## CONCLUSION

1. It was found that the results of flotation of pure minerals of lead and copper mainly depend on the flow rate of the reagent, on the size of the grinding, pH of the medium, mixing speed, etc.d.

2. The process of selection of lead-copper concentrate using ammophos has been studied and the optimal flotation mode has been established: flushing the initial collective concentrate with a solution of sodium sulfate at a flow rate of 6-8 kg/t for 15-20 minutes, then flotation of copper at a consumption of ammophos of 2.5 kg/t, butyl xanthogenate 30 g/t.

3. A highly efficient, new technology for breeding collective lead-copper concentrate using cheap, non-toxic local raw materials - ammophos, as an effective depressor of lead minerals has been developed.

### ABSTRACT

*The article describes the methods and technology of using "portfolio" technology. Evaluation of the results of scientific activity of university teachers, students and masters, monitoring data allow to support the level of understanding of the goals and opportunities of the portfolio of teachers and students and its implementation. According to the research of teachers, the introduction of a portfolio has a positive impact on the organization of the learning process.*

**KEYWORDS:** *Portfolio Technology, Virtual Portfolio, Rating, Scientific Teacher And Student Activities, Technology, Scientific Achievements.*

---

### INTRODUCTION

Today, the problem of assessing the quality of education is of great importance in all countries of the world. Assessment technologies are largely based on the concepts and strategies of education that exist in different education systems. The process of evaluating the effectiveness of the university does not depend on pedagogical activity and subjective factors that characterize its scientific features and the quantitative parameters given to society. In this regard, there is a need to determine the effectiveness of teachers' activities, and the quality of student training, in particular, the assessment of their scientific achievements, as well as the criteria for quantitative evaluation of scientific activities are not sufficiently developed. Therefore, it is the development of systematization technology, the development of scientific documents, the determination of the

effectiveness rating of teachers and students. Evaluation of research and scientific-methodical activity of professors and teachers and determination of the rating of research work of university students is an important educational process.[1]

We have used "portfolio" technology for teachers and students to store, organize and document the results of scientific activities.

The term "portfolio" has long been familiar to art professionals: many, now and in past centuries, some artists have created a portfolio of their creative work.

There are many approaches today in interpreting the concept of 'portfolio'. A portfolio is a form of realistic assessment of learning outcomes based on scientific activity created by a student or teacher in the process of learning, creative, social and other activities. The portfolio emphasizes the planning and self-assessment of learning outcomes by teachers and students. Thus, the portfolio is consistent with the goals, objectives, programs, and technology of the training.[3]

**Portfolio evaluation.** The portfolio is evaluated by the administration of the educational institution or by a public body depending on the purpose of its presentation. The evaluation will look at all the materials in the portfolio in terms of how they have affected student outcomes and teacher development. Thus, the pedagogical electronic portfolio is, on the one hand, the personal portfolio of the teacher, on the other hand, the integration and understanding of the experience of other educators, methodologists, IT-specialists. It provides space for the educator and his students to work independently and creatively. In addition, the communicative role in the development and use of electronic portfolios, which is reflected in the communication and interaction with other teachers, students (e-seminars, consultations, web projects, etc.) in the educational environment using computers and the Internet we emphasize. These processes help to develop the technology of the university's portfolio of faculty and students.[1,3]

***In real pedagogical practice, there are three main types:***

Portfolio of documents "- a portfolio of a certified (documented) individual.

"Work portfolio" - a description of various creative, project collections, research work, as well as the main forms and directions of activity.

A "commentary portfolio" is an assessment by an author of his or her accomplishments, an analysis of various activities and their outcomes, a conclusion, future planning stages of professional growth, as well as various reviews and more.

The purpose of the traditional portfolio for teachers and students is to present their work to demonstrate their educational achievements. However, it is very important to form a university student who accepts the news. That is why in our research we talk about the portfolio of scientific achievements of the teacher and the student. The main task of research and teaching research activities is to deepen and strengthen students' knowledge, increase the share of ratings. Teachers 'and students' scientific activities and scientific-practical tasks, as well as their participation in scientific-practical activities of students in different areas of conducting scientific-practical conferences The introduction of research elements into various forms of teaching eliminates contradictions at the present time. very effective. The role of scientific advisors, teachers and curators in increasing the effectiveness of the student portfolio is great.[2]

***Principles of the technological portfolio of scientific achievements of teachers and students:***

- Voluntary participation in the project, self-assessment of students' results;
- Mastering certain types of scientific activities;
- Systematic and regular self-monitoring;
- The structure and consistency of the information provided in the Portfolio;
- Reliability, integrity of the submitted materials.

***The portfolio of teachers of the University for scientific research and scientific-methodical activities is as follows:***

- Qualification characteristics (academic degree, title, membership (RAS, RAO));
- Scientific supervision and departmental awards, honorary titles for masters, graduate students and doctoral students;
- Membership in UMO in scientific and methodological councils on the specialty;
- Provide information on all types of scientific and methodological and research;
- Information on inventive activity, preparation of candidates and doctors of sciences, preparation of students of Olympiad winners of different levels and student scientific competitions;
- The volume of research of economic contract and state budget, as well as the completion of various types of research work with students and scientific, organizational work.

A very large list of scientific activities and activities, research and scientific-methodological activities of teachers, the research does not allow students to perform them systematically in a timely manner, the use of modern information technology is advisable. An important component of the student portfolio and the teacher's portfolio is the module, which allows to determine the level of their scientific effectiveness and to assess the virtual portfolio of students' scientific achievements. The level of participation in events, the number of works performed and their evaluation, is determined by the level of activities.[4,5]

In the window of editing information on the results of the teacher's scientific activity: Rankings are calculated throughout the university, by faculties, departments, frameworks and academic groups are calculated at the end of each semester, as well as throughout the educational process. Four researchers will be provided to ensure that the results are comparable. Categories of teaching staff:

- professors,
- Associate Professors,
- Senior teachers,
- Assistants.

Teacher and researcher rankings describe the teacher's accumulated qualification potential, working hours, as well as production and creative activities. The teacher's rating for the last five years is determined accordingly. In the e-portfolio of teachers and in the e-portfolio of students

new scientific achievements in the format of personal documented web resources as well as the rating of scientific achievements allow to have a variety of analytical data.[6]

For each teacher, an absolute rating of his or her academic performance is obtained, and efficiency and relative rankings are determined among colleagues in the work group. All points are shown in the table of generalized rating of teachers based on the portfolio of scientific achievements. Thus, student and teacher portfolios are the basis of the ranking of scientific achievements in the web resource format, the ability to improve the system of criteria for students and teachers and the regulation of indicators of performance evaluation of university departments. technologies are used. Therefore, the diversity of portfolio models, the differences in the areas of education and professions in which they operate, the specific goals of certain types of portfolios are constantly trying to create a certain typology of it with teachers and requirements. Nowadays, the importance of the portfolio of teachers and students for the university is of great importance as a way to increase the effectiveness of teaching and support the improvement of teaching. Describes the curriculum portfolio as documents and materials that together reflect the scope and quality of faculty training. The training portfolio will also increase the scientific effectiveness of the list of publications, grants and benefits.

## CONCLUSION

Working with portfolio technology can help solve many pedagogical problems. Modern educational innovations make the teacher and the student the subject and center of the educational process, giving him maximum freedom and responsibility in setting goals and organizing their educational activities. focuses on self-assessment. For example, in the search for sources of information, the selection of specialists and leaders in educational research, the development of individual curricula, and so on. The article describes the purpose and essence of the portfolio, the presented technological processes, portfolio models and methods of their evaluation, as well as the specific features of each portfolio model, the authors use portfolio technology as a required educational technology.

**ABSTRACT**

*In this article, we will show how polymers are taught in the section on this topic. Information on the history of the Department of Polymers at the Faculty of Chemistry is provided at universities. Polymer science courses at the University of Concept are an integral part of the curriculum in seven programs - chemistry, biochemistry, bioengineering, civil engineering in materials, chemical analysis, chemistry and civil engineering in chemistry. A detailed description of the polymer-based courses included in the curriculum, as well as the scientific and methodological basis for the integrative improvement of the course "Polymer Chemistry" in the bachelor's degree program "Chemistry" in universities.*

**KEYWORDS:** *Polymer Chemistry, Methodology, Chemistry, Integrative Improvement, Teaching Methods, University, Curricula.*

**INTRODUCTION**

Polymers are a part of our lives; scientists dedicated to polymer science are developing new materials, thinking about environmentally friendly methodologies and meeting people's needs. In many universities, polymer science is taught by academics associated with traditional chemistry departments (organic, analytical, physical, and inorganic chemistry). Like various sciences, polymer chemistry has its own language and terminology. Poly- means many, inheritance- means size. Also, the molecular mass of polymers is very large. Their exact scientific name is called

high-molecular compounds. However, you are well aware that the so-called "polymer" is synonymous with science, technology and is widely used in life. The molecule of polymers is also called a macromolecule because they actually have a molecular mass. Polymers are high-molecular compounds whose macromolecules have a chain structure, consisting of groups of atoms (joints) that repeat many times.

Due to the interdisciplinary nature of teaching polymer chemistry to undergraduate students, there are specific difficulties in conveying the topic clearly. It aims to propose a new curriculum for teaching this core course to overcome some major barriers. In particular, new integrative research methods are being added to the professors responsible for teaching first-year polymer chemistry. Starting with the simplest chemical pathway, i.e. live anionic polymerization, we intended to facilitate polymerization. In addition, some pedagogical challenges are highlighted in this article. These new scientific methods of polymer teaching are based on knowledge of organic chemistry.

What is the purpose of the science of "polymer chemistry"? In fact, it is to acquaint undergraduate students in the field of chemistry with the basics of polymer chemistry and its important practical features, which the chemist-bachelor should know, and to help them to test their theoretical knowledge in practice. The general course focuses on explaining the properties of polymers that differ from ordinary submolecular compounds due to the large size and chain structure of macromolecules. The general theoretical course of the subject "Chemistry of Polymers" is carried out by students through laboratory work.

Teaching improvement processes:<sup>1</sup>

- Strategies for providing teaching and workshop opportunities to improve teaching staff;
- Creating opportunities to improve academic courses and research through conferences;
- Update by reading more books and articles related to the course;
- Improving methods in the classroom and allowing students to focus on the learning process through relationships such as improving and enhancing the teacher-student relationship. World experience shows that the relationship between teacher and students certainly affects the quality of education.

Polymer chemistry course materials and learning outcomes should be reviewed periodically and modified. The development of scientific and methodological bases for the integrated improvement of the course of polymer chemistry and the introduction of innovations in this area require the use of modern and interactive teaching methods, mainly through the initiative. Pedagogy is a fundamental and applied science. First fundamental applied research and is characterized by the expression of fundamental priorities. The strategic goal of fundamental research is to identify laws and regularities, to create theories and concepts, to systematize the properties and significance of real objects.

The increasing use of IT or web directories will also make it easier to educate students through changes in content as a result of new research. Polymer Chemistry course materials will be posted on the website, which students can access and can easily use both intensive and integrative coursework. Electronic materials and computer-based software are used to support the course material.

It is necessary to continuously use traditional and interactive methods during the teaching of students, mainly in the course of Polymer Chemistry. It is also important in this area, as it is in every field. The laboratory room is a place where students test their theoretical knowledge in practice. Chemistry is a complex science and we need to be able to explain it to students in a simple and easy way through various interactive and interactive lessons, using modern methods. Fundamental research performs not only prognostic, ontological, but also heuristic and methodological functions to reveal new aspects of the problem in the education system that need to be explored and to develop heuristic technologies and strategies for applied research.

In the context of information globalization, the enrichment of science with different information, a high degree of freedom to analyze and interpret information, like other disciplines, determines the sense of looking at the science of pedagogy from different angles, ie perspectives. An understanding of the course of polymer chemistry that is incompatible with its nature, and attempts to forcibly assimilate approaches, may also be overlooked. The main way to preserve the fundamental nature of this science is to clarify and correctly explain its methodology.

Why is the motivational method necessary for the course of polymer chemistry ?!

Motivation for everyone is a power and a power that inspires a sense of inner confidence that can empower you to take a bold step toward your goal. I believe that the most important result will be a good result if teachers and professors teach students using motivational methods during the course. These methods and integrative scientific methods have been tested in my own teaching activities.

According to the results of the new research, lessons are organized on the basis of interactive methods by introducing the content of the course and giving assignments to improve the overall skills of the student. The main purpose of this course is to acquaint students with current methods of spectroscopic analysis. They are used in a variety of analytical applications by studying and linking their performance, design, problems, and using the following methods with data:

- Instrumental integrative research methods;
- Analytical interactive methods;
- Methodology of analysis and thinking.

The result of science as a system of scientific knowledge and scientific activity is reflected in new scientific knowledge of theoretical and practical type. In general, the existence of truth and novelty is the most fundamental value for scientific knowledge. Science as a component of culture is based on a socio-cultural perspective, a specific historical and cultural context, develops in an axiological context; on the other hand. - serves as a basis for the development of science and culture.

Based on the need for a scientific and methodological basis for the integrated improvement of the course "Chemistry of Polymers" in the bachelor's degree program "Chemistry", which fully reflects the methodology of scientific and pedagogical research, the creative team provided textbooks, methods and manuals. was created. Because this science is complex, understanding a textbook can certainly be a little harder at the beginning. You will have to rely on philosophical and logical thinking in situations like this. According to pedagogical, methodological and scientific research, using the results of scientific research on the course of polymer chemistry, it

is possible not only to understand the essence of the course of polymer chemistry, but also to study the lessons intensively.

In conclusion, I can say that the educational process is always in need of innovation, new teaching and learning methods. A solution to this problem can be found mainly through the scientific research of university students and teachers. In teaching the science of polymer chemistry to young people on the basis of interactive, integrative scientific methods, which have become popular in recent years, it is necessary to conduct lessons with students, both collectively and individually.

By studying the scientific and methodological basis of the integrative improvement of the course "Polymer Chemistry" in the bachelor's degree program "Chemistry" in universities, we see both the quality of education and its level. Basically, it is necessary to conduct research in this area and use the power of modern technology, as well as to guide students in this regard. In the future, we intend to develop new methods in the field of polymer chemistry and to train mature and knowledgeable personnel through lessons based on each of the integrative scientific methods used in the further development of these fields in our country.

## CLINICAL SIGNS AND FREQUENCY OF POSTPARTUM ENDOMETRITIS IN BREEDING COWS

**Abdiev S.B\***

\*Senior Teacher,  
 Samarkand Institute of Veterinary Medicine,  
 UZBEKISTAN

### ABSTRACT

*The main factors causing postpartum endometritis in imported dairy cows in our country are the low level of feeding and housing conditions, lack of motivation, the incidence of this disease on farms is more common in spring and winter, complications of endometritis, increased service life of cows, several times of repeated intercourse, loss time, decreased milk production, untimely calving and even infertility after effective treatment of the disease, and the exclusion of cows after the third birth can cause significant economic damage to farms.*

**KEYWORDS:** *Breeding Cows, Endometritis, Purulent-Catarrhal, Infertility, Cervicitis, Ovarian Dysfunction, Trauma, Etiology, Opportunistic Microorganisms.*

### INTRODUCTION

The livestock breeders of the republic are faced with the urgent task of providing the population of our country with ecologically clean local food. To solve this problem, it is necessary to increase the herd population, prevent various diseases of the uterus and infertility of cows, increase milk production and reduce early weaning of cows. The main factors affecting the fertility of cows on dairy farms are congenital and postpartum diseases, as a result of which cows develop endometritis, cervicitis, ovarian dysfunction and others. [2,3,5,9,10,11].

Endometritis - is an inflammation of the lining of the uterus. Depending on the course of endometritis: acute, semi-acute and chronic, depending on the manifestation, it has a clear clinical sign and is latent. Acute endometritis can be catarrhal, purulent, purulent-catarrhal, fibrinous, necrotic and gangrenous, depending on the form of inflammation [6].

After childbirth, various microorganisms enter the genital tract and cause serious diseases of the genital organs. Microorganisms can enter the genitals in 2 ways: exogenous and endogenous [7].

Microorganisms enter the genitals when they help to give birth exogenously through the hands of an obstetrician, tools, dirty bedding and other objects. Microorganisms endogenously enter the genitals long before birth. These are saprophytes trapped in the uterus or vagina, and microorganisms prone to disease when the body's defenses are weakened[1].

In recent years, endometritis has become very common among cows, causing significant economic damage to dairy farms. The disease was diagnosed on average from 24.6% to 44% of cows[9]. In the Republic of Dagestan, the incidence of endometritis is recorded in 50% of pedigree cows of the Red Desert, about 30% in brown Caucasian and Swedish cows, in 10.5% in Simmental cows and in 9% in local cows[8].

A survey of existing cows on the farms of the Vologda and Vladimir regions revealed the incidence of acute postpartum endometritis in cows from 29.8% to 32.4%[9].

In the farms of the Krasnodar Territory, postpartum endometritis ranged from 5% to 40% among frequently infected cows at different times of the year[4].

Taking into account the above, the study of regional etiological factors causing postpartum endometritis among imported cows in the country, the degree of their occurrence and clinical signs is of great scientific and practical importance.

**Research purpose.** In connection with the above, the study of regional factors causing postpartum endometritis in imported cows in our country, the degree of their occurrence and clinical signs was carried out.

**Research object and methods.** Studies, including the study of regional factors, the degree of morbidity and research work related to the clinical signs of postpartum endometritis, were carried out in the "Feruzjon Boglari" of the Samarkand region and the district, the livestock farm "Farovon Grand Invest" in the Akdarya district, the livestock farm "Agro Gold Spring" in the Narpay district, the livestock farm "Utkir Chorvo Invest" in the Pakhtachinsky District.

The frequency of postpartum purulent endometritis in farms, the number of days after birth, the onset and symptoms of the disease, the etiology and pathogenesis of the disease were studied. Methods of obstetric and gynecological examination G.A. Cheremisinov and others, namely: time, quantity (ml), color, pH (medium), the consistency of the liquid secreted from the genital organs of cows; the clinical signs of the disease, urinary incontinence, and changes in posture were studied and diagnosed.

**Research results.** A study of the incidence of postpartum endometritis in 2020 in the Feruzjon Boglari farm of the Samarkand region and the district, the Farovon Grand Invest livestock farm in the Akdarya district, during a clinical examination of 47 cows that gave birth in winter, 9 of them revealed the presence of purulent catarrhal endometritis with clear clinical signs and this figure was 17.39% in a clinical examination of 37 cows that gave birth in the spring, 9 of which had purulent-catarrhal endometritis with obvious clinical signs, and 31.87% in a clinical examination of 22 cows that gave birth in the summer, 1 of them had purulent - catarrhal endometritis and this indicator was 4.54%, and during a clinical examination of 28 cows who gave birth in the fall, the presence of purulent-catarrhal endometritis was detected in 2 of them with obvious clinical signs and this indicator was 7.14%.

Similarly, in 2020, a clinical examination of 19 cows that gave birth in winter at the Agro Gold Spring farm in Narpay district of Samarkand region revealed the presence of purulent catarrhal endometritis in 4 of them, it was 21%, of 22 cows that gave birth in the spring underwent a clinical examination and 5 of them were diagnosed with purulent-catarrhal endometritis and it was 22.72%, 16 cows who gave birth in the summer were clinically examined, of which 1 had purulent-catarrhal endometritis and it was 6.25%, in 17 cows who gave birth in the fall during a clinical examination in 1 of them was found to have purulent-catarrhal endometritis with clear clinical signs at the beginning, and it was noted that it was 5.88%.

When examining 17 cows that gave birth in the winter months at the Utkir Chorvo Invest livestock farm in the Pakhtachinsky district, it was found that 3 of them have purulent-catarrhal endometritis, and it is 17.64%, with a clinical examination of 20 cows that gave birth in the spring months, 4 of them revealed the presence of purulent-catarrhal endometritis with obvious clinical signs, and it was found that it is 20%, during a clinical examination of 14 cows who gave birth in the summer months, 1 of them revealed the presence of purulent-catarrhal endometritis, which was 7.14%, a clinical examination of 15 heads of cattle that gave birth in the fall revealed the presence of purulent-catarrhal endometritis in 1 of them, which at first had obvious clinical signs, which amounted to 6.58%. Similarly, at the Utkir Chorvo Invest livestock farm in the same area, 17 cows that gave birth in the winter months were examined, of which 4 have purulent-catarrhal endometritis with obvious clinical signs, which amounted to 23.52%, a clinical examination of 16 cows that gave birth in the spring, revealed the presence of purulent-catarrhal endometritis in 5 of them, which was 33%, during a clinical examination of 12 cows that gave birth in the summer, the presence of purulent-catarrhal endometritis with clinical signs was revealed in 1 of them, which amounted to 8.33%, with clinical Examination of 13 cows that gave birth in the fall revealed the presence of purulent-catarrhal endometritis with clinical signs at the beginning in 1 of them, and this amounted to 7.69%.

During the seasonal analysis of the survey data obtained, it was noted that purulent-catarrhal endometritis with more pronounced clinical signs is more common in winter and spring. At the same time, in 2018, 84 cows were clinically examined that gave birth in the winter months from 4 farms, of which 15 (18.89%) cows, during a clinical examination, 91 cows gave birth in the spring of which 23 (26.40%) cows, during a clinical examination of 72 cows that gave birth in the summer, of which 6 (8.56%) cows, and during a clinical examination of 82 cows that gave birth in the fall, it was revealed that 5 (6.84%) cows were diagnosed with the initial stage of purulent-catarrhal endometritis and processes with clear clinical signs.

In cows, the processes of purulent-catarrhal endometritis were mainly acute and chronic, with the release of a grayish-white fluid from the uterus, mainly in most animals 5–6 days after birth. Mixed purulent discharge of caruncles and rotten fragments of the placenta from the uterus of some cows was observed when the animal strained, lay down or massaged the rectum with his hands, and in most cases the exudate hardened in the abdominal part of the tail. There was edema, redness and hemorrhage on the mucous membrane of the vagina and cervix, the exudate from the uterus was collected in the vaginal corridor, especially in front of the cervix, the cervical canal was opened 1-2 fingers wide.

When we examine the uterus through the rectum, the wall of the uterus becomes hollow, in some cases of a pasty consistency. Although the general condition of the cow was satisfactory, there was a decrease in the amount of milk. The animal walks and feeds with the general herd. The

general condition of the cow depends on the state of purulent-necrotic processes in the uterus, depending on the severity of the process, its general condition worsens, bends, weakens, begins to lose weight dramatically and the overall temperature rises to 1-1.5 ° C.

In pedigree dairy cows in the republic, the main factors causing postpartum endometritis are metabolic disorders and a decrease in immunobiological properties due to low nutritional levels and storage conditions and lack of mobility, as a result, opportunistic microorganisms enter the body through injuries of the uterus during childbirth. and cause the development of purulent-inflammatory processes 8-10 days (in some cases 3-6 days) after birth.

In recent years, the introduction of highly mechanized industrial technologies based on the standards of different countries for the storage and milking of pedigree livestock, some shortcomings in the design and construction of livestock buildings, increased the number of injuries and stress among animals and caused general discomfort. These stressful situations and general discomfort ultimately lead to a decrease in the resistance of animals and, as a result, the development of endometritis, cervicitis, ovarian dysfunction and other pathological processes in cows.

In many developed countries, postpartum endometritis is one of the leading obstetric and gynecological diseases, even among cows that are fed according to modern highly mechanized industrial technologies and are provided with modern veterinary services. The complications of the disease are severe; cows temporarily or permanently become infertile. Early diagnosis of the disease is not always achieved, and treatment does not give good results. In many farms, postpartum endometritis is poorly treated, and the treatment of animals is left to chance.

What complications are caused by untreated and effectively cured endometritis? The lifespan of the cows is increased. If a cow has a lifespan of 180 days, the farm will have to spend a lot of money, labor and time to heal that cow and mate it several times.

It is known that any disease that occurs in animals leads to a decrease in milk yield, which also causes great economic damage to the farm. If bacterial drugs, such as the tetracyclines group, are used to treat the disease, the economic damage increases again, as the economic damage caused by antibiotic use to dairy farms in developed countries averages 30% of farm profits. The cause of infertility, such as the inability to calve during similar economic losses and even after effective treatment of the disease, is exacerbated by the deregistration of cows after the third birth. If the deregistered cow was bought abroad, the economic damage to the farms will be even greater.

## CONCLUSION

1. The main factors that cause postpartum endometritis in dairy cows in our country are the low level of feeding and storage conditions, lack of motivation, leads to the ingestion of opportunistic microorganisms through lesions of the uterus during childbirth and the development of purulent-inflammatory processes due to metabolic disturbances. and a decrease in immunobiological properties.

2. In a clinical examination of 84 animals from farms, of which 15 cows (18.89%), in a clinical examination in the spring, 91 cows gave birth, of which 23 cows (26.40%), in a clinical examination of 72 cows that gave birth in the summer, of which 6 cows (8.56%) and in the fall, during a clinical examination of 82 cows that gave birth, it was revealed that 5 of them (6.84%)

were infected with the initial stage of purulent-catarrhal endometritis and processes with obvious clinical signs.

3. As a result of complications of untreated and effectively cured endometritis, prolongation of the life of cows, repeated intercourse several times, loss of time, reduced milk yield, not getting a calf on time and even the cause of infertility even after effective treatment of the disease, it was noted that deregistration of cows after the third birth will cause great economic damage to farms.

### ABSTRACT

*The sentence is traditionally defined as the expression of a complete thought. But this seems to be open to thought and discussion because completeness is, in fact, very relative and depends largely on the purpose of the speaker or writer as well as on the context, linguistic or situational. This article is dedicated to the study of the sentence and its main grammatical features: predicativity and intonation.*

**KEYWORDS:** *Sentence, Predicativity, Intonation, Declarative Sentence, Interrogative Sentence, Imperative Sentence, Exclamatory Sentence.*

### INTRODUCTION

The traditional definition is that a sentence is a group of words expressing a complete thought is to-day often criticised on the ground that a sentence is sometimes one word and that the thought is not always complete but largely depends on the meaning of preceding sentences.

Some recent writers have attempted to make "utterance" do the work of the classical term "sentence". But this does not seem fully justified because the two terms belong to different planes, one historical and the other linguistic.

The dissatisfaction with the term seems to result from the fact that accurate studies of syntax distinguishing what is grammatically self-contained in writing, and what are the corresponding structures in actual speech, have not yet been made. This deserves special systematic description.

The sentence is the immediate integral unit of speech built up of words according to a definite syntactic pattern and distinguished by a contextually relevant communicative purpose. Any coherent connection of words having an informative destination is effected within the framework of the sentence. Therefore, the sentence is the main object of syntax as part of the grammatical theory. [1]

The sentence, being composed of words, may in certain cases include only one word of various lexico-grammatical standing.

Cf.: *Good! Look! Thanks! Away! Why? Certainly.*

The actual existence of one-word sentences, however, does not contradict the general idea of the sentence as a special syntactic combination of words, the same as the notion of one-element set in mathematics does not contradict the general idea of the set as a combination of certain elements. While the word is a component element of the word-stock and as such is a nominative unit of language, the sentence, linguistically, is a predicative utterance-unit. It means that the sentence not only names some referents with the help of its word-constituents, but also, first, presents these referents as making up a certain situation, or, more specifically, a situational event, and second, reflects the connection between the nominal denotation of the event on the one hand, and objective reality on the other, showing the time of the event, its being real or unreal, desirable or undesirable, necessary or unnecessary, etc.

A sentence is a unit of speech the grammatical structure of which conforms to the laws of the language and which serves as the chief means of conveying a thought. A sentence is not only a means of communicating something about reality but also a means of showing the speaker's attitude to it. And it possesses the following properties:

- The sentence as a linguistic expression of extralinguistic reality must be actualized. Actualization of the sentence content makes predicativity an inseparable property of every sentence.
- The sentence, just like any other meaningful language unit, has a form. Every sentence has an intonation pattern.

The function of the sentence is to model some fragment of the world. This model should be referred to the original, to a fragment of the world. It means that a sentence is to be referred to reality. This property of sentence was first proposed and described by V.V. Vinogradov in the late 1930s. V.V. Vinogradov named this feature predicativity and showed that predicativity means reference of the content of the sentence to reality indicating its time in relation to the moment of speech, the degree of probability of the fact described in the sentence, and its relation to the participants of communication. [2]

## **METHODS**

The sentence differs from the word-group by its relatedness to objective reality – predicativity. Every sentence shows the relation of the statement to reality from the point of view of the speaker. [3]

There are three approaches to the interpretation of predicativity:

- semantic approach interprets predicativity as a reference to a certain situation of objective reality;
- logical – interprets predicativity as reference to a proposition, which is the main form of thought;
- formal-syntactical approach rests on the interpretation of predicativity as subject-predicate relations. There is no contradiction between the suggested interpretations of predication. Each of them deals with a separate side of one and the same phenomenon.

The communicative function of the sentence distinguishes it from phrases and words, which have one function – naming.

*E.g. 1) The doctor's arrival.*

*2) The doctor has arrived.*

Both examples consist of the same lexemes and render the information about one and the same person and his action. Nevertheless, there is a fundamental difference between them. The 1st example does not express an event, which refers to a particular time. The 2nd example expresses an actual fact, which refers to the past. Grammatically the 2nd example is characterized by the categories of tense and mood, by means of which this structure refers to objective reality. Thus, the 1st example is a non-predicative word-group and the 2nd example – a sentence. The correlation of the thought expressed in the sentence with the reality situation of speech is called predicativity.

The functional essence of predication has hitherto been understood in linguistics as the expression of the relation of the utterance (sentence) to reality, or, in more explicit presentation, as the expression of the relation between the content of the sentence and reality. This kind of understanding predication can be seen, for instance, in the well-known "Grammar of the Russian Language" published by the Academy of Sciences of the USSR, where it is stated that "the meaning and purpose of the general category of predication forming the sentence consists in referring the content of the sentence to reality". [4] Compare with this the definition advanced by A. I. Smirnitsky, according to which predication is understood as "referring the utterance to reality". [5]

Predicativity is also expressed by intonation, which is the essential feature of the sentence as a unit of speech.

In written language a sentence is a string of words standing between an initial capital letter and the mark of punctuation at the end while in spoken language a sentence is marked by special intonation. [6]

Intonation is the combination of pitch, stress and juncture with which an utterance is spoken. [7]

Being a unit of speech, the sentence is intonationally delimited. Intonation separates one sentence from another in the continual flow of uttered segments and, together with various segmental means of expression, participates in rendering essential communicative-predicative meanings (such as, for instance, the syntactic meaning of interrogation in distinction to the meaning of declaration). The role of intonation as a delimiting factor is especially important for sentences which have more than one predicative center, in particular more than one finite verb.

Cf.: 1. *The class was over; the noisy children filled the corridors.*

2. *The class was over. The noisy children filled the corridors.*

Special intonation contours, including pauses, represent the given speech sequence in the first case as one compound sentence, in the second case as two different sentences (though, certainly, connected both logically and syntactically).

## DISCUSSION

The structural types of sentences do not have connections with any special meanings. Yet if we take a sentence and start changing its structure, we may observe that the sentence received as a result of transformations possess some common and altering meanings.

Cf.: John will come tomorrow.

Will John come tomorrow?

Come tomorrow, John!

Comparing these sentences, we can see that all of them describe one and the same event – John's arrival at a certain place. But the first sentence presents this event as a fact that is to happen, and the speaker INFORMS the listener about it. The second sentence shows that the speaker wants to know if the event will become a fact and ASKS the listener to confirm or to negate it. The third sentence also shows that the speaker demands something of the listener, this time that the listener should do so that the event should become a fact. The difference of meanings corresponds to the difference of the form of the sentences. It means that we observe here an opposition of forms reflecting a certain meaning, which corresponds to the idea of a grammatical category. The semantic basis of the category or in other words its categorical meaning is the speaker's influence upon the listener. This basis corresponds to the illocutionary meaning of speech acts. If we compare these meanings with the illocutionary classes, we can see that they reflect two most frequent classes – in formatives and directives. The first sentence embodies the informative type of speech acts and is called declarative. The other two belong to the directives and formally differentiate direction for an action (the third sentence) and has the name of imperative or direction for a special type of action – informing the speaker (the second sentence) and is termed interrogative.

A declarative sentence states a fact in the affirmative or negative form. It is generally pronounced with a falling intonation.

*Charles Dickens was born at Landport, Portsmouth. (Laing)*

*They don't want anything from us – not even our respect. (Douglas)*

An interrogative sentence expresses a question, i.e. a request for information. It is connected with an answer, forming together a dialogue unity.

There are four kinds of questions:

- a) General questions
- b) Special questions
- c) Alternative questions

d) Disjunctive questions.

a) General questions require the answer *yes* or *no* and are spoken with a rising intonation. They are formed by placing part of the predicate, i.e. the auxiliary or modal verb before the subject of the sentence.

*Do you like painting?*

*Can you speak German?*

b) Special questions begin with an interrogative word and are spoken with a falling intonation. The order of words is the same as in general questions, but the interrogative word precedes the auxiliary verb.

*Where do you study?*

When the interrogative word is the subject of the interrogative sentence or an attribute to the subject, the order of words is that of a statement, i.e. no inversion is used.

*Who lives in this room?*

*Whose book is on the desk?*

c) Alternative questions indicate choice and are spoken with a rising intonation in the first part and a falling intonation in the second part.

*Do you live in town or in the country?*

e) Disjunctive questions require the answer *yes* or *no* and consist of an affirmative statement followed by a negative question, or a negative statement followed by an affirmative question. The first part is spoken with a falling intonation and the second part with a rising intonation.

*You speak English, don't you?*

*You are not tired, are you?*

An imperative sentence serves to induce a person to do something, so it expresses a command, a request or an invitation. As Hall stated that imperative sentence commands and requests use the simple form of the verb without any stated subjects. [8]

Commands are characterized by a falling tone.

*Come to the blackboard!*

*Stop talking!*

Requests and invitations are characterized by a rising intonation.

*Open the door, please!*

*Do come to see me tomorrow.*

An exclamatory sentence expresses some kind of emotion or feeling. It often begins with the words *what* and *how*, it is always in the declarative form, i.e. no inversion takes place. It is generally spoken with a falling intonation.

*What a lovely day it is!*

*How wonderful!*

## CONCLUSION

The sentence is the smallest unit of speech that expresses a thought, both orally and in writing. In oral form, the sentence pronounced by the sound up and down and hard soft, interrupted by pauses, and ended with a final intonation followed by a silence that prevents sound assimilation or fusion or other phonological processes. In the form of writing, a sentence begins with a capital letter and ends with a dot (.), question mark (?), or an exclamation mark (!), And in it can be included punctuation such as a comma (,), colon (:), split (-), and spaces.

The center of predication in a sentence of verbal type (which is the predominant type of sentence-structure in English) is a finite verb. The finite verb expresses essential predicative meanings by its categorical forms, first of all, the categories of tense and mood (the category of person, as we have seen before, reflects the corresponding category of the subject). However, proceeding from the principles of sentence analysis worked out in Russian school of theoretical syntax, in particular, in the classical treatises of V.V. Vinogradov, we insist that predication is effected not only by the forms of the finite verb connecting it with the subject, but also by all the other forms and elements of the sentence establishing the connection between the named objects and reality, including such means of expression as intonation, word order, different functional words. Besides the purely verbal categories, in the predicative semantics are included such syntactic sentence meanings as purpose of communication (declaration – interrogation - inducement), modal probability, affirmation and negation, and others, which, taken together, provide for the sentence to be identified on its own, proposemic level of lingual hierarchy.

### ABSTRACT

*This article describes the views formed on the basis of science and experience aimed at developing independent thinking and creativity in students in the educational process. In this regard, it can be said that the teaching module of the subject in the education system: educational-methodical complex, electronic educational-methodical complex (syllabus), glossary in many respects has the ability to provide students with a variety of additional information. Such cases are quite common in the interpretation of data types and additions, data classifications. This is probably necessary for transition textbooks, but they cannot be justified from a mathematical and didactic point of view. Therefore, such withdrawals should be phased out of textbooks.*

**KEYWORDS:** *Educational-Methodical, Necessary*

### INTRODUCTION

Achieving our great goals and noble intentions today, the renewal of our society, the development and prospects of our lives, the ongoing reforms, the effectiveness of our plans, the fate, first of all, depends on the problem of training highly qualified, intelligent, independent thinking and creative professionals. The role of pedagogical-mathematical knowledge in the formation of the younger generation as a mature and harmoniously developed person is invaluable.

Significant changes and restructuring in the education system remain a vital necessity to nurture a creative, active, independent-minded individual. Therefore, radical changes in education, the

creation of a scientific basis for the training of active, creative, intelligent, intelligent professionals are becoming an urgent task of a number of disciplines, including mathematics.

Also, one of the most important issues facing the world of pedagogy and mathematics today is the search for ways, means and means of forming an independent thinking person who is not only knowledgeable but also logically thinking.

If we look at the history, our thinkers who have lived and worked in our country, in their time, have put forward important ideas on what methods and means of teaching should be used in the education of independent-minded, creative people. In particular, the encyclopedic scholar Abu Rayhan Beruni in his works focuses on these issues and explains which aspects should be paid more attention in education in order to develop the personality and thinking of the student. In particular, Beruni emphasizes that in teaching it is important not to memorize, but to understand, to think logically, to draw conclusions.

Based on the above, it is possible to identify the following current problems facing the science of mathematics in the education of an independent-minded, logical-minded person in the educational process today:

- Mathematical methods (methods, forms), tools, methods that can meet the modern requirements of the process of education (formation) as a person in educational institutions, enriching them with new content, dialogic, innovative (innovation-based), cooperation with the teacher from the monologue teaching system transition to new types of education, such as harmonization of student activities);
- revision of the curriculum, syllabus for teaching students and textbooks, manuals, developments, lecture notes based on them, taking into account the achievements of modern mathematics;
- The formation of thinking in students in the educational process, teaching them to think logically, to achieve the formation of critical thinking;
- organization of activities of talented students in educational institutions, ensuring their diversity of logical tasks and the formation of their ability to perform them, understanding the existence and continuity of elements of logical thinking, directing students to perform non-standard tasks;
- Education should be built on the basis of active methods, so that the teacher-student cooperation takes precedence. Ensuring that active, independence-oriented teaching methods and forms, such as tests, debates, business games, complex pedagogical problems, heuristics, training, psychodrama, puzzles, brainstorming, logical problem solving, and problem-solving, become the basis of education.

In the organization of education in this area, the correct choice and application of teaching methods, improving the quality of education, the education of an independent thinker in the educational process, the following have risen to the educational center:

- Cognitive - is an educational activity that leads a person to the process of thinking, encourages cognitive activity to enter into the essence of a vague, unknown new elemental problem and directs to solve it, and leads to the growth of knowledge and information, individual consciousness, creativity and intellectual development;

- Dialogic learning - ensuring the interest of each learner not only by activating learners, but also by creating a creative environment and providing an exchange of ideas by discussing the topic or problem in a group setting with the teacher. Through this the learner becomes the subject of the learning process from its object;
- Consciousness - the ability to demonstrate a conscious attitude to the learning process, to draw inductive conclusions through the thought process of the given task or tasks.
- Problem-based learning - teaching students to solve problems and situations

Naturally, the above criteria allow students to think independently and freely, to be active and analyze their own point of view, providing them with the opportunity to take the initiative, knowledge and make full use of their intellectual potential.

Based on the above, the main directions of educating an independent-minded, logical-minded person in the educational process today can be identified as follows:

- "Industrialization of education", ie the strengthening of the intellectual activity of modern youth on the basis of computerization and technology;
- Transition from the most prevalent forms of education to the methods and forms of active learning. This direction is the transition from the "school of memory" to the "school of understanding", the "school of thinking";
- Transition from strictly defined control methods in the organization and management of the educational process to developmental, activating, improving methods and game methods. This creates an opportunity to support and develop the organizational-creative, independent activity of students;
- organization of interaction between the student and the teacher, ie ensuring the participation of students as a joint team activity. In this case, the main emphasis is shifted from the teacher's "teaching" activities to the student's "learning" activities.

It should be noted that today many textbooks and manuals are being prepared in a content aimed at developing students' independent thinking and creativity. In particular, curricula and textbooks in the general education system, developed in accordance with state educational standards, are based on the criteria and scientific principles set out in the Law "On Education" and the "National Training Program". Clearly, they are composed of materials in the context of things and events related to the student's lifestyle and daily life, designed for the level of psychological development of learners at each age stage.

Both the step-by-step sequence in the teaching of new textbooks and assignments, the ways in which the practice of developing students' mental activity in each subject becomes more complex, and the process of learning begins with active observation and ends with practical application. fully compatible with cognitive psychodidactic foundations. Clearly, the consistent application of such a method of education in practice, gaining experience in this area requires correction, supplementation and clarification.

To do this, we can first list the following methods and techniques aimed at solving the tasks facing the system of continuing education:

- One of our most important tasks is to popularize the method of verbal cognitive education (a new pedagogical technology of education today) among teachers. Because unless teachers learn to use modern pedagogical technologies, computer technology, and the practical use of visual aids to apply this method, they will not be able to achieve effective results in this area;

- In order to increase the effectiveness of textbooks and teaching methods, students must be provided with additional sources of information, which currently include textbooks, Internet data, electronic resources, student memory, daily life, other subjects, and inquiries from others. That's definitely not enough. Therefore, teachers must be provided with an encyclopedic reference, a variety of information (explanatory information, logical situational issues, pictorial materials, etc.) that combines the riches and capabilities of science and can convey them to learners. In this regard, it can be said that the teaching module of the subject in the education system: educational-methodical complex, electronic educational-methodical complex (syllabus), glossary in many respects has the ability to provide students with a variety of additional information. In addition, this would drastically reduce the current size of the textbooks, which would basically consist of an algorithm of assignments to study each topic (think creatively and create something within each topic). Of course, this is a big deal. But whether we have stepped into the method of verbal cognitive education and set ourselves the goal of nurturing a creative and independent-minded person, we have no choice but to do so. Without them you will not achieve our goal;

- In our opinion, in some of the current textbooks, "looking back" - it seems out of the norm to first rely on previous scientific interpretations and then deny or update them. Such cases are quite common in the interpretation of data types and additions, data classifications. This is probably necessary for transition textbooks, but they cannot be justified from a mathematical and didactic point of view. Therefore, such withdrawals should be phased out of textbooks. To do this, it seems necessary to reconsider the curriculum and textbooks of the primary grades in the entire education system, especially in secondary schools. The main factor in this is purely pragmatic - as shown in the program, the scientific knowledge that is not necessary for mass practical application is redundant for students, especially students of a young age;

- Do we think that in some textbooks it is necessary to give comments with the comment "learn", which completes the study of each topic, which is sometimes encountered, and the essence of which serves to check the independent conclusion of the learner ?! In this case, the reader prefers to read what is ready rather than invent it! In essence, these "learns" are answers and solutions to examples and problems in mathematics. So we think that if these, too, were too concise and given at the end of the textbook, it would have encouraged the children to search more independently;

- Tests are given in textbooks, especially in the repetition sections. These tests, on the other hand, are far from cognitive and verbal, they are more retroscopic and receptive in nature. It's time to think and research on the creativity of these tests. To this end, it would be expedient to increase the number of questions and assignments required for our own old, oriental tests, or 'competition of the talents', which are partially reflected in the textbooks.

In conclusion, the above-mentioned ideas are the views formed on the basis of our scientific and life observations aimed at developing the ability of students to think independently and creatively in the educational process. However, in our opinion, such issues have a special place

in the educational process in the formation of students' ability to think independently and in the development of a creative personality.

UZBEKISTAN

### ABSTRACT

*In the conditions of the southern zone of the Aral Sea region, a water-saving and optimal irrigation regime has been developed for medium-fibrous cotton varieties "S-4727", "Sulton" and "Chimboy-5018". Comparative analysis showed that a high yield of cotton variety "Sulton" was achieved with soil before irrigation at a moisture level of 80-80-60% of LCMF and an irrigation rate of 650-800 m<sup>3</sup> / ha and an irrigation rate of 3500 m<sup>3</sup> / ha. At the same time, the yield of cotton was 31.2-32.6 c / ha.*

**KEYWORDS:** Cotton, Fibers, Irrigation Scheme, S-4727, Chimboy-5018, Sulton, LCMF, Raw Yield, Meadow–Alluvial, Moisture, Soil;

### INTRODUCTION

There has been a water shortage in Karakalpakstan for the last 5-6 years. In years of water scarcity, the water supply of agricultural crops is 30-40% and in many areas leads to a decrease in crop yield and quality. Therefore, the area of saline lands in irrigated lands is expanding as a result of anthropogenic impacts.

In the current context of global and local climate change, one of the urgent tasks is to improve the demand for water in agriculture, to conduct research to take into account natural and climatic conditions in determining the impact of external factors on soil properties

In the irrigated lands of the republic, comprehensive measures are being taken to ensure the efficient use of water resources and increase the yield of cotton. Therefore, the Decree PF 5748

of June 17, 2019 "On measures for the efficient use of land and water resources in agriculture" and other regulations related to this activity to some extent serve the implementation of the tasks.

**Research methods:** All observations, measurements, calculations and analyzes were carried out on the basis of the techniques [1-3]. In all variants, in order to determine the minimum moisture capacity of the field before irrigation, in early spring, a trial plot measuring 1.5x1.5 was laid on the plots. The duration and rate of irrigation was determined by taking soil samples at each site (0-50 cm before flowering, 0-70 cm during flowering and 0-50 cm during cotton opening) from each 10 cm layer to determine moisture content by drying in a thermostat within 6 hours and subsequent weighing on the scales. The amount of water used for irrigation was determined using 50 cm wide Chipoletti water meters.

**Experimental results:** Field experiments In 2018-2020, in the meadow-alluvial soils of the northern and southern regions with a groundwater level of 2-3 m, the irrigation regime of medium-fiber cotton varieties "S-4727", "Chimboy-5018" and "Sultan" was studied and the effect on yield was determined.

According to scientific research, in the northern region of the Republic of Karakalpakstan, the yield of cotton varieties "S-4727", "Chimboy-5018" and "Sultan" with an average soil moisture of 70-70-60% of ChDNS in 2018 averaged 25.3 ts / ha of S-4727. In 2019 and 2020 it was 27.1 and 26.9 ts / ha, respectively.

**TABLE 1 IMPACT OF IRRIGATION SYSTEM ON COTTON YIELD (2018-2020)**

Op t. s/n	Pre- irrigation soil moisture relative to ChDNS, %	Cott on vari eties	Northern region				Southern region			
			Irriga tion syste m	Season al irrigati on rate, m3 / ha	The averag e yield in three years is ts / ha	Addit ional yield, ts / ha	Irriga tion syste m	Seaso nal irrigati on rate, m3 / ha	The averag e yield in three years is ts / ha	Addit ional yield, ts / ha
1	70-70-60	C- 472 7	0-2-0	2129	26,4	± 0,0	1-2-0	2856	27,2	± 0,0
2	80-80-60	-//-	1-3-0	2952	27,4	+ 1,0	1-4-0	3559	28,9	+ 1,7
3	70-70-60	Chi mbo y- 501 8	0-2-0	2221	28,7	+ 2,3	1-2-0	2918	29,3	+ 2,1
4	80-80-60	-//-	1-3-0	2826	30,0	+ 3,6	1-4-0	3891	30,9	+ 3,7
5	70-70-60	Sult an	0-2-0	2145	30,3	+ 3,9	1-2-0	2864	31,5	+ 4,3
6	80-80-60	-//-	1-3-0	2928	31,2	+ 4,8	1-4-0	3430	32,6	+ 5,4

With the transition of soil moisture to 80-80-60% relative to ChDNS, an increase in cotton yield was observed and 26.8 per cent, respectively; 27.6; The yield was 27.9 ts / ha.

It should be noted that in all cotton varieties studied, the highest yield of cotton was observed when the soil moisture before irrigation was 80-80-60% of ChDNS, while relatively good results were obtained in the variety "Sultan"

In the Chimboy-5018 variety, when the soil moisture was 70-70-60% relative to the ChDNS, an average yield of 28.7 t / ha per hectare was obtained in 3 years, or 2.3 t / ha more than in the S-4727 variety. It was found that with an increase in soil moisture from 70-70-60% to 80-80-60%, the cotton yield increased by 3.6 ts / ha.

Cotton yield of "Sultan" variety when soil moisture is 70-70-60% from ChDNS 2018-31,2; 2019 y-30.4 and 2020 y-29.3 ts / ha, or an average of 30.3 ts / ha in 3 years, which is 1.6 ts / ha higher than the navigation "Chimboy-5018".

However, with an increase in soil moisture relative to ChDNS by 80-80-60%, the yield per hectare in 2018, 2019 and 2020 was 33.1, respectively; 29.4 and 31.0 ts / ha, ie an average of 31.2 ts / ha in 3 years, and an additional cotton yield of 4.8 ts / ha compared to the standard navigation. Compared to the Chimboy-5018 navigation, the additional cotton yield was 1.2 ts / gani. According to the level of yield of cotton varieties can be placed in the following order: "Sultan" (29.4-33.1 ts / ha), "Chimboy-5018" (29.7-30.3 ts / ha) and "S-4727" ( 26.8-27.9 ts / ha)

Irrigation regimes of these varieties at optimal times, depending on the biological characteristics of cotton varieties, climatic conditions, allowed to obtain high yields.

Medium-fiber varieties of cotton "S-4727", "Chimboy-5018" and "Sultan" in 2018-2020, the grassland-alluvial soils of the southern region, the groundwater level is 2-3 m. Irrigation system was studied and its effect on productivity was determined.

Yields of cotton varieties studied in the southern region are irrigated in 1-2-0 systems per year when irrigation is carried out in the order of 70-70-60% relative to soil moisture, with irrigation norms of 910-1075 m<sup>3</sup> / ha and seasonal irrigation norms of 2800-3015 m<sup>3</sup> / ha. Yield on cotton variety "S-4727" averaged 26.1-27.8 t / ha, on variety "Chimboy-5018" 28.4-30.0 t / ha and on variety "Sultan" 31.0-31 , Was 9 ts / ha.

Irrigation rate was 640-890 m<sup>3</sup> / ha and seasonal irrigation rate was 3350-3930 m<sup>3</sup> / ha when pre-irrigation soil moisture was carried out at 80-80-60% humidity relative to ChDNS and required 5 times irrigation, irrigated in 1-4-0 system. . In the above irrigation regime, the average yield of S-4727 cotton was 28.9 ts / ha in three years, Chimboy-5018 - 30.9 ts / ha and Sultan - 32.6 ts / ha

This means that cotton varieties require a 1-4-0 system of irrigation in the southern region of Karakalpakstan, and require an additional one or two times irrigation compared to cotton varieties grown in the northern region.

## CONCLUSIONS

In all the cotton varieties studied in the northern and southern regions of the Republic of Karakalpakstan, the highest cotton yield was observed when the soil moisture before irrigation was 80-80-60% relative to ChDNS, while relatively good results were obtained in the Sultan variety with high yields. In the southern region, the periodic irrigation rate is 600-700 m<sup>3</sup> / ha, the total irrigation rate is 2800-3500 m<sup>3</sup> / ha and requires irrigation in the 1-4-0 system, i.e. the

irrigation regime of cotton varieties is recommended to be irrigated one or two times more than in the northern region.

---

### **INTRODUCTION**

The future of our country will largely depend on the innovative changes in the field of education, the level of work aimed at raising it to a level that meets the new requirements of our time. This requires the training of future professionals in a competitive manner, taking into account the requirements of the times.

In the modern education system, the organization of the educational process in a certain coherence and interconnectedness of the content and objectives of general subjects, along with improving the quality and effectiveness of education, expands the worldview of students and their serves to enrich the world of thought with bright images. The possibilities of interdisciplinary communication are endless in optimizing the content and scope of education, enriching the learning process with modern pedagogical technologies and information and communication technologies, embodying the content of education in the minds and thinking of young people through life images.

## THE MAIN FINDINGS AND RESULTS

That is, the organization of integrated lessons in primary education is a feature of the lesson, in which two or three and sometimes more teachers can participate. Is such an integrated education easy or difficult? Much depends on the teachers. However, it is important to remember that the lesson is an important part of the job. It is through the course that the key issues are addressed in an integrated course, and the outcome can be successful or unsuccessful. However, the concept of integrated learning remains controversial. What are the hallmarks of an integrated lesson?

1. The integrated course itself is a new complex unit, in a completely different form, and focused on solving problems clearly and effectively.
2. They are planned on the basis of two or three disciplines. Therefore, several teachers or several teaching materials are combined mechanically.
3. Skills and competencies will be developed in ways to stimulate interest in learning.

The purpose of the integrated lesson is to develop students' creative interests, aspirations and creative thinking. Integrated lessons take many forms, depending on the tasks assigned to teachers and students.

In peer review classes, couples and couples work together. This requires students to be well-prepared. All activities require an objective and accurate assessment.

The creative research class focuses on students solving independent problems. These processes increase students' cognitive, conscious learning, and effectiveness. The main feature of an integrated lesson is that such a lesson is based on one subject, it is the main focus, the rest are integrated with it, and it is used to understand the meaning of science in the study of its relationships and processes, to apply the acquired knowledge in practice.

Integrated learning outcomes are reflected in the development of teachers' creative disciplines. Interdisciplinary integration is not about showing how many subjects are related to each other, but about giving students an idea of the integrity of the world around us through integrated learning. Scientists say that integration accelerates the formation of the learner's worldview

Another important quality of a future primary school teacher is that he / she organizes educational activities on the basis of the principles of interdependence of primary and secondary education subjects and the principles of interdependence of primary education subjects. There are many problems in the work of primary school teachers in urban and district schools today, including shortcomings in the use of non-traditional teaching methods in the teaching of private subjects in primary education; inaccuracies in the assessment of students' knowledge; inability to feel the psychological state of students and, as a result, not be able to motivate them to the learning process; inability to ensure interdisciplinary communication in the learning process; there are cases of non-compliance with didactic principles due to a lack of understanding of their essence. Without a positive solution to these problems, it is impossible to talk about the quality and effectiveness of education in the primary grades.

The experience of pedagogical activity is absorbed through the teaching, upbringing and development of each learner through the acquisition of scientifically based, specially selected and somewhat structured knowledge, skills and competencies. This experience is passed on by educators and the structure of learners is shaped by the interconnected learning process. The

educational process in the educational institution is methodologically based and each component of the process is enriched with pedagogical principles. Each component of the educational process: goals, content, organizational forms and methods, teaching aids, behind the design of pedagogical principles, there are many pedagogical and psychological paradigms, concepts, approaches and theories.

From the above, it is clear that the pedagogical experience of a teacher has a complex structure and, no less, a complex content, and is mainly creative in nature. Not all educators can instill this experience in the learner, and not every learner can apply it. Therefore, the educational institution has special requirements for the professional and personal qualities of the teacher and the student, teaching and learning activities; they are reflected in the job responsibilities of the faculty and in the responsibilities of the students. For example, the educator must be a component of his professional and pedagogical activity, have knowledge of science, skills and abilities, a high level of duty and responsibility, creative potential, creativity, communication skills. The teacher's constant search, increasing knowledge and experience, deep understanding of students, understanding of their inner world, monitoring of growth and development, and the success of the educational process are all factors.

The deeper and more comprehensive the preparation of future teachers for practice, the more they must choose the right direction of pedagogical integration. At the same time, the integration of methodological, technological and personal pedagogical knowledge will be much easier, faster and more productive for the purpose. The following components are activated by: firstly, the acquisition of theoretical knowledge and experience of methodological reflection, secondly, pedagogical knowledge at the methodological and technological level, thirdly, the task of personal development of the teacher, the formation of identity enters.

Talented youth is the foundation of the future. Selecting them, targeting their activities and thinking is one of the main directions of our education policy today. Coordinating the activities of talented young people with promising research plans requires a great deal of responsibility and research from the educator.

It can be easily used in solving the problems of optimizing the educational process and in shaping the updated educational content to improve the training of future professionals, and it will undoubtedly provide creative pedagogical results.

It is determined by the fact that educators and learners have an integrative character and a humanitarian component on the one hand and a technocratic component on the other. At the same time, each of these components affects the other, changing the process of formation of learners in all its aspects.

An integrated approach based on intelligent teaching aids and systems will provide a solid didactic basis for training future teachers and, on this basis, for mastering effective innovative methods and technologies, as well as their implementation in practice.

So, integration means creativity, ingenuity, memory consolidation, research, imagination. Imagination creates a creative spirit, and creativity stimulates the development of thinking. That is why it is important to know the relationship between the disciplines, to be guided by these laws in the educational process.

## CONCLUSION

In conclusion, the process of integrative education requires every future teacher and educator to have great intelligence, patience, high love for students and their profession. The success of the teaching and learning process is due to the fact that the teacher is always inquisitive, constantly increasing his knowledge and experience, and is able to help with words, deeds or practical actions when needed. The results of this research can be easily used to address the issues of optimizing the educational process and the formation of an updated educational content to improve the training of future professionals, and undoubtedly provide creative pedagogical results.

In this regard, an integrated approach based on intelligent teaching aids and systems will be a solid didactic basis for training future teachers and, on this basis, the development of effective innovative methods and technologies, and their implementation in practice to increase the effectiveness of education.

### ABSTRACT

*This article discusses the problems of forming national pride in the primary school students of the orphanage based on hadith sources. The theoretical and practical significance of the problem is analyzed, as well as opportunities for primary school pupils to use interactive teaching methods to formation national pride through hadiths, and the experimental results are summarized.*

**KEYWORDS:** *Orphanage, Primary School, National Pride, Hadith, Lesson, Occupation, Criteria, Factors, Educator, Pupil.*

### INTRODUCTION

In the world, the problems of social protection and education of children who have lost their breadwinners have been studied in detail and put into practice because they have achieved good results. A child can become an orphan during adulthood due to various social reasons. Orphan prevention issues are handled in the Foster family. This issue is one of the main problems of every state. Globally, the Foster family is the primary form of upbringing dedicated to the prevention of orphanhood. In the Foster family, every opportunity is created for children who cannot get along with their parents. In the Foster family, the children are brought up and returned to their family after a positive outcome.

In accordance with the Convention on the Rights of the Child of 20 November 1989, adopted by the United Nations General Assembly, orphanages receive social protection. It feels that every state is responsible for achieving the goal set out in it. In particular, children in orphanages need

to find solutions to problems related to the formation of personality traits and a number of mental problems, crime among neglected children, the nature of delinquency, the fact that a child is never born a criminal or delinquent, the re-education of delinquency and delinquency among neglected children. attention.

The Regulation on the House of Mercy, approved by the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 230 of October 17, 2008, was adopted and ensured its current implementation. Also, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 171 of April 12, 1999, Article 22 of the Law «On Education» and Article 64 of the Constitution of the Republic of Uzbekistan guarantee full control and social security of children in orphanages. Resolution of the President of the Republic of Uzbekistan dated February 11, 2019 No PP-4185 «On additional measures to strengthen social protection of orphans and children deprived of parental care» Development of the program of de-institutionalization of orphanages for 2019-2023, Ministers of the Republic of Uzbekistan No. 824 of September 30, 2019, “On the choice of alternative forms of placement of orphans and children deprived of parental care, strengthening the institution of the family.

**Relevance of the topic and purpose of the Research:** Scientists of our country have opinions on the topic, including the management of orphanages, preparing them for family life, cultivating national pride in adolescents, their individual and socio-psychological characteristics, the formation of tolerance, intestinal microbiocenosis and the specificity of the immune system. forms, methods, means and ways of correctional and pedagogical work.

**Methods used in the Research:** Theoretical (pedagogical-psychological analysis, comparison, systematization), empirical (pedagogical experiment, test, questionnaire and mathematical-statistical analysis (descriptive statistical methods).

**Literature Review:** The issues of returning orphans to their families, bringing them up as full-fledged adults are covered in the research work of K. Petrovich, E. Tukhtamurodov, U.M. Askarova, I.O. Khaydarov, G. Yusupova, N.A. Adilkhonova, L. Muminova, Ya. Chicherina, E. Azamkhodjaeva, G. Koshanova, F. Ruzikulov, N. Egamberdieva, G. Yadgarova and other psychologists, pedagogical scientists.

In the past, special organizations were almost never engaged in the protection of orphans. The orphan would do his job and hear the gratitude of the man. Orphanhood is an economic impoverishment. It is known that social insecurity complicates the situation of orphans. Accordingly, many of them suffered a lot, even to feed their stomachs. Orphanhood is a phenomenon that requires public attention. Uzbek humanity, childhood, and the grief of this people have always encouraged the protection of the interests of orphans, at least on a community basis. This noble spirit shines in the following. “Do not weep for the orphan,” “Do not call the orphan an orphan,” “Do not eat the orphan's right,” “The orphan's right has dried up seven rivers,” “The orphan's right is God's arrow.”

Bringing up the young generation as harmoniously developed people has always been an important task, and even the Republic of Uzbekistan pays special and high attention to this issue, because young people know that today is tomorrow. That is why it is pursuing a special state youth policy in this regard. Especially during the years of independence, great attention has been paid to this issue, including the opening of opportunities for our youth to get an education and show their strength and knowledge in all areas among all countries.

«We have no right not to study, describe and promote this heritage, as long as the great thinkers of our history have passed away, their scientific and spiritual heritage, exemplary life and teachings have helped us to solve today's problems.» Of course, the right conclusion must be drawn from these considerations. This applies to every citizen. It is the duty of the younger generation to remember that our ancestors, who have great national pride, are our pride and to always follow in their footsteps.

Thanks to our great blessing of independence, every sphere has been radically reformed, including the sphere of education. In this regard, special attention was paid to the honorable tasks of forming national pride in the child, because our national pride plays an important role in the development of the child. Nationally proud youth are the builders of a free and civil society. One of the main issues is to bring up our youth with national pride, paying special attention to this issue. The implementation of these issues has become one of the most pressing issues in the education system. During the years of independence, a special approach was taken. It is included in the curricula and textbooks of social sciences and humanities in general secondary schools. It is the samples of folklore in reading, etiquette and music textbooks of primary school that are important source of cultivating national pride. On the basis of the given themes the child develops such qualities as patriotism, wisdom, honesty, humanity, courage, heroism.

Based on the individual psychological and pedagogical characteristics of children in the same situation, it is important to form national pride in orphanages. Why is it necessary to form national pride on the basis of hadiths in orphanages primary school pupils?

As the Republic of Uzbekistan moves forward at the level of developed democracies, education plays an important role in raising our country to the level of developed countries. The activity of teachers is important in this. Education is a two-way street. That is, the teacher is the student, and in orphanages the process of activity between the educator-student. Educators working at orphanages should be sweet, polite and demanding to their students. The formation of national pride on the basis of hadiths is one of the most important issues in the primary school pupil of foster child. Because the correct organization of each lesson, educational activities plays an important role in the life of the pupil. It is important that every lesson, educational event should be organized in accordance with today's requirements. Only then will the formation of national pride in the foster child be at a high level.

It is important and effective to form national pride on the basis of hadiths in foster child primary school pupils.

It is necessary to pay attention to and understand the content of the basic concepts in the coverage of the content of the formation of national pride on the basis of hadiths in the primary school pupils of foster child. That is: pride, national pride, and hadith.

When we think of national pride, we first talk about pride, and then what the meaning of national pride means, because the solution of a psychological and pedagogical problem, such as the formation and upbringing of national pride, is directly related to the meaning of the words and phrases.

The word pride means pride, pride, arrogance, pride, joy, rejoicing. In classical poetry and prose, in veterans, ballads and epics, as well as in folklore, the above words are used in synonymous

terms. The taste of the word pride is as sweet as the heat of bread, as dear as air and water. Pride is the most precious of all feelings given to people.

Only a person who knows and learns the language, religion, history, meaningful life of his ancestors, world-wide discoveries, can understand who he is and a sense of pride in his heart, body and soul. Also, in it, the desire to be faithful to one's ancestors and to perfect oneself enhances one's pride, one's true qualities.

National pride is derived from the historical past of a nation, national values, achievements of science, religion, literature, art and culture, which have been recognized around the world for centuries, and the geniuses who created them, historical monuments, national customs and traditions, motherland, a sense of pride and pride in the wise people, the beautiful past and present of the Motherland, the heroes of the national people.

Professor S. Otamuratov says the following about national pride. National pride is national pride. National pride is the care and respect for all the material and spiritual riches, historical heritage, customs, traditions, morals, lifestyle, high spirituality, all historical achievements and lessons of its people, created over the years. . According to M. Kuronov, national pride means the material and spiritual heritage of the nation, pride in the people, the motherland, views and attitudes to the psychology of the nation. It is reflected in the glorification of the country where a person was born and grew up, in the blood of his umbilical cord, in his grief and pride for his past, present and future. In the opinion of U. Mahkamov, national pride is a great force that unites the power of the people, their dreams and aspirations.

National pride is characterized by the glory, vitality and truthfulness of the people and the country. National pride portrays nation as nation, nation as nation. Thanks to the independence of Uzbekistan, the sense of national pride of the Uzbek people has risen around the world. Therefore, today Uzbekistan is recognized as one of the most influential countries in the world.

According to U. Makhkamov, to be proud, to defend the interests of the people, to benefit the people. Our people have always relied on the rules of morality and spiritual values, which embody the most noble ideas in their lives and way of life. Thanks to such advanced ideas, justice, honesty, purity, non-betrayal of the rights of others, compassion for the disabled, humanity, brotherhood and other human values have developed in our country. At the heart of our national pride lies these universal feelings.

R.A. Mavlonova gives the following description of national pride by giving a rough example of the indicators and criteria of national upbringing of pupils in the field of national oriental education. «To understand one's ethnicity means to understand the essence of the Uzbek people, to understand oneself as a child of one's own nation, to understand one's national duties, to love one's mother tongue, to speak and think correctly in that language».

Bringing up the younger generation with national pride is one of the great tasks facing education today. Therefore, every educator is responsible for this. A child should be brought up with national pride from the very beginning of primary school. These ideas also apply to orphanages's primary school pupils.

In our next opinion, we will briefly dwell on the hadith and its content.

The hadith is that in the countries of the East, man and society “play an important role in strengthening their spirituality and educating young people in a moral and ethical manner. Because the hadiths contain comments on the management of society, the formation of a just society and a perfect person in the country, life experiences, education. That is why the hadiths have been deeply rooted in human nature for centuries and have fulfilled their unique qualities. The great significance of the hadiths is that they help people to live in harmony by turning moral norms into obligatory norms of conduct for all”.

Hadiths have served as a lesson for centuries, strengthening people’s sense of trust, purifying and elevating them, and overcoming life’s trials, problems, and difficulties. The hadiths determine the effectiveness of shaping a high level of spirituality in the younger generation. The spiritual and moral qualities in the hadiths have not lost their significance and relevance even today. The spiritual and moral ideas in the hadiths of the Prophet Muhammad are important in seeking and finding ways to get rid of such moral evils as ignorance, oppression, injustice, dependency, indifference, in order for our country to rise to the level of developed countries.

The study of hadiths has its own history. This history began with the works of great hadith scholars, ie from the VIII to IX centuries, and continues to this day. During the years of independence in our country, after the collapse of the dictatorial regime, communist ideology and the education system that serves it, there is an opportunity to conduct research on the spiritual heritage and its enrichment. An important source in the organization of spiritual and moral education, a number of works have been done on the publication of the work. In particular, the publication of Bukhari's four-volume works «Al-Jami as-Sahih» and «Al-Adab al-Mufrad» in Uzbek, as well as «A Thousand and One Hadiths», «One Hundred and One Hadiths», «Etiquette and Morality» It is expedient to publish our spiritual heritage, such as «Gulistan».

Hadith is at the same time a set of high moral qualities that have become universal values. A human child who embodies these moral qualities will never raise his hand against his parents, will not become their killer in the pursuit of his evil intentions, but will live according to the principle of «Parents agree, God approves.»

Those who do not betray their homeland will not become traitors to their homeland in return for the loyalty of others. Consequently, they will be able to protect themselves from the influence of their religious fanatics. We see that hadiths are also important in the fight against religious fanaticism. Although the History of World Religions introduces students to the hadiths, their ability to fully reveal their educational significance is limited. Because the task of academic science is not only to teach pupils the knowledge of hadith.

It is known that our compatriot, Imam al-Bukhari, has a special authority in the science of hadith. We should be justifiably proud that the hadiths collected by our great ancestor are recognized in the Islamic world as the second source after the Qur'an, and that we are the grandchildren of the great scholar. The main purpose of the science of hadith is to contribute to the work of educating people to be patriotic, moral, knowledgeable and enlightened, and ultimately perfect. It is a great task to give a true knowledge of the science of hadith, and to teach the knowledge gained to apply it in life.

Al-Marwazi was the first in Mawarounnahr to teach a collection of hadiths. In addition, al-Marwazi, Ishaq ibn Rahawayh al-Marwazi, al-Shashi, al-Barakati, al-Nasafi, and others have classified collections of hadith. Over time, the hadiths were selected and those that were

considered important were put into a system. At the beginning of the IX-X centuries, there were 6 collections of hadith, which are considered the most reliable among the believers. These are: Sahih Bukhari, Sahih Muslim, Sahih al-Tirmidhi, Sunan Abi Dawud, Sunan Ibn Maajah, Sunan al-Nasa'i. Two of the muhaddithin who compiled these 6 collections of hadith were from Movarounnahr.

One of the innovations after independence was the translation into Uzbek of a collection of reliable hadiths by Bukhari, Al-Jami as-Sahih, described in the Islamic world as the «Imam of the Hadiths» and the «Sultan of the Science of Hadith.» The great muhaddith's work «Al-Jami as-Sahih» was translated from Arabic into Uzbek and published in thousands of copies in the early 90s of the last century by the current edition of the Qomus (National Encyclopedia of Uzbekistan).

“Hadith” - (Arabic - news, speech, news). The main source after the Qur'an is the science of hadith. Hadiths play an important role in strengthening the spirituality of man and society in the East, in educating young people in a moral and ethical manner. Because the hadiths contain comments on the management of society, the formation of a just society and a perfect person in the country, life experiences, education. That is why the hadiths have been deeply rooted in human nature for centuries and have fulfilled their unique qualities. The significance of the hadiths is that they help people to live in harmony by turning moral values into obligatory norms of behavior for all”.

**The scientific essence of the article:** While the hadiths glorify moral qualities such as kindness, chastity, patience, and gratitude from human qualities, they condemn such vices as extravagance, greed, greed, lust, envy, and ignorance. The science of hadith purifies the spiritual world of every human being. Leads to good. Forms human qualities. It makes you a believer and encourages you to be proud of life and live it with pride. It is this pride that forms national pride in a person. Hence, hadith is also a force that shapes national pride. Taking into account the age characteristics of the pupils in the formation of national pride on the basis of hadiths in the primary school pupils of Orphanage, the conduct lays the groundwork for achieving an effective result. Our independent country today wants to see our young people who are able to behave in all aspects of spirituality and enlightenment, who can defend their honor and pride.

That is why today it is necessary to bring up every child with national pride. In this regard, every educator is required to perform responsible duties.

The science of hadith, which has become our noble values, forms the best qualities in the heart of every human being. Looking at the hadiths with kindness, respect and love adds strength to his power. Increases self-confidence. As a result, the child also develops respect, trust and kindness to others.

What is important is that pride becomes pride, national pride emerges.

The formation of national pride in the primary school students of Orphanage on the basis of the science of hadith sets important tasks for educators. Concluding from these tasks, first of all, educating the students with national pride is one of the priority tasks. It is more important to start this task from Orphanage primary school pupils, because the knowledge, skills and abilities imprinted on a child's mind and thoughts from an early age will last forever. There is a saying, «Knowledge acquired in youth is a pattern carved in stone.» Also, in the opinion of Yusuf Khas

Hajib, «Where there is knowledge, there is greatness, and where there is knowledge, there is greatness.» Concluding from these considerations, we found it important to form national pride in Orphanage primary school students.

The science of hadith leads the students to greatness and priority. The science of hadith must be used to achieve this goal. Then national pride is formed in the pupils, they try to apply it throughout their lives. As a result, the following characteristics are formed in students:

Living with pride: respect for the language and religion of the nation: knowledge of history: appreciation of the rich heritage of their ancestors: study of universal discoveries: achievements of science, religion, literature, art and culture and their geniuses, historical monuments and monuments, national traditions, feelings of pride and pride in the traditions, the motherland, the wise people, the beautiful past and present of the homeland, the heroes of the national people. Relationships are also formed, such as treating all historical achievements and lessons with boundless respect and reverence, taking care of them. Today, our state has a high level of care for students of orphanages, and educators and teachers must be able to approach it responsibly.

Speaking of national pride, everyone who says he is Uzbek should have a sealed feeling in his heart. They can even be observed in important documents of our state. For example, the State Youth Policy, the Constitution of the Republic of Uzbekistan, the Law on Education of the Republic of Uzbekistan, the Action Strategy of the Republic of Uzbekistan, and the Convention on the Rights of the Child.

When we use the science of hadith to form national pride in Orphanage primary school pupils, first of all, it is necessary to cite the criteria of national pride. In the formation of national pride, first of all, it is necessary to pay attention to its criteria. Below are the criteria for national pride.

**TABLE 1**

<b>Pride of the homeland</b>	<b>Oriental etiquette</b>	<b>Humanity</b>	<b>The national idea</b>
Knowledge of the history of our country, its past, interest in the brave and courageous heroes. Enrichment of understanding of the Motherland, study and preservation of its material and spiritual riches, love for the Motherland, readiness to serve the Motherland, zeal for the Motherland, becoming a brave defender of Uzbekistan, participation in events that can contribute to the development of the Motherland, selflessness. Know and follow the national values, traditions and customs of the people. Respect for universal values,	Rules of greeting, respect for adults, respect for children, friendship, cleanliness, politeness, etiquette for boys and girls, adherence to oriental national etiquette, good manners, family etiquette, behavior in public, understanding of etiquette, scientific enlightenment.	Conscientiousness, honesty, integrity, honesty, positive behavior patterns, proper understanding of one's duty, avoidance of injustice, ability to have the right relationship with people.	An independent country is a sign of independence of Uzbekistan, a sense of pride in what is being done, an understanding of Uzbekistan's position in the world, a sign of respect for the state language.

<p>oriental traditions and mother tongue.</p> <p>Knowing and following the teachings of Eastern scholars. Respect for the art of the Uzbek people.</p>			
--	--	--	--

It is possible to create and improve national pride by forming defined criteria in educators. The procedure for using hadiths to achieve this goal is given below.

While national pride is formed through feelings of love and pride for the homeland, attention should be paid to enriching the knowledge of students about the homeland. Therefore, it is necessary to teach 1st graders to love and respect the Motherland by describing it.

There is such a great word in the world that it always shines in the human heart like divine light, scattering light gives strength to the body, pleasure to the soul, a lifetime of rest to human life. This is a delicious and dear word «Vatan». She stands next to the majestic word «Mother.» There will be one mother and one motherland in the world, this notion will never change, it will never become obsolete. As bread is always delicious, no matter how many times these words are spoken, their value never diminishes. In both cases, we call the Motherland «motherland» by the definition of the most beloved person. It is no coincidence that the most honorable words in the world are said to parents, motherland.

Uzbekistan is becoming more beautiful day by day. New, beautiful buildings, bridges, smooth, flat roads have been built in our country. We are proud of our Motherland, because our great ancestors lived in this sacred land.

Everyone loves their homeland, and even these hadiths state, «Loving one's homeland is a matter of faith.»

We quote the following hadith about the first homeland of man. “Man's first homeland is his mother's stomach. When he is born, his birthplace can be his homeland. “As the Motherland is equated with the most precious human being in the world, we must protect our Motherland as we protect our mother.

The first part of the textbook «Odobnoma» for 1st grade is called «Uzbekistan - a free and prosperous country», which includes topics about the homeland. The feeling of love for the Motherland is expressed on the basis of themes. Through the topics of this section, the child develops such qualities as patriotism, pride in the Motherland. The motherland is equated with the mother, and the mother is called the motherland.

It is advisable to use hadiths to form this feeling in 1st graders.

Samples of age-appropriate and hadith-related tales can be used to help students understand the content of the hadiths quoted, as 1st graders are very interested in fairy tales. In fairy tales, good triumphs over evil. It was considered expedient to explain the content of the hadiths on the basis of fairy tales. From them, the trainees draw the right conclusions, as well as understand the content of the hadith. The story of the «Seven Girls» can be a proof of our opinion.

Based on the content of the hadith, it would be expedient to convey the content of the fairy tale «Seven Girls» to the children in roles. The trainee not only memorizes the content of the hadith, but also becomes accustomed to acting on stage. It is also quick to remember.

We have recommended the use of role-playing games. Role-playing games are appropriate for the child's age and psychological characteristics. When they are used, the quality and effectiveness of in-class and out-of-class activities increase. Pupils are encouraged to be active in extracurricular activities, to express themselves independently and freely. It is important that each trainee actively participates in the training without being left out. There will also be a high level of interest in learning. In this, the pupil learns himself and learns from one another what he does not know.

Pupils are encouraged by the tutor after performing the roles based on the content of the fairy tale. Based on the content of the story, the educator asks questions. For example:

1. What did you learn from the story?
2. Did the girls do the right thing?
3. Do you consider the courage of girls as loyalty to the motherland and people?
4. Can you imagine what would happen if the king's daughters did not behave like that?
5. Is the work done by the king's daughters a duty?
6. How would you behave when you were there?

Crosswords were given to explain the hadiths. Based on them, there will be an opportunity to memorize the content of the hadith.

A crossword puzzle on the topic

Crossword questions:

1. September 1....
2. From the ancestors... country.
3. Our... is Uzbekistan.
- 4... - small homeland.

All the information presented is based on the theoretical aspect of national pride, that is, it focuses on the content of national pride for the reader, why a person needs it, and the possibility of forming national pride on the basis of hadiths. It also shows ways to gain an understanding of the hadith and its content. Tales were given according to the content of the hadiths, taking into account the quick comprehension of the reader.

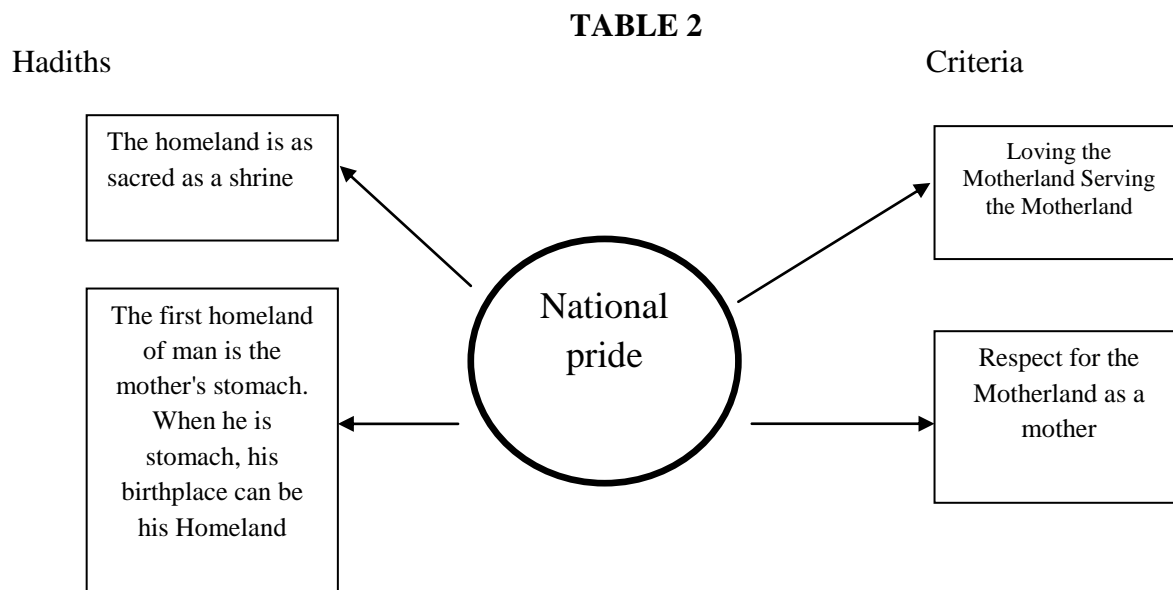

Crossword puzzles are given in accordance with the content of the hadith, which encourages the child to work mentally. So, all of them can be the basis for the formation of national pride. The interest of the 1st grade pupil in applying the theoretical knowledge gained in practice will prevail. Only then will he have the skills to remember and apply in life.

## RESEARCH RESULTS

Based on the points made, it should be noted that practical work is always of effective importance. Therefore, below are ways to put the topic into practice. Now we present the content of practical work on the formation of national pride on the basis of hadiths.

To do this, it is appropriate to use a mental attack based on the solar schedule. On one side of the image are the hadiths on the theme of the homeland, and on the other side are the criteria that shape the national pride formed as a result of mastering the hadith.

For example, as follows:

This table is distributed to 1st graders. On this basis, they receive an assignment, that is, after mastering the content of the hadiths on the right, the criteria are written on the basis of the left. (The content of the hadith given in each class section is performed by the pupil in this order). As a result, the child becomes aware of their responsibilities and becomes accustomed to accepting them as a responsibility.

The future of every nation is determined by the quality of education provided to the younger generation. The work being done in our country in this regard is noteworthy. Achieving the effectiveness of education on the basis of the criteria set out in the Law «On Education» and the

«National Training Program» is one of the important tasks facing every educator. Therefore, it is necessary for educators to use advanced pedagogical technologies that develop the worldview of young people in extracurricular activities and, as stated in the «National Training Program», «to introduce new forms and methods of education.» For this purpose, we have given some examples of interactive methods.

Pupils of the wheel method are divided into groups and given a sheet with assignments. For example: Determine the content of the hadiths.

TABLE 3

Hadiths	Homeland	Greetings	Good manners	Science and profession	Material and spiritual wealth
Homeland - mother, the threshold is gold.					
The first homeland of man is the mother's stomach. When he is born, his birthplace can be his Homeland					
Your best ones are kind, sweet conversationalists.					
Whichever young man respects the old man, he will see that respect as he grows older.					
The best of the qualities bestowed on human beings is good morals.					
The word of man is the scales of the mind.					
Man becomes great by doing good to his people					
The crumbs of bread is also bread					
Every wealth ends, science and profession are endless wealth.					

Procedure:

TABLE 4

Ҳадислар	Homeland	Greetings	Good manners	Science and profession	Material and spiritual wealth
Homeland - mother, the threshold is gold.	+				
The first homeland of man is the mother's stomach. When he is born, his birthplace can be his Homeland	+				
Your best ones are kind, sweet conversationalists.			+		
Whichever young man respects the old man, he will see that respect as he grows older.			+		

The best of the qualities bestowed on human beings is good morals.			+		
The word of man is the scales of the mind.			+		
Man becomes great by doing good to his people	+				
The crust of bread is also bread					+
Every wealth ends, science and profession are endless wealth.					+

The task in the table can be done by the trainees on a group basis and individually. The task can be completed by placing a “+” sign in the columns or writing words, depending on the assignment.

The following tabular handouts are available for use in written discussions in educational institutions:

Group 1

**TABLE 5**

Discussion: Is it one's duty to serve The people?
<p><b>Yes</b></p> <ul style="list-style-type: none"> <li>• Answer. Everyone should love his hand as much as he loves his homeland. Therefore, serving the wind, the heart must always be with them. Because it is everyone’s duty. Only such a person strives for perfection with the blessing of the hand.</li> <li>• Give evidence. There are many such people in our country is formed. For example, we can proudly cite the first President of the Republic of Uzbekistan IA Karimov. From him we learned to love the Motherland, to serve the people and the Motherland. Each of us, like our ancestors, must follow in their footsteps and serve our people.</li> </ul>

To 2 groups

**TABLE 6**

Discussion: Is it one's duty to serve the PEOPLE?
<p><b>No.</b></p> <ul style="list-style-type: none"> <li>• Answer. Serving the people can also be seen as a task. Because every task I perform is a service to the people.</li> <li>• Give evidence. For example, being a good student, being a good person, doing my daily work can serve the people.</li> </ul>

Each group that writes this table comments on their ideas. Those who have a positive opinion should try to confirm their opinion. At the end of the session, the educator encourages the active group. The advantage of the above-mentioned written discussion training is worth mentioning. At the same time, each student is able to freely express their independent opinion and is encouraged to take action.

The degree to which national pride is formed on the basis of hadiths in primary school pupils of orphanages is scientifically based, according to the study. Experimental work on the formation of national pride on the basis of hadiths in the primary school pupils of orphanages showed that they initially had a low level of understanding and knowledge of national pride.

TABLE 7

Number of pupils	The first stage of the experiment								
	2017-2018			2018-2019			2019-2020		
	e.g. - 60 people c.g.- 63 people			e.g. -61 people c.g. - 64 people			e.g. - 64 people c.g.- 64 people		
	High	Medium	Lower	High	Medium	Lower	High	Medium	Lower
<b>Experimental group</b>	26 (43,3%)	24 (40%)	10 (16,7%)	26 (42,6%)	26 (42,6%)	9 (14,8%)	28 (43,8%)	30 (46,8%)	6 (9,4%)
<b>Control group</b>	26 (41%)	24 (38%)	13 (21%)	27 (42,2%)	24 (37,5%)	13 (20,3%)	27 (42,2%)	25 (39%)	12 (18,8%)

So, at the end of the study in the experimental group БК-4,7% (Lower), 48,4% (Medium) and 46,9% (High). The control group had the following indicators after the experiment: ТК - эса 14% (Lower), 41% (Medium) and 45% (High).

TABLE 8

Number of pupils, people	The final stage of the experiment								
	2017-2018			2018-2019			2019-2020		
	e.g. - 60 people c.g.- 63 people			e.g. -61 people c.g. - 64 people			e.g. - 64 people c.g.- 64 people		
	High	Medium	Lower	High	Medium	Lower	High	Medium	Lower
<b>Experimental group</b>	26 (43,3%)	24 (40%)	10 (16,7%)	28 (45,9%)	27 (44,3%)	6 (9,8%)	30 (46,9%)	31 (48,4%)	3 (4,7%)
<b>Control group</b>	26 (41%)	24 (38%)	13 (21%)	28 (43,8%)	25 (39%)	11 (17,2%)	29 (45%)	26 (41%)	9 (14%)

## CONCLUSION

Educators working in orphanages have certain responsibilities. One of them is educating young people with national pride. It is advisable to perform this task from the first elementary school period of the pupil. The use of hadiths in the formation of national pride is an effective tool. Based on the above considerations, an example of the formation of national pride in 1st graders on the basis of hadiths was given. From this it can be concluded that.

- Extracurricular activities for children from orphanages. The use of hadiths in their time teaches them to follow the rules of etiquette. Therefore, it is advisable to use hadiths through extracurricular activities.

- Educators of orphanages act as parents. Parents bring up a child at home on the basis of the teachings of our ancestors, the example of adults, the hadiths. These goals should be effectively implemented by the educators of orphanages. Fairy tales are used to explain the content of the hadith. He was able to easily understand the content of the hadith. Crosswords, on the other

hand, can stimulate mental activity and increase interest. The given information serves to form national pride in pupils.

- national in primary school pupils of orphanages the solar schedula we have proposed is effective in the practical study of the theoretical knowledge gained in shaping pride on the basis of hadiths.

Effective from recommended interactive methods and hadiths when used, the opportunity to form national pride on the basis of hadiths in the primary school pupils of orphanages is purposefully realized. Following our comments above, the following

recommendations.

- Hadiths of national pride in orphans use in the creation of a set of teaching aids as a didactic tool for educators in the formation of

- Training courses for parents involved in the organization of a foster family.

- Orphanages are electronic for primary school students use in the creation of methodological manuals.

## ANALYSIS OF THE LEGISLATION ON CIVIL SERVICE IN THE REPUBLIC OF UZBEKISTAN

**Dilmurodjon Rakhimov\***

Base Doctoral Student,  
 Academy of Public Administration under the President,  
 Republic of UZBEKISTAN  
 Email id: drakhimov95@gmail.com

### ABSTRACT

*The article analyzes legislation on the civil service of the Republic of Uzbekistan. The legislation was studied in terms of labor and responsibility relations, the organization and management of the civil service. Based on the research, proposals and recommendations for improving the legislation of the civil service of the Republic of Uzbekistan has been developed.*

**KEYWORDS:** *Civil Service, Legislation, Labor Relations, Responsibility Relations, Disciplinary Liability, Administrative Responsibility, Criminal Liability, Action Strategy.*

### INTRODUCTION

The civil service as a legal institution is a kind of interrelated social relations, that is, a set of legal norms governing the civil service. It is known that the Law "On Civil Service" has not yet been adopted in the Republic of Uzbekistan. So legal norms governing the civil service are reflected in laws and other normative legal acts.

The legislation on civil service can be divided into three parts:

1. Legislation regulating labor relations in the civil service;
2. Legislation regulating liability in the civil service.
3. Legislation related to the organization of civil service.

***Labor relations of civil servants*** are established by labor legislation. In particular, it should be noted that the Labor Code of the Republic of Uzbekistan, which came into force on April 1, 1996, is the legal basis for regulating labor relations in the civil service. Article 18 of the Code

stipulates that "the specifics of the regulation of labor of civil servants shall be determined by law." [1]

This Code contains more systematic, perfect and clear norms than the labor legislation of other states, especially Western states. True, this Code regulates the civil service relationship in terms of the relationship between the employer and the employee, the social, labor rights and obligations of employees, but does not define the principles and legal regime of the organization of the civil service.

Recruitment, dismissal, working hours, vacation time, remuneration, guaranteed payments and compensation payments, labor discipline, financial responsibility, employer liability, labor protection, additional guarantees and benefits, social insurance rules, provision of benefits is carried out on the basis of the provisions of the Labor Code, unless otherwise provided by law.

The employment relationship of a civil servant is determined by the employment contract. An employment contract is concluded in writing and is a normative document. Its content is determined by the agreement of the parties and the provisions of labor legislation. The terms of employment contracts with civil servants may vary. The procedure for concluding an employment contract, the procedure for amendment, the procedure for termination, the documents required for the conclusion of the contract, the circumstances preventing the conclusion of the contract are specified in detail in the Labor Code. [2]

The procedure for appointing and dismissing ministers, heads of some central institutions, and regional governors is established by the Constitution of the Republic of Uzbekistan. For example, regional khokims are appointed and dismissed by the President of the Republic of Uzbekistan, and their appointment and dismissal are approved by the relevant regional Councils of People's Deputies.

***Legislation regulating liability in the civil service*** has a special role in the system of public civil service legislation. Liability of civil servants means the application of certain types of penalties provided by law for violations of the law by civil servants. [3]

Liability can arise in case of non-compliance with the law, violation of service discipline, non-performance or improper performance of official duties or negligence, material damage to the state, public associations, violation of the rights and legitimate interests of citizens. The subject of this responsibility will be the civil servant.

The responsibility of civil servants can be as follows:

- Disciplinary liability;
- Administrative responsibility;
- Criminal liability.

The main document determining the rules of disciplinary liability is the Labor Code of the Republic of Uzbekistan, on the basis of which the rules of internal labor may be established.

The following disciplinary measures may be applied to a civil servant for violation of labor discipline by an authorized body or a manager: a fine in the amount not exceeding thirty percent of the average monthly salary (internal labor regulations may also provide for a fine in the

amount not exceeding fifty percent of the average monthly salary). termination of employment contract.

If the administrative liability of civil servants is established by the Code of Administrative Responsibility of the Republic of Uzbekistan, if there is a criminal element in their actions, it can be resolved by the Criminal Code of the Republic of Uzbekistan and the Code of Criminal Procedure of the Republic of Uzbekistan.

In particular, according to Article 15 of the Code of Administrative Responsibility of the Republic of Uzbekistan, a person holding a certain position in an enterprise, institution, organization, regardless of the form of ownership, is subject to management, organizational, ordering, inspection and control of material assets. is considered an official if the existing tasks are assigned. [4]

Not all officials are considered civil servants. To be a civil servant - a subject of administrative responsibility, of course, must hold a certain position (position) of the state in a public organization, perform the duties and functions of the state and commit an administrative offense in connection with civil service activities. [5] As a rule, civil servants (officials) are a special subject of administrative responsibility.

Officials should be held administratively liable for administrative offenses related to non-compliance with the established rules and regulations in the field of management, state and public order, protection of the natural environment, public health and other rules included in their official duties.

*The most important normative legal act on the organization of the civil service* is the Constitution of the Republic of Uzbekistan. Section V of the Constitution, entitled "Organization of state power", based on the principle of separation of powers, defines the basic rules for the organization of public civil service in Uzbekistan. [6]

According to the Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No4947 "On the Action Strategy for further development of the Republic of Uzbekistan", the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 is a new step. In the implementation of its first direction "Improvement of state and society building", measures to improve public administration, first of all, civil service reform, reduction of public administration in the economy, modern forms of mutually beneficial cooperation between public and private sectors, e-government planned to implement. According to the decree, the basic principles of the organization and functioning of the civil service, the formation of the civil service, the transition to the civil service, the transition to service and resignation, the regulation of guarantees in this regard. [7]

Also, the Decree No5185 "On approval of the Concept of administrative reform in the Republic of Uzbekistan", signed by the President of the Republic of Uzbekistan on September 8, 2017, identified six main areas of public administration reform. One of them is the formation of an effective system of professional public services. According to him, the organization of the civil service, including the legal status, classification of civil servants; transparent mechanisms of recruitment (on a competitive basis), the formation of a reserve of personnel, the transfer of service, ensuring compliance with ethical standards. [8]

In order to systematize the tasks provided for in the Action Strategy and the Concept of Administrative Reforms and their implementation in practice, on October 3, 2019 the Decree of the President of the Republic of Uzbekistan No 5843 "Priority measures to radically improve personnel policy and civil service in the Republic of Uzbekistan" was adopted. [9] In our opinion, this decree covers a number of important aspects of the organization of the civil service:

First, the civil service in Uzbekistan is functionally divided into the state special service and the state civil service.

Second, the Agency for the Development of Public Service under the President of the Republic of Uzbekistan was established, which is responsible for implementing a unified state policy in the field of personnel management and human resource development in government agencies and organizations. The main tasks, functions and activities of the Agency are defined in the Regulations approved by the Presidential Decree No 4472 "On measures to organize the activities of the Agency for the Development of Public Service under the President of the Republic of Uzbekistan." [10]

Third, a program of measures has been developed in three areas to radically improve personnel policy and the civil service system in the Republic of Uzbekistan. The program includes the development of conceptual framework of personnel policy and the civil service system, improving the regulatory framework of the system, capacity building of the civil service, the development and adoption of a number of regulations, as well as some features of the system. implies improvement.

Fourth, the introduction of the principle of meritocracy and the "career model" in the system was established in order to create a transparent mechanism for entry into the civil service and career advancement.

Fifth, it is planned to develop a draft presidential decree approving the state register of civil service positions. The classification of civil servants' positions according to their powers (political, administrative and technical) and their levels (national, republican, regional and district) is one of the main shortcomings in this area. In particular, the Decree of the President of the Republic of Uzbekistan dated December 9, 2003 No3358 "On improving the system of public administration of the Republic", the Ministers of the Republic of Uzbekistan, although the register of positions is not in terms of civil service positions.[11] In accordance with the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No 339 of July 3, 1997 "On the establishment of a twenty percent increase in salaries of civil servants" lists of civil servants serving in public administration bodies and organizations are provided. [12]

The issue of ethics of civil servants also plays an important role in the organization of the civil service. This issue is reflected in the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated March 2, 2016 No 62 "On approval of the Code of Ethics for employees of public administration and local executive authorities." This decision means that all civil servants must follow the rules of ethics in the course of their employment. Thus, civil servants conduct their professional activities on the principles of justice, ensuring the rights and freedoms of citizens, a serious approach to the duties of the service, not putting the interests of the state and society above their own interests, not to allow corruption. The constant adherence of civil servants to the rules of etiquette is important in that they are given special consideration in appointments to positions during their professional careers. [13]

In conclusion, although the civil service is regulated by a number of normative and legal acts due to the nature of labor, responsibility and organization, the lack of a single law remains the most pressing problem in public civil service legislation. Therefore, the adoption of the Law "On Civil Service" and its distinction from the special service due to the formation of a clear register of civil servants, a clear definition of the rights and obligations of civil servants based on the register of positions, the transition to a unified system of remuneration. The solution of topical issues such as is the most important factor in the legislation in this area.

**ABSTRACT**

*The traditional attitude of India's social reformer, political leader, current politicians, diplomatic and policy makers are having the habits of cooperating to international order, if it seems fair and applicable to world justices. India have been participating in so many world affairs with material assistances as part and parcel of human rights protector than any other country in the contemporary history with the permission of powerful countries. Very notably, since dawn of 2001 as focus light of south Asia peace as well as Afghanistan peace even after death of Taliban rule in Kabul. India interest sprang at high level to strengthen Afghanistan political institutions with goal to protect human rights. Since soviet invasion in 1979 to 1989, there were sporadic chaos, commotion and bomb blast due to supper power politics, rivalry and regional countries politics. This had created so many economic damages, unrest and human rights lost. After end of Russia invasion Taliban ruled Kabul again about ten years with so many human rights violations as unanswerably as unaccountably. Therefore, as big power of south Asia India could not have prevented and involved in Afghanistan for protection human rights against Talban rule unless U.S bring new anti –terrorism law as a new world order. So, after initiated new world order by U.S as to destroy terrorist has been as most useful to India in number of ways such as ,rapprochement with Muslim people ,protecting human rights ,gaining good name from the Afghanistan people and fortifying India's growing power beyond the South Asia.*

## INTRODUCTION

### What is new world order?

So many world order have emerged from birth of politics to development of politics, all these orders are seeming as a new world order as per the situation of ancient period ,and medieval period toward protect citizens from natural hazards ,drought ,famine and poverty along with making unusual law for the public safe and happy purpose. The chief aim of this order is to attract the world people attention by showing its special output for world order that will emerge according the world bad or good situation for make a smooth atmosphere where human being could be live at congenial way in the civil society .Additionally, we can mean this law as a growing crops according to season for full fill the farmers needs, like this new world order would be good for people peaceful life by creating something and destroying something.

### What is Aim of this order?

Emergence of new world order with the help of USA in this modern period being much more helpful to solve so many global facing problems such as climate changes ,financial crisis ,inflation ,terrorism ,insurgency and outlaw group atrocities in the world countries .In this way ,anti-terrorism policies of the world powerful countries in Afghanistan attached with new world order for establish a tranquil atmosphere in nook and corner of the world .In Afghanistan, Taliban and war lord motivated terrorist out fits are posing a grave threat to several countries in south Asia and central Asia as continuous annoy as restless disturbances to world countries peace . To contain and control all this anti-social elements, U.S.A enacted anti-terrorism policy at the cost of its three fold country budget expenditure for kill the villain of world peace.

### Birth of New World Order

September 9/11 attacks on (WTC) organizationby Taliban has let to think about to terminate and enact unanimously anti-terrorism law along with world countries approval and united nation authority support. The interest of U.S.A about this policy is to dismantle terrorism networks and its whereabouts across the world. This would be applicable on those who support, finance, train and accommodate terrorism in the nook and corner of the world as unanswerably .Indeed, this policy has gathered world attention based on its aim to establish peace and prosperity.At the same time this order should be analyzed whether it is good policy or not .For this, people across the world had been raised several questions that why U.S.A have not been taken same action when several countries were attacked by Taliban .So finally people perceived this policy asU.S.A self-centered policy than world welfare. Additionally world people accepted this policy with aim to no longer terrorism should be in the world even though this policy was attribution ofU.S.A self-protecting policy and world peace making policy.

### Assessing of Anti-Terrorism law

People got panic globally with compassion about world trade centre attacks (W.T.C) which was orchestrated by Taliban on 9/11 for revenge USA involvement in gulf countries. Anti-terrorism law came out with aim to control war, violence and terrorism in the Afghanistan and rest of countries. Simultaneously, people of rest of countries contemplated when America sought world community support for crush down terrorism that why not U.S.A bothered about when so many poor countries are affected by Taliban and its duty ended merely at expressing condolence through the television and mass media. Collectively, U.S. Aposition was as a spectator of over other

countries attacks by terrorism and other internal problems .This silent spectator attitude of USA has forced itself to initiate an anti-terrorism policy with self-centered attitude when its World Trade Center was attacked .Therefore, its true angry broken out when its people killed in WTC incident and why did not come out a true angry when Indian parliament was attacked by Taliban team. So, its policy has given more weightier to its internal development than world peaceful development when we look at its policies.

### **Influence of New World Order on Human Rights Protection**

Every bad policy reaches its goal by crossing so many good polices in this way, America brought out anti-terrorism policy which reached its good goal by killing lacks of people in Afghanistan. Its policy was welcomed by so many leaders despite its policy was concerned to fulfill its country interest rather than to protect world justice .Anyhow ,since its policy was seemed to protect human rights in Afghanistan from children to adult it was accepted by world community for the purpose of establish conducive development in Afghanistan. America compensation and assistance to Afghanistan for restore its war made damages has been protecting still so many citizenlife in so many welfare policy ways under the objective of anti-terrorism policy since 2001-2014. In spite of USA has involved in anti-terrorism activities in Afghanistan, its war oriented compensation service has been helping to Afghanistan immensely in following way such as: protection of human rights ,establishing good livelihood sources ,workable situations ,earning atmosphere and business starting opportunities. Totally, all its policies have been satisfying Afghans civics needs.

### **Emergency of Terrorism**

The world has undergone the hardship of the colonial and imperialism dominations .By which, so many country started so many revolutions and independent struggle through the positive, passive and bloody ways. In fact ,these struggle emerged as per situation and atmosphere of those who lived in those days for get freedom from the colonial country .This movements and struggles are instructed to today school going generations as a subject of freedom movements mixed with violent revolution and nonviolent revolution for enable them to understand old colonial administration .Therefore today generation are revising and reading to get wider insight about initiate new methods and tools to revenge or control those country which wants to dominate other country on the name of super power .This modern policy of particular affected countries are named as terrorism as a policy to achieve quickly what does or do they want .Therefore collectively ,terrorism is also a good policy to a particular group or country for protect them from future attacks or invasion of mighty powers and its main theme of ideas are motivations of freedom fighters of particular religion and country.

### **Containing Terrorism**

Why do world people or community coined bloody or unexpected causalities is known as terrorism because which does not have an ethical principle regarding to world welfare and people life .Its action and outcome would be resulting at much more agony ,panic ,eternal fear and devastation of total human being life and assets in particular region of their unlike people or country .Indeed ,how do people call terrorism is most fear full one is based on its consequence of intolerable ,unacceptable ,un-accommodative , ferocious and heart rending outcome of its activities . .Its threatening attitude through bomb and explosive devises have caused ever remaining fear and injuries at the heart of leaders and common people in the South Asia, Central

Asia, Middle east .After plausible and blatant evidence seen by the world community that terrorism is a tools of some organized people or group to castigate and punish its opponent country in terms of politics, economics and social aspects. Therefore, world countries got together to crush down terrorism birth and remains in the world for the cause common people peaceful life.

### **Advantage of New world order**

Although this new world order implemented by super power along with fifty percentage of self-centered order and fifty percentage of human rights protection interest,it was heralded by the world people since this policy is being so important to protect human rights in Afghanistan and to destroy terrorism network. In fact, this policy was impossible to enforce by all other countries previously except U.S.A though so many countries are affected by terrorism. Therefore, America adventurous anti-terrorism policy has been most wanted and relevant actions at present days and it has destroyed the cruel terrorism networks in Afghanistan.

### **America contribution**

After 9/11 incident ,U.S.A goal was to destroy terrorism for world welfare ,in this regard it has done so many rehabilitation and restructuring works inAfghanistana as a humanitarian work of its war made damages in Afghanistan such as:Deployed more than one lack NATO troops for ensure internal afghan peace

- Established hospital ,clinic and sent doctors
- Allotted abundant money for develop Afghanistan education
- Sought Britain ,France ,Japan ,Germany and India help to reconstruct Afghanistan
- Trained afghan military and Afghan National police
- Offered much more military vehicles and airplane and helicopters for its security after its withdrawal
- More NGO have been inducted in Afghanistan for effective social reconstruction
- Provided plenty of facilities to develop hydropower project, science and technology
- Committed in renovation public schools ,civics needs ,security ,business ,livelihood and agriculture
- Arranged necessary facilities for women's developments such as freedom and liberty without fear
- Focusing state wise developments
- Focusing human resource developments ,employment opportunities and entrepreneur atmosphere
- Paying attention at child nutrition development, school feeding programme and dress .Like this plethora of welfare policies regarding to Afghan reconstruction activities by the U.S.A have been don just for fill up the gap of its war damaged infrastructure and shows itself that it is obviously accountable not only for destroy but also to renovate and restructure entire Afghanistan entity with full brightness.

### **What is India Policy?**

India policy in Afghanistan is so many in the area of politics ,economics ,defense ,agriculture ,science and technology ,culture ,telecommunication ,education ,urban development ,and human resource development .All these policies were established through the memorandum of understanding between India and Afghanistan for ensure that India is fluctuations to take part in Afghanistan internal reconstruction programme as a great democratic neighborwith peace laden approach for the welfare of Afghanistan people. Still now India's humanitarian assistances to Afghanistan reached about 2 billion as a great partner as a marvelous regional player from south Asia continent .Its financial assistances secured fifth international donoramong the more than 140 countries which are contributed to the Afghanistan development .This policy has not been doneby India alone, it is done together with world community which are still pertinent for establish a durable peace in Afghanistan

### **What is aim of India's policy?**

India's policy in Afghanistanprimarily was considered as a pro neighbor policy with aim to make peaceful South Asia as well as Central Asia through the strengthening a strong Afghanistan along with cemented infrastructure .India has never involved in Afghanistan reconstruction activities contrary to other country policy or against other country interest or demonstrate its power in SouthAsia through the Afghanistan reconstruction policy. So, its policy is never aimed at countering, control, contain and collide any other country. Therefore, India's policy in Afghanistan is primarily to promote them from the long mourningand weepingsituation to long mesmerism and well-beingsituation based on international humanitarian law .Because, their laughing life will influence positively to make conducive south Asia atmosphere, at the same time their unlaughing situation will influence negatively on both South Asia and India peace and prosperity.

### **What is outcome of India'spolicy?**

Definitely no country could do something to some country without expectation that is either financial or non-financial aspect, in this way India's reconstruction policy in Afghanistan is to stop terrorismattacks in India and pullAfghanistan to India's side for its peaceful future life .This policy created a new theory that is finance giving and peace buying. This India'sattitude is inevitable and obligatory one presently for protect its country and peoples as per its geography location and enemy plane, is waiting to do much more detrimental activities in future .The input of India'sreconstruction policy is to mitigate and allay the Islamic people tension and ill will on India's which rose due to various reason of India- Pakistanconflict, separation and Hindu – Muslimdissimilarity in the India. Thereby ,frequent terrorism attacks on India is due to unbridled angry of Muslim people on India which could be solved only through the soft policy than hard policy .Because ,Muslims are most blessed people in the world with identity of poor ,self-employed ,illiteracy ,entrepreneurs without government support and upper people domination on-Muslim people .Their emotions are true and valuable which should be solved so smoothly through the international negotiations without hurt their heart.

### **Impact of India's policy on Afghan human rights protection**

Its policy has been influencing toward secure human rights in Afghanistan even still now after math of September 9/11.How doe human rights are protected through India's policy? For instance,

people are having their basic inherent rights along with constitutional security and guarantee, at most of occasions their rights are violated by so many reason and at so many situation in the world politics due to power sharing problems, power showing game and power encroaching attitudes. This unpredictable socio, economic and political oriented problems at international and domestic levels have been causing so many resentments among the citizens like war, resurgence ,infiltration ,terrorism ,ethnic conflicts ,inter-community ,caste and political riots .Therefore in this category Afghanistan faced manifold socio ,economic damages by terrorism ,external power intervention and ethnic conflict. By which Afghanistan government could not able to give primary civics needs to its citizens for maintain and run their life according to other country citizen life style .To fill up this expectation of them, September 9/11 made a lucky chance to Afghanistan for draw world assistances. In which India helped more to Afghanistan for protect basic human rights such as school feeding programme ,fellowship to college students ,computer skills training to afghans ,educational exchanging programme ,cultural exchanging programme with fellowship ,self-help group training ,medical facilities ,offered 100 buss ,vocational training, urban and rural development ,toilet construction and Indira Gandhi child hospital and so many administrative training to afghans officials .Therefore, all these human being benefiting polices of India's since 2001-2010 have been immensely protecting human rights by not giving chance to get it violated by any other bad reasons in Afghanistan.

## CONCLUSION

India policy really have made so happy Afghanistan people by its marvelous humanitarian assistances, it has eradicated Afghanistan socio-economic and political defects for Afghanistan entire society benefits as well as developments .The reason for India policy has been so famous in Afghanistan is due to USA brought out Anti-terrorism law as a new world order.This law emboldened India to cooperate with world countries for controlterrorism with all moral supports to Afghanistan. In future, India will get benefit from Afghanistan and Afghanistan will get support from India by both country mutual understanding for develop and recalibrate their national agenda as well as all relevant sources to strengthen socioe-conomic and political developments.However all, success and developments came to both India and Afghanistan through USA Anti-terrorism policy in Afghanistan .Therefore America toiled much more than others to create an affable climate in Afghanistan as well as between India and Afghanistanso, both country should not create gab and give gab as commemoration of USA created relations for South Asia Regional Integrity.

**ABSTRACT**

*This article examines the role and significance of reading. As it is known, practical language proficiency is primarily the ability of the student to use the acquired skills in the Russian language in their activities. Reading contributes to the improvement of other types of speech activity and the preservation of knowledge of the language being studied, in particular speaking skills.*

**KEYWORDS:** *Reading, Oral Speech, Enrichment, Text, Speech Development, Retelling, Practical Significance, Assimilation, Perception, Communication.*

**INTRODUCTION**

Communication between people occurs in two ways: by direct exchange of thoughts (oral speech) and indirectly-through a book (writing, reading).

Every year, despite the widespread use of radio and television, the flow of information through the book increases, and the problem of mastering reading as a source of information, a means of educating and training qualified specialists for the national economy becomes of great importance.

As it is known, practical language proficiency is primarily the ability of the student to use the acquired skills in the Russian language in their activities. In comparison with oral speech and writing, the use of reading in practical activities has a number of advantages. Oral communication in Russian is limited due to the lack of a specific language environment, and then reading becomes an important source of information, a means of communication, as well as further development and improvement of the individual. Proficiency in reading is a necessary condition for obtaining a specialty in professional colleges and universities.

Reading contributes to the improvement of other types of speech activity and the preservation of knowledge of the language being studied, in particular speaking skills. In the process of reading, the vocabulary is enriched and fixed, pronouncing skills are practiced, and the possibility of probabilistic forecasting is developed. No wonder in one of his lectures L. V. Shcherba said that the knowledge of the language is kilometers of lines read.

In recent years, in the national groups of universities, teachers in the classroom have begun to pay great attention to the development of oral speech skills. In this regard, reading has become considered as a means of teaching speaking, translation, and retelling, and has lost its significance. This methodological orientation of many teachers has led to the fact that most students of national groups do not have sufficient skills of fluent reading in Russian by the end of their studies.

Reading in a national group is the goal and means of teaching the Russian language. In the first case, it is considered, first of all, as a type of speech activity. In the second - as a means of forming skills and abilities in other types of speech activity, mastering lexical and grammatical material. When teaching, it is important to distinguish between these two concepts – reading as the goal of learning and reading as a means of teaching the Russian language. Tasks that are most often offered to students in textbooks, teaching aids and in the classroom (read and retell the text; read, answer the questions; make a plan; find certain words, sentences, etc.), serve only as a means of teaching oral speech, in particular retelling, mastering lexical and grammatical material, and not as a means of teaching reading as a type of speech activity.

In order for learning to read to be a learning of speech activity, the following requirements must be met.

In real life, we read about ourselves in our native language, and this type of reading helps us to extract the necessary information. Reading aloud performs another communicative function – it helps to convey the received information to the listener. In real communication, it is limited, so it can hardly be the goal of studying in universities.

The reading should be informative. A person in real life reads newspapers, magazines, books in order to learn something new, to get this or that information. The process of reading is very time-consuming, and reading the text, just like that, without receiving information, is naturally impractical. When reading a certain text, there are many difficulties, so students perceive repeated reading without setting a communicative task as an exercise with language material, and not as a type of speech activity aimed at obtaining information.

Thus, the teaching of reading should be structured in such a way that students perceive it as a real activity that has practical significance. This is achieved by being able to read a new text and understand its content, especially if it contains interesting information. Satisfaction with the results, the achieved success convince students of the practical usefulness of this type of work and make them treat reading as a real activity. Students, when transmitting basic information, should be able to formalize it in a certain way in accordance with the norms of the language.

For this reason, it is not recommended to familiarize students with the content of the text in advance. The first text should be read by students, not the teacher, in order to independently carry out the mental work associated with understanding the content.

As for the teacher's exemplary reading, it is necessary only for practicing the reading technique, correctly pronouncing certain difficult words and sentences. It is impractical to give a sample of reading an entire text, since the text contains a large number of different difficulties (both pronounceable and semantic), for example: pronouncing words, setting accents (verbal, phrasal, logical), finding intonation structures, determining the lexical meanings of words and phrases, understanding the content and meaning of the whole text, etc. it is impossible even for an experienced reader to remember all this and then correctly reproduce it in the process of their own reading, so students, listening to the teacher, focus their attention only on understanding the content, and the sample of correct reading remains outside of their attention and, thus, does not contribute to the formation of students' skills of correct reading. Exemplary reading, if it also takes place with closed books, forms students' listening skills, that is, the perception of speech by ear, rather than the skills of reading techniques and understanding, the formation of which is based on visual perception of the text and their own reading.

Students throughout the years of study should feel their progress, that is necessary to ensure the development of reading skills.

Reading, like any activity, is purposeful and motivated. The purpose of reading is to obtain information, the motive is to satisfy the need for information. The result of the reader can be positive and can be negative. If the reading mechanisms are not sufficiently formed, the result will be negative, the reader will not be able to understand the text, extract the necessary information. Work on overcoming technical difficulties in the reading process, that is, improving the reading technique, occurs at all stages of learning, but it is important to build this work so that students gradually increase the speed of reading, the volume and complexity of texts, and the speed of understanding. If there is no dynamic of skills, then the difficulties of the text become insurmountable and students will not be able to achieve the necessary results, that is, to understand the text, so the interest in reading, and at the same time in the Russian language weakens. This attitude to reading is observed among students when the volume of texts for reading increases, and the language capabilities of students remain limited. This leads to a gap between the effort expended (deciphering the text) and the results obtained (reading comprehension).

Before describing the methodology of teaching reading as a type of speech activity, consider the reading process itself, its components.

### ABSTRACT

*This article discusses the importance of computer in teaching pupils, materials and methods of intercultural communicative competence and also teaching aids for the development of ICC. Consequently, foreign language teachers are often confused and do not know which aspects of culture to teach, what materials to use and what teaching techniques to use with the aim of developing intercultural communicative competences of their learners. They vary from culture to culture and can cause great misunderstandings if perceived or performed inappropriately. There are a lot of materials that could be used in teaching culture. Several English language textbooks offer materials developing ICC in separate parts called cultural pages. Furthermore, English language teachers can develop their creativity when designing and adapting material to promote more learning of the target language and its use.*

## INTRODUCTION

Authentic materials are believed to be the best types of materials for developing intercultural communicative competences of foreign language learners. Authentic materials bridge the gap between the classroom and the outside world and they bring reality to the classroom. Authentic materials are those which were not created or edited for language learners, consequently most everyday objects in the target language qualify as authentic materials. Exposure to the authentic materials allows language learners to make contact with the real-life language, customs and way of life of the target culture. Using authentic materials in teaching culture is a great motivational factor and it helps learners to recognize that there is a community of users who live their lives in this other language. Authentic materials include audio, visual and printed materials. This paper discusses and gives examples of activities how to use authentic materials in developing socio-cultural knowledge, sociolinguistic competences, pragmatic competences and non-verbal communication. The CEFR, which serves as the base document for developing national curricula, also emphasizes development of ICC. However, the CEFR does not elaborate on the development of ICC for each level of proficiency. The CEFR only describes the competences in general, and the aspects of ICC are only included in individual competences and therefore the connection with ICC is not immediately obvious. Consequently, foreign language teachers are often confused and do not know which aspects of culture to teach, what materials to use and what teaching techniques to use with the aim of developing intercultural communicative competences of their learners. Based on CEFR, general and communicative competences connected to culture have been excerpted and summarized and put into clear diagrams, which can serve as a basis for cultural teaching. In the component of socio cultural knowledge the empirical knowledge relating to day-to-day living, shared values, beliefs, history and taboos of social groups is considered to be essential to intercultural communication. Existential competence is considered to be culture related as it includes the sum of personal characteristics, personality traits, attitudes, self-image and one's view of others. Skills of cultural awareness, to see contrast between own and target culture and ability to overcome stereotypes are important components of ICC. Sociolinguistic competences refer to linguistic markers of social conventions use and choice of greetings, address forms, turn taking, rules of politeness, register differences. Pragmatic competences are concerned with the functional use of the language. The cultural component is very important here, as it includes suggestions, requests, introductions, invitations, correct use of please and thank you, etc. Non-verbal communication is an important part of intercultural communication. Paralinguistic features, such as gestures, facial expressions, eye contact, body contact, proxemics; extra-linguistic speech sounds for expressing silence, happiness, disgust, approval, disapproval, and prosodic features such as loudness, pitch of the voice are very delicate features in intercultural communication. They vary from culture to culture and can cause great misunderstandings if perceived or performed inappropriately. There are a lot of materials that could be used in teaching culture. Several English language textbooks offer materials developing ICC in separate parts called cultural pages. However, it is often difficult to convince English teachers that the teaching of culture is not a secondary goal. Culture is an inseparable part of foreign language teaching, because language without culture is a set of symbols which can be misinterpreted, if they are not understood in the right cultural context. Nowadays, authors of English language textbooks are aware of the necessity to develop ICC of learners and are trying to make more effort to create culturally relevant texts, recordings and activities. However, materials in English language textbooks are adapted materials, which have

great advantages, but also disadvantages. One of the greatest advantages is that they are designed according to the pedagogical and psychological characteristics of the learners. They are created for a particular age group, language proficiency and suitable topic, and they are easier to use for foreign language teachers. The greatest disadvantage of adapted materials is that information can be quickly out of date, e.g. when teaching popular arts, which are popular and motivational topics for young learners. Textbooks often use fabricated texts travel stories or visits by families to foreign countries and these have a tendency to feel forced and irrelevant. Another disadvantage is that adapted materials do not always use real everyday language, nor portray real picture of foreign cultures. Adapted materials are limited to texts, pictures, audio and video recordings authentic materials offer more resources. The Intercultural Communicative Competence allows individuals to relate with the world around them, by being aware of their own cultural identity, appreciating other people's cultural differences and being able to express themselves accurately in another language. Unfortunately, this capacity is overlooked in our English teaching settings. This project aimed to foster the Intercultural communicative competence through the implementation and adaptation of materials for cultural awareness with eleventh graders at a public school. In this qualitative action research three instruments were used to collect the data during the implementation of the worksheets with cultural content, a survey, artifacts and teacher's journal. The results of the intervention showed that the inclusion of cultural topics as well as the variety of activities made the materials appealing for students, which led to an innovation in the classroom that fostered learning in a meaningful way.

In today's digital world, computer science is a critical field of study that offers a limitless amount of opportunities for both academic and technological growth. Since the invention of the internet, the development of new computing technologies has steadily increased, leading to fundamental change in the way we live and work. It is hard to imagine a life without computers, laptops, mobiles and tablets, but without computer science, that is exactly what we would have. As computing technologies continue to rapidly expand and evolve, why are many schools still reluctant to harness the countless benefits of teaching computer science? Taking basic knowledge as well as skills to operate computers to perform better jobs. Computer education is all about extending to its various branches of study in different sectors. Computer, along with internet facility is the most powerful device that children can use to learn new abilities in education. Computer plays a significant role in each n every field of life. They help us in several ways. For example, they find applications in medicine, industrial process, aviation industry, making bills in various big shops, creating presentation slides in application software for making delivering lectures in colleges, universities and a lot more. In short, not only in just one, but the Computer plays an all-rounder role in the field of education of students. Innovation in computer technology has a profound impact on education. It forms a part of the school curriculum as it is an essential part of every individual today. Computer education in schools plays a major noteworthy role in the career development of young children. Being actively used in various educational institutes like schools, college's big universities, computers are used to aid the learning process of students. Professors in college's teachers in schools take help of audio visual techniques to prepare lesson plans for children<sup>1</sup>. For this, they use Microsoft power point to prepare electronic presentations about their lectures. These electronic presentations can be shown on multimedia and sound projectors in classrooms. It is an interesting and simple method to learn for students. Multimedia presentations are easy to deliver for teachers also as these presentations spare a great deal of time and effort. Computers can be used for online education research. With

the help of the internet, students can find useful information about their projects, assignments and also can take useful help from other researchers as they organize their research materials in computers. In computer based training, various educational programs are prepared or set up with the assistance of expert educators and audio-visual media help. These educational programs are generally set up in the shape of lectures on a specific topic are given on CDs. Students can learn when they wish at their homes. Immense storage is yet another main great characteristic of a computer. Students and teachers can download and store a lot of educational materials, books, presentations, address notes, question papers, and so on in computers. Students can find many different ways to solve a certain problem given to them. Through computer, they can interact with people having same decisions. Speed is the fundamental attributes of a computer. We can easily find information with just a single touch of a button. One of the primary uses of computers in education is the access to the internet for information search about any topic. Appealing and better introduction presentation of data through applications programming software like microsoft PowerPoint to introductions for creating splendid presentations for notes. Another main advantage of using computers in the education field is the improvement in the quality of teaching-learning process and communication between students and teachers. For this, they use microsoft powerpoint to prepare electronic presentations about their lectures. Computer revolutionizes the way of study while making education smoother and quicker. It also connects us to different sources, which show us different ways to understand a particular topic or idea. In general, a computer has helped the education world and also has changed the way we learn. The kids of today they tap, swipe and pinch their way through the world. But unless we give them tools to build with computers, we are raising only consumers instead of creators. Through her book, children learn technology through play, and understand the curriculum of coding through the eyes of a six year old. Her goal in working with children, encouraging them to dream and imagine the possibilities of what they could create using computers, comes with the moment when a kid realizes the world is definitely not ready yet. A really awesome way of making the world more ready is by building technology, and that each one of us can be a part of that change. In front of the monitor, moments become hours, appearing often reproaches from parents, like why to play in place to learn. Software manufacturers have tried to combine this two sides and so was both computer aided. Whether for websites or the products distributed on CD, as example this work. Students who use computer for learning at home, achieved higher scores than other children, is because lessons at the computer completes teacher explanations with multimedia elements and virtual experiments. In this case students understand and retain easier difficult topics from books. The role of computer in teaching activities is becoming more important because world is in a continuous and rapid modernization. The computer plays an important role in teaching and learning process. We live in a world where changes are made with high steps, and we must keep up with them<sup>2</sup>. The computer can be used in teaching-learning of play form, drawing the children. Computer use in school has and will have a great role in the presentations of lessons, and for communication and information. A test conducted by electronic means has various advantages among direct monitoring by the teacher in a virtual class, the results can be stored in databases is different draw conclusions on the evolution of each particular student and his performances can be available to test different data can be accessed repeatedly, leading to an adaptable and flexible learning and assessment, as part of a complex mechanism of the educational process. Computer training is the way in which the interaction of teaching and learning, between teacher and students, is the means of this computer. Integrating computers in

teaching refers to how information and tasks contained in software work is articulated with other sequences of training and responding to objectives pursued by the teacher. Proper handling of the computer itself can be done by teachers or by students, depending on the task of learning content and specific situation in which the learning. If we know how to weave the traditional with the modern lesson, if we managed to make students to participate in their training, if they educate students who will know how to find certain truths, proves that the methods used by us in the educational process were most suitable, we chose the best way. Using the computer as a tool in teaching school subjects lead to the development of critical thinking, allowing students to demonstrate spontaneous. Satisfaction of the highlights is the talent to make their own creation.

There are a lot of materials that could be used in teaching culture. Several English language textbooks offer materials developing language. However, it is often difficult to convince English teachers that the teaching of culture is not a secondary goal. Culture is an inseparable part of foreign language, because language without culture is a set of symbols which can be misinterpreted, if they are not understood in the right cultural context. Nowadays, authors of English language textbooks are aware of the necessity to develop of learners and are trying to make more effort to create culturally relevant texts, recordings and activities. However, materials in English language textbooks are adapted materials, which have great advantages, but also disadvantages. One of the greatest advantages is that they are designed according to the pedagogical and psychological characteristics of the learners. They are created for a particular age group, language proficiency and suitable topic, and they are easier to use for foreign language teachers. The greatest disadvantage of adapted materials is that information can be quickly out of date. when teaching popular arts, which are popular and motivational topics for young learners. Textbooks often use fabricated and these have a tendency to feel forced and irrelevant. Another disadvantage is that adapted materials do not always use real everyday language, nor portray real picture of foreign cultures.<sup>3</sup> Adapted materials are limited to texts, pictures, audio and video recordings. Authentic materials are with no doubt the best materials for teaching cultural aspects, as they bridge the gap between the classroom and the outside world and they bring reality to the classroom. The use of authentic materials in EFL classrooms may be useful for teachers and students to develop not only grammatical skills but also to reinforce students' ability to understand and contextualize the language used in the classroom and the language people use in other social contexts. Furthermore, English language teachers can develop their creativity when designing and adapting material to promote more learning of the target language and its use. For the development of this project, authentic materials are taken as the material that is not designed for teaching purposes, it means that the material utilized is not commercially produced to teach a target language itself, which can include EFL textbooks, audiotapes, workbooks, worksheets. Furthermore, the students participating in the study had the opportunity to share what they had learnt from those tasks with their classmates. These students designed and used posters, brochures, and videos for sharing what they had learnt from the tasks developed. There are several differences between authentic materials and no authentic materials in terms of spoken language. For example, conversations recorded for language texts often have a slow pace, have particular structures which recur with obtrusive frequency, and have very distinct turn-taking of speakers. Also, hesitations are often missing, and sentences are very well-formed with few if any mistakes. In other words, what the language learners hear in class is different from the language in other social contexts. In one of the semi-structured interviews, for instance, the participating students claimed feeling nervous when speaking in English due to

feeling afraid of making mistakes or misusing the grammar rules. In many cases, the language heard in EFL classrooms is a stilted use of spoken English; the real objective of teaching this language is lost because of a need to teach specific language points in a method that some teachers may feel would be more understandable for learners. Authentic materials as spoken or written language data that have been produced in the course of genuine communication, and not specifically written for purposes of language teaching. In fact, in his teaching practices, he encourages students to bring into the classroom their own samples of authentic language data from real world contexts outside of the classroom. In this sense, the use of authentic materials to address cultural topics in an EFL classroom allows students to practice real language, to listen to different accents, understand their classmates, and make themselves understood. Authentic materials focus mainly on contents and meaning and not on linguistic forms and structures. Authentic materials do not replace textbooks, but could be very beneficial additional materials or a substitution for certain texts that might not be well suited for the specific classroom. Most everyday objects in the target language qualify as authentic materials. Authentic materials are those which were not created or edited for language learners. Exposure to the authentic materials allows language learners to make contact with the real-life language, which can be a great motivational factor and it helps them to recognize that there is a community of users who live their lives in this other language. Authentic materials include audio, visual and printed materials. There is a great choice of authentic materials, which could be used in teaching culture in foreign language lessons, but teachers need to pay a lot of attention in choosing appropriate materials. Teachers should set up criteria for selecting materials, which would suit the specific groups of learners. The materials should fulfill the requirements of the curriculum topics, interest of learners, usefulness, language level, age and background knowledge of learners. The authentic materials need to be culturally appropriate, but at the same time comprehensible for learners of English as a foreign language. It needs to be kept in mind, that authentic materials are based on native speakers' culture, which might appear alien or inappropriate to language learners. There are several steps in using authentic materials in teaching English. The first step is to identify learners' needs and goals for learning target language and culture. Learners should be invited to participate in the process of choosing authentic materials, for example they are asked to bring recipes, newspapers, labels and other non-school materials to the classroom<sup>4</sup>. Learners might consider these materials inappropriate for school, based on their earlier academic experiences. Teachers should discuss with learners the aim and rationale for using authentic and their connection with target culture. Teachers and learners could become partners in collecting materials. Authentic materials are easily and inexpensively obtainable. Especially the internet is a rich source of all kinds of materials. The authentic materials should be suitable in content interesting and relevant, exploitability the way authentic materials could be used and comprehensibility appropriate level of language. Benefits of authentic materials in developing intercultural communicative competences are immense. They remind learners that there is a real world community that functions exclusively through the use of the target language. Authentic materials help learners to use language in real life like situations. Learners are exposed to the real use of language and they are immersed into the real world of the target culture while they are in the classroom. Authentic materials, especially texts, videos, songs need to be actual, as they are culturally sensitive and can become quickly out of date. They can be used for all language levels, from basic to advanced, but need to be carefully chosen. Finally, they have a positive effect on learner motivation as they provide real cultural information and exposure to real language. For

example, it is more beneficial to use a current newspaper to search for relevant and up to date weather forecast, than to use an out dated text for searching nouns or verbs which is a typical school based approach. Authentic materials are exciting to use, but it is inevitable that we might face some problems. Certainly, there are disadvantages with authentic materials. First of all they are very difficult and time consuming to choose culturally appropriate, up to date and comprehensible materials. Real life language is often difficult to understand, as it uses dialect words, idioms, complex language structures. Language can be culturally biased for certain groups of people and learners might have problems decoding the language. Unsympathetically used can cause frustration with the language learners. Listening to authentic language can also cause problems, as there are many different dialects and accents. Although, there are some disadvantages with using authentic materials, but there are still many more advantages, especially with developing intercultural communicative competences of learners. In fact, it is hardly possible to develop ICC without using authentic materials, particularly the sociolinguistic, pragmatic and non verbal competences.

To be more practical and specific, several activities using authentic materials with the aim of developing intercultural communicative competences are listed here. A controversial view of authentic tasks by noting that there is probably no such thing as real task authenticity since classrooms are, by nature artificial. However, it is the relationship between the learner and the input text, and the learner's response to it, that should be characterized as authentic, rather than the input text itself. Thus in foreign language learning contexts, where exposure to the language being learned is scarce, English language teachers should create paces within the classrooms with the objective of making students have access to authentic tasks that permit them to study the language structure and to focus on more than one skill at the same time.

It was common to assign pedagogical tasks to students to grade them about a single grammatical structure and almost always by using only one skill per task, as a result, students came to believe that the English language was something they learned by pieces and not being able to use it to know or talk about their own culture and others. Thus, there was an imperative need to implement tasks which would facilitate learners to meaningfully and purposefully use English within varied contexts and contents, valuing these rather than merely grammar structures.

Teachers should develop materials because it is like embarking upon a fascinating task that allows your imagination to fly and go far beyond your capabilities. It could also be living an enjoyable and rewarding experience that implies careful thought, fondness, inspiration, originality and the occasion for you and your students to develop both personally and professionally. This is basically an invitation for us, teachers to rely on our own capacities to be innovators in the classroom, to love our labor, and to find inspiration on everything we see to transform our labor into a tool to boost learning as well as to develop ourselves as people and professionals. Being able to design materials is an aspect that leads us teachers to reflect upon our own teaching practices, finding ways to adjust them in order to innovate as well as influence our contexts.<sup>5</sup> Moreover, materials development guides us teachers to select proper materials that meet the objectives of our classes and gives us self-confidence in the processes we carry out in the classroom. Teachers become innovation leaders in our own classrooms by means of teacher developed materials that are the result of teachers' reflection on the learning process and the appreciation of the EFL setting. This helps us to realize that students are integral human beings that have different learning styles and rhythms, abilities, interests, experiences and knowledge of

their own. Thus, we are able to make decisions to readjust our practice to meet students' needs and make them feel motivated and engaged in their own learning process and not frustrated in their language acquisition. Furthermore, teachers have to consider our learners needs, expectations, contexts, learning styles and multiple intelligences. Moreover, the way the input is presented has to be catchy and easily understood by the students; the activities have to be designed in a way that students find them challenging but not frustrating, and also meaningful and relevant to their lives. In other words, teacher developed materials are the best way in which we can put our creativity, commitment and knowledge in-action at the service of our learners since we understand that it is our responsibility to create proper learning environments that can benefit them. Consequently, our practice can address all of our students' dimensions as human beings because we have the option to put different strategies into practice to reach realistic goals in our courses within specific contexts. One way to define realistic goals that we need to consider at the moment of applying teacher developed materials is through syllabus design. Firstly, language focus in which the author gives many syllabi possibilities depending on how language teaching is perceived Structural, Situational, Theme based, Functional, Competency based, Task based, Content based and Skill based. Secondly, learning and the learner focus that implies the perspectives of the students in terms of learning strategies that are known as the steps to guide them, the interpersonal skills that rely on interactions as a learning booster, and finally, the affective goals that imply students' attitudes towards learning and the target language and its culture. Thirdly, social context that deals with aspects such as socio linguistic proper use of language depending on the situations, socio political critical thinking and effective participation in the society and socio cultural cultural understanding in terms of identity, customs and behavior. The experience of learning another language is more than simply the acquisition of an alternative means of expression. It involves a process of acculturation, akin to the effort required of the traveler, striving to come to terms with different social structures, different assumptions and different expectations. In this sense, learning another language entails being sensitive to a different culture which means understanding other perspectives, customs and world visions; and finally, adapting oneself to them. Therefore, all the theory that has been addressed so far made me aware of the necessity of designing materials as a way to innovate in the classroom. One way to reach these innovations is by using materials that give students opportunities to acquire that sensitiveness to cultural differences. Based on the aforementioned assumptions, I will describe what materials for cultural awareness, as one of my main constructs, entails. The experience of learning another language is more than simply the acquisition of an alternative means of expression. It involves a process of acculturation, akin to the effort required of the traveler, striving to come to terms with different social structures, different assumptions and different expectations. In this sense, learning another language entails being sensitive to a different culture which means understanding other perspectives, customs and world visions, and finally, adapting oneself to them. Therefore, all the theory that has been addressed so far made me aware of the necessity of designing materials as a way to innovate in the classroom. One way to reach these innovations is by using materials that give students opportunities to acquire that sensitiveness to cultural differences<sup>6</sup>. Based on the aforementioned assumptions, I will describe what materials for cultural awareness, as one of my main constructs, entails. As a starting point, it is important to define Materials as anything used by teachers or learners to facilitate the learning of a language. Materials could obviously include cassettes, videos, CD Roms, DVD's, dictionaries, grammar books, readers, workbooks, photocopied exercises, all kinds of realia, lectures and talks by guest

speakers, Internet sources, and so on. This spectrum of teaching resources has indeed opened up to other types of materials contrasting with the old idea that language teaching materials were just the course books. Materials as the center of instruction and one of the most important influences on what goes on in the classroom. Undoubtedly, this definition represents a great responsibility on the part of the teachers who must seriously consider what materials to use in their classrooms. Another basic and very essential concept that calls out for definition is materials development. As anything which is done by writers, teachers or learners to provide sources of language input and to exploit those sources in ways which maximize the likelihood of intake, in other words the supplying of information about or experience of the language in ways designed to promote language learning. To the previous definition I would add that materials development encompasses any kind of activity or exercise games, role plays, readings, problem solving situations, group discussion. totally developed from raw texts, with or without pedagogical purposes, for the students' level and created to address a section of the course content, that seems to be weak or lack further development or practice. materials development ranges from creating a short grammar exercise to writing a complete textbook. Some teachers may question the need to develop or adapt teaching materials if everything they need is already in a textbook elaborated by people who really know. Being this a very valid opinion, it is necessary to analyze the positive and negative aspects of using a textbook, and from there, discuss the need to develop and adapt materials. Books provide a grammatical and functional framework from within we could work. It is a nonsense to argue that this framework is never the same from one group to another even though the ultimate, specific uses two groups may make of language may differ. The framework is as much a result of the language itself as it is of the learner's needs. Almost always a textbook can be found which will provide the core language which is necessary and useful for a group whose needs may at first seem unique.

Nowadays the world experiences significant changes. Global economy has influenced the way countries establish and maintain relationships. Advances in technology have enabled people to be in touch and communicate in real time despite the geographical distances. Furthermore, in the last two decades people have been able to mobilize more easily around the world. All these changes have encouraged socio-cultural encounters between individuals of different cultural backgrounds. This is the picture of societies today. There are no boundaries for intercultural encounters. Today, societies are multicultural entities where individuals display and share multiple identities. These identities bind them to particular social groups and their cultural practices. It is clear that in multicultural societies language becomes not only the means of reference but also the instrument that carries cultural meanings that help to maintain a speaker's sense of belonging to particular social groups. To understand clearly what ICC means, it is necessary to think of a communicative situation in which people from different cultures or backgrounds- interact and bring to the situation their knowledge, their awareness of similarities and differences, their beliefs, their attitudes, their behaviours, their skills and their languages to negotiate meanings and establish effective interpersonal relationship<sup>7</sup>. It is clear that in this process none of the interlocutors are tabula rasas. Materials could serve as the auxiliary means to promote mutual understandings between people and cultures as well as powerful tools to deal with cultural diversity. In a like manner, materials might contribute to broaden students' perceptions about cultures and empower them to develop social behaviours such as tolerance and respect towards diversity. Through materials students are aware of how other people do things differently. How people live and behave in different ways. Also they can develop positive social

attitudes towards difference. These are fundamental behaviours individuals require for the development of ICC.

It is true that materials are culturally loaded and are influenced by social context. Of interest here is to mention that despite innovative ideas of how to bring cultural explanations to the classroom, course books stay with the idea of language training. In some ELT course books iconic, tourist brochure images of material that is more representative of the multicultural diversity of contemporary. The idea of language training remains but the new texts and visuals are just contextual backdrops to language tasks.<sup>8</sup> Additionally, the majority of course books are designed to function in as diverse a market as possible, materials design is rarely capable of encompassing the learner's cultural identity as part of the learning process. At most, learners may be called upon to comment on superficial differences at the level of observable behaviours. Clearly, cultural information in course books is still treated incidentally or even worse it is treated as additional information. Students are not required to compare cultural similarities and differences, or integrate new information to their scheme of thought, or to relate their experiences with the experiences of others. In conclusion, the subculture of the language learner and the small culture of the classroom tend not to be addressed. Although it is mentioned some foundation principles of ICC, we need to know which specific principles are linked to the purpose of developing materials for ICC. These can be grouped in three main categories which are related to whether materials allow learners to have intercultural experiences. Materials for ICC should promote among other things:

- An experiential learning
- A structured approach to intercultural learning
- An intercultural learning linked to a language learning

Intercultural learning implies experiential learning. It is not sufficient to read books or to listen to lectures about other cultures. It is necessary to be confronted with new unknown situations, to experience insecurity, fear, rejection as well as security, trust and sympathy, and to deal with the subject of culture on an emotional level. In fact, this is one of the main characteristics of the text driven approach for materials development learners experience texts emotionally. Generally texts, in this approach, are characterised as cultural artifacts, a piece of literature, an article, a song etc, which enable learners to acquire a language. The approach of learning experientially is linked to the left and right hemispheres of our brains. The left hemisphere is concerned with learning that is analytical, rational, intellectual and numerical, whereas the right hemisphere deals with the experiential, the visual, the imaginative, the intuitive, the spatial. Since culture is reflected in both parts of our personality, materials should address both parts to guarantee an intercultural learning experience.

A triangular didactic involves a three point relationship you, me and a common theme or project that is pursued jointly. Working together on a specific project makes cultural differences and cultural conflicts visible. Intercultural learning means how to deal with these differences and conflicts when doing a common task. We can have a list of projects but, of course, they change according to the curriculum and the school. It could be something of general concern, like environmental issues, nuclear energy, European integration, etc. Or, It could be related to politics, economy, society or the culture of the countries, such as comparisons of the educational systems, political decision-making processes, lifestyles, etc. It could also be related to specific

subjects like history, science, business. The idea of the projects is that pupils will be learning together and learning from each other. Finally, we have to say that language learning is an essential element of intercultural learning. In bicultural or multicultural classroom situations, a major emphasis is put on the minority cultural language groups to learn the teaching language, which is normally the language of the majority culture or language group. Ideally, teaching would be done bilingually.

## THE IMPORTANCE OF MARKETING ACTIVITIES IN PLACEMENT TOOLS

**Salimova Sarvinov Fazliddin kizi\***

Master's student,  
 Department of Tourism and Hotel business,  
 Bukhara State University, Bukhara, UZBEKISTAN

### ABSTRACT

*The article scientifically proves the importance of marketing activities in and how important it is in hotel operations, with a systematic approach by the consumer and the manufacturer, as well as the need to segment the service market in the development of marketing strategies. Because customer loyalty is important, salespeople and executives spend a lot of time and resources to increase brand awareness and create consistent, interrelated campaigns. Offering hotel accommodation to a large number of customers is gradually becoming a thing of the past. It is necessary to clearly define the type of goods and services to meet the needs of any narrow category of travelers.*

**KEYWORDS:** *Marketing, Marketing Of Placement Tools, Market Segmentation.*

### INTRODUCTION

In the twentieth century, the use of marketing in almost all industries and sectors of many countries has increased. Tourism also has economic and social potential and plays an important role in a market economy. Today, the tourism industry is a lucrative industry. There are many opportunities for tourism in Uzbekistan. In this regard, President Shavkat Mirziyoyev said in his address to the Oliy Majlis on December 28, 2018, "Tourism in our country is often limited to our ancient cities, historical and cultural monuments. However, the unique nature of our country, national reserves, mountainous areas have great potential for tourism development. In particular, the development of medical tourism, pilgrimage tourism and ecotourism will give a great impetus not only to the development of the economy, but also the social sphere.

This, in turn, will help improve the living standards of the population. The opportunities in the tourism industry are huge. In the context of foreign standards, the tourism environment is rapidly evolving and the services they provide are based on well-developed marketing activities. It is

very important to form marketing activities in the means of placement, which is the main infrastructure of tourism. However, the number of placement facilities across the country was 1,188 in 2020, 1,128 in 2019, and 914 in 2018. It can be seen that the number of residential buildings increased by 214 in 2019 compared to 2018, and by 60 in 2020 compared to 2019 (Figure 1).

**Figure 1. Placement facilities of the Republic of Uzbekistan over the years<sup>1</sup>**

These figures undoubtedly testify to the rapid growth and development of the hospitality industry. So it is indispensable to conduct marketing activities in order to achieve strong competitiveness in the placement vehicle business.

## REFERENCES AND METHODOLOGY

Marketing is an important element in running any business. Although this has been proven to be an essential factor in determining the success of any hotel unit, it is a commonly accepted occurrence.

The term "marketing" originated in the American economic literature in the nineteenth and early twentieth century's, and is derived from the English word "market", which literally means to "trade in the market"<sup>2</sup>. The term marketing is interpreted differently in different sources. In defining this word, we think it is impossible not to turn to Philip Kotler, the American scientist who is the father of marketing. He defined the term: "Marketing is a customer-oriented business approach. This client should always be the focus of the whole organization"<sup>3</sup>. According to him, the company should focus not only on profit, but also on meeting the needs of the customer, offering him quality goods and services.

British scholars – David Bowie, Francis Buttle, Maureen Brookes, Anastasia Mariussen cited the descriptions of two marketing organizations in the book Hospitality Marketing. These are the

American Marketing Association (AMA) and the British Marketing Charter Institute (CIM). They cite the following definitions of marketing:

“Marketing is a set of institutions and processes for creating, delivering, and sharing offers that are valuable to customers, clients, partners, and society as a whole. (AMA)

Marketing is a management process that is responsible for identifying, forecasting, and profiting customer needs. (CIM)

The AMA definition emphasizes the importance of value creation. It has value when customers use or consume a product or service. This is called usage value. Food in a restaurant or hotel doesn't matter as long as consumers don't use or consume it. The CIM definition emphasizes the importance of customer satisfaction. The common requirement of every customer to combine the two definitions is to feel the value”<sup>4</sup>, - they define in this way.

Marketing includes different types of activities:

1. Disclosure of the wishes and needs of the consumer.

Successful companies constantly monitor their guests and strive to improve service capabilities.

When given the opportunity, guests are willing to tell themselves exactly what is appropriate and what needs to be improved in the service. It is important for leaders to learn to listen to their guests and do what they recommend.

2. Creating a set of goods and services that meet the desires and needs.

Every year new goods and services are created and enter the market. Only in recent years have the hotel business, “apartment” class hotels, hostels and many other types of hotels emerged. Studying the market requirements leads to offering consumers a variety of hotel services.

3. Marketing of goods and services and sale of created goods and services in order to create an acceptable level of profitability of the enterprise.

It takes a lot of strength, ingenuity and ingenuity to be successful. The key to success is based on conveying relevant customer information and provoking his or her response through promotional publications filled with various commercial offers, which, at best, can lead to the purchase of company services.

The final step in marketing is to create an acceptable level of revenue. This is exactly what everyone strives to achieve, but only successful companies achieve it<sup>5</sup>.

Modern marketing is not only one of the tasks of a business, but also its philosophy, type of thinking, way of creating and understanding a business. A marketing tool should never be used to deceive a customer or damage a company's reputation. Marketing is the creation of a combination of goods and services that provide the customer with the desired value, motivating them to purchase those goods and services and meeting his or her real needs.

Marketing in the service sector has its own characteristics compared to other commercial activities.

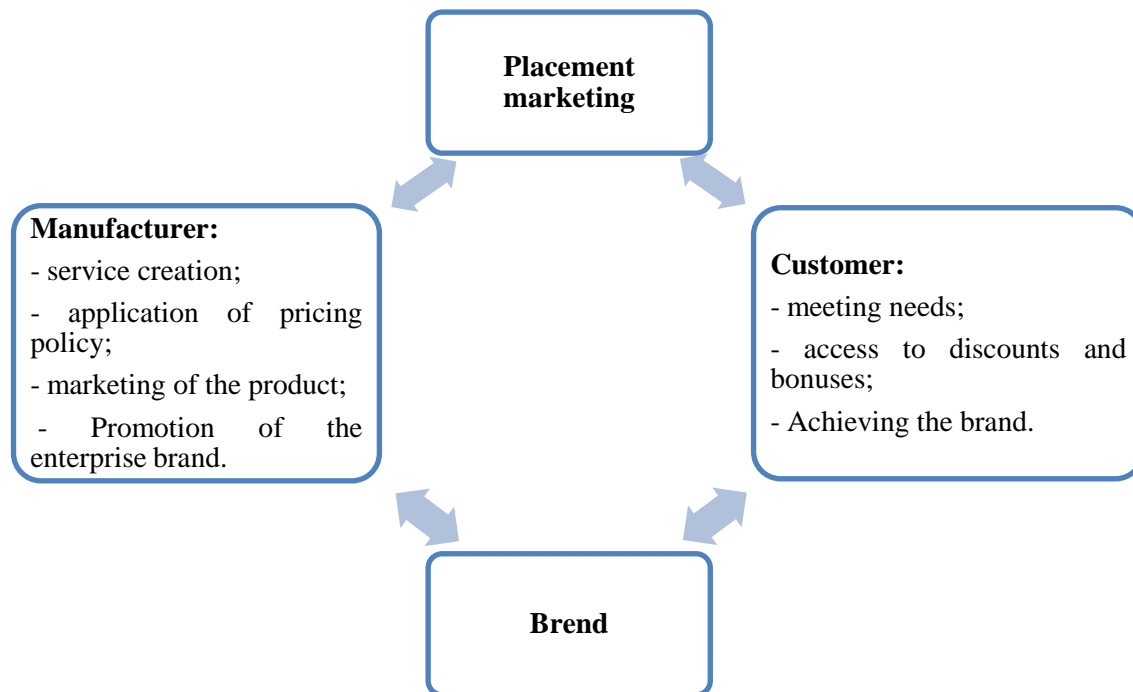

The highest priority of the placement tools marketing concept is to meet the wishes and needs of the customers. The management of placement tools focuses on meeting customer needs rather

than focusing on profit first, achieving more financially rewarding results, and then providing excellent customer service.

## THE RESULTS

To understand the importance of marketing activities in placement tools, it is necessary to approach it from different angles: by the manufacturer and the customer (Figure 2).

**Figure 2. Placement marketing<sup>6</sup>**

Of course, in order to fully cover the marketing of accommodation facilities, it requires a systematic study from the point of view of the manufacturer (i.e. hotel and other accommodation facilities) and the customer. At first glance, their goals may seem different, but from a single brand perspective, their goals are similar. Because the hotel wants to create its own brand and be known all over the world, and the customer wants to spend the night in this hotel, using the services of this famous brand. In short, placement marketing means meeting the customer's needs, offering discounts and bonuses through the manufacturer's creation of services, application of pricing policies, product launches and brand promotion, as well as motivation to achieve the brand.

So, it is very important to create a strong marketing strategy, build a brand, attract new customers and maintain loyalty in the placement tools. Because customer loyalty is important, salespeople and executives spend a lot of time and resources to increase brand awareness and create consistent, interrelated campaigns. These marketing efforts typically include print and digital pledges designed to attract old visitors as well as new customers<sup>7</sup>.

Deployment tools play a vital role in the study of marketing activities, deep market segmentation, comprehensive customer service and sales promotion.

Market segmentation involves dividing the entire potential market into smaller, more uniform sectors. Offering hotel accommodation to a large number of customers is gradually becoming a thing of the past. It is necessary to clearly define the type of goods and services to meet the needs of any narrow category of travelers.

Depending on the specific needs of consumers, the hotel industry can be divided into segments: full boarding for business travelers, economy-class service, apartment service, high-class economy-class service, resort service, city in the center and on its edges, service along highways, and so on.

Deployment tools need to create their own service strategy to meet the specific needs of the market that has chosen a particular segment.

The hotel market segmentation is traditionally based on the following variables:

- Demographic (age, gender, income, level of education);
- Behavioral (frequent, infrequent, rare trips);
- Price (high, medium and low cost of a set of services);
- Psychographic (lifestyle, behavior, level requirements convenience).

## CONCLUSION

Thus, understanding the importance of marketing in placement tools can help you stand out and stand out in a competitive job market. Any business can offer the best product in the market, but without good marketing activities it will not bring the required return on investment because it is marketing that informs potential customers about the product or service.

### ABSTRACT

*This article describes features and development of entrepreneurship in tourism industry. The business environment is a general environment that is manifested as a result of business. Entrepreneurship is another major source of employment in tourism. At present, great attention is paid to the development of entrepreneurship in our country. There are many aspects to consider when developing a business in tourism. The reform of the system will create many new jobs and develop the tourism industry. Today, tourism is one of the fastest growing sectors in the world economy. In our country, the attention to this area is growing from year to year. Therefore, the formation of a tourist market in our country is very important. The second aspect of the efficient use of tourist resources is the formation of the tourism market.*

**KEYWORDS:** *Tourism, Hotel Industry, Products, Marketing, Entrepreneurship, Services, Destinations, Employees*

### INTRODUCTION

An important issue today is the development of the economy, increasing incomes and improving the socio-economic situation. Today, more than 60% of the population of the Republic lives in rural areas. Therefore, the creation of new jobs in rural areas with a large labor force, the expansion of opportunities in the service sector is a key factor in the well-being of the population. In addition, the development of tourism in rural areas is one of the tasks before us. Karakol is a beautiful place with a beautiful nature, created in the desert for thousands of years. Its beautiful nature, deserts and lush green meadows attract everyone. The fact that astrakhan leather is of great interest to foreign tourists in particular is a great reason for its further development. Karakol sheep are bred all over the world and it is impossible to grow high-quality

skins from them. This requires good climatic conditions, grass and sunlight. Demand for high-quality Uzbek karakul and its products is growing in the world market. The fact that it is widely and effectively used in the creation of high-quality hats, tops, interiors and other works of art for man testifies to the great importance of this industry in attracting international tourists. For centuries, various fur products have attracted the attention of mankind. It is known from history that human beings have been using skin for a long time before they started using fire. By the time primitive humans began to use leather and fur, fire had not yet been invented. Naturally, at that time fur was not yet sewn from karakul, it was simply used as a simple fur. At present, the industry is closely linked with a number of other sectors, especially tourism. Tourists visiting our country are very interested in hats made of astrakhan leather. Our local artisans have treated the leather so well that not every tourist who sees it can leave without buying a hat or cap. The unique patterns and beauty of Karakol leather have always been used as a comfortable, high artistic and aesthetic garment. has become a unique commodity that traders carry around the world in caravans.

## **MATERIALS AND METHODS**

Today, tourism has become one of the most lucrative businesses in the world. It is an integral part of a market economy and has become a rapidly growing industry in many countries around the world. Tourism is closely linked with the world economy's transport, communications, trade, agriculture, and consumer goods industries, and has a place in the world economy. Tourism is one of the main sectors of the economy of the republic, including agriculture, industry, transport and other macroeconomic sectors has enough resources to take its rightful place.

Our country is a leader in Central Asia in terms of tourism development. The country is rich in historical, archeological, architectural, cultural, agricultural and other tourist resources. In addition, the unique and beautiful nature of our country, mountains and valleys, rivers, deserts and various landscapes are the main recreational resources. Tourism, which is a young industry in our country, is developing rapidly today. This means that many jobs can be created. It also allows the countryside to become more beautiful.

Currently, the share of economically active population in the tourism sector in the country is very small. The participation of the rural population in this regard is generally low. Our goal is to create new tourist areas using the recreational and natural resources of rural areas and attract the rural population to tourism in the development of domestic tourism. The experience of developed countries shows that the existence of attractive areas alone is not enough for the development of tourism. Adequate development of local tourism infrastructure is also an important issue. The role of domestic tourism in the region is also important, and it is important to earn income from local tourism, meet the needs of the local population, provide services to them, and develop opportunities to provide jobs for the unemployed.

Currently, in the world experience, the form of agro tourism is widely developed. Agro tourism is one of the brightest types of tourism in our country. Because our country has an agro-industrial economy, the bulk of the population is engaged in agriculture, in addition, our country is rich in recreational resources, and we can develop recreational activities in many areas. Financial resources are essential for countries in transition to a market economy.

---

## RESULTS AND DISCUSSIONS

It has its own characteristics of the development of agritourism. These are:

- Accommodation and meals in rural areas are 2-2.5 times cheaper than in urban areas;
- ecological cleanliness of rural areas;
- Availability of ecologically clean food;
- as an object of ethnographic tourism, the preservation of national identity in rural areas, etc.

As for rural tourism, in the early twentieth century, the aristocrats of St. Petersburg, as well as those who put themselves in their shoes, could not afford to spend their holidays in Baden-Baden. Such people live in Martishkino (southern part of St. Petersburg), which was considered a resort area at that time, or 30 km from the Finnish capital. They rented cheap country houses for recreation in Terioko, a road to the United States. Because there was no need to issue foreign passports. The tenants of such country houses were mostly intellectuals.

Holidays are very exciting for any city dweller, whether in the countryside or in the yard. That's the decent thing to do, and it should end there. Field yards or other places have always been rented for recreation in places that have been trusted and inspected for many years. The peculiarity of rural tourism is that, for example, in the agrarian regions of Sicily, the excess labor force can send poor tourists or students to work without pay, for shelter and food. That such a "vacationer" could find the money to go back. Along the way, you can spend a day or two swimming on the beaches, visiting museums, monuments and more. Today, rural tourism is a lucrative industry and has a special place in the world tourism market. While rural tourism cannot compete with large volumes such as seaside resorts, it does play a role in tourism. Special attention should be paid to its study and development. There is no rural tourism in the country. It has a future due to the small population in the village, the purity of nature, the environmental friendliness. In fact, it is cheaper to be a tourist in the countryside than in the resort areas or popular tourist centers. Not everyone can relax in expensive tourist centers, so the development of rural tourism is of great importance.

Rural tourism is carried out in the following cases:

- In rural areas, regardless of the amount of money available to certain categories of people, for example, according to family traditions;
- on the advice of a doctor to conduct rehabilitation in rural climates;
- Proximity to nature, the purpose of spending more time in the fresh air;
- for the possibility of eating environmentally friendly and inexpensive products;
- There are real opportunities for employment in agriculture;
- not to travel thousands of kilometers to find what you need for life;

Rural tourism is a unique feature of other areas of tourism, providing tourists with a unique opportunity to get acquainted with the local traditions of the local community, as well as improve living conditions and sources of income for rural families in remote areas of the country, as well as preserve national and cultural heritage. is distinguished by According to the analysis of international experience in the field of tourism, the focus on the development of rural tourism is

given by locals in rural areas to rent hotels for tourists to spend the night, organize dining and entertainment programs, provide guidance services, handicrafts. increases opportunities for additional income through the manufacture and sale of goods.

## CONCLUSION

The dedication of local tour operators to attract tourists to their villages, to bring tourists to the development of their people and state, to create jobs, to strengthen the tourist resources of their country, to bring currency into the country and to pay taxes on this income. they deserve to be taxed. In general, tourists in rural areas are much cheaper than in sanatoriums or popular tourist centers. Not everyone can relax in expensive tourist centers, so the development of rural tourism is of great importance.

Kokand State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*This article provides a pedagogical basis for the professional training of future teachers and their learning activities, and describes the methods and techniques for the development of learning activities. The main criteria for professional training are the practical training of the future specialist and the acquisition of knowledge, skills and abilities in the field of specialization, the level of adaptation to the requirements of professional activity. The works of medieval thinkers who lived and worked in the Near and Middle East emphasize the importance of the type, principle, structure, and criteria of scientific knowledge in relation to human mental development and perfection.*

**KEYWORDS:** *Pedagogical, Specialization, Perfection*

### INTRODUCTION

Social, didactic, active, professional, axiological, acmeological, creative, reflexive, cognitive activity, traditional education, skills, abilities, etc. From the first years of independence of Uzbekistan, the first President Islam Karimov objectively analyzed the achievements and shortcomings in the education system and proved the need for radical reforms in training. Also, I.A. In his speech, Karimov stressed the social necessity of this issue, saying, "It is necessary to implement a series of comprehensive measures to ensure the entry of talented young people into science. In this regard, it is necessary to radically reform the activities of universities, and even general education schools," he said. Indeed, the solution of these issues is aimed at radically reforming the existing education system in the country, the formation of a highly spiritual person through the formation of a system of continuing education. Therefore, the role of higher education institutions in educating a harmoniously developed person, forming him as a specialist, gaining a worthy professional and social status in society is great. Quality-monitoring of the

system of modernization of higher education institutions and their educational process, training of pedagogical specialists increase, modern professional knowledge, skills and abilities of future teachers arming them with acmeological motivation for professional activity formation of professional training of pedagogical specialists is one of the important tasks in the process.

he experience of developed countries, in particular, the United Kingdom, Australia, Switzerland, Germany, Malaysia, Canada in the training of specialists shows that the main task of vocational education is to develop students' intellect and logical thinking based on the specifics of the chosen specialty. On the basis of this task, the professional training of students will be provided. The main criteria for professional training are the practical training of the future specialist and the acquisition of knowledge, skills and abilities in the field of specialization, the level of adaptation to the requirements of professional activity. These factors, which determine the effectiveness of the process, are reflected in the system of training of junior specialists in the context of the "National Training Program". creates the need for fundamental research to improve the content of vocational training by ensuring its practical implementation. It is known that for thousands of years in Eastern pedagogy, the issues of career choice, career guidance, vocational education have been combined with mysticism. The Qur'an, which has been an important source in the formation of the spirituality of our people In the hadiths, as well as the great thinkers Muhammad Ismail al-Bukhari, Muhammad Isa al-Termizi, Mahmud Qashqari, Abu Nasr al-Farabi, Yusuf Khos Hajib, Hussein VoizKashifi, Amir Temur, AlisherNavoi expressed in the form of rare ideas in the scientific heritage. Thus, finding solutions to didactic problems in pedagogical technology is an important step in the implementation of the national program. If the educator has in his hands the students who are thirsty for knowledge, the program, textbooks and manuals in accordance with the purpose of science, he can successfully carry out the didactic process. can effectively and consistently introduce new pedagogical technologies into practice, effectively using organizational forms of cognitive activity. Thus, as a result of these ideas, theoretical analysis and generalization of the results of observations and empirical analysis obtained in the process of scientific and pedagogical research, it was found that the effectiveness of the process of professional adaptation of future teachers is based on the following factors:

- Motivational factor - aspects characterized by the level of awareness of future teachers about the chosen profession and its essence, professional orientation and motives for choosing a profession;
- Social factor - the existing social environment in society and the social prestige of the profession, as well as the development of professional and social norms by students, the application of social experience in the system of personal and professional institutions;
- informational-meaningful - a set of socio-theoretical, pedagogical-psychological and special-methodological knowledge, skills and abilities necessary for the successful acquisition of a factor-selected field of professional activity;
- Activity factor - the motivation to apply the acquired special professional knowledge, skills and abilities in specific situations and situations, self-analysis and development;
- Organizational and methodological factor - innovative types of education: person-centered, differentiated education, interactive education, collaborative education, software education, problem-based learning, game technology, modular lim, independent study and effective use of

others in the educational process; teacher and student interaction; students' ability to learn independently, students' creative approaches to learning, the formation of independent thinking skills; the establishment of an informed creative environment; healthy competition; objective assessment of students' learning activities;

- Didactic factor (tools) - the availability of specially equipped (computerized) classrooms; educational resources (improved curricula, lecture notes, electronic textbooks, teaching and methodical manuals, electronic developments, graphic organizers, audit tools), teaching equipment and tools, information technology. Based on these factors and the current requirements of the labor market for the training of teachers, it is clear that the content of the formation of professional flexibility in future teachers is directly determined by their physiological, psychological, social and organizational adaptation. Socio-theoretical training of students of pedagogical higher education institutions is influenced by motivational and social factors, the content of which includes information, knowledge, the basics of science, which are acquired in the field of general education.

Pedagogical and psychological training of students is based on the principles of the educational process, the documents that illuminate the content and essence of education, forms, methods and means of teaching, as well as knowledge of the age and individual characteristics of the student and their psychological state. Is determined by the level of professional knowledge, skills and abilities in the acquisition. The skills of practical adaptation of future teachers to the professional activity will be formed on the basis of direct special-methodical training. In this case, the correct design and implementation of the educational process of the student, the organization and management of the activities of teachers and students, the correct orientation of students' learning activities, teaching, the level of mastery of skills in the effective use of forms, methods and tools of control and evaluation in the field of science, training and subject are described as key components. To be included in the process of professional adaptation of future teachers one of the modern requirements is the ability to actively master and implement these innovations. Innovative training is one of the criteria of professional training determined by the formation of an axiological, acmeological, creative, reflexive approach to pedagogical activity, the creation of an environment of creative cooperation in education, the introduction of innovative technologies in the teaching process, active motivation for innovative activities. is considered. Another important consideration is the process of professional development of future teachers aspect is the professional knowledge, skills and in the areas mentioned above is the definition of a set of necessary conditions for the acquisition of skills and their full implementation in practice. Because a comfortable and goal-oriented pedagogical environment allows the process to achieve the desired result relieves the earliest sources on student learning and its nature date back to antiquity. It has been known since ancient times that students' cognitive activity helps them to delve deeper into the essence of things, processes and events, and strengthens memory. The works of medieval thinkers who lived and worked in the Near and Middle East emphasize the importance of the type, principle, structure, and criteria of scientific knowledge in relation to human mental development and perfection. Al-Khwarizmi clearly distinguished between cognition through emotion and cognition through "logical reasoning": emotion is a "small" property, and "logic" is the study of essence, and they are interrelated. In order for the learning process to be productive and efficient, students must have a certain level of cognitive activity. Education should be both a goal and a tool for students to develop their learning. Therefore, the

school is tasked with educating an active, creatively inquisitive person. Therefore, the development of cognitive activity is necessary not only for the successful completion of educational tasks, but also for the fulfillment of educational tasks, which should develop students' mental abilities, respect and enthusiasm for work. The problem of developing cognitive activity is related to the development and application of specific methods and techniques. According to P.D. Zubenko, who observed the work of future teachers in a special experiment, the development of students' mental activity depends in many ways on teaching aids. However, the organization of cognitive activities alone does not provide a complete solution to the problem. In recent years, it has been proven wrong to divide teaching into active and passive methods.

In traditional education, the teacher explains the material, poses a problem, finds a solution, and the student repeats the teacher's actions. In this method of teaching, the teacher is active, and students are limited to performing the role of a weak performer. A number of studies have been conducted to improve traditional approaches. A.J. Attokurova, S.Yu. Kutlimuradova, M.I. Enekeev, S. Kariev in their research agreed that the cognitive activity of students can be developed through independent work. The urgency of the problem of developing students' cognitive activity is due, firstly, to the lack of consensus among pedagogical scholars on the definition of this topic, and secondly, to the fact that methods of development are also interpreted differently in the scientific and methodological literature. The analysis of the above scientific research shows that there are three main directions of the problem: The first direction is to accelerate learning to a certain extent by performing exercises and practices that determine the knowledge of more students. The second direction in the concept of developing students' cognitive activity is related to the formation and development of cognitive activity, which focuses on such qualities as activity, independence, initiative, creative activity and independent learning. The third direction is to create the necessary conditions for the development of cognitive activity. In our opinion, these directions in the concept of the development of cognitive activity do not negate each other, but are inextricably linked. However, because all three areas of the problem are so broad and multifaceted, researching them should be a priority, identifying the main areas in which students will develop their learning. Modern didactics uses the achievements of educational psychology in the study of students' cognitive activity. Depending on the age and content of the educational material, the specificity of this activity establishes the psychological laws of the educational process, considers the individual and typical characteristics of students in cognitive activities.

 UZBEKISTAN

**ABSTRACT**

*Talented writer Isajon Sultan has complementary characters in every story, short story and novel. These heroes in a sense demand a national character. The article focuses on character creation skills in this process. The nature and spiritual world of the characters in the writer's stories were looked at.*

**KEYWORDS:** *Character, Portrait, Plot, Composition, Image, Style, Skill, Poetics.*

**INTRODUCTION**

A comprehensive and in-depth study of aspects of the national mentality in the creation of a work of art by a writer requires a laborious and complex process. Each artist illuminates the elements of the national language at a unique level. The great Greek genius Aristotle: "As for the characters, they have four goals. First, and most importantly: the hero must be noble. As we have said before, a person acquires character if he pursues a purpose in his words and deeds. If a person has good goals, his character will also be good. It can be present in anyone: a woman or even a slave may be good, the former (worse than a man) may be worse, and the slave may be worse than him. Second, the characters must be unique: the character is masculine, but masculinity and strength do not befit a woman: this is not to say that they are absolutely different, as described above, and that they should be described as good or handsome. Fourth, the characters must be consistent: even if the person portrayed is inconsistent, all the actions of that character may be inconsistent" [1, p. 44].

**THE MAIN FINDINGS AND RESULTS**

Apparently, the works of Isajon Sultan contain dozens of complementary characters that grow from story to story, from story to novel. This is the image of a woman. When describing the character of the women of our working people, the writer always takes into account two aspects.

The first is to describe the shifts in the social life of an ordinary peasant woman, while the second is to depict the fate of wise housewives who have not seen the light in hard working conditions. These are the Mother of the Stranger in “Munojot”, Rano in “Onaizorim”, Dilorom in “Ozod”, Bibi Salima in “Bibi Salima”, Zulayho in “Yusuf and Zulayho”, and the mother in “Qismat”. All four elements of character creation that Aristotle emphasizes require the strengths and weaknesses of the female race, her aspirations, her civic duty, her role in the family, in social life.

In the author's stories and narratives, we examine in part the artistic evolution of the characters. In particular, we see the tragic images in the story “Onaizorim” as a writer depicting the brutal realistic scenes of life, moving away from the lyro-romantic style typical of the early works of Isajon Sultan. It should be noted that the realistic style was chosen exactly in accordance with the concept of the story. The author's portrayal of tragedies not only through the depiction of two-sided plates, but also through the artistic depiction of the fate of the protagonists and the tragic complications that remain a painful point in his heart, ensured that the work was convincing and educated. The literary language in the story requires extremely simple and logical thinking. The writer used every word effectively, in which the laws of language took on a high meaning. The use of idioms typical of rural life served to increase the appeal of the story.

*“Ota xastalanibytibqoldi.*

*Kuzkelganedi. The leaves of the quince are golden, reddish-gold, the leaves of the grass are pale greenish-yellow, and the leaves are pale green. The weather began. In the morning, the meadows were covered with dew, and the gray soil of the fields was darker than mine.*

*– Nimabo'ldisizga? – dediona.*

*– Bilmadim, – dedi otaihrab. – Shu, biqinimsanchiydi. Anchadanberisanchib-sanchibqo'yardi, o'tibketar deb yuraveribman, endikuchayibketdi.*

*- Voyo'lmasam, nimaqilamiz?*

*– Maqsuddo'xtirnichaqiraqol, – dediota.*

*Ona qo'shninikigachiqibketdi. U erdan “Maqsuddo'xtirnikigaboribkeling, bolam, akangiznimazasiqochibqoldi”, deganieshitildi.*

*Ra'nootasiningyonida ne qilarinibilmayo'tirardi. Birnima deb ko'ngliniko'targisikelardi, o'ylabturib-turib, axiyri:*

*– Choy damlabkelaymi, ota? – debso'radi.*

*Otaningatrofitirishlargato'lako'zidailiqifodapaydobo'ldi.*

*"Jonimqizim", dedi ovozi allanechuko'zgarib. Yana birnimalardemoqchibo'libjimqoldi, o'ylariko'zlaridan bilinardi. Harholda, suyib-alqabanchagaplaraytgisikelganbo'lishimumkin. Keyinqiynalibroqbiriyutindi-da:*

*– Mayli, qizim, – dedi.*

*Ra'nootaningaytaolmagangaplarinitushungandayedi.*

*O'shamahaldanimalardegisikelganekanulkangavdalibarvastabukishining?*

*Qalbsezib-*

*tug'yonko'tarar, o'ziniotabag'rigaotgisi, to'yib-to'yibyuzlariniishqagisi, yanaallaqanchanoma'lumistaklarborvahammasiqzningotagaulkanmehridanbinobo'lmoqdaedi.*

*Lekin, ota ham birnimademadi, qiz ham. Ra'noayvongabordi-da, choy damlashgatutindi* [2, p. 69].

*“My father fell ill.*

*Autumn had come. The leaves of the quince were golden, the poplars were golden red, the long leaves of the grass were pale yellow and green, and the stream was green. Criteria began to fly in the air. In the morning the meadows were soaked with dew, and the gray soil of the fields was darkened by moisture.*

*“What happened to you?” He said to her.*

*“I don't know,” said Father Ihrab. “That's my shoulder.” It had been stinging for a long time, I was walking past it, and now it was getting stronger.*

*“What are we going to do if I don't die?”*

*“Call the doctor, Maqsud,” said the father.*

*The mother went out to her neighbor. From there, he was told, “Go to Maqsud's doctor. My son, your brother has lost his appetite.”*

*Ranowas sitting next to her father, not knowing what to do. He wanted to cheer her up, but then he thought:*

*“Shall I have some tea, Dad?” He asked.*

*A warm expression appeared in his father's eyes, full of tears.*

*“My dear daughter,” his voice changed. He was silent, trying to say something else; his thoughts were clear in his eyes. In any case, the lover may have wanted to say more. Then he swallowed harder:*

*“All right, girl,” he said.*

*Ranoseemed to understand what her father could not say. What did he mean at that moment by the huge body of this man? His heart was pounding, he was throwing himself into his father's arms, his face was full of greed, there were some more unknown desires, and it was all built on the girl's great love for her father.*

*But neither the father nor the daughter said anything. Ranowent to the porch and started making tea.”*

There is Uzbek sorrow, pain and grief in the relationship between a father and a daughter who have reached the end of their lives. The landscape in the picture is in harmony with the rush of autumn, reflected in the writer's sharp eyes, like the shedding of leaves. Behi - symbol! The author's goal is to point out the image of the Father in the story of the dying quince tree, the calm and greenery of the waters, the gray, darkening of the soil from moisture. On the one hand, the fate of the father, who is growing from illness and pain, creates a deep chasm in the heart of the spotless and sincere Rano .**“Jonimqizim”, dediovoziallanechuko'zgarib. Yana birnimalardemoqchibo'libjimqoldi, o'ylariko'zlaridanbilinaredi**” – “My dear daughter,” he

said, his voice changing a little. He was silent, trying to say something else; his thoughts were visible in his eyes.” The father's last wish, but also his farewell, evokes a feeling of sadness in the student's heart. It is not difficult to understand the concept embedded in the architecture of the story in a short dialogical dialogue by Isajon Sultan. Because, *“Muallifchekinishi – buijodkorningfalsafy, lirik, avtobiografikvaboshqayo'nalishdagimulohazalariifodasibo'lib, ularbirorpersonajyokitimsollaro'rtasidagimunobabatniizohlashgaqaratilmaydi.*

*Muallifchekinishiasarkompozisiyasidabo'lishishartemas, lekinasardabundaychekinisho'rinqo'llanilganbo'lsa, u kattaahamiyatkasbetadivaalbatta, alohidatahlilgatortilganimaq'ul”* [3, p. 235] - The author's retreat is an expression of the artist's philosophical, lyrical, autobiographical, and other thoughts, which are not intended to explain the relationship between any character or emblem. The author's retreat does not have to be in the composition of the work, but if such a retreat is used appropriately in the work, it is of great importance and, of course, it is desirable to draw a separate analysis”.

The author pays special attention to the author's retreat in many of his works. This is called his style of expressing reality. Style is a special concept! It has a special place in the nature of every literary genre. However, it is commendable that the simple style of the writer's style depicts the realities of rural life from today's level. The dynamic growth and change of the characters unfolds from work to work. Rano's diligence, his habit of doing any work diligently, his ability to swallow his sufferings and tears, have become an integral part of the writer's creative concept. It should be noted that the adaptation to destiny, the desire for desires and inclinations remain nourished by national mental characteristics:

*“Saharlabqushuyqusidaxiyolko'ziilinganRa'nonixolasidahlizdanovozberibuyg'otdi.*

*“Tur, qizbo'lmayqol, hovlilarnisupur, ishlaringniqil”, dedipichirlab.*

*Ra'noo'rnidanturdi. Ohorlikelinlikliboslarinikiydi, u liboslaro'zigayarashdimi-yo'qmi, oynagatuzukroqqarayolmadixam, ammo rang-barangligi, islarivayangiligiyoqaredi.*

*Tashqarichiqarkan, u ham pichirlab, xoladan:*

*– Supurgiqaydaekan? – deyasoradi.*

*– Hammasinitopibqo'yganman, – dedixola. – Men ham chiqaman, bo'laqol.*

*Hovlikengginaedi. To'yo'tgach, qolganqavmuqarindoshhammayoqnisaranjomlabketishganekan. Birchetdadasta-dastapiyolayulaganlarturar, rayhonlarostidaRa'noyangisupurginiko'rdi. Xolasidanminnatdorbo'lib, hovlisupurishgatutindi. Ko'chaeshikoldiniikkitarafdagiqo'shnilarningdarvozaxonasigachasupuribbordi, suvlarsepdi, keyinqaytibkirib, nonushtatayyorladi, buoradaqaynota-qaynona ham turishdi. Birchetgaqumg'ondasuv ham isitibqo'yganedi, qaynotakelinigaqaramasdan, boribtahoratiniolibkeldi. U kelgunigaqadarRa'noshoshilibularyotganuygakirib, joynamoziniqiblagato'g'rilabsoldi”* [2, p. 77].

*“In the morning, Rano's aunt, who was dreaming in a bird's sleep, woke her up by shouting from the hallway.*

*“Get up, don't be a girl, sweep the yard, do your work,” he whispered.*

*Ranostood up. He wore a heavy bridal gown, and he couldn't look in the mirror to see if it suited him, but he liked the variety, the smell, and the novelty.*

*When he came out, he whispered to his aunt:*

*“Where's the broom?” He asked.*

*“I've found them all,” said the aunt. “I'll go out, too.”*

*The yard was spacious. After the wedding, the rest of the people and relatives took care of the cabbage. On one side stood piles of bowls and bowls, and under the basil Ranosaw a new broom. Thanks to her aunt, she started sweeping the yard. The street swept the front door to the neighbors' gates on both sides, sprinkled water, then went back in and made breakfast, while the in-laws also stood. Aside from the sand, the water was also heated, and the father-in-law went and brought his ablution, in spite of his daughter-in-law. Before he arrived, Rano hurried into the house where they were sleeping and turned his prayer towards the qibla”.*

Our national way of life is interpreted on the basis of simple communication. There are no dreams in the heart of the newlyweds, which is torn between life and imagination. Family Relationships and Upbringing Rano is a symbol of goodness in nature. It is the chain between reality and the writer's creative intent that ensures that Rano's character emerges in all its complexity. At a glance, the writer gives the impression that he is describing the fate of an ordinary person. But at its core lies the destiny of the nation, the attitudes of society, the dreams of the family, and the goals of parents. “... when studying the text of a work of art, taking into account the interdependence of all the elements in it allows us to come to the right scientific conclusions. In this context, the study of the relationship between plot and psychologism in the novel also makes it possible to clarify the individual style and skill of a particular writer. While the plot depicts the chain of events, changes in space and time of the characters, their lives in alternating situations and situations with the help of artistic psychologism, the psychological world, emotions and experiences of the literary hero are reflected in the plot reality. While the events described by the writer constitute the subject world of the work, the depiction of the psyche of the characters is the beginning of the novel, which constitutes the artistic psychology” [4, p. 123]. Character is the psyche of the writer's primary ideological and artistic credo.

Norwegian thinker Johan Borgen writes about the complex processes of creative psychology: “Man's memories of the past are never preserved as a whole, but are blinking in the form of a subtle gesture, an abstract feeling, or an object, and are absorbed into a stream of uncontrolled imagination” [5, p. 156]. According to him, artistic creation is the ability to absorb the rays of abstract emotions, to express them in words. Creativity is a multi-stage phenomenon. Undoubtedly, this process, which Borgen envisioned, also belongs not to the sample of world literature encountered, but to the highest stage of artistic creation. In Isajon Sultan's story “Onaizorim” the literary language is more pronounced when it uses the dialect and the simple way of speaking instead. That is, as the protagonist individualizes his speech, the essence is embodied in a unique way. Not the unusual features of the language, but the light and simple words of the epic infuse universal problems:

*“Sovchilaryanakelishdi. Endiulargaberiladiganjavobaniqedi.*

*– Sahar kelibko'changiznisupuribketaydesam, zamonboshqa, ammo shuqizingizuchunilbo'yiharkunisupurishgayamroziman, – deyaavradikuyovningammasi, semizxotin.*

*O'zamma-xolalari ham shundaedilar.*

*– Sizdayxushmuomala, harnarsanio'ylabishtutadiganoilagabermasak, kimgayamberardik, – dediona. – Qoshimniostida, kiprigimniustidaavaylabo'stirganqizimgao'zimdan ham afzalono'lasiz-ku, sizniyam, avlod-ajdodingizni ham yaxshibilaman.*

*Bu birishora, zamiridao'ksikroqhayiqishsezilar, ya'ni, berishgaberarmizu ammo shunchayilzahmatlarbilankattaqilganqizimgao'zbolangizdayqararmikansizdeganilg'ar-ilg'anmasbiro'tinch ham boredi. Non sindirildi, oqlikberildi. Kelganlarningerkaklarigabelbog', ayollarigaro'mol, dasturxonlariga non vaqand-qurssolindi. Sovchilarxushhol, yuz-ko'zlarisevinchumannuniyatdanporlab, xayr-xo'shlashibjo'nashdi. “Xudoxohlasa, endiqarindoshbo'ldik”, deyishdiketaroldidan. “Oqlik ham berildi, endibuyog'ito'y, qizo'lgur”, dedioxolasi, Ra'nonibiqininichimdib, sevib-suyib.*

*“Hoy qiz, endiko'chagachiqqaningdaqarindosh-urug'laridanbirontasio'tibqolsaqochgin, – dediona. – Yo'lingo'shatomongatushsa, u ko'chadanyurmagin.*

*Gapirishsagapirmaysan, ko'rishamandesayuqochganiilojinqolmasa, ergaqarabturasan.*

*Elningko'zisendabo'ladi, bularningbariseninghayo-odobingniko'rsatadigannarsalar, hushyorbo'lasan”.*

*Qo'ni-qo'shnilar – keng-mo'lguldorko'ylakkiyganshaddod-shaddodxotinlarko'rpa-to'shakqaviganichiqishdi.*

*Qoqergakattakonpalossolindi. Qo'shnilar u yoq-buyoqdangaplashib, to'shakqaviredilar” [2, p. 78].*

*“The bridesmaids are here again,” he said. Now the answer to them was clear.*

*“If I want to sweep the streets in the morning, the time is different, but I agree to sweep for your daughter every day of the year,” said the groom's aunt, the fat woman.*

*So were their aunts.*

*“If we didn't give it to a family as polite and thoughtful as you, we would give it to someone,” said the mother. “You will be a better mother to my daughter, whom I have carefully raised under my eyebrows and above my eyelashes, and I know you and your descendants well.”*

*It was a sign that there was a deeper urge to give, but there was also an unmistakable urge to look at my daughter, whom we had raised with so many years of hard work, as your own child. The bread was broken, whitened. The men were given belts, the women with handkerchiefs, and bread and sugar. The bridesmaids said good-bye, their faces shining with joy and good-bye. “God willing, we are now relatives,” they said before leaving. “Whiteness has been given, now it's a fat wedding, girl,” said her aunt, pinching Rano's shoulder and kissing her.*

*“Daughter, when you go out, runs away if any of your relatives pass by,” said the mother. “If you go that way, don't walk down that street.”*

*If they talk, you don't talk, I'll see you, and if you can't escape, you look at the ground.*

*You will have the eyes of the people, all these things that show your modesty, you will be vigilant. ”*

*Neighbors - squeamish women in loose-fitting floral dresses - came out to make the beds.*

*A large carpet was placed on the bare ground. Neighbors were talking here and there, and the bed was crumbling”.*

It is not a change in the fate of the hero, but the revelation of it through the characters is the most basic feature of Isajon Sultan's style. After all, the writer does not polish the existing rules in the discussion, but seeks to keep them natural. This leads to how skillfully he has to use his language. In this film, the writer describes the rituals of Rano's wedding. The protagonist was able to skillfully weld the psyche of the image based on the demonstration of intellect. In the background, the story unfolds in a more vivid way. Consequently, destiny was giving happiness to a girl named Rano. Living happily with this happiness makes the girl's dreams even more abundant. But he had no idea what life would be like after marriage. This is also a testament to the writer's aggressive style.

### CONCLUSION

The conclusion is that he sought to reinterpret the discipline of art not only in the story but also in the novels. In particular, the novel “Ozod” reveals the inner secrets of the human will in the story “Onaizorim” - the national language and spiritual closeness. The images of Rano and Dilorom, Bibi Salima, and Ona (mother) are complementary characters.

There is a certain connection between the character in the story and the character in the story. There are different ways and means of creating a character. Each writer is defined as an individual, possessing a new image style. However, this laborious process does not always bring good luck to the writer. Characters similar to each other undermine the poetic integrity of the work. Therefore, it is important to carefully study the many theories of character creation from a global perspective. It is better not to deviate from tradition in the illumination of national identity, in the depiction of the psyche of sincere people. A national character is created on the border of tradition and non-tradition. After all, the writer was formed in the midst of this complex creative process. Eternal themes such as the color of the valley, kindness and forgiveness in human nature, cruelty and love are an integral part of renewed artistic thinking.

### ABSTRACT

*This article provides information about agro technology of fertile cultivation of Rovot, Productive varieties of beans, which are grown as a secondary crop in the typical gray soils of Tashkent region. In the experiment, local white beans, Rovot, Makhsuldor varieties are grown. Irrigation is carried out in the order of soil moisture 70-70-60%, 65-65-60% relative to limited field moisture capacity. In the foothills and irrigated areas, groundwater is saturated mainly by surface water. The water resources of rivers and groundwater are interconnected. Excessive use of groundwater will reduce river flow.*

**KEYWORDS:** *Typical Gray Soil, Fertigation, Black Polyethylene Film, Rovot, Productive Bean Varieties*

### INTRODUCTION

**Relevance and necessity of the topic** The world's oceans, groundwater, glaciers, soil moisture, river water, atmospheric vapors, and the hydrosphere, according to some estimates, have 145,4327.2 thousand km of stable water resources. Theoretically, water resources are inexhaustible, because when these resources are used wisely, water resources are constantly renewed. However, in many countries, the problem of water scarcity arose in the late 20th century due to the increasing use of water resources for agricultural, industrial, communal and other purposes, as well as the pollution of water sources by discharging wastewater into rivers and lakes. In the foothills and irrigated areas, groundwater is saturated mainly by surface water.

The water resources of rivers and groundwater are interconnected. Excessive use of groundwater will reduce river flow. In the irrigated agricultural regions of Central Asia, the annual water resources are 114 km, including 74.7 km in the Amudarya (along with Zarafshan and Kashkadarya), 39 km in the Syrdarya, and 2.4 km in the Tajan and Murgab. Although water resources are geographically unevenly formed in the mountains, they are used by a wide range of irrigation canals, mainly in the plains.

**The main purpose of the study.** In the conditions of typical irrigated gray soils of Tashkent region, beans are irrigated by simple tillage and black polyethylene film between the rows, fertilization of organic fertilizers in different norms and proportions, ie dissolved in water. To study the effect of application on plant growth and productivity.

**The main objectives of the study:**

- Improving the elements of irrigation technology by applying mulching between rows of beans with black polyethylene film;
- To determine the effectiveness of the application of organic fertilizers in water, ie fertilization, using a simple furrow and irrigation with a black polyethylene film between the rows;
- Mulching of beans between rows with black polyethylene film to obtain a fertile layer of soil and prevent the leaching of nutrients;
- Improving the efficiency of irrigation by mulching between rows of beans with black polyethylene film;
- Achieving to saving of water and resource by mulching between rows of beans with black polyethylene film;
- Achieving a rich and high yield.

**The object** of the study was the second crop of beans "Rovot", "Mahsuldor".

Field experiments will be conducted in 2021 on the Small Experimental Farm of TashDAU. The mechanical composition of the soil of the experimental field is heavy sand, typical gray, groundwater is located 15 m below, and is irrigated from the old. The experiment is performed in the following system

Before plowing, the norm of local fertilizers is 5-10 tons per hectare. Irrigation is carried out by flexible pipes instead of ditches, with black polyethylene film between the rows. In the experiment, local white beans, Rovot, Makhsuldor varieties are grown. Irrigation is carried out in the order of soil moisture 70-70-60%, 65-65-60% relative to limited field moisture capacity. The experiment consists of 5 variants, each delyanka area is 280 m<sup>2</sup>, placed in three rows, one tier.

Beans are a widely grown crop. Yields decrease when planted in bulk. Row spacing can vary from 50 to 70 cm. 300-400 thousand bushes per hectare provide high yields.

On irrigated lands in Uzbekistan, beans are grown mainly in rows with a spacing of 60 cm. Beans are also planted at 45.70 row spacing. In the experiments conducted at Samarkand Institute of Agriculture, the average yield of beans when planted in the scheme 60x15x6 was 20.9 s / ha, when planted between rows 45x15x6, the grain yield decreased by 18.6 - 17.3 s / ha.

Numerous experiments show that in the conditions of beans in Uzbekistan the yield is highest when the sowing rate of 60 cm between rows is 70-75 kg / ha. Reducing the sowing rate by 70 kg or 120 kg per hectare led to a decrease in grain yield.

The convenience of sowing between rows is 60 cm. The main crop in the Republic is cotton, which is often planted at 60 cm between rows. Therefore, the techniques used in the cultivation of cotton can be easily used in the cultivation of beans.

Bean seeds are sown to a depth of 4-5 cm. If the mechanical composition of the soil is sand, the planting depth is increased by 6-8 cm. Throwing seeds too deep will reduce field germination and cause many seeds to rot. Sowing is carried out on seeders SPCH-6, SPCH-8A, SST-12A. When using beet seeder SST-12A, an additional section STYA-31000 is installed. STVX-4 or SON-2,8 vegetable seeders can also be used for sowing seeds.

## CONCLUSION

For the cultivation of ecologically clean products from water-scarce, arid and eroded, prone to irrigated areas of the country, using organic fertilizers and water-saving technologies, high-yield agro-technology of "Rovot", "Productive" bean varieties will be developed. As a result of scientific research, the positive effects of legumes on the agrochemical and agrophysical properties of soil due to biological nitrogen and organic matter left in the soil are studied.

### ABSTRACT

*This article presents the results of research- fertilization by laying a black polyethylene film between the rows of cotton and field experiments on irrigation technologies conducted in the conditions of typical gray soils of Tashkent region. In order to save water in the irrigation of cotton and other crops, mulching between rows with black polyethylene film and straw and the introduction of irrigation technology using flexible artificial pipes is highly effective. The plant thrives only when the soil moisture is moderate. This can be achieved by improving irrigation techniques and technologies. In field experiments, the timing and rate of cotton irrigation were determined by soil moisture. It was found that the seasonal water norm saved an average of 1,095 m<sup>3</sup> or 27.3% of irrigation water per hectare in the variants irrigated between rows with black polyethylene film compared to the options irrigated by conventional irrigation.*

**KEYWORDS:** *Typical Gray Soils, Cotton, Navruz Variety, Feeding, Irrigation Regimes.*

## INTRODUCTION

**Relevance of the topic.** Creation and maintenance of fast-ripening, high-yielding and high-fiber cotton varieties, resistant to various stressors in the development and widespread introduction of optimal agrotechnologies for the further development of cotton growing.

One of the important measures in the system of agro-technologies of cotton cultivation is irrigation and feeding with mineral fertilizers and tillage. Saving available resources through minimal tillage of the soil, the source of mineral fertilizers and irrigation water resources is scarce today and their rational use is becoming a requirement of the times.

When cotton is fed with mineral fertilizers from the growing season, part of the fertilizer is blown into the air, part is washed away by sewage, and the efficiency of assimilation by the plant is very low. In world agricultural practice, the use of mineral fertilizers in water methods is widely used in crop nutrition, which is considered effective. In recent years in our country there is a problem of water shortage in the irrigation of agricultural crops, in particular, cotton and cottonseed.

At present, when there is a shortage of available water resources, it is advisable to reduce the wasteful use of irrigation water as much as possible when calculating the seasonal water norm in cotton. This can be achieved through the direct application of water and resource-saving technologies and their further improvement.

In order to save water in the irrigation of cotton and other crops, mulching between rows with black polyethylene film and straw and the introduction of irrigation technology using flexible artificial pipes is highly effective. When cotton is mulched between rows, the physical evaporation of soil moisture is reduced, soil washing is prevented, and when water is distributed to the field through flexible artificial pipes, water wastage is eliminated through ditches.

Mulching between rows can achieve two most important efficiencies: it saves irrigation water and increases the yield of crops grown between rows. Improving the elements of irrigation technology through cotton sowing, mulching between rows using local mulch materials is one of the ways to save water and protect the soil.

**The main purpose of the study.** To study the effect of application of mineral fertilizers in different norms and proportions, ie on plant growth and development and cotton yield, along with irrigation of cotton under typical gray soils through a simple furrow and between rows with black polyethylene film.

**Research results.** Field experiments were conducted in 2015-2017 on the area of 1.1 ha on the №86 contour at the Akkavak experimental site of Institute of Cotton Breeding, Seed Production and Cultivation Agrotechnology. The mechanical composition of the soil of the experimental field is heavy sand, typical gray, the groundwater is located 15 m below, and it has been irrigated for a long time. The experiment was conducted in the following system. In the experiment, a promising medium-fiber cotton variety "Navruz" was planted. Irrigation was carried out in the order of 70-70-60% relative to the soil moisture limited field moisture capacity. The experiment consisted of 9 options, each delyanka area was 240 m<sup>2</sup>, placed in three tiers, one tier. All observational measurements and analyzes in the research were carried out on the basis of the methodical manual "Methods of field experiments with cottonseeds in the conditions of cultivation" adopted by Institute of Cotton Breeding, Seed Production and Cultivation

Agrotechnology (Former UzPITI), agro-technical measures were carried out in the order adopted by the farm.

On April 25, 2017, cotton was sown in the experimental field at the rate of 60 kg per hectare of hairy seeds of medium-fiber Navruz variety. Germination of seedlings averaged 8–12 days after sowing. During the season with mineral fertilizers were fed in accordance with the experimental system at a rate of 240 kg of nitrogen, 175 kg of phosphorus and 100 kg / ha of potassium. Depending on the weed experimental options, 3 manual mowings and 2 weeding were performed. In 2017, 20% of ENTO Suchio chemical treatment against aphids and thrips was used at 300 g / ha, Omayd against spider mite at 100 g / ha and sulfur powder during weeding and flowering.

Irrigation in the experimental field was carried out in accordance with the experimental system on the basis of the work program, pre-irrigation soil moisture in the order of 70-70-60% relative to the limited field moisture capacity. At the same time during the season in all variants of the experiment watered 6 times.

Intercropping of cotton was carried out only in the variants irrigated by simple sowing, and this was 4 times during the growing season. Mulching of black polyethylene film between the rows was carried out during the cotton weeding (26.06). The cotton was spun twice by hand and defoliated once in September. The cotton crop was harvested by hand in two harvests.

Today, when there is a shortage of water, the role of irrigation in the production of high and high quality crops from cotton and other agricultural crops is invaluable. Delayed and poor quality irrigation in the care of agricultural crops not only reduces yields, but also has a negative impact on crop quality.

The plant thrives only when the soil moisture is moderate. This can be achieved by improving irrigation techniques and technologies. In field experiments, the timing and rate of cotton irrigation were determined by soil moisture. Prior to each irrigation, soil samples were taken from every 0–10 cm layer to a depth of 0–100 cm and determined using the thermostat weighing method. Water consumption for each irrigation was measured using a 900-degree Thomson water meter. During the application period, pre-irrigation soil moisture in all irrigation methods of cotton was carried out in the order of 70-70-60% relative to limited field moisture capacity.

According to the results, the typical gray soils of Tashkent region were irrigated 6 times at the rate of 602-980 m<sup>3</sup> per hectare during the period of validity in 1,2,4,5 and 7,8 variants irrigated by ordinary furrow, the average seasonal water norm was 4075 m<sup>3</sup> per hectare. In variants 3,6 and 9, irrigated with black polyethylene film between rows, it was observed that cotton was irrigated 6 times at an average rate of 500-590 m<sup>3</sup> per hectare during growth and the seasonal water norm was 2980 m<sup>3</sup> per hectare on average.

The calculated layer of soil moisture before irrigation was calculated as 70-100-70 cm in accordance with the phases of growth and development of cotton in options 1,2,4,5, and 7,8, while in options 3,6 and 9 the calculated layer was calculated as 50-50- Formed a layer of 50 cm. In the variants mulched with black polyethylene film between the rows, irrigation was carried out less frequently. It was found that the seasonal water norm saved an average of 1,095 m<sup>3</sup> or 27.3% of irrigation water per hectare in the variants irrigated between rows with black polyethylene film compared to the options irrigated by conventional irrigation.

## CONCLUSIONS

At the beginning of the cotton growing season, the average content of humus in the 0-30 cm driving layer of the soil is 0.146%, total nitrogen and phosphorus content is 0.047-0.128% and nitrate content is 0.84 mg / kg, mobile forms of phosphorus and potassium average 20.3-312 mg / kg. In the 30-50 cm layer, these values are proportional to the average humus content of 0.108.3%, total nitrogen and phosphorus content of 0.031-0.087% and nitrate content of 0.51 mg / kg, mobile forms of phosphorus and potassium averaged 17.4-288. mg / kg. It can be concluded that humus and nitrate are low in mobile phosphorus and medium in mobile potassium.

In the 1,2,4,5 and 7,8 variants irrigated by the normal field, the norm was 595-1010 m<sup>3</sup> per hectare 6 times during the period of operation, the average seasonal water norm was 4200 m<sup>3</sup> per hectare. In variants 3,6 and 9, irrigated with black polyethylene film between rows, it was observed that cotton was irrigated 6 times at an average rate of 450-750 m<sup>3</sup> per hectare during growth and the seasonal water norm was 3300 m<sup>3</sup> per hectare on average.

**INTRODUCTION**

The agriculture of Uzbekistan has been tasked with significantly expanding the area under orchards and vineyards. Agriculture produces basic food products as well as raw materials for food and other industries. The main task of the agro-industrial complex is to improve the quality of products, eliminate its losses at all stages of production, transportation and storage.

Since 2014, the area allotted for gardens has been expanding in Uzbekistan, intensive gardens have been created on an area of 5.6 thousand hectares. Gardens on an area of 4.1 thousand hectares and vineyards on an area of 6 thousand hectares were reconstructed. 410 hectares were developed for greenhouses.

In recent years, despite the lack of water supply, thanks to the efforts and labor of our farmers, a good harvest has been obtained and harvested. In particular, for 9 months this year, 6.7 million tons of vegetables (111% compared to 2013), 1.9 million tons of potatoes (111%), 1.2 million tons of melons and gourds (109 %), 1.7 million tons of fruits (115%) and 991.6 thousand tons of grapes (109%).

Gardening in the structure of agriculture in our Republic is traditionally considered one of the main and profitable areas. The fruits grown here are known in the world and are of good quality and high taste.

One of the most important tasks for improving the quality and quantity of fruits facing gardeners is to reduce losses from harmful organisms, in particular from the development of various plant diseases, the causative agents of which can be fungal, bacterial, viral, phytoplasmic organisms and nematodes.

Favorable climatic conditions of Uzbekistan for the development of plants are also favorable for the preservation and development of pathogens of various diseases. As a result of the disease (scab of apple and pear trees, powdery mildew, moniliosis stone and pome rocks, leaf rolling, klyasterosporioz apricot, grape powdery mildew, anthracnose, etc.) each year occur in our gardens. Therefore, in the absence of protective measures, we lose a significant part of the potential yield.

The main emphasis in solving these problems is given to chemical plant protection, on the one hand, this method is the most effective and easy to use, but it carries many negative aspects. First, the constant use of the chemical method, including non-selective drugs, leads to environmental pollution, toxic effects on other living organisms, including humans.

Preventive and agrotechnical measures carried out correctly and on time against plant diseases have a positive effect on reducing the population of pathogens, however, with a massive and strong development of diseases, they are not enough. In this connection, expanding the range of fungicides approved for use in Uzbekistan and their effective use is an important task in horticulture.

One of the most widespread and harmful disease in pome fruit crops in orchards Uzbekistan is n yatnistost apple leaves or F illostiktoz fruit crops .

Fillostiktoz fruit crops - a disease which is caused by imperfect fungi of the genus *Phyllosticta* . They form mottles characteristic of certain types of fungi.

On the apple tree, the most often isolated - *Phyllosticta mali* Pr . et Del . , *Phyllosticta briardi* Sacc . On pear and apple - *Phyllosticta pirina* Sacc . On quince - *Phyllosticta cedoniae* Sacc . \_ \_ \_ \_

The infection is widespread, but it manifests itself periodically, mainly in foci.

Defeat the first symptoms of phyllostictosis often appear in late May - early June. By the middle of summer, a strong progression of the disease is noticeable. Pathogens affect mainly the leaves of the apple tree, less often quince and pear. On the leaf blades, the formation of necrotic, in most round, brownish spots is observed. In some cases, lesions appear on the fruits of the apple tree in the form of medium-sized brown, slightly deepened dry specks, with a diameter of 5 mm to 8 mm.

The causative agents of the infection are fungi of the genus *Phyllosticta*, in some cases forming the teleomorphic (marsupial) stage - *Mycosphaerella spp.* Most often, *Phyllosticta mali* Pr. et Del. ;

*Phyllosticta briardi* Sacc. ; *Phyllosticta pirina* Sacc. ; *Phyllosticta cydoniae* Sacc. . . . .

*Phyllosticta mali* Pr. et Del. - affects the leaves of the apple tree, forms small rounded spots, at first brownish, later gray with a dark brown border. *Phyllosticta briardi* Sacc. - affects the leaves of the apple tree, forms light yellow rounded or somewhat angular spots, without a border, up to 5 mm in diameter. *Phyllosticta pirina* Sacc. - affects pear leaves, is less often noted on an apple tree, forms round or irregular spots, merging with each other. A characteristic symptom of the disease is the formation of black pycnidia with colorless unicellular pycnosporos on the spots, differing in shape and size depending on the type of fungus. *Phyllosticta mali* Pr. et Del. - ovoid or oval pycnosporos. Disease-causing pathogens overwinter in the form of pycnidia on fallen leaves. Sometimes they form perithecia, in which bags with ascospores are formed (teleomorphic stage). Often the disease develops against the background of necrotic lesions caused by various reasons, including improper use of pesticides, necrotic spots of the causative agent of black cancer (apple tree), and others. . . . .

Warm, rainy weather contributes to the development of infection. In conditions of high humidity, pycnidia swell and release pycnosporos, which leave the place of maturation with a mucous mass of a ribbon-like, wriggling shape. Some pycnosporos are carried by wind, rain and insects, fall on leaves, germinate and form new areas of infection.

Fungicides registered in Uzbekistan against diseases of fruit crops occupy an important place in agricultural practice, however, it is of great importance that the country has a sufficiently wide range of highly effective and modern fungicides with different active ingredients, so that agricultural workers have the opportunity to provide the population with high-quality fruits and vegetables.

Fungicide Hebenepl 40% SK. experienced in the areas, planted apple varieties in Zheromin, Red Chief, Red Dilishes in farmer's ozyaystvAndijan and Ferghana regions. The zone is located in a mountainous farming area. The gardens were laid out 10 years ago.

The treatments were carried out using a motorized knapsack sprayer with a calculated flow rate of the working fluid of 1000 l / ha. The experiments were laid in the morning hours, from 8 to 10 o'clock, when the air temperature did not exceed 26 ° C and the wind speed was 1 m / s.

To account for the intensity of disease - scab applied scale Anpilogova (Giants et al., 1980), where the calculated percentage of diseased leaves (rating 0 - lesion otsutviem; 1 point - struck to 1/5 the entire area or plants to 10% of the surface sheet 2 - affected up to 1/3 of the plant area or up to 25% of the leaf; 3 - affected up to 2/3 of the plant surface or up to 50% of the leaf surface; 4 - more than 2/3 of the plant or more than 50% of the leaf surface are affected), for moniliosis - 100 fruits for each point of 4-point scales according to the formula:

$$R = \sum (AB_1 + AB_2 + AB_3 + AB_4) / K$$

Where, R is the intensity of the disease,

A is the number of plants; B<sub>1</sub>; B<sub>2</sub>; B<sub>3</sub>; B<sub>4</sub> - points from 1 to 4.

$\sum (AB)$  - the sum of the products of the number of plants by the corresponding score

K - the highest score of the scale of accounting for the intensity of the lesion

The report shows the average values of the data for 10 trees

To calculate the biological effectiveness Hebenepl 40% SK . the treatment against leaf spot was carried out starting from the appearance of spots on the leaves (Khasanov et al., 2010).

Testing of the drug, conducting accounting and processing of digital material was carried out in accordance with the "Methodological instructions ..." of the State Chemical Commission of the Republic of Uzbekistan (2004). To determine the infection of oidium leaves and shoots, the scale recommended for taking into account the development of oidium on vine leaves was used according to A.E. Chumakov , I.I.Minkevich , T.I. Zakharova , 1973 (Zakharenko, Chenkin , 1985).

$$C = \frac{R_k - R_o}{P_k} \times 100$$

where: C - biological efficiency,%;  $P_k$  - indicator of the development of the disease under control;  $R_o$  is an indicator of the development of the disease in the experimental site (in the experiment), in terms of 15, 30 or 45 days, point.
