### ABSTRACT

*This article discusses the concept and essence of service activities. The activities of small businesses in the service sector were analyzed. Innovative forms of small business organization in the service sector have been studied.*

**KEYWORDS:** *Service, Small Business, Innovation, Franchising, Market Economy*

### INTRODUCTION

The colossal effect of using small business as a market instrument abroad has been noted for a long time. The phenomenon of its influence on the political, economic, social and technological development of the country and the ability to stabilize the processes taking place in these areas is receiving close attention.

Small business mitigates the consequences of structural changes in the economy, quickly adapts to changing market requirements, makes a significant contribution to regional development, and has the ability to generate and use technical and organizational innovations. Organically linked with big business, it is the basis for the country's sustainable development and increasing the competitiveness of its economy. Small business plays a special role in the development of the service sector, which serves as a kind of indicator for assessing the level of economic development of any country.

The relevance of the chosen topic does not raise doubts, since at the present stage one of the main trends in the development of the economy is advanced development of the service sector, which predetermines the constant search for its quantitative growth and qualitative improvement. An important role in solving these problems is assigned to small business, which, by its very nature, is able to flexibly respond to the needs and demands of the service market, better and

sooner saturate it with high quality services. In this regard, it is becoming increasingly important to create a small business management system in this area, as an objective necessity for the country's further movement along the path of economic and social progress.

Service activity is a type of activity aimed at meeting the needs of people through the provision of individual services. Service activities are carried out by individual entrepreneurs and service organizations. The result of their labor is service. A service is a product of labor, the purpose of which is to meet the specific needs of people.

The service is the result of direct interaction between the contractor and the consumer (customer), as well as the contractor's own activities to satisfy the needs of a person. A service is an activity aimed at satisfying the needs and requirements of people.

This activity can be embodied in products (material services) or exist as a useful effect of labor consumed in the labor process itself (non-material services). For example, the service of a tailor is that he sews a suit. The transformation of the material into a suit is the tailor's service. The tailor's activity is embodied in a suit (material service).

An important feature of a service is a useful action for the consumer, and this action can be provided by both living labor (intangible service) and labor embodied in a tangible product. This is the fundamental purpose of services, their social function - direct service to the population, creating comfortable living conditions: in transport, in public places, during rest.

The useful effect of a service is a set of useful properties of a service, directly aimed at satisfying a particular human need.

A consumer of a service is a citizen who receives, orders or intends to receive or order services for personal needs.

Service provider - an enterprise, organization or entrepreneur providing a service to a consumer.

The result of the service is the restoration (change, preservation) of the consumer properties of the goods, the creation of a new product by order, the movement, the creation of conditions for consumption, the provision or maintenance of health, the spiritual or physical development of the personality, the improvement of professional skills.

In serviceology, there are concepts of ideal and real services. An ideal service is an abstract, theoretical model of a particular type of service activity. It includes the rules for serving the population, quality standards, technology for the provision of services.

A real service is a specific material action aimed at meeting the needs of the consumer. These services are individualized for performers, consumers, specific conditions for their provision.

Service organizations provide material and socio-cultural services. Material services are services that satisfy the material needs of people. Material services provide the restoration (change, preservation) of consumer properties of products or the manufacture of new products according to the orders of consumers, as well as the movement of goods and people, the creation of conditions for consumption. In particular, material services include household services (services for the repair and maintenance of products, buildings and structures, photography services, hairdressing services), housing and communal services, catering services, transport services, agricultural services, and so on.

Social and cultural services are services that satisfy the spiritual, intellectual needs of people and support their normal life. Social and cultural services ensure the maintenance and restoration of health, the spiritual and physical development of the individual, and the improvement of professional skills. Social and cultural services include medical services, cultural services, tourism and education.

The result of material services is the work or product performed. The result of social and cultural services (services proper) has no material form (the result of tourist or excursion services).

Material and socio-cultural services are complementary. Often the purchase of goods is accompanied by the consumption of services (for example, after-sales services), and the consumption of services is accompanied by the purchase of related goods. For example, when consuming public catering services, a consumer receives a product - food products, a place of consumption of food products, a service for serving food and drinks, and psychological relief.

Services are provided to consumers in the process of servicing. The provision of a service is the activity of the service provider necessary to ensure the performance of the service. The provision of the service is divided into separate stages: provision of the necessary resources, the technological process of execution, control and evaluation, the process of service. Services are inseparable from consumers and performers.

The service life cycle is divided into several stages:

- 1) Provision of information on services offered to consumers;
- 2) Acceptance of an order for a service;
- 3) Performance of the service;
- 4) Quality control of the performance of the service;
- 5) Issue of the order to the consumer.

The interaction between the consumer and the service provider takes place in the process of service. The nature of the interaction depends on the form of service provision and can be direct (face-to-face) and mediated (correspondence). With direct interaction, there is a direct contact between the contractor and the consumer, and with indirect interaction, the contact can be carried out through intermediaries or auxiliary personnel of the service provider.

Service is the activity of the service provider in direct contact with the consumer. The service process is provided by means of production and personnel of the service organization. The service includes the analysis of the consumer's order, the development of projects for the provision of services (technical specifications and the process of rendering services), the search for compromise solutions in the conditions of the multivariance of methods of providing services, the establishment and provision of the required quality of the service, coordination, registration and delivery of services to the consumer.

The efficiency of the service enterprise depends on the correct organizational and management activities of the managers.

Organizational and managerial work includes:

- planning the service activities of the organization, forecasting the development of the organization when the market or the range of services changes;
- Assessment of production and non-production costs;
- optimization of the composition of technological equipment and technical means, taking into account the range and level of quality of services;
- organization of the contact area for communication with the consumer of the service;
- selection of employees with psychological abilities to work with consumers.

Thus, the service activity is a complex multifaceted process, which is ensured by the competent management of the personnel and resources of the enterprise, the observance of the requirements of service standards, and the correspondence of the services provided to the requests of consumers.

### ABSTRACT

*The government's encouragement to support business activities in Uzbekistan is analyzed in this article. The aim of the article is to investigate the objective reasons for the role of the government in promoting business affairs and examine the conditions created by the state and socio-economic directions of the business in the context of ongoing reforms. Additionally, the writer emphasizes the contribution of enterprises that are embarking on new innovations, due to which export capacities can be increased. In a state of market economy, Uzbekistan has paid great attention to establishing entrepreneurial activities. In turn, this has required the foundation and improvement of property relations, which are considered as the legitimacy of market relations and entrepreneurial activities. Indeed, entrepreneurship is thought to be the driving force of every society's economy. Moreover, small business and entrepreneurship is the most flexible area in technology and management plans which helps adapt to minimum losses and respond to changes in market relations.*

### INTRODUCTION

Business holds an important role in each and every society. Therefore, supporting business affairs is one of the crucial activities of the government. As business affairs are the main income stream of all members of the community because of which every country encourage entrepreneurship consistently. Promoting businesses motivates entrepreneurs, the reason is that feeling the sense of trust towards the government, their business with the deep proprietary responsibility. Thus, some research is required in promoting entrepreneurship by the

government. The core of this study is to scientifically investigate the social indicators of governmental support for entrepreneurship in Uzbekistan.

Social indicators of the support for the entrepreneurship is characterized with host of objective reasons. Firstly, the fact that it has been less investigated in Uzbekistan, in the sphere of sociology, makes business activities more extensive for analysis. Secondly, the outcomes of investigations can be the practical and analytical base of state support for business activities in Uzbekistan. Thirdly, in the field of study, conducting research of governmental encouragement and examining the essence, makes it possible to designate the prospective directions of socio-economic processes in the course of ongoing reforms.

In a state of market economy, Uzbekistan has paid great attention to establishing entrepreneurial activities. In turn, this has required the foundation and improvement of property relations, which are considered as the legitimacy of market relations and entrepreneurial activities. Indeed, entrepreneurship is thought to be the driving force of every society's economy. Thus, depending on the capabilities, every country boosts entrepreneurial affairs. Private entrepreneurship is considered one of the key sectors of our economy and ensures the socio-economic stability, therefore, in the Republic of Uzbekistan, governmental encouragement for business affairs can be carried out in the following procedure:

Supporting at the expense of the state budget

Supporting at the expense of different associations and funds

Supporting at the expense of subsidy or giving facilities in the credit system

Supporting with providing with information

Provision in regional economic and social programs

Moreover, small business and entrepreneurship is the most flexible area in technology and management plans which helps adapt to minimum losses and respond to changes in market relations. Small businesses and private entrepreneurship help to active innovations, development of regions, development of scientific and technical space prevent socio-economic problems, reduction of unemployment, as well as bring additional income to the public and opposes to monopoly.

For this reason, in the context of market relations, special committees and councils have been set up for the development of entrepreneurial activities and government support. They are as follows:

Reform and investment coordination center under the President of Uzbekistan. Budget and economic committee of Supreme Assembly. Special agencies such as state committee for demopolization, support for entrepreneurship. To provide state support for entrepreneurial activities in developed countries, there are several programs and organizations. For example, in the USA, small businesses are developed by National Science Foundation, established in 1973, which carries out small innovative firms and researches. The firm that passed the competition takes 50,000\$ for preliminary investigations for a half year. Upon successful completion, it receives 500,000\$ subsidy. At the same time, it helps small and large enterprises work jointly, that assists to be subsidized by large companies.

In comparison with the USA, Japan strives to implement new scientific works, there the cost Arge is twice as high. A common feature of Japanese national policy is to create financial incentives for small firms that are at the stage of scientific technology researches.

To make inventions, France founded a national agency which covers nearly 35 % small firms' expenses and 50% of the cost of introducing and mastering new technologies.

Support for entrepreneurship in Uzbekistan has been implemented with taking national characteristics of the population of our country into account. To demonstrate, in 2018 alone, according to the programs such as "Every Family is an Entrepreneur" or «Youth is Our Future" our government allocated two trillion sums to implement more than 2600 business projects. State support for entrepreneurship has a positive impact on the economic development of each country. For this reason, each state implements governmental programs. The essence of these programs is to increase entrepreneurial activity at higher rates. In the Republic of Uzbekistan, the above mentioned programs, "Every Family is an Entrepreneur" and «Youth is Our Future" were created on the basis of world experience to support entrepreneurial activities. To develop business activities, along with abovementioned state programs, it is good to implement the following programs:

Developing tax and financial incentives for exporting organizations. This, in turn, ensures that the price of the product remains cheap and helps have regular customers. Businessmen need to have more date on information structure, market conditions, the sales of goods and services and foreign buyers. Because the larger the database, the more information the entrepreneur has about the size of the product and the time of sending and the cost. Only when the businessmen organize their activities in this way, can there be an increase in their work.

Providing credits to private businesses to increase the export potentials. Since capital is necessary to encourage business activities. If only the businessmen have enough fund, there will not be any disruption in their work.

Encouraging innovations and business activity. The peculiar feature of business is the creation of the basis of new ideas and inventions. Therefore, it differs with the fact that it does not need a huge amount of money.

It is necessary to provide entrepreneurs with regular training in the field of foreign economic activity. This is because the entrepreneur studies the supply and the demand of the external market and thus guarantees the future of the business.

Based on abovementioned programs, state support for entrepreneurial activities helps implement encouragement policy as well as allows to do the following:

Keeping high employment rates and by this to increase the social stability and welfare of the population. As a result of implemented reforms in our country, this ensures able-bodied population to be employed in this sector. Contributing to decrease the unemployment rate, provides social stability in society, because of which the income of population will increase

Supporting the production of new types of products for the needs of society through the financing innovative ideas. Promotion of innovative ideas plays an important role in business. This, on the one hand, is not costly for small businesses which are testing innovative ideas. On the other hand, small businesses have the opportunity to rapidly change production processes.

Stimulating the inevitable processes. Funding is an important factor in the development of entrepreneurship. Therefore, the entrepreneur focuses on financing the profitable part of his business based on his own interests. This, in turn, will facilitate the further development of the production potential.

Based on the experience of developed countries, in our country, constitutional basis of supporting entrepreneurial activities were created and the President's decisions and decrees can be a typical example of this. It includes the President's decree "Improving the system of the support and protection of entrepreneurial activities" and the president's decision «Organizing the implementation of business initiatives and projects “. In particular, in previous years, large-scale work was done in the field of developing entrepreneurial activities and strengthening legal guarantees of the protection of the legitimate interests of the entrepreneur. In the first quarter of 2019, 16.4 trillion sum- credit was allocated to implement the projects of entrepreneurs, as a result the number of new established entrepreneurial firms increased 2.3 times.

Moreover, it was observed in the world experience that private business is one of the crucial factors that decide economic growth in developed countries. For instance, the contribution of small and medium-sized businesses in the gross domestic product of EU member states is 67%, in Germany 65%, in the USA it accounts for 52%. In Japan 80 % of the employed population are engaged in small or private businesses while it accounts for 70% in the European Union. Private entrepreneurship is an important sector of the economy of Uzbekistan. Today there are more than 525,000 businesses and it can be a good instance. The following innovators show that the majority of manufacturing sectors falls on business sector in our countries. The share of entrepreneurial activity in the gross domestic product has reached 60%. 78% of the population work in this area and develop this sector. It also accounts for one third of country's industrial output and 90% of agricultural output. In many other regions it accounts for 70-90%.

Tax policy is also important in supporting the economy of our country. That is because we can see some benefits by reducing the tax burden of entrepreneur:

Firstly - it will be uncommon for an entrepreneur to hold income. This leads to high taxes paid by entrepreneurs.

Secondly- the entrepreneur starts his business with a new type of activity. For example, it provides new opportunities for entrepreneurs to engage in virtual activities in a new type of business that is needed for our country. The trend of emergence of modern markets, globalization of markets, the significance of the increasing prices, their costs and the rate of customers' need, the importance of the relations with consumers and the utilization of information affect to this form of entrepreneurship.

Thirdly- the entrepreneur creates new jobs. In this way, entrepreneurs help our country solve social problems like unemployment and so on.

Taking these factors into account, special attention was paid to the tax policy of our country with the help of our country's President's Shavkat Mirziyoyev the entrepreneurs received tax incentives and broadened their activity. The year 2019 has already been successful in this sphere. For example, the income tax on individuals doubled to the state budget. Additional

571,000 tax payers were identified at the beginning of the year. Also, the reduction of value added tax from 20% to 15% as of October 2019 is an opportunity for entrepreneurs.

To summarize, many opportunities have been provided to our entrepreneurs after Independence. That is because the ownership layer is the main driving force of the economy in the context of market relations. We can see it on the example of developed countries in the world. Therefore, the support of private entrepreneurship in the country increased to the level of state policy. The working population, the largest share of gross domestic product and the main part of investments are in this sector.

It is also important to organize entrepreneurship based on centuries-old national handicrafts in our country. Because they allow us to pass our national values to future generations. Important festivals or conferences are organized by the government. International Handicraft festival was held between 10 and 15th September of 2019 in Kokand, Fergana region. This can also indicate that craft-based entrepreneurship is supported and our national traditions are becoming widespread.

Based on the above, it is advisable to implement the following recommendations to improve further entrepreneurship support:

For the improvement of protection of intellectual property rights to support innovations in entrepreneurial activity. Because entrepreneur creates and implements innovations throughout his or her career and meets the financial and emotional needs of the members of society. For this reason, it is expedient to protect the intellectual rights of entrepreneurs.

Establishment of specialized organization for the legal and financial support of private entrepreneurship activity. It is advisable to establish financial, organizational and improved banking business advisory centers in our country.

Establishment and development of infrastructure to support private entrepreneurship. Material and technical support of an entrepreneurial activity contributes to its development and the strengthening of its faith in the future.

Development of a credit system for the development of private entrepreneurship. The business is directly related to the financial and credit system. It would be advisable to establish entrepreneurs' branches of the bank, because it helps the businessmen find the solutions to the problems that await them, while saving their excessive time.

Further simplifications of the registration system and taxation of private business, etc.

It is clear that in our country particular attention is paid to the organization and support of entrepreneurial activity. Because the more business people in our country, the better the economic welfare of the country along with the economic performance of the country. And this is one of the important factors that will help our country gain a foothold in the world community.

### ABSTRACT

*Each religion in its time made a sharp change in the thinking of people, turning the principle of the realization of the desire and happiness of living on the basis of divine blessings into a way of life. However, the role of the Islamic factor in the current situation, which has escalated the conflict of interests between the states and the regions, is significant.*

**KEYWORDS:** Religion, Humanism, Khoja Ahror Vali, Value, Spiritual Heritage.

### INTRODUCTION

Referring to this historical process, the president of the Republic of Uzbekistan Sh.M.Mirziyoev said at the 72nd session of the UN General Assembly “we consider it the most important task to convey the true humanitarian essence of Islam to the world community. We value our sacred religion as an expression of the incarnation of our age-old values. We strongly condemn those who put our holy religion in a row with violence and bloodshed, and we will never be able to reconcile with them. The religion of Islam encourages us to peace with kindness, to preserve the original human qualities. I would like to emphasize the invaluable contribution of many bright figures of the period of Central Asia to Islam and world civilization”, he said.

Today, thanks to the happiness of self-awareness, we have been eager to study the life, activities and creations of the great saints, who have grown up on the ground. Among such great leaders, Khoja Ahror Vali's services before humanity were also recognized. Khoja Ahror was a scholar who lived and worked in the time of the crown prince - Temurids, had his place in the development of the Eastern philosophical thought of the XV century, was a great representative, reformer and follower of the doctrine of naqshbandia, made a worthy contribution to the transformation of naqshbandia into a world doctrine.

One of the greatest services of Khoja Ahror Vali is his contribution to the transformation of the doctrine of naqshbandia into the world doctrine. It is impossible to imagine the socio-political, religious - scientific and ideological scenes of Movarounnahr and Khorasan in the XV century without the image of the first-class naqshbandi pir-Khoja Ubaydullah Ahror Vali. On the one hand, Khoja Ahror Vali was the leader of the sect – Khoja Bahouddin Naqshband's faithful caliph of that time, on the other hand, if he was a religious figure who fought for the stability of the hanafi sect with all his body. If it is permissible to interpret, in the ideological regions of the Timurids' principality it is the commandment of the coming into the world of an idea without judgment and permission. On the third hand, one of the great services of Khoja Ahror Vali – those who made a worthy contribution to the transformation of the doctrine of naqshbandia into a world doctrine.

On these services of the teacher, Alisher Navoi thought in the work “Nasayim – ul muhabbat”, glorifying the person not only in Movarounnahr, but also in Khorasan, Iraq, Azerbaijan, even Rum and Egypt, China and India as a great representative of the famous sheikh, orif, coach, teacher and mysticism teachings. In the game it is called: “Ҳазрат Хожаға онча мукнат даст бердики, маълум эмаски, машойихдин ҳеч кимга ул даст берибдур, ё йўқ. Мулкка ажаб исило ва салотин ва мулукка ғариб исрофу ҳукм, Мовароуннаҳр салотини ўзларин аларнинг муридзодалари ва маҳкуми ҳукми тугорлар эрди. Йўкки, ёлғиз Мовароуннаҳр салотини, балки Хуросон ва Ироқ ва Озарбайжон, ҳаттоки бир соридин Рум ва Мисрғача ва бир соридин Хито ва Ҳиндғача барча мулук ва салотин ўзларин Хожанинг маҳкуми ҳукми ва маъмури фармони тугорлар эрди ва руқбалари бу салотинга онча муассир эрдиким, аларнинг аҳкоми ўз худдомиға бўлмағай ва Ҳазрат Хожага зоҳир жамияти барча абнои замондин кўпрак воқеъ эрди”.

In every Egypt written by Alisher Navoi, there is a sense of world. This means that Khoja Ahror's services in spreading the world of the sect of pattern making are matter of study. Professor Alexander Knish in his book “Musulmanky misticism” separately notes the role of Khoja Ahror in the penetration of non-materialism in Iran and Turkey. In the north west of Iran, the pattern of knitting is slowly spreading in relation to Movarounnahr and Herat. In the city of Kazvin, located in the north west of Iran, the disciple of the sect was sheikh Ali Kurdiy, the disciple of Khoja Ahror Vali.

The teaching of knitting began to spread among the Western Turks a century after the death of the Great founder of the sect, naqshband. This pattern has been a very important step in the way that the banditry deviates from the Movarounnahr circle. In the kingdom of the Usmons, the naqshbandian sect was able to attract a large number of supporters among the Turkish population in the short term, which led to the loyalty of Islam to the direction of sunnism, consistent adherence to sharia traditions.

In Turkey, the first propagandist of the sufism methods of naqshbandia was Mullah Abdullah Ilohi Samovi (death 1490). He studied in the Khoja Ubaydullah Ahror in Samarkand. At the end of his education, Mullah Abdullahi Ilahi spread the sect in the city where he was born for several years, and then in the Istanbul. Zeyrek was one of the first in mosque and established the center of naqshbandiya and attracted many supporters of the sect. Nevertheless, Mullah Abdullah had the choice to live in the divine and preferred to devote himself to the religious sciences. The disciple of the divine Amir Ahmad Bukhari(v.1516). Since the time of the divine presence in Samarkand, Khoja sought to take Ahror lessons from Murshid.

Amir Ahmed Bukhari's movement laid the foundation for three centers of knitting and the ranks of the sect were filled with many scholars and writers. One of them was Mahmoud Lali Chulobi (death 1532y) from the city of Burs. The center, founded by Buhari, operated until the beginning of the twentieth century. Another disciple of Khoja Ahror in Turkey was grandfather Heydar Samarkand (death 1550y). Since he had the honor of Sultan Suleiman Kanuni, the Sultan gave the man a tekka in Ayyub. This center was destroyed by fire in 1912 year. The center was in its time a settlement where the Sufis from Central Asia settled. From those times, the names of tekkas "Bukhara", "Qashgar", "Uzbeks" were still preserved. Among the sufis from Central Asia, there was also a treasury. In India, the pattern of knitting began to spread from the XV century.

Khoja Ahror achieved a certain degree of reformation and especially socialization of the teaching of naqshbandiya, and in its composition also established its branch named "ahroriya". Through the mutasavvif and his followers, the doctrine of naqshbandia came out of the Movarounnahr territories and penetrated into the territories of Khorasan, the Caucasus, the North Caucasus, the Usmon Turks, India (along with present Pakistan). In particular, the connection of historical figures such as Jami, Navoi and Hussein Boyqaro to Khoja Ahror was a great event for the teaching of naqshbandi. In a short period of time, the teaching of naqshbandiya was studied separately in the studies of the Sufi scientist Jafar Holmominov, who as a result of the activities of Ahmad Sarhindiy, famous for the name of Khoja Ahror Vali and the bishop of the Indian naqshbandiy – Imam Rabbani, became a means of unification of representatives of different states and nationalities around a single ideology.

The spread of naqshbandi in India is associated with the name of Muhammad Zahiriddin Babur. Mirzo Babur calls the person "Mullo Bobo", hide the incomparable kindness in this word, which is said to be naive. In their memoirs, Mirzo Bobur writes about the fact that their father, Umarshayh Mirzo naqshbandiya, was the disciple of Khoja Ahror, the bishop of the sect, and they themselves recognized Khoja Ahror as a spiritual pir and received spiritual support from ul-zot.

Khoja Ahror's work "Anfosi Nafisa" is devoted to the statement of the issues that the people of the sect should follow. This treatise was also published in India along with the works of other thinkers. About the work "Risolai Validiya", the Afghan scientist Shafiq Bright wrote: "the theme of the prose work" Risolai Validiya "of Khoja Ahror consists in the purification of human appearance and botini and Abul Fazl Allomi considers it "the pearl of the sea of enlightenment". The author of the work "Masmuot" Mir Abdulavval came from Nishopur and for seven years they will be in the service of Khoja Ahror and will study the science of tariqat. Mir Abdulavval managed to promote the world doctrine in Nishopur(Iran)with the direct help of Khoja Ahror.

Another Services of Khoja Ahror Vali – that man is famous as a reformer of the doctrine of knitting. Until the XV century, the people of mysticism did not go with the statesmen, each other. It is worth to say that the guard of honor is a strategic turn in the pattern, closely connected with the idea of reconciliation with the statesmen, the way of reconciliation, the transition from conflict to conflict, the active participation of the sufi in society. The way of conflict with the kings, revealed by Khoja Ahror Vali, led to an increase in sectarianism and prestige, and created an opportunity for the rulers to have a positive influence, to control their statehood activities on the basis of the criterion of justice for the citizens.

This event gave a social tone to the activities of Khoja Ahror Vali, turned the sectarian into a great public figure. And the sect connected with society and secular life, becoming a great socio-political force. Such a look was a reform in the pattern. The event of disagreement with the kings came from the motto of naqshbandi "dialogue", Khoja Ahror Vali developed it and raised it to the level of active participation in socio-political life, participation in public affairs.

Above we have mentioned Khoja Ahror Vali as a continuation of the doctrine of knitting. It is in this place to recognize the great services of Khoja Abdulkhalik Ghijduvani in the history of sufism, who laid the foundation stone for the doctrine of khodjagon. By means of the sect of khodjagon, he generally coordinated the sect with the sunnah of the Prophet Muhammad, cleansing it from various heretics and superstitions. The observance of the sharia turned the abstinence from it into the main rule. Abdication world having rejected nook, made it obligatory to be with the church.

Allah has called on not to give up the world as love. The honesty of the bite is defined as the main desire of the sect that everyone should see the day with his own efforts. This sect does not approve of extremes as fear. The issue of morality has been firmly established. All this became important in the development of mysticism. Bahouddin Naqshband is famous for giving a ratio "Dil ba yoru dast ba kor!" Let your hand be at work with a heartfelt heart felt. It is also not surprising that the slogan as an idea was originally put forward by Abdulkhalik Ghijduvani. Khoja Bahouddin Naqshbandi, who was brought up from Abdulkhalik Ghijduvani spirit and founded the naqshbandiya sets band this slogan was adopted as the main rule of his sect (the story is that Naqshbandi himself grew up from the khodjagon sets and is referred to as khodjagon-naqshbandi, and Abdulkhalik Ghijduvani is considered his initiator (Sarhalkai silsila). The real-life conditions of khodjagon-naqshbandi, the fact that it is based on the existing capabilities of a person, indicate that it is a solid sect with a floor that meets the demand of all times and all strata. The fact that Abdulkhalik, who has been subjected to sharia and without superstitions and defects, has been recognized as an acceptable document for centuries and in all groups, and the reasons why the khodjagon-naqshbandi sect, which is widely spread in Turkestan, Iran, Afghanistan, India, Turkey, Iraq and even in North Africa, is now functioning in many countries of the world.

The services of the outstanding Abdulkhalik Ghijduvani and Khoja Ahror in front of our people are very friendly to our history, today the philosophical and social views of the outstanding, the advice of great importance in the integration of ideas that inspire kindness and spiritual perfection in the hearts and minds of the younger generation. At present, recognizing the services of our great ancestors and thinkers directly in respect of the doctrine of knitting in different parts of the continent as a progressive spiritual doctrine is a symbol of boundless respect for them.

**ABSTRACT**

*In this article, an analysis of the objects of cultural heritage in the Fergana Valley in 20-30 years of the XX century and the state of their preservation is given. In various sources in Namangan and Fergana regions, information about mosques and madrasahs in Turkistan, which were built by Muslims and functioning as scientific centers, was given.*

**KEYWORDS:** *Mosque, Madrasah, Tower, Caravan Palace, Culture, Cultural Heritage, Museum, Education, Sect.*

**INTRODUCTION**

It is known that in the appeal of the president of the Republic of Uzbekistan to the Oliy Majlis on December 29, 2020, it was noted that it is necessary to adopt a separate program to ensure the maintenance, preservation and protection of objects of cultural heritage[1]. Proceeding from this, it should be noted that today more than 8 thousand monuments of cultural heritage are registered in Uzbekistan.

It is known from history that during the Soviet period there was a misconception that every sample of local culture was accepted as backward and foreign. And in 1920-1930, politically incorrect slogans of the tribe of “national, socialist in content” and the decision “on the elimination of silence in architecture and construction” adopted in 1956 year were aimed at quickly putting artistic creativity and architecture into one common mold.

In its place it should be noted that the 20-th years of the twentieth century were a special stage in the study of the history of material culture of Uzbekistan. The committee on the preservation of monuments of art and nature, antiquity and museum works (Turkomstaris), which was established in 1921 under the people's education Commissariat of Turkistan, was of great

importance in this regard. In 1925 year, that is, after the conduct of the policy of national state borders, this organization was called Sredazkomstaris (on the territory of Central Asia), and it operated until 1928 year. Thanks to the efforts of this organization, a number of works have been carried out on preservation of material and cultural monuments of Central Asia, Study of their history and organization of museum Affairs.

It is important that not only Russian scientists, but also National intellectuals could actively work with them in the identification and restoration of historical-cultural monuments. Because they correctly understood that the historical past of the nation will reach the next generation through its material and spiritual monuments. Important work has been carried out to study the history and state of construction of historical monuments existing in the country by nationalists who are part of scientific expeditions organized by this organization. They published their observations in the form of articles of reporting quality. It is also necessary to emphasize the service of the national press in this regard. Because, they had become the pulpit of the intelligentsia, which protects the interests of the nation, which appeals to the people, who died for the development of society.

In particular, the magazine “education and teacher”, which is owned by the people's education commissariat, published in these years, gained a special place in the press of that period not only a number of articles devoted to the issues of public education, but also the development of Turkistan culture and spirituality. On the pages of this magazine are the most prominent national intelligentsia of that period M. Abdurashidkhanov, Sh. Rahimiy, Fitrat, M. Saidjonov, Chulpon, Botu, G. Zafari and other progressives raised in their articles the problems of preservation and protection of the history, material and cultural heritage of the nation as the actual issues of their time, the analysis of them from the point of view of today was considered one of the important tasks.

For example, the famous progression M. Saidjonov's scientific article “the city of Bukhara and its old buildings” covered ancient monuments in Bukhara, which mainly covered historical places in the city, buildings and structures of the era of Ark, Shahristan, Registan, Somoni and Ashtarakanids were studied. This article by M.Saidjonov provides valuable information on the topography of Bukhara in the Middle Ages, the study of the history of some monuments in the city.

In this regard, it is also necessary to emphasize the article “examination of historical works in Uzgen” belonging to the pen of another progressivist Shokirjon Rahimiy. This author refers not only to handcrafted works under the guise of historical monuments, but also architectural monuments. It reflected the issues of the state of material and spiritual heritage in the country and the need for study. This article was published in the journal “Education and teacher”, enriched with photos. In this work, which was written as a report, the historical-geographical location of Uzgen, which was the capital during the Karakhanid period, the structures built there, especially the tower of XI-XII centuries, which was erected until the Mongol invasion, small tombs around it (in the article they are called Tombs – M. M.), information on sources and documents on the history of Uzgen is given that they also have significant scientific value for today's researchers.

For example, in the 1925 issue of the magazine "education and teacher", the following information was given about the city of Uzgen and its architectural monuments: "it is known that

Uzgen was a great city in Central Asia, and even if it was known on the dates that Fergana was the center of muzofot, now this city is known as a village Uzgen is a village in the north of Osh, between Osh and Jalal-Abad, which is very important on the trade route with the Qashqar region of Turkistan and China. Even if you go by car 25 km from Khanabad railway station on the Jalalabad railway and 45 km from then on, the first road is difficult as it is through a few large passes through Karadarya, which is the head of Sirdarya, and the 2nd Road is through a pass called 33 steppe.

In Uzbekistan there are 25 neighborhoods and its people are considered to be 7-8 thousand. There is also a nation close to Uzbek, whose people are Uzbek and Kashgar, a little bit Turkish (this people came to these sides 600-700 hundred years ago from Turkmenistan in their own words, and then stayed, "banned" from their horses and became Turkish suckers). In the village there is a caravan with several shops-a girls school, 2 land school (Shuroi), a club, a school of literacy, 2 co-operative shop. The air is even higher than that, it is incredibly pure and pleasant.

The landscape of the city is beautiful, on one side of which is the Black Sea and the beautiful hills that burn it, and then the snowy mountains stretch. But, it is not known to many people that the people of ABOM, upon being unaware of the culture, are due to the fact that he himself is on the verge from the center[2].

The village is incredibly rich in historical things, the buildings that are in it now, the works of the building that are found all the time under the ground, the old scrape and the coins show that there was no doubt a cultural land before (about this book the famous tourist Nushiravon in his touristic book the Sheikh rubbed this book without giving it three days). In addition to historic buildings there is now a churchyard consisting of 3 tombs, which improved in one great tower. It is about this book that the famous traveler Nushiravon in his travelogue asks in the content "the sheikh did this book without giving it 3 days ago".

Here in the last 32 years 27 bath, many abrasions and other instruments have come out. The Uzbeks call these midges "Popok midge". They take a lot of bricks that come out from under the ground and use them to the building.

The most famous in the old works of Uzgen is the huge minaret, which is longer than 25 gas. This tower is not currently connected to a mosque or a honeycomb, but around it is empty, on one side is a large embankment. On the one hand, where there is a bazaar, he stands alone giving his chest to the chest. The appearance is incredibly repulsive and dignified.

Although it is not clear when this minaret was built, it is suspected that it was built 700-800 hundred years ago in the form of old minarets laid before the arrival of Isfahan and the Mongols in the Marv from Uzbek ornaments and structural oil.

The tower remained in its old form until last year, standing unchanged. It was taken 43 years ago and made of millet. From the picture, too, it is clearly known that the head side of the minaret was extinguished, the bottom was cut and some of the husbands were in a state of a kiss. But in the last year (1923), a man called the son of Obid Rasul, who disappeared with six months of effort from may (if only he had been left in his own way) remount the minor. The kissed husband under the minaret was fixed by a Russian brick. On top of the 8 dacha dome was built, but left incomplete.

Walking from the great minaret to the south, there is a madrasah laid out a hundred years earlier than that. The people of Uzgan call it “the tombs of the Sultan”. Three tombs (tomb-small tomb, Sagana – M.) adjacent to each other, the back of which is turned to the east on Earth, which is the Tomb of Hazrati Sultan. M) there is. The shrines extend from the south to the North.

One of the tombs is the Tomb of Sultan Ilig, the other is the monument memory of Sanjar bin Malikshah, the middle one is the pea. Inside all three of the tombs there is also a tomb, similar to each other. But, to some extent, there are no gravestones. Now, when it comes to tombs, the northern and the southern tombs are very decorated with ornaments and patterns, and the middle is then placed in the middle, keeping both buildings (tombs) intact. The decoration of the building is artistically designed to amaze the mind, and the art that is in it makes the person interested for hours. The professor comrade who was next to us said that this art was not there except from the Tomb of the famous Ismail Somoni, who was on the side of Bukhara alone in the whole East.

The entire structure of the building consists of silt, earthenware and stones, and even if the structure was several hundred years old, the tops were completely demolished and demolished. But the patterns, on which the side is still solid, are an elegant form and a phrase from 1 lines, some of which are inscriptions in different forms, and some are made by observing the latest (fashionable) of the Eastern-style architect. The patterns and inscriptions on the surface of these buildings we divided into 14 parts and took samples from each of them. (That is, in order to check how beautiful the buildings are, it is necessary to pay attention to the picture put on it). The slats used in these buildings are in different molds, the smallest of which is in a simple match box, the largest of which is made by 4 contributions to an ordinary Muslim brick. But, the size of the knitting stalks goes up to 4 meters with jam. I must also say that the patterns of the building are completely on the surface and on the side of the view, slightly decorated with a hollow. But the sides and the back are in a simple mold[3].

When it is mentioned about madrasahs at the end of the XIX – early XX centuries, it should be noted that they served as the first embodiment of Turkistan culture[4]. Madrasahs were secondary and higher educational institutions. In accordance with the conditions of his time in the madrasahs, various specialists of the field were trained, including mudarris, qozi, imam and mirzas, based on the needs of the people. During this period, young people who received education in madrasahs were educated together with religious and secular science, that is, as components of the unified science. According to the archival documents about Muslim institutions, in 1898 in the Turkistan region there were 452 mudarris and 7903 students in 348 madrasahs[5]. It can be concluded that no matter how much the Russian Empire resisted the opening of Muslim madrasahs for various reasons, their attempts did not yield in most cases.

However, such cases as the weakening and overthrow of the Tsar's power in the first quarter of the XX century, the transition of power into the hands of the Soviets, the overthrow of the national independence movement in the Fergana Valley have their negative impact on the development of madrasahs[4]. In particular, in the article titled “madrasa reform in Namangan” by the correspondent of the Turkistan newspaper, which operates under the pseudonym “Uzbek”, The views on the madrasah “Saidkulibek”, which is located next to the madrasah of Mulla Kirghiz in this city.

This article was written at the beginning of the 1920 years and is important in highlighting the policies of the Soviets in relation to Muslim madrasahs. When writing about the madrasah of

Saidkulibek, the author also gives information about the state of the psyche of other madrasahs of that time in the article. In accordance with his comments, madrasahs described him as having hardened his condition during this period as frozen rivers in the North, having become silent as cemeteries in terms of their spirituality, while recognizing that they were deprived of the rights necessary for them to function in accordance with the requirements of the times in the following centuries, they were left behind for various It also shows that madrasahs became a place where specialists, including engineers, doctors, scientists, etc., needed for their period, instead of growing up, surrounded their bodies with spiritlessness, the body grew weak poppies[4].

From author's views on this matter, it can be seen that the madrasahs were somewhat behind the social life as a result of the fact that initially the Tsar rulers, and then the Soviet authorities looked at the madrasahs of Muslim countries with a low point of view, tried to eliminate them as a furnace of superstition and declared the properties of the

In the information about mosques and madrasahs in Turkestan, which were built by Muslims in various sources and functioning as scientific and scientific centers, by the Soviet period they were converted to red soldiers as accommodation, horses as a stables[6], cultural places of recreation. For example, about himself "M.N." according to the information written by an unknown author who signed the contract, in 1925, the Kokaldash madrasah was rented to the leased cinema for thirty-three days with thirty-day fasting and a three-day committee on the condition that the Soviets left the equipment to the foundation[7]. The reason for this was the activity of the Soviets to form an atheistic worldview in the minds of people in relation to religion, Islam, and, consequently, all religions, as well as their view of our religious belief as an outdated idea, which is the basis of national education, as an old.

When writing about the madrasah of Saidkulibek, the author says that it was one of the oldest and richest madrasahs of Namangan. In the period after the October coup, the Taliban of the same madrasa became the head, and gathered the Taliban of the whole madrasa of Namangan into one association and supported the new government, providing many services. In those who have tried to attract other madrasahs to this work, too, many cannot achieve their goal, which causes resistance. At a later time, this Madrasah will come to life again, expressing confidence in the Soviet state and striving for the implementation of new reforms. The Taliban say Akromkhan Tara, who is in danger at Koson madrasah with the condition of introducing lessons in sciences and a number of other reforms to Madrasah, is in danger.

Observing such actions of the madrasa Taliban, the author observes their actions by drawing up new working plans, acknowledges that in 1917 the madrasa was also demanding the membership of some of their insiders in the legal courts, which caused the tragedies of young people, and that every effort of the eshons and the rich, who tried to return them, was also fruitless. Informing about the further activities of Madrasa, the author gives information about the fact that the Taliban recently held opening ceremony of the madrasa and began taking lessons with a six-day plan for the Week[4].

In place of the conclusion, the author addressed the taliban of madrasah and said that your initiative is to open the right way for our people to go out into the light in the future. But do not forget that the work of reform consists not only of taking lessons from two to three subjects per week. After that, you must continue in your own good work and enter into your program the various sciences that are necessary for our lives and completely cleanse the old superstitions

from the madrasahs and do not strive to find real educational nutrients for your soul, and also to immerse the foundation's work in ways that are useful in your own scientific and On this you need to set an example to others[4] – concludes his article with the comments.

In the sources, almost no other information on Saidkulibek madrasah in Namangan is encountered. Information about when, at what time, in what situation the madrasa was in crisis is unknown. Recognized as one of the oldest and richest madrasahs of Namangan during the initial period of the Soviet rule, this madrasah was destroyed by the order of the Soviets from 1930-1935 years.

### ABSTRACT

*In this case, the tax structures in Uzbekistan, tax rates, the principles of setting tax rates, the transfer of corporate income to insurance funds, the main percentage of the state budget, the obligations of taxpayers, the legal framework and the tax code 'information is given.*

**KEYWORDS:** *Tax Code, Proportional, Progressive And Regressive Rates, Fiscal Function, Social Function, Regulatory Function.*

---

### INTRODUCTION

The origin of the tax is closely related to the emergence of the state. After the Republic of Uzbekistan also achieved its state independence, many reforms were carried out in order to reform its national tax system. The establishment of the state tax office of the Republic of Uzbekistan in our country in 1994 has literally started a new era in the formation of the national tax system.

1995-2005 years coincided with the stage of rational maintenance of the tax system, in this process the basis of the tax legislation of the Republic was laid and its legal base was strengthened. In 1997, the law of the Republic of Uzbekistan “on the state tax service” was adopted in order to give legal status to the activities of the bodies of the state tax service, to establish its legal bases and to clearly formulate the rights and obligations of taxpayers. In accordance with this law, the most important state duty is assigned to the state tax authorities as taxes and mandatory payments fall into the budget in full and on time. Also, in 1997, the tax code of the Republic of Uzbekistan was adopted as the only legal basis in the system [14].

Even in the current period, the problem of funding the tasks that the state performs comes out of the necessity of the tax burden.

The tax object is legal evidence that stipulates the obligation of the taxpayer to pay taxes. In 1998, paragraph 392(2) of the tax code of the Republic of Uzbekistan; in contrast to Article 89 of

the tax code of the Republic of Uzbekistan, it is said that the tax is “paid by individuals with property at their disposal”[2.95].

According to the method of recovery, the right and the curve are divided into tax. The correct tax is introduced directly into the property and income and is paid by the taxpayer without intermediate intermediaries. Common types: value added tax, income tax, inheritance and gift tax, turnover tax, sales tax, export tax and other curved tax (excise) the tax that is intended to be included in the prices or tariffs of goods (services) and which is subsequently loaded on the consumers of the goods according to the characteristics of the state system, the tax system consists of taxes and fees

There is also a tax deduction. Tax benefits are divided into two depending on the nature and nature of benefits [3.14]:

- 1) Tax exemption from taxes;
- 2) Taxable income tax;

The tax deduction is divided into three categories, depending on what is indicated in the accountant's account:

- 1) Permanent benefits;
- 2) Temporary benefits;
- 3) targeted benefits;

The legal basis of the tax system in the Republic of Uzbekistan, the rights and obligations of its payers, the procedure of tax proceedings 1997 24 April accepted at and 1998 1 January the tax code of the Republic of Uzbekistan, which is entered into from the tax code of the Republic of Uzbekistan. The general tax introduced in the Republic of Uzbekistan is the income (profit) tax from legal entities; income tax from individuals; value added tax; excise tax; tax for the use of underground resources; ecological tax; tax for the use of water resources. The general tax is distributed annually between the relevant budgets according to the norms established by the legal procedure. Local taxes and levies - property tax; land tax; advertising tax, tax on the sale of motor vehicles, social infrastructure development tax, levies for the right to trade; levies and other local taxes and levies for landscaping work are transferred to the local budget.

The tax levied by the state is redistributed through the budgetary means, and the socially necessary public services to taxpayers, such as health care, education, science development, defense, protection of rights, are returned by indirect means.

With the help of tax, the corresponding part of the national income is distributed and redistributed. Taxes levied by the state, as well as forms and methods of their organization together constitute the tax system. In the national economy, taxes perform the following three important functions:

1. financing public expenditure (fiscal function);
2. mitigation of social tension (social function);
3. the task of regulating (regulating) the economy.

Although public expenditure is carried out on the account of tax revenues, the increase in the volume of public expenditure, in turn, dictates the growth of taxes and determines its level. In the current period, the growth of public spending, which is a general trend, and, accordingly, the volume of taxes, are dictated by the following factors.

- Population growth.
- Increased demand and urbanization for the quality of services of the social sphere.
- Pollution of the environment.
- Implementation of programs to reduce income inequality.
- Increase in the volume of costs of national defense, state security.
- Tax regulation of the activities of enterprises is carried out on the basis of the following general principles:
  - the obligation to collect taxes from all incomes, regardless of their source;
  - single general policy for all tax levies;
  - to provide a stimulating role of tax standards in productive enterprises and advanced forms of economic conduct;
  - Financial control over the obligation of all subjects on the tax fee.

The Association of enterprises, organizations and firms allocate 24% of their salaries to the pension fund, transfer 0,3% to the Employment Fund and 0,2% to the Social Insurance Fund.

Taxes accounted for about 90% of the state budget revenue. The collected taxes are spent on various sectors of the country in a manner and the money turnover in the country is consistently adjusted.

Taxes come first of all the social relations of the state, as well as the need to provide financial resources. The functions of the state in front of it are as follows:

- Social protection of low-income sections of the population (students, pensioners, invalids, etc.);
- ensuring the country's welfare;
- ensuring peaceful employment and free living protection of citizens of the country;
- Implementation of continuous social, cultural activities (education, health, culture, Social Security, etc.) within the country;

The tax rate plays a major role in the calculation of taxes. Tax rates are divided into the following types: proportional, progressive and regressive rates[4.65].

Proportional rate – is determined by the object of taxation in a single percentage. For example, in the property tax, a single tax rate is imposed on the value of fixed assets.

The progressive rate – with an object value or revenue growth, the rate will grow. For example, in the income tax on wages of citizens starting from 1 January 2007, up to 4 times the minimum wage of the amount of income is taxed by 13%, and with an increase in income, the tax rate also increases by 25%.

The more income increases at regressive rates, the tax also decreases. This is the opposite of the progressive rate.

According to the tax declaration, the tax authorities determine the cost of the taxpayer's income from net income (that is, the taxable income), support the tax rate, calculate the amount of tax.

The definition of the tax rate is based on a number of principles.

1. Principle of carnal desire-means that a tax must be levied from different persons, depending on the degree of their use of programs financed on the account of taxes.
2. Principle of solvency-it is necessary that the amount of tax corresponds to the level of wealth and income of the taxpayer. In other words, Taxation should be subject to a fair distribution of income.
3. The principle of fairness is that those whose income and level of use of government programs are equal should pay an equal amount of tax.

Tax benefits are established on the basis of the procedures and conditions established in legislative agreements. In practice, the following types of tax benefits are common: – the designation of the minimum level of non – taxable objects; – the exemption of a particular person or certain groups of persons (for example, war veterans) from paying taxes; – the reduction of the tax rate (rate); – deduction from the amount to which the tax is levied; – tax credit (delay in taxing or reduction of the

It should be noted that with a thorough tax policy in Uzbekistan, the provision of unique rates of economic growth, the prosperity of the country through the modernization of the economy and the further improvement of the welfare of the population serve as one of the most important factors.

### ABSTRACT

*Autopsies and retrospective analysis revealed several diseases of the risk group. It can be chronic hepatitis, arterial hypertension, diabetes mellitus, and obesity, and chronic bronchitis, varicose veins of the legs, coronary artery atherosclerosis, coronary heart disease, and atherosclerosis. Therefore, in patients with malignant tumors, it is necessary to pay attention to existing risk factors, such as hepatitis, obesity, arterial hypertension, coronary heart disease, varicose veins of the legs, chronic bronchitis, diabetes mellitus, atherosclerosis, and coronary heart disease.*

**KEYWORDS:** *Thromboembolism, Venous Thrombosis, Malignant Tumors, Pulmonary Embolism.*

### INTRODUCTION

Actuality of the topic: 6 million people in all countries of the world are diagnosed with a new primary form of cancer. The incidence and mortality from malignant tumors vary from country to country. Morbidity and mortality from malignant tumors in European countries have now come to the fore at the expense of stomach and lung cancers. The practical significance of the

problem of pulmonary artery thromboembolism is currently determined by the apparent increase in the frequency of pulmonary artery thromboembolism in various diseases, a significant increase in the frequency of postoperative and posttraumatic embolisms that occur frequently during complex surgical interventions; in addition, deaths from pulmonary artery thromboembolism in highly developed countries are the third leading cause of death after ischemic heart disease and stroke.

The purpose of the study: to improve the assessment of pathomorphological changes and causes of death in malignant tumors complicated by pulmonary artery thromboembolism

## MATERIALS AND METHODS

We made extensive use of data from a retrospective study of autopsy statements and medical history of 128 corpses who died during treatment in the treatment departments of the Republican Specialized Scientific-Practical Medical Center of Oncology and Radiology from 2004 to 2018.

## THE MAIN FINDINGS AND RESULTS

Retrospective analysis of the autopsy data copy revealed that the thromboemboluses were directed from the right ventricular cavity of the heart to the pulmonary artery shaft and that the vessel was completely occluded or occluded, with small pieces of thromboembolus located in different parts of the small and segmental capillaries of the lung. In particular, 39 (30.5%) corpses reported the presence of thrombus particles in the right pulmonary arteries, while 75 (58.6%) corpses reported the presence of thrombus fragments in the arteries of both lungs. In 14 (10.9%) cases, only small capillaries of the left pulmonary artery were occluded with small fragments of a thrombus stuck in the pulmonary trunk. In the small and segmental branches of the pulmonary arteries, 77 (60.2%) corpses were found to have small thrombus fragments.

**Figure 1. The degree of occurrence of thromboembolic fragments on the localization in the pulmonary arterial branches**

According to the results of retrospective studies conducted in the study, hemorrhagic infarction in the lungs developed from macroscopic changes in lung tissue. The infarct is conical in shape, clearly demarcated from the surrounding tissue, with the base facing the pleura. Fibrin deposits are seen in the pleura of the infarct area. The dead tissue is dense, granular, dark red in color. The lungs are enlarged, the edges are sharp, the pleura is clear, the lung tissue is soft, elastic in consistency, pale red, airy, pinkish-red on the incision surface when cut, a large number of small or large foamy secretions. There was venous stagnation in the tissues, plasma saturation, edema, stasis in the capillaries, and numerous diapedesis hemorrhages. As a result of acute venous stasis, the alveolar capillaries dilate (lung tumor), and there is blood flow into the alveoli. These changes intensify and fibrosis develops.

Looking at the results of the data analysis, macroscopic changes were observed mainly in the lung fragments. In 26.8% of observations, signs of necrosis developed in the lung tissue of the corpses. These changes were found in 18.8% of corpses in one piece, 6.3% of corpses in two or more pieces, and 10.1% of corpses in polysegmental injuries. Injuries to the lower extremities accounted for 21.8% and in the upper extremities to 5.1%. The total injury of lung tissue in each part of the lung ranges from 60% to 70%.

**Figure 2. Analysis of macroscopic changes in lung tissue**

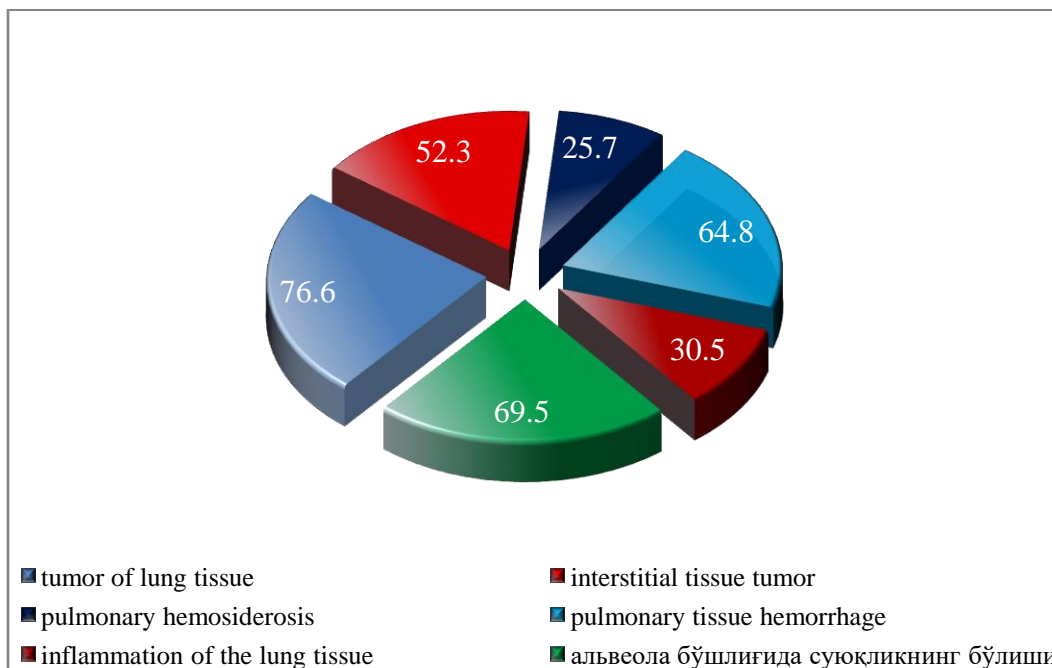

In the histology of lung tissue in 76.6% of cases there is an enlargement of the alveolar cavity, in some places there is a violation of the trophism of alveolar cells, an increase in volume; hypochromic staining of the nuclei, broad and bright cytoplasm, vascular richness of the stroma of the alveolar barrier, flattening of the endothelium; eccentric location of the nuclei and richness of fibrocytes. Lymphocytes accumulated in some areas of the interstitial tissue and erythrocytes leaked from the blood vessels.

Interstitial tumor of the alveolar-capillary membrane consists of erythrocytes, a tumor consisting of a small number of segmented nuclear leukocytes, lymphohistiocytic, macrophage infiltrations, increased permeability of arterial vessel walls, venous blood stasis in the vessels, plasmorrhagia, interstitial edema of interstitial endothelial lesions, I. Erythrocytes, neutrophils, and macrophages are often found in alveolar fluid, hyaline membranes are located along the alveolar barriers. The walls of the alveoli are fibrous, fibrous interstitial pneumonia is observed. Sometimes bronchopneumonia was added and found to be fatal.

On histological examination of the bronchial walls, the mucous layer was composed of multilayered squamous cell epithelium; the submucosal layer is composed of fibrocytes. The mucous layer is full, swollen, mucus production in glandular and goblet cells is sharply increased, the covering epithelium of the mucous membrane is displaced, the walls of the bronchi and bronchioles thicken due to cellular infiltration and edema, leading to impaired bronchial drainage activity.

In the vascular wall of the bronchial wall, hypoxia also increased vascular wall permeability, plasmorrhagia developed, and intima layer suffocation resulted in injury to endothelial cells, basal membranes, muscle tissue, and vascular wall fibrous structures.

The results of histological examination show that the tumor in the lung tissue - 76.6% (98 people), interstitial tissue tumor - 52.3% (67 people), pulmonary hemosiderosis - 25.7% (33 people), pulmonary anthracosis - 57, 1% (73 people), bleeding into the lung tissue - 64.8% (83 people), inflammation of the lung tissue - 30.5% (39 people), the presence of fluid in the alveolar cavity - 69.5% (89 people) .

**Figure 3. Occurrence rates of microscopic changes in lung tissue.**

Analysis of macroscopic and microscopic changes in the endothelium of the pulmonary vascular wall in corpses who died of pulmonary artery thromboembolism in malignant tumors showed

that, macroscopically, the vascular wall mucosa was thickened, swollen, bruised, and microscopically viewed in some places narrowing of the endothelial spaces was observed.

Histological examination revealed the development of tumors due to disruption of the movement of plasma fluids through the alveolar-capillary walls as a result of suffocation of endothelial cells in the pulmonary vessels. In all the corpses examined, fully formed and developed emboli were found. When the detected thrombus composition was observed, it was observed that it consisted of platelets, erythrocytes and a small number of leukocytes, and that they were located not only in the anterior position of the vascular wall, but also in the free state in the vascular cavity. Cases of changes in erythrocytes as a result of changes in blood properties due to complete cessation of blood flow in the arteries have been observed.

As a result of these advanced pathomorphological changes, deaths from various causes have been observed in malignant tumors. If we compare the prevalence of deaths from malignant neoplasms among young people, the number of deaths from COPD in the age group of 30-39 years is 3 (2.3%), and the number of deaths from other complications is 10 (7.8%); Deaths from COPD in the age group of 40-49 years - 23 (18.0%), deaths from other complications - 10 (7.8%); In the age group of 50-65 years, 39 (30.5%) deaths were due to COPD, and 6 (4.7%) deaths from other complications; Among 66-year-olds and older, deaths from COPD were 33 (25.8%) and deaths from other complications were 4 (3.1%).

**TABLE 1 AGE-RELATED PREVALENCE OF CAUSES OF DEATH IN MALIGNANT NEOPLASMS**

Age of patients	The main cause of death was pulmonary embolism (n = 98).		Deaths from other causes (n = 30)	
	abs.	%	abs.	%
	57,8±3,5		56,6±3,5	
30-39 years old	3	2,3	10	7,8
40-49years old	23	18,0	10	7,8
50-65years old	39	30,5	6	4,7
66 and older	33	25,8	4	3,1

Thus, pathomorphological changes in the formation of thromboembolic complications in the lungs were found to occur in the perivascular areas. In the alveolar walls there is an increase in vascular wall permeability, dominated by clearly developed interstitial tumors containing erythrocytes, platelets, a small number of leukocytes; impaired movement of fluids through the alveolar-capillary membranes; led to tumor development and severe arterial hypoxemia.

Based on the results obtained, it was found that those who died of pulmonary artery thromboembolism in malignant neoplasms developed signs of necrosis in the lung tissue of 26.8% of corpses from macroscopic changes in lung tissue. Histological examination revealed tumors in the lung tissue - 76.6%, bleeding into the lung tissue - 64.8%, inflammation of the lung tissue - 30.5%, the presence of fluid in the alveolar cavity - 69.5%.

## CONCLUSION

To conclude based on the data of macroscopic and microscopic and hemostatic changes obtained in our research, in order to prevent deaths from COPD complicated by malignant tumors in the postoperative period, it is necessary to prescribe treatments that improve blood circulation, as well as dangerous tumors, special attention should be paid to the rheological changes in the blood that occur during the treatment of patients with chemical drugs and radiation, as well as risk factors such as chronic hepatitis, obesity, diabetes. The practical use of these indicators allows timely diagnosis of pathological changes in blood components, their level, prevalence and hemodynamic significance.

**ABSTRACT**

*The article addresses the problems of using semiconductor LEDs in the creation of environmentally friendly, high-efficiency, energy-efficient biophysical trapping device and their introduction into agriculture. The use of semiconductor LED lamps that are compatible with the spectrum of solar light in the device is preferred over other methods in that it is effective in combating pest flying insects and does not harm beneficial insects. The proposed device is environmentally friendly compared to chemical and biological methods of pest control. The device consists of an energy-saving circuit, which does not require high energy in use. This prevents inconveniences when used in field conditions, and the efficiency of useful work in the fight against flying insects is higher than other methods.*

**KEYWORDS:** *Semiconductor LED, High Voltage, Circuit, Semiconductor Transistor, Transformer, Conductors, Energy Consumption, Light Spectrum, Power Supply, Solar Photo Element, Battery, Biophysical Trap, Flying Insects, Sexual Pheromone.*

**1. INTRODUCTION**

It is known that there are more than 80,000 species of pests of agricultural crops, of which more than 10,000 species cause significant economic damage to agricultural crops. According to the United Nations, one-third of crop yields are lost to pests each year. This figure is 50-60% in developing countries and 10-12% in developed countries.

The productivity of agricultural crops, the quality of the harvest increases the efficiency of production, ensures the economic and food security of the country, increases the material well-being of the population. At present, the use of technologies based on innovative technical solutions that meet modern requirements is a key factor in the development of agriculture.

There are several widely used methods of pest control in the world: chemical, biological and physical. Of these, the method that combines biological and physical methods is the biophysical method, which is technically distinguished by its effectiveness. Currently, extensive research is being conducted on the use of this method, in particular, on various models and mechanisms of its operation. They are a high-voltage grid device based on optical radiation according to their structure and mode of operation [1,2]. The main mechanism that attracts insects in such devices is a source of optical radiation. It is surrounded by a high-voltage net in the form of a net, and the insects that seek the light are destroyed in this net. A common disadvantage of such devices is the extinction of all types of insects, including beneficial insects, the use of a special lamp as a source of optical radiation, ie, such a lamp does not attract large numbers of insects due to limited service life, high energy consumption, slow light wave propagation. Another device [3] has also been developed, a biophysical trapping device for killing harmful flying insects. This device is surrounded on three sides by a transparent wall of the sex pheromone, the fourth side by a high-voltage mesh, and the optical radiation source is mounted on its front. The main disadvantage of the device is that in field conditions, beneficial insects are killed by colliding with a high-voltage net at the expense of wind. Surrounded by a transparent wall on three sides, which reduces the scattering of optical rays in this direction, a special shaped fluorescent lamp was used as the optical radiation lamp. The required 220 V power supply is required for the device to work. This poses a problem in power supply in field conditions. Given the shortcomings of these methods, one of the current challenges is to create an environmentally friendly, inexpensive and highly efficient, energy-efficient biophysical trapping device to protect agricultural crops from various pests, to study its physical mechanisms. The newly developed device by us [4] illuminates the physical nature of the energy-saving biophysical trap device based on an optical source semiconductor LED, free from the above shortcomings.

## 2. STRUCTURE OF THE DEVICE

Figure 1 illustrates an energy resource-efficient biophysical grip device. According to the structure of the device, the base of the device consists of a cap, a bag for insects and electrical circuit elements. The upper part of the base of the device is in the form of a bath (1), on the surface of which is mounted a fighter device (2) in the form of a high-voltage grid. Beneath it are placed sex pheromones (3). Dead insects fall into the bag (4) through a hole in the bottom of the tub. The bag is located on the closed part of the device base (5). Inside the closed part of the base of the device are the elements of the electrical circuit. The electrical circuit consists of a low-power energy-saving transformer, a switch, a transistor, a conductor. The device cover (6) is fixed to the base by means of threaded rods (8) through the troupe (7). The semiconductor LED lamp (9) is located between the hood and the bath. To supply it with power, electrical conductors pass through the troupe.

Figure 1. Simplified scheme of energy-saving biophysical trap device.

### 3. TECHNICAL CHARACTERISTICS OF THE ELECTRICAL CIRCUIT OF THE DEVICE.

Figure 2 shows the electrical block scheme of the device, which consists of an electrical amplifier transistor [5-7], an energy-saving high-voltage transformer, switch-off switches, a semiconductor LED lamp, and conductors.

Figure 2. Electrical block scheme of the device.

The transistor converts an alternating 12-volt voltage from the current source into alternating current and transmits it to the transformer. The first winding of the transformer consists of 50 to two windings of copper wire with a cross-sectional area of 50 mm<sup>2</sup>. The second winding consists of 1950 copper wire windings with a cross-sectional area of 30 mm<sup>2</sup> [8-10]. A high voltage of ~3000 volts is generated in the secondary winding of the transformer, which is transmitted to the wire mesh. The range of the device to attract insects ranges from 500 m to a radius of 1000 m. Power supply capacity (duration of operation) 1 day.

#### 4. THE WORKING PRINCIPLE OF THE DEVICE.

The device consists of a low-power energy-saving electrical circuit, the power supply voltage required for the operation of the device is constant 12 V. Batteries with such a parameter can be used to operate the device. It is not necessary to bring the battery to the mains to recharge, it is possible to recharge the battery during sunny days of the day using solar panels while standing in the field. In the device, an energy-saving low-power light bulb with a high luminous flux is placed under the cover of the device. The optical radiation lamp attracts insects. In ancient times, local farmers widely used the color of fire to collect insects, which was done by lighting a fire. Flame color has the property of dissipating heat as well as light. It has attracted a large number of insects under natural conditions. With this in mind, the underside of the cap of this device will be red and the surface of the tub will be yellow. Due to the fact that the lamp is located between the two surfaces, the light returning from them is mixed with the light of the lamp and diffuses in the form of a flame color. This attracts a large number of insects. This allows the identification of all types of insects in the area. A high-voltage net designed to kill insects is mounted horizontally on the surface of the bath-shaped kit, along with the base of the device. Beneath the destructive device in the form of a high-voltage grid mounted on the surface of the bath is a sex pheromone, which acts as a trap. Its essence is that the pheromone separator under high voltage attracts the main pest insect, as a result of which the pest insects that seek it are destroyed in a high-voltage net barrier. Another important aspect of the device is the vertical placement of the semiconductor optical radiation lamp, the high-voltage mesh and the pheromones. It is known that pheromones attract insects by spreading odors. The infrared light in the color of the flame, which is seen above, that is, returning from two surfaces and diffused by mixing with the light of the lamp, enhances the odor-scattering property of the pheromone. The odor rises to the top through a high voltage mesh. This is amplified in the range of the optical voltage lamp as well as the high voltage mesh and increases the attractiveness of the insects. Insects that seek out the odor-spreading pheromone are destroyed in a high-voltage net. Dead insects fall into the bag through the crack. Does not harm beneficial insects. Their destruction is prevented. The area of influence of one device ranges from 500 m<sup>2</sup> to 1 hectare.

It should be noted that pheromones in the device can be used for any type of insect. This, in turn, allows the device to be used in any area of agricultural crops in the fight against pests.

The efficiency of the device is determined by the intensity of the optical source attracting a large number of flying insects. The light sensitivity of flying insects corresponds to the wavelength range ~460–650 nm [11]. It is important to select suitable light sources that take into account the distribution of light intensity in the environment at a certain wavelength, as well as the increase or decrease of the light power effect when propagating in the environment.

Known light sources include incandescent lamps, fluorescent lamps, and semiconductor LED types. They differ from each other in lighting intensity, performance efficiency, power consumption, operating time, and the fact that they emit a certain wavelength. At present, semiconductor LEDs are mainly used in manufacturing, industry and the national economy. Semiconductor LEDs differ from other types of lighting in quality and light distribution ability, low power consumption, long service life, ability to emit different light spectra, control the emitted light power, high durability, environmental and fire safety [12, 17-19]. Depending on the type of semiconductor LED, the wavelength of the light emitted can range from 0.4  $\mu\text{m}$  to 1  $\mu\text{m}$  [13, 18]. Another important aspect of semiconductor LEDs is that the illumination does not change even when the operating voltage drops below the required voltage.

### RESEARCH METHOD

In addition to the parameters listed above, in order to increase the efficiency of the device when choosing an optical source for a fishing lighting device, it must meet requirements such as lighting efficiency, light wavelength propagation in the environment and attracting large numbers of insects. Therefore, lamps with the same luminous flux of 1200 lumens [14] were selected as the source of optical radiation for the study. Determining the wavelength of light in the air is one of the most important scientific and technical problems in research. Figure 3 illustrates a simplified scheme of the research method.

Figure 3. Simplified scheme of the research method. 1 - light source, 2 - light source, 3 - light source, 4 - luximeter, h - distance from the lamp to the luximeter.

The studies were carried out in the process of changing the distance from the optical radiation source to the luximeter in the range  $h=50 \div 600$  cm. The resulting light intensity was measured using a luximeter brand LX1330B. The LX1330B luximeter receiver sensor type silicon photodiode filter is made of selenium semiconductor material and has a large light measuring range. The experiment was performed several times between 6pm and 4am and the results were found to be consistent.

### RESULTS AND THE MECHANISM OF INTERPRETING THEM

Figure 3 illustrates the dependence of the luminous intensity of optical sources on  $h$ . We can observe the different distribution of light rays from optical radiation sources in the air. In all cases, it was found that the luminosity decreases exponentially with increasing distance from the

optical radiation source to the luximeter. The value of light intensity in an incandescent lamp takes smaller values in all cases than in a fluorescent lamp and a semiconductor LED. We can see that the luminous power of a semiconductor LED is higher in all cases than that of a fluorescent lamp and an incandescent lamp. This is because the flux of white light emitted from a semiconductor LED source is close to the spectrum of sunlight and has a wide spectrum range [15, 16, 18], it propagates in light spectra of different wavelengths.

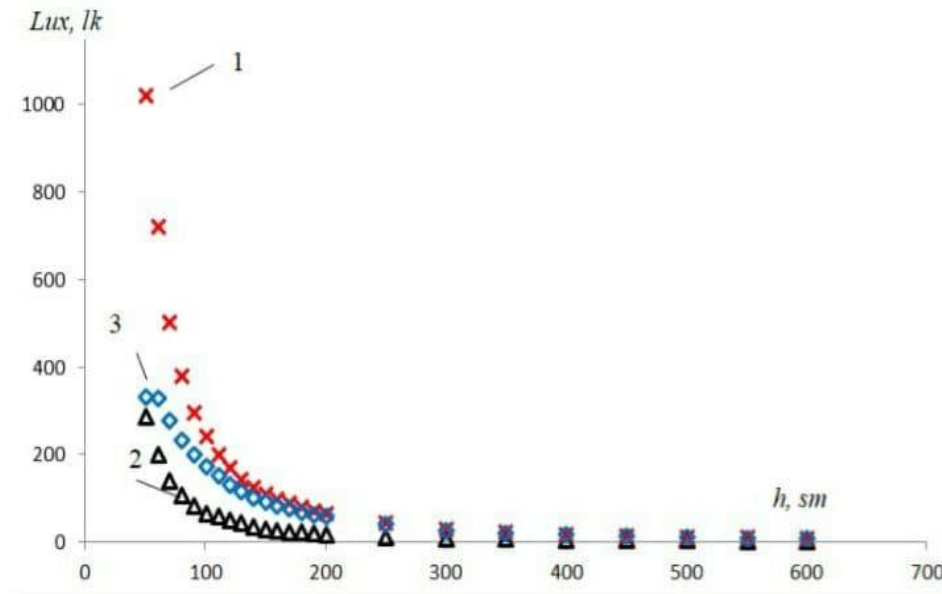

Figure 4. Dependence of optical source light power on h. 1 - LED, 2 - incandescent lamp, 3 - fluorescent.

The use of semiconductor LEDs in comparison with incandescent lamps and fluorescent lamps in the development and implementation of biophysical trapping devices against agricultural pests indicates that they attract large numbers of flying insects and are the preferred source of optical radiation with a wide wavelength of propagation in the air.

## RESULTS OF THE EXPERIMENT

Preliminary research results were used against cotton plant pest flying insects. The experiment was conducted between 00<sup>00</sup> and 4 p.m., and found that 62 caterpillars were caught in more than 1,000 biophysical traps, and no beneficial insects were harmed.

## CONCLUSION

In summary, such a modern improved physico-technical solution of a biophysical grip device based on a semiconductor LED lamp has not been recorded in the literature to date. The device is energy efficient and effective in combating agricultural pests, plays an important role in increasing the productivity of agricultural crops, the quality of products.

UZBEKISTAN

**ABSTRACT**

*The article describes the content of some aspects of the professional competence of future engineers related to the application of intellectual abilities in higher education institutions. The practical results of this process are clearly reflected in all spheres of our lives today, and most importantly, in the consciousness, aspirations and actions of our people. In particular, the goal of the national training program is to radically reform the education system, to free it from the ideological stereotypes of the past, to create a national system of training qualified personnel at the level of developed democracies, meeting high spiritual and moral requirements. As one of the general technical disciplines, "Descriptive Geometry and Engineering Graphics" is the main discipline in the training of engineers. Each of its sections contains materials related to the content of other disciplines and involved in their study.*

**KEYWORDS:** *Youth, Education, Upbringing, Future, Professional, Engineering Graphics, Computer Graphics, Design, Competence, Intellectual, Integration, Intellectual, Creative, Cognitive, Future, Ability, Efficiency.*

**INTRODUCTION**

Educating young people, educating them, educating them as worthy personnel for the future has always been one of the top priorities of every state. In our country, too, such work is constantly in the spotlight of the leaders of our state - we can say the same truth. The Action Strategy on the five priority areas of development of the Republic of Uzbekistan, adopted on the direct initiative and under the leadership of President Sh.M. Mirziyoyev, has launched a new stage of development in the republic. The practical results of this process are clearly reflected in all spheres of our lives today, and most importantly, in the consciousness, aspirations and actions of

our people. Particular attention is paid to the improvement of the education system, which is one of the priorities of the fourth strategy of action - the development of the social sphere.<sup>1</sup>

In the meetings and speeches of the head of our state during his visit to each region, in various meetings, in his speeches and conversations educating a harmoniously developed generation, following a healthy lifestyle of young \_\_\_\_\_

1. Decree of the President of the Republic of Uzbekistan. On the strategy of further development of the Republic of Uzbekistan. Tashkent, February 7, 2017 PF - 4947

people living issues are seen as a topical issue on the agenda is coming. As the President said: "If we do not bring up our children properly, if we do not pay attention to their behavior every day, every minute, if we do not teach them science, if we do not find a decent job, we will lose this deposit."<sup>2</sup>

It is known that the laws "On Education" and "On the National Training Program" also set the task of training highly qualified specialists in our country who can meet the requirements of world standards. In particular, the goal of the national training program is to radically reform the education system, to free it from the ideological stereotypes of the past, to create a national system of training qualified personnel at the level of developed democracies, meeting high spiritual and moral requirements. In the current period of gradual reforms in the field of education in our country, based on the requirements of the National Training Program, there is a need to put into practice the existing conclusions and recommendations to improve the effectiveness of education.

In particular, one of the main goals of the "National Training Program", which is being implemented in three stages, is to form competitive, active and creative individuals who can adapt to the transition to a market economy. Therefore, the Decree PF-6108 "On measures to develop education and science in the new period of development of Uzbekistan" signed by President Islam Karimov on November 6, 2020 also states that "the country is able to come up with new initiatives and ideas for development. Training of a new generation of high intellectual and spiritual potential, formation of skills and knowledge necessary for graduates of educational institutions to become modern professionals" is one of the main directions in this field.<sup>3</sup>

This issue, along with other disciplines, is a key task in teaching technology. This requires the effective and rational use of teaching methods in the teaching process, as well as the improvement of these methods, the search for new ones, increasing the effectiveness of technology education. Therefore, the main issue in the field education today is the training of qualified teachers who are well versed in the methods and forms of education and can easily apply them in practice. Because the teacher's personality and his activity are of special importance in educating students, directing them to professions. Consequently, nothing else can overwhelm the teacher's open communication-style learning process. Therefore, improving the quality and effectiveness of education is an important factor for the training of qualified teachers, to improve their professional skills.

Radical changes in all spheres of society require the search for and use of effective technologies for the training of highly qualified personnel. Success in the economic development of the country is inextricably linked with the quality of training engineers for various purposes. In such conditions, professionals in professional and other fields of activity as a creative person The

formation is the main task. The qualification of an engineer is characterized by the ability to creatively solve problems of creating new equipment, developing modern high technologies, optimizing the production and operation of technical facilities.

In our country, these needs are strengthened by a number of factors. A set of problems related to the ability of people to use their mental and professional abilities in rapidly changing environments has been identified. (*A set of problems related to adapting people to rapidly changing conditions to apply their intellectual and professional abilities has been identified.*) The process of transformation of the traditional mechanisms of development of society expands the range of issues related to the change in the emphasis on priorities in the social, cultural, practical policy of the state. Depending on these situations, the quality of education is the focus of leading educators and society as a whole.

The situation has in many respects set new requirements for the training of highly qualified, competent specialists in mechanical engineering, energy, production technology, construction and other fields. Scientific substantiation of the integrity of the higher education system is required, the importance of optimizing various forms of organization of the educational process, the development of criteria for assessing the competence of future professionals in the profession is growing. In a changing society, modern trends in economic development place new demands on the field of professional qualities of the specialist.

The main reasons for this process are as follows: education does not respond to the challenge posed by a changing economy. As a result, society is dissatisfied with the quality of education; increasing the independence of educational institutions and teachers is not always positive; normative-legal uncertainty often regulates relations in the field of education in the opposite way. Laws and bylaws change frequently; Often, innovative innovations do not improve the performance of educational institutions, but rather worsen them;

In recent years, the active participation of our country in the integration process, joining the Bologna process, the organization of the educational process of 43 higher educational institutions of the Republic in the credit-module system as a test requires effective and mandatory quality control. An effective system of support is needed in the training of qualified professionals. These include: collecting data from personnel consumers; order formation in personnel consumers; selection of educational paradigm; selection of parameters for evaluating learning outcomes; predict the goal; comparison of expected results with existing ones, etc.

The transformation of educational technologies and methods of organization of educational activities, depending on the changes in the forms and technologies of the educational process, the criteria for assessing the quality of training of engineers, provides ample opportunities for pedagogical researchers, and the gradual implementation of forms. The teaching process involves directing students to what unites and forms the basis of the professional competence activities of future engineers. Such an order of society required pedagogical research to identify key changes in the development of professional competence of future engineers during their studies at the university. General engineering training at a university can help solve these problems. Issues of professional training of future specialists in the higher education system SI Arkhangel'sky, VP Bepalko [8, 111], VA Slastenin, UN Nishonaliev, AA Abdukadirov, AR Khodjaboev, R . It forms the basis of scientific research of such scientists as Khasanov, N.Saidahmedov, K.O.Tolipov, SSBulatov. Graphic training as a basis of professional training in

the system of higher technical education R.Khorunov, Yu.Kirgizbaev, K.Kobuljanov, Sh.Muradov, J.Yodgorov, A.Akbarov, I.Rakhmonov, P.Odilov, R. Scientists such as Ismatillaev, DF Kuchkarova, TJ Azimov, E. Sobitov contributed to the development of the theory of graphic sciences (in particular, descriptive geometry) with their textbooks and manuals. Pedagogical scientists from many independent Commonwealth countries, including A.D. Botvinnikov, D.M. Borisov, E.I. Valpas, K.Ya. Vazina, A.A. , V.A.Xerver, G.F.Gorshkov, E.A. Gnatishina, N.M. Kathanov, Yu.F. Kathanova, V.V. Karpov, A.F.Kaseev, A.S.Meshcheryakov, S.G.Marfin, V I.Nilova, A.A. Pyatyshkin, et al. G.A.

To the problems of optimizing teaching practice, developing creative thinking in the process of graphic preparation. Ivashchenko, D.V.Matveev, L.G, I.A. Roitman, S.A. Frolova, N.F. Chetveruxin, A.A. Chekmarev, V.I. Dedicated to the works of Yakunin and others.

However, descriptive geometry; engineering graphics; basics of design; the problems of studying engineering and computer graphics and other geometric-graphic sciences have not been sufficiently analyzed in relation to the teaching of general sciences, taking into account the characteristics of future professional activity. It should be noted that quantitative and qualitative criteria for assessing the level of professional suitability at the stage of mastering the graphic sciences, which combine the organizational - pedagogical, methodological and technological bases of the educational process, have not yet been developed.

The above considerations lead us to the need for theoretical substantiation and experimental verification of the effectiveness of the system of general engineering-graphic training of university students, which is especially relevant in the context of high demand for the quality of professional competence of future engineering training.

Generalization of practical experience of students' graphic training and analysis of scientific-methodical work in the process of graphic training of highly qualified future specialists **shortcomings and contradictions** allowed to determine. **First:**

- Over the past decade, the results of numerous studies on the preparation of engineering graphics by professors and teachers of higher education institutions have been published. They addressed the problems of general engineering graphics focused on the chosen profession;
- There is no integrated methodological theory of the formation of professional skills in the field of engineering work and education of production technologies;
- There is no research that can increase the motivation in the study of descriptive geometry and engineering graphics to ensure a high level of use of graphic knowledge in the course work and graduation work;
- Problems of graphic training are not analyzed in the process of adaptation of young professionals to practical, design and production activities.

The most important feature of the level of professional competence of future engineers during their studies in higher education is the quality of graphic training. This requires the creation of pedagogical conditions in which students can ensure the effectiveness of graphic activities, taking into account modern requirements.

In the design and implementation of the teaching process of "Drawing Geometry and Engineering Graphics" it is very important that the knowledge gained is taken into account at a

higher level of education, which is especially relevant in this regard. all the subjects studied in the disciplines are highly interdependent. The shortcomings in the preparation of the previous topics of the course begin to show immediate negative results in the subsequent topics of teaching.

The development of new science-based forms of improving professional competence in the teaching of graphic geometry and engineering graphics in higher education is based on the analysis of the purpose, structure and interrelationships in the education system. Recently, the following trends have emerged: ўқув ахборот ҳажмининг ўсиши;

- significant limitation of study time;
- complicated educational content.
- Significant limitation of study time;

The integrity of the level of education and the implementation of new methodological methods in the structure of teaching graphics allows the science of "Descriptive Geometry and Engineering Graphics" to be integrated into the general system of training. The formation of intellectual, creative and cognitive abilities of students plays a leading role in teaching based on the principles of continuity of educational materials.

Consistency, harmony of the nature of educational and cognitive activity of students in the forms and methods of teaching are currently used by leading specialists - teachers, and the issues of professional training of future specialists UN Nishonaliev, AA Abdukadirov, AR Khodjaboev, R. . Khasanov, N.Saidaxmedov, Q.O.Tolipov, S.S.Bulatov; It forms the basis of scientific research of scientists from the CIS countries, such as SI Arkhangelsky, VP Bespalko, VA Slastenin.

After in-depth study of qualification requirements, curricula, sample and working programs, 5310600 - Territorial transport systems and their operation, 5340600 - Operation of transport facilities, 5340800 - Roads and airfields, 5320300 - Technological machinery and equipment and other specialties After analysis, we came to the following conclusion: intensive targeted training of specialists in technical universities is based only on the traditional curricula that we use, cannot be based on business plans. It seems that the interdisciplinary connection in the professional orientation of education has remained. Each department teaches students their subject in higher education, and none of them teaches them to apply in a comprehensive way the knowledge they have acquired in solving the professional problems facing university graduates in life.

In the subject of 'Descriptive Geometry and Engineering Graphics', almost all subjects are traditionally described at the same level, and it is difficult for students to know exactly what they need to master in order to successfully pursue their studies and subsequent careers. Apparently, we are training "knowledgeable" professionals, but not "talented" professionals. Students view the final controls as a benefit to themselves. In the minds of many of them, the notion of passing knowledge and skills, rather than passing tests and trials, dominates.

In order to eliminate these contradictions, we tried to analyze the experience of designing, conducting and researching the educational process on the example of the subject "Descriptive Geometry and Engineering Graphics" for students of specialties. This process reveals new

aspects of the importance and place of descriptive geometry and engineering graphics in professional development, allows to study the interdependence of this discipline and the special disciplines of the program, including the graphic part, and improves the professional competence of future engineers.

As one of the general technical disciplines, "Descriptive Geometry and Engineering Graphics" is the main discipline in the training of engineers. Each of its sections contains materials related to the content of other disciplines and involved in their study. Therefore, in the process of studying the subject of descriptive geometry and engineering graphics, it is very important to ensure an integral connection between this subject and the future professional activities of students in the senior courses of the University. Such coordination increases the importance of the subject of "Descriptive Geometry and Engineering Graphics", arouses interest in reading and studying the chosen profession.

In our research, we relied on the experience gained in teaching different subjects in secondary schools, vocational schools, technical schools and colleges with different specialties, universities in different disciplines. At the same time we have I.Rahmonov, Sh.A.Abdurahmonov, T.D.Azimov, N.J.Yodgorov, K.A.Zoyirov, R.Q.Ismatullaev, P.O.Odilov, M.H.Pirimjarov, IT Rakhmonov, EI Ruziev, and foreign scientists: James D. Bethune, GS Phull, HS We referred to the experience reflected in the works of Sandhu [16, 164], R.B.Gupta, N.D.Bhatt, presented to a certain extent in their scientific and methodological work. In the research of TV Chemodanov, the concept of "professional graphic training" is very interesting and sufficiently expressed - this allows the training professional to solve educational and professional problems using geometric modeling methods of flat and three-dimensional images and to perform them adequately for future training. This graphic cycle is a combination of geometric, engineering-graphic, information-technological, methodological knowledge, skills and abilities in the field of general engineering sciences, there is no methodology for selecting material that actively enhances the student's professional interest. The existing forms of organization of the educational process in descriptive geometry and engineering graphics do not fully correspond to the potential for solving problems in teaching this subject, with an emphasis on the specialty under study.

One of the ways to overcome these contradictions is to look for new content and forms of teaching that fully realize the potential of teachers and students.

The problem under consideration is relevant both in terms of preparing students for educational activities in the departments of general engineering and graduate, as well as in terms of increasing the efficiency of the educational process and increasing the mental activity of students.

***Second:***

The leading activity of the student is his educational and cognitive activity, and for the teacher - educational work. All of this requires the teacher to think deeply and reflect on the didactic support of preparation for lectures and practical sessions.

Today it is necessary to further democratize the society, to raise the activity of higher technical education institutions to a new level of quality in the conditions of wide opportunities for the activities of private higher education institutions. This should be reflected, first of all, in the rejection of the principle of uniformity in education, in the organization of different types of

educational institutions, in the creation of new curricula and textbooks, the content of which corresponds to the field of higher education, in the revision of teaching methods and tools.

Modern trends in the development of higher education institutions pose a number of new theoretical and practical problems for professors and teachers working in technical universities. One of them is the reflection of the integration and differentiation of knowledge in the content, essence and activities of education.

This problem cannot be solved without taking into account the results of the interdependence of the studied disciplines. scientists R.H.Djuraev, N.J.Isakulova, M.X.Lutfillaev, I.V.Makhukhina, A.Musurmonov, M.Q.Muxliboev, B.N.Oripov, A.A.Salomov, N.I .Taylakov, N.S.Fayzullaeva, N.I.Hurboev; and others studied in the works of educators.

The future engineer must be able to apply a set of knowledge in various disciplines in their professional activities. In the scientific and pedagogical literature, the concept of "interdisciplinary integration" is vaguely interpreted, thus defining its various roles and place between pedagogical categories (categories). According to EB Shoshtaeva, interdisciplinary communication is a unit of professional activity, reflecting the continuous and integrated phenomena, represents the process of community of educational sciences E.V.Perexosheva defines interdisciplinary integration as a process of combining educational sciences on the basis of cognitive (knowledge) and technological problems in the light. For us, interdisciplinary integration represents a set of educational goals, principles, and meanings in creating a broad-based interaction of all academic disciplines. Therefore, professional competence begins to develop in the first stage of student education, aimed at giving senior students quick optimal decisions in any complex professional situation, in which the formation of skills to perform certain actions independently can be achieved through interdisciplinary communication.

In short, higher education achieved faster and better results if it abandoned less effective forms of teaching. Research based on the current reality is needed. One of the tools that have a positive impact on the training of professionals is to increase their interest in the profession.

 UZBEKISTAN

**ABSTRACT**

*The article provides information on the upbringing of children in out-of-school education in Uzbekistan, the importance of five initiatives in child development, the qualities of a child's readiness for public life in a rapidly developing society. It also focuses on the implementation of five initiatives put forward by the President in children's schools "Barkamol Avlod", international assessment programs, as well as an integrated approach to this system.*

**KEYWORDS:** *Generation, Society, Five Initiatives, Life, Education, Circle, Program, Education, Complex, Management, Efficiency.*

**INTRODUCTION**

Education and its place in the world civilization are essentially determined in the end by a high and always urgent problem. The main goal of any public policy is the intelligence of future generations and spirituality. Rewarding the next generation is spiritually mature, well rounded, intellectuals are a priority in any country. The World Educational Forum (World Educational Forum), "WorldSkills" plays a special role in creating an innovative system based on a comprehensive framework. Currently, the priority of education is characterized by improving life skills, harmony with theory and practice, and self-sufficiency skills in harmony.

When we look at the international experience, the school education of a child is explained by the level of preparation for life and is also important for the active development of public life, and this is one of the urgent tasks facing educational institutions. In the process of education reform, the complex unit of theory and practice is explained by the interaction of education and other institutions in the formation of the child as a comprehensive mature person.

The system of extracurricular education in Uzbekistan has been one of the most common types of education in recent years. Activities of children's schools "BarkamolAvlod" children's schools consist in the profession, the development of talents and abilities, the implementation of life skills, the meaningful organization of their leisure skills. However, it is necessary to develop research models aimed at providing a comprehensive, bold, developer generation in a global society, activating a harmonious generation and self-development.

Resolution of the President of the Republic of Uzbekistan "On measures to radically improve the effectiveness of extracurricular education in the public education system" 30 September 2019 in PP-4467, Resolution of the President of the Republic of Uzbekistan "On additional measures to further improve the education and upbringing system" 6 November 2020 PP-4884, Decree of the President of the Republic of Uzbekistan "On measures to develop the spheres of education and upbringing, and science in the new period of development of Uzbekistan" 6 November 2020 UP-6801 these are important documents for current education.

Young people who are our future in every way, communicative, wise, intelligent, can find a decent sunny life in life, is one of the most aspiring challenges in our community. Consequently, a number of decisions and arrivals are made to serve as programs in reproducing these functions. The main purpose of the internship is to improve the effectiveness of education, which is a pressing issue that is critical to this modern teacher ability.

In addition to school education in Uzbekistan, extracurricular education is a unique system, which is a large school that develops children's development, efficiency, ability. A number of decisions and decisions of the President of the Republic of Uzbekistan, the number of decisions made in this system will be determined in order to find their children in the world society, as well as our children in the world society. Research in the system serves to improve the efficiency of the industry, improve the development of the industry, improving the quality of scientific and implementation of scientific and implementation of scientific and implementation of quality of scientific and implementation.

In accordance with the decision of the President of the Republic of Uzbekistan "On measures to further improve the effectiveness of the President of the Republic of Uzbekistan" on measures to radically improve the effectiveness of the President of the Republic of Uzbekistan "On measures to improve the effectiveness of the President of the Republic of Uzbekistan "Action Strategy for 2017-2021, President

It is known from history that before the ancient parenting is important to society and takes this problem seriously. It can read a lot of information in ancient works. In particular, Farabi is Fozil's own team for grouping people according to different attributes. No need to pay attention to people, abilities, abilities, psychic talents, not to religious sects or the race of people. The state also needs to be regulated by a local person; That is, he says that he is fair and wise, create laws and create laws and take care of the future, care for concerns of the Republic of Uzbekistan" " Creation of modern methodology, improvement of state requirements and development and implementation of a new generation of educational and methodological complex, further improvement of the effective organization of the activities of extracurricular educational institutions.

Despite the fact that education about conducting education in the service of Farabi is a close education, it emphasizes that every place and feature is in the development of a person.

Beruni can beautifully make any morally harmonious person of human weakness. Beruni is important for human qualities-if it is purity, and the closest thing to a person says that his nature and spirit. That is why man shows that his nature is to make things pleasant by his pleasure. At the same time, with the inner world, the outer beauty, the harmony of beauty is a way of life. It has been noted that the work of strollers, words, words, hearts, their daily lives, to this, and everything they do in their daily lives, is beautiful.

The possibility of separating religious and spiritual requirements, this possibility gradually becomes characteristic of human behavior. Ibn Sina plays a special role in shaping a person, the people who surround him around a person who is not only to the external environment, and people know the world around them, but also to find the formation of access or evidence in his behavior. Therefore, it does not require children to be careful in raising children, so as not to teach the child bad habits, you need to keep it away from the bad environment.

Scientists of the CIS countries R. Meminsky, S. A. Shakova, E. Mitina, N. V. Chit, L. P. Shopina, E. Bredis, O. Shkapovar, P. V. Gornostaev, V. A. Gorokhov, L. A. Kokhanova, V. K. Tebiev and additional education conducted research on the regular development of the child's creative skills and creative languages. V. N. Tersky, A. S. Makarenko noted that a person should be educated in an integrated system of the system. He says that the role of outstanding educational institutions for the knowledge he gained in school is invaluable and definitely in practice. Therefore, they were eager for young people to study and nurture.

Our children are engaged in independent thinking, modern knowledge, and their profession, has a solid vital position, and rising that of a true patriot nation is important.

The 5 initiatives that were sent to the president were met with great interest by our people and young people. Deep thoughtful goals and objectives are given in the content of each initiative.

The first initiative serves to raise his talents in music, fiction, literature, theater and art, to create the necessary conditions for young people to show the skills of young people, their ability in sports. The third initiative is aimed at organizing the use of computer technologies and the Internet between the population and young people. The fourth initiative, in turn, is aimed at increasing the spirituality of young people and organizing systematic work to promote communication between them. The fifth initiative involves the problems of women's employment.

The Five initiative fulfills the spirit of modernity in the wishful mind of the younger generation to launch them into new areas of creativity. Indeed, the scope of work carried out in our country, the scope of work carried out related to young people, is very wide. This process is based on the designated responsibilities for education managers, staff, and education. Young people are the successors of our future, their attention to them today, attention to the future of our state and the future of our people.

It is this five initiative that requires the integrated functioning of children's schools "BarkamolAvlod" in the system of extracurricular education. The role of children's schools "BarkamolAvlod" is of great importance in the significant free time of the child. It shows that cooperation with such schools, special sports schools, neighborhood and high schools, as well as a number of other institutions. The child will find it worthy to find his place in life to make the theoretical knowledge that the practitioner wants to make it. In a child from young adults, the

scan itself provides its own activity in social relations. From childhood, the initial skills and skills of any profession play an important role in the growing master of their profession in the future. Cooperation with production enterprises in the field of children's schools "BarkamolAvlod" will allow the child to develop in a complex society. Cooperation between sports complexes of children's schools and special sports schools "BarkamolAvgans and special sports schools provide the meaning and potential of the learning process.

President of the Republic of Uzbekistan "On measures to improve the effectiveness of extracurricular careers in public education" schools of the scope of the scope of BarkamolAvlod in children's schools "BarkamolAvlod" will again cooperate with your teacher, allowing you to create a free environment in the place where he is familiar to himself.

Children's schools of "BarkamolAvlod" prepare the child not for the exam, but for life. Concept of the President of the Republic of Uzbekistan 29 April 2019 " Concept b by Decree No. PF-5712 notes the main directions of long-term development of the public education system, including:

Achievement of the PISA (The Program for International Student Assessment) of The Republic of Uzbekistan. International Student Assessment Programs International student development programs at the international level is one of the top 30 leading countries;

The objectives of the system of continuing education are put aside in the direction of the quality of the content of the system, as well as training, retraining and advanced training of professional personnel.

The participation of the Republic of Uzbekistan in international programs and studies (PISA, TIMSS, PIRLS, etc.) in the public education system was revealed. "Tasks are registered in international programs and studies.

The child's theoretical knowledge will be transformed into entertainment in non-school educational institutions. It is self-evident that the child is ready for life, and not directly for the exam. Life skills develop and manifest as a person.

Conclusion it can be said that the child's focusing skills are reflected in the practice, acquired and formed in the child's mind on the spot. In addition, at the time of school, the meaning of a child's life is a leading tool in his future marriage and will become an active enterprise for society. The development of the future of the motherland is determined by the abundance of such active people in society.

## FROM THE HISTORY OF STUDYING ALISHER NAVA'S LYRIC POETRY

**Dilnoza Ahmad qizi Rustamova\***

\*Researcher,  
 State Museum of Literature of the Academy of Sciences,  
 Republic of UZBEKISTAN

### ABSTRACT

*Alisher Nava'i's lyric poetry has been studied in Uzbekistan and abroad. The process of studying the literary heritage of the poet in Uzbekistan began in the thirties and forties of the last century on the occasion of the five hundredth anniversary of Nava'i. Research on Nava'i's poetry was conducted mainly in two directions: theoretical research and textual research. The article provides information on the beginnings of theoretical research. M.Shaykhzoda, A.Hayitmetov, Y. Ishakov's fundamental research aims to study the lyrical hero of Nava'i, used poetic arts, the characteristics of the genre (genres of ghazal, qit'a, tuyuk, fard), the characteristics of the subject and the main images. After independence, Nava'i scholars studied religious themes in the poet's poetry (ghazals praise be to Allah and prophet), they conducted research within the framework of Nava'i's Sufi views. Nearly a hundred years of research have given rise to the science of Nava'i studies.*

**KEYWORDS:** *Ghazal, Nava'i Studies, Diwan, Nava'i Lyrics, Lyrical Hero, Genre, Image, Poem, Poetics.*

### INTRODUCTION

While the study of Nava'i's lyrics began in the 1930s, it was conducted mainly in two directions. The first direction was the textual examination of the poet's works. At the same time, the literary critic Hamid Suleiman worked on the preparation of an academic edition of "Hazoin ul-Maoniy" and a scientific critical text. The first theoretical researches on lyricism can be observed in the scientific works of academicians Oybek, E. Bertels, M. Shaykhzoda and A. Hayitmetov.

In general, to express the study of Nava'i's poetry from the point of view of the laws of art began while the poet was still alive. His contemporaries such as Jami, Lutfi, Babur, Sayyid Hasan Ardehir, Pakhlavon Muhammad gave him a neutral and objective assessment.

The emerge of the science of fundamental Nava'i studies can be divided into two historical periods: pre-independence and post-independence scientific research.

**The main part.** Maksud Shaykhzoda's research and a series of articles on "Nava'i's lyrical hero" is the first and special stage of pre-independence scientific research. Although the research is based on the "Gharoyib us-Sighar", it contains general theoretical views on Nava'i's lyric poems. The study provides theoretical insights into the identification of the poet's lyrical protagonist, some poetic methods of lyricism, the distinctiveness of the Eastern Diwanian tradition and the Nava'i diwans, and the role of science bade in the study of classical poetry.

As in all diwans, the "main organism" of the "Gharoyib us-Sighar" is the ghazal, the scientist assesses his creative skills as follows: "The main and first characteristic of Nava'i's ghazal is its logical structure, the birth of one moment from another". In the poems of the poet, the principle of creating a perfect event, a lyrical situation with a plot, that is, the principle of evolution is also felt in the development of the image. In a deeper understanding, analysis and study of the essence of Nava'i's lyrics, Maksud Shaykhzoda dwells in detail on the contrast and contrast of spiritual arts, and quotes unique examples of the poet's lyrical monument.

Prof. A. Hayitmetov's fundamental research of a monographic nature called "Nava'i lyrics" was also one of the important steps in Nava'i studies. The scholar conducted research on the genre features of Nava'i's lyrics, the features of the creative method, the topics addressed in the ghazal, which is considered the most active genre and the characteristics of the main lyrical images. In particular, the issue of determining the true chronology of the poems included in "Hazoin ul-Maoniy" was scientifically concluded by Doctor of Philology Hamid Suleiman – Both Maksud Shaykhzoda and A.Hayitmetov confirmed that the manuscripts copied while Nava'i was alive were not written in the four seasons of his life. In addition, the study of the genre features of Nava'i's lyrics is considered a key issue in the study of the creative lyrical heritage. Therefore, the monograph notes that the genres of qit'a, fard, sokiynoma, chiston, problem, rubai, tuyuk were enriched with new features in the poet's lyrics and developed in all directions. The genre of ghazel is also specifically mentioned. Poet who wrote ghazals before Nava'i's Sa'di, Hafiz, Lutfi, Otoy, Jami, Khusrow Dehlawi followed the literary traditions of the time, his incomparable success in ghazal writing was reflected in the weight, theme and specific new details. Maksud Shaykhzoda describes the lyrical hero as Nava'i himself, while A. Hayitmetov focuses on the main characters, the lyrical hero - the admirer, the beloved, the poet himself, the sheikh and other characters.

The poetry of the protagonist also cited three main characteristics: "... he is, firstly, a fiery lover, secondly a rind, a drunkard, and, thirdly a poet-thinker, about life and being, about science and art, when he is overwhelmed by the sufferings of his lover and fails. a thinker, intellect person, a person who writes poems about it."

There are some considerations in the research of Shaykhzoda and A. Hayitmetov, which we have seen above. In particular, when Shaykhzoda writes about genres, we don't see a qasida on the divan. He said: Nava'i did not consider official poems worthy of a lyrical diwan (although it is known that he wrote several poems about Bayqarah). However, A. Hayitmetov emphasizes that

the poem "Hilaliya", which is present in almost all manuscripts of "Badoe ul-vasat", is a very original and least studied genre. Of course, this comment is correct for the Shaykhzoda's object of study, "Gharoyib us-Sighar", but its general character shows that the phrase "unworthy" is problematic. Ishakov's first study was dedicated to the "First Diwan" composed by Nava'i's fans and was called "Alisher Nava'i's first lyrics". In it, for the first time, the ideological and artistic features of the first lyric were analyzed, and the poet's attitude to the lyrical traditions of his time was determined. These helped to understand the essence of Nava'i's work. After all, the observation of his complex creative path, which he traversed before his ascent to supreme, focuses on the fact that the first manifestations of humanity were manifested in his very first poetry by studying each stage. The scholar's work "Nava'i Poetics" provides a detailed analysis of the poetics of genres and the poetics of artistic imagery of the work "Hazoin ul-Maoniy". In the history of classical literature, the development of lyrical genres and their rise to a new level is directly related to Nava'i's work, each genre is its own object of image, one genre can not perform the function of another genre. In the section "Some methods and means of poetic image" analyzes the specific description of the content of the poem on the basis of stylistic and compositional means.

Y. Ishakov also addresses the subject of ghazels such as Shaykhzoda and A. Hayitmetov, and in contrast to them, ghazels on a romantic theme are divided into descriptive ghazels, descriptive-type ghazels, discussion-type ghazels, descriptive ghazels, and plot-based ghazels.

The literary critic summarizes his opinion on the poetics of Nava'i's ghazals as follows: "through his ghazals, Nava'i demonstrated in practice the various possibilities of this genre; Nava'i's ghazel's is distinguished by its large number in the history of ghazel; ghazels are created in different weights of aruz; their integrity and perfection in content and form is a special phenomenon; the individual biographical basis plays an important role in the ghazels. The scholar divides the main styles of medieval Uzbek poetry into Turkic, classical, high or Nava'i style. Brings the Nava'i style as a completely new phenomenon, consisting of a synthesis of the most characteristic features that are unique to all styles. He argues that its emergence is influenced by such factors as the philosophical and social essence of lyricism, pathos, internal evolution of genres, dynamics.

Nava'i scholars of the independence period paid attention to the little-studied aspects of the poet's work. N. Kamilov, I. Hakkulov, A. Abdukodirov, Dilorom Salohiy, S. Olim, K. Mullakhojaeva and other scholars based on the mystical aspects of the poet's poetry, the symbols of Sufism, imposed prohibitions. In particular, N. Kamilov's analysis of Nava'i's works on the basis of mystical and sectarian ideas, commentaries on ghazels, I. Hakkulov's series of articles "Return to Nava'i" on some topical issues of Nava'i poetry, analysis of ghazals, qit'as, rubai, comparative analysis of Dilorom Salohi's ghazel texts, researches on the gradual development of the poetic style of the poet, K. Mullakhojaeva's researches on meaning, symbolism and art, expression of Sufi views in hymns of praise and praise are among them.

## RESULTS AND DISCUSSIONS

Throughout the history of the study of Nava'i lyrics, attention has been paid to the following aspects:

- The issue of lyrical heroism in Nava'i poetry was considered. It turned out that Shaykhzoda and Hayitmetov had different views.

- The genre features of ghazals, qit'as, tuyuks, and rubais from the Diwans were studied.
- The themes and images of the most active genres used by the poet were described.

## CONCLUSION

In short, during almost a hundred years the history of the study of Nava'i's lyrics has led to the formation of it as a fundamental science, expanding the scope of research. The object of study shifted from general to specific, and different interpretations emerged. Today, studying Nava'i is facing new interpretations of the poet's lyrics and the correction of errors in the publication.

**EDUCATION OF YOUTH IN UZBEKISTAN, RAISING THEIR MORALE**

**Fakhriddin Joylovich Yormatov\***

\*Associate Professor,  
 Department of General History,  
 Termez State University, UZBEKISTAN

**ABSTRACT**

*In the Republic of Uzbekistan, a systematic, phased strategy of reforms in the field of education and improving the morale of young people has been developed, closely related to other spheres of life - socio-economic, life. The role of various organizations, institutions and foundations in solving youth problems in the Republic of Uzbekistan has also grown.*

**KEYWORDS:** *Education, High Spirituality, Reforms, Initiative, Social Protection, Youth Policy.*

**INTRODUCTION**

Since the first days of independence, childcare has become a priority in Uzbekistan, solving the problems of social protection, especially for young people.

Uzbekistan has done a lot to solve the problems of youth. The work done by the state to educate them, to educate them into mature professionals, to transform them into worthy members of society, has begun to bear fruit. Certain progress has been achieved in protecting the rights and interests of the younger generation. Indeed, one of the first international legal instruments ratified after the Republic of Uzbekistan gained independence was the Convention on the Rights of the Child. After joining the Convention in 1992, the Republic of Uzbekistan assumed a number of international legal obligations to ensure the rights and freedoms of the child.

The current legislation of Uzbekistan on the protection of children's rights is being developed in accordance with the requirements of the Convention on the Rights of the Child on the basis of the Constitution of the Republic of Uzbekistan. According to him, the basic rights of the child, their protection are enshrined in the Civil, Family, Labor, Criminal Procedure and other codes of the Republic of Uzbekistan. The adoption of these norms has made a great contribution to the development of legislation on the protection of children's rights.

To date, the UN Committee on the Rights of the Child has received two national reports on the work carried out in the Republic of Uzbekistan to fulfill the requirements of this convention. Uzbekistan has an excellent child protection system. [1]

From the first days of independence in the Republic of Uzbekistan, a systematic, phased strategy of reforms in the field of education of young people, raising their morale, closely related to other spheres of life - socio-economic, life.

According to him, reforms were carried out in the following priority areas of youth protection:

- creation and improvement of the legal framework that guarantees the protection of the rights of young people;
- to support the necessary institutional structures related to the protection of the rights of youth;
- improving the morale of young people, improving the quality of education;
- the formation of young people's aspirations for a healthy lifestyle;
- creation of a system of mass development of children and youth sports;
- prevention of delinquency among minors in need of social protection;
- creation of the necessary socio-economic conditions for the upbringing of a harmoniously developed generation [2].

Secondly, there are more than 950 thousand young families in the Republic of Uzbekistan. They make up 16 percent of all families. Comprehensive material and moral support is one of the priorities of the leadership of the Republic of Uzbekistan. [3.166.] It was important to resolve the issue of employment. It was also necessary to protect the rights and interests of young people in Uzbekistan, to create decent living conditions for them.

Fourthly, it was necessary to change the psychological and ideological outlook of youth, characteristic of the Soviet dictatorial system. In particular, the attitude towards young people in Soviet times was as follows:

1. Youth has become a political object of politics.
2. Young people were forced to participate in political life.
3. A single worldview connection, dependence.
4. Mental addiction.
5. Cases of spontaneous alienation.
6. A situation has developed when a false initiative, a sense of "brotherhood", "heredity", "subordination" to the party, communist ideas and views, were introduced into the minds and hearts of young people. [4.11.]

From the first years of independence, the policy pursued in the Republic of Uzbekistan in the interests of the population in need of social protection began to bear fruit. "Other forms of social protection for young people include additional payments that cover part of the cost of meals, part of the additional costs for school canteens and canteens from the budget, additional payments for those who live in private homes, low fares on public transport and other benefits. In accordance

with national traditions, a preferential procedure for the purchase of furniture and carpets for newlyweds has been established "[5.289.]

Such measures have proven to be very useful in the transition to a market economy. The society has ensured socio-political stability, possible economic and political crises, as a result of which the impoverishment of a certain part of the population has been prevented.

In this regard, certain positive work has been done in the Kashkadarya and Surkhandarya regions. The work carried out by regional authorities, various government agencies, trade unions, institutions related to social protection has instilled confidence in the citizens of the future. For example, on February 24, 1992, the Kashkadarya regional department of social protection of the population issued an order "On measures for the social protection of students and teachers." According to him, the issues of providing special social assistance to students, secondary specialized educational institutions and schoolchildren have been resolved. There have been established benefits for students and schoolchildren for food, medical care and the use of transport. In particular, 50 percent of school meals are covered by the republican and local budgets.[6]

In the first years of independence, the Government of Uzbekistan paid special attention to the difficulties of the transition period, in particular, the issues of social protection of large families in the context of price liberalization. For example, in 1992 alone, an additional 5.9 billion soums were allocated for the interests of children and compensation. In addition, 10 billion soums were allocated for bread, milk, yogurt, sugar, eggs, meat and other food products.[7]

The work of trade unions in social protection of the population, including youth, is also effective. The policy of social protection of young people and low-income families with many children was based on science, taking into account the existing conditions and opportunities, as well as the traditional way of life of the Uzbek people. It is known that the allowance paid before the child reaches the age of two plays a special role in the social protection system. In 1994, the number of such families in Uzbekistan was 60 680 people. Of these, 5018 are in the Kashkadarya region and 8162 in the Surkhandarya region. At the same time, out of 70,832 families with children under 16 years old living in the country, 3,527 - in Kashkadarya and 4,716 - in Surkhandarya regions [8].

**Methods.** Over the years of independence in the Republic of Uzbekistan, the mechanism of social protection of the population has undergone changes and gradually improved. Most of the social assistance consists of benefits. 30 types of benefits introduced in Uzbekistan exempted or provided benefits to 15 categories of citizens from the requirements and obligations of the adopted general rules. Benefits were provided, first of all, to all categories of disabled people, war veterans and persons equated to them, families of military personnel killed, lonely elderly people, citizens who have special services to the country and people. Various public organizations and institutions took an active part in solving the problems of youth in the Republic of Uzbekistan, their social protection. The Youth Fund of the Republic of Uzbekistan "Kamolot" has also done some work in this direction. The work carried out by the Foundation was carried out in different directions, especially in the field of material and moral support for young families, search, selection, training of talented youth, sending them to study and career growth. Work with low-income families with children and children with disabilities has also begun to bear fruit.

350,000 soums have been allocated for caring for fathers, landscaping and asphaltting school grounds in the district [9].

In the Kashkadarya region, the regional branch of the Kamolot Foundation provided sponsorship assistance in the amount of 50,000 soums for the opening of a business incubator in the Shakhrisabz region. 20,000 soums have been allocated for awarding the winners of various events [10].

In 2000, the Prosecutor's Office of the Republic of Uzbekistan studied the mistakes made by local self-government and self-government bodies in the field of social protection of young people and solving their problems. It turned out that the ministries of finance, labor and social protection of the population, the People's Bank, the Republican Agency of Post and Telecommunications, as well as local authorities are indifferent to the problems of youth and laws on social protection of families with children.

In 2000, 1,370 applicants for social assistance were provided in the Surkhandarya region, but they were rejected without study and analysis by the local labor, employment and social protection authorities. In Kashkadarya region, the rights of 45 large families to social assistance were violated.

The role and place of the youth public movement "Kamolot" in the social protection of young people and in solving their problems is growing. The work of the Kashkadarya branch of the movement turned out to be very effective. The Department carried out a large-scale work on all-round support of young people, realizing their potential, material and economic support for those in need of social protection. For example, in 2004 alone, work for this purpose was carried out in 12 directions. In particular, work was carried out to support youth and children's publications, measures to solve the socio-economic problems of youth, employment, participation in small and medium-sized enterprises, socially significant measures to protect the interests of young people, additional financial incentives. important in solving the problem.[11]

Similar work was carried out in the Surkhandarya region. For example, only in Termez region in 2004 small businesses spent 14 192 soums on solving youth problems, and in Termez - 46.1 thousand soums. The volume of voluntary contributions from sponsors in the Termez region amounted to 486 thousand soums [12]. During the training period, a lot of work was done on the social protection of orphans, their material and spiritual support. In the Surkhandarya region in 2005, survivor pensions and social benefits were received by 18,425 families. Of these, 43,288 children from 17,762 families received pensions on the occasion of the loss of the breadwinner, the monthly pension amounted to 4.89,154,400 soums, which were paid on time through post offices. In 2005, 742 children from 374 families of the region received social benefits for the loss of a breadwinner. 651 orphans lost their parents, 396 families were transferred to their care in accordance with the decision of the district akim on guardianship and custody. They were paid pensions and social benefits on time, and 360 people received clothing from South Korea. [13.5.]

Much exemplary work has been done in this direction in the Guzar district of the Kashkadarya region. In 2006, the district received a list of 14,488 pensioners and social beneficiaries, of which 226 were disabled, 264 were breadwinners and 1398 social pensioners. In this regard, in order to establish social justice, the district department of social protection of the population has taken a number of measures, the department regularly holds "Open Doors" days, once a month training

seminars are held. In 2006 alone, 120 disabled children received wheelchairs and orthopedic legs [14.15.]

## RESULTS AND DISCUSSION

The year 2008 played a special role in solving the problems of youth in the Republic of Uzbekistan. In Surkhandarya and Kashkadarya regions, as noted above, the role of the current legislation in solving youth problems was significant. In 2008, 68,235 young people graduated from 844 secondary schools and 30 specialized schools in the Surkhandarya region. Of these, 48,928 graduated from the 9th grade and 19,307 - the 11th grade. Within the framework of the state program "Year of Youth", the Forum of Culture and Art of Uzbekistan, "Kelajak Ovozi", the "Youth Initiative" Center and the "Mehr Nuri" Charitable Foundation were organized together with the youth public movement "Kamolot". We are the youth of Uzbekistan "" were held under the motto. At the Vesna restaurant a table was prepared for 500 people from low-income strata of the population and young people with disabilities, and gifts were handed out. In accordance with the signed agreement between the youth public movement "Kamolot" and JSCB "Microcredit Bank", a competition has been announced for obtaining microcredits for young entrepreneurs of the Surkhandarya region. The winners of the competition were provided with soft loans at 5%. In 2007-2008, 644 young families in the region applied for soft loans for the purchase and construction of housing. Their documents were reviewed by working groups, and 471 young families were provided with soft loans. 61 of them received loans from the regional administration of Ipoteka Bank in the amount of 963 million 102 thousand soums [15].

To provide social protection to low-income families, a generous entrepreneur from the Denau region donated a head of cattle to 38 young families and circumcised 38 children. [16]

In 2009, in Surkhandarya region, consumer loans were issued to 220 young families, microcredits - to 1,669 young families. Their total amount was 4.2 billion soums. In addition, 759 low-income young families of the region received free livestock for 979 million soums through sponsorship. In addition, 1465 young families were provided with preferential loans for the purchase of livestock at the expense of state commercial banks and the State Fund for the Promotion of Employment [17].

## CONCLUSIONS

The role of various organizations, institutions and foundations in solving youth problems in the Republic of Uzbekistan has also grown. In the Kashkadarya region, for example, the work of trade unions has also yielded results. According to the collective agreements signed by the trade unions in 2008, 15.5 million soums were allocated for spiritual and educational work in the region, 11 million soums were allocated to replenish the library fund by equipping the premises of the "spiritual and educational" one. 700 thousand soums, 26.5 million soums for sports events. soums were spent. 1 billion soums have been spent on protecting the health of the population and members of their families, children. Of this amount, 45 million UAH. soums were formed by trade union funds. 58 young people with disabilities and 127 low-income citizens received charitable assistance in the amount of 57 million soums [18].

In the Kashkadarya region, the most important direction was humanitarian aid, financial assistance to the poor, the disabled and lonely elderly people. In 2009, the amount of funds allocated for benefits and material assistance to low-income families increased. 54 billion soums

for mothers caring for their children under 2 years old, 51 billion soums for families with children under 18 years old and 4.3 billion for low-income families. [19]

**ABSTRACT**

*Renal fibrosis markers were evaluated in dynamics to study specific changes in the kidneys of patients with different hemodynamic types and functional classes of chronic heart failure with anemia and to evaluate the effectiveness of complex treatment. Renal fibrosis marker TGF- $\beta_1$  levels in the blood were  $2591.0 \pm 108.4$  and  $755.0 \pm 18.87$  pg / ml, respectively, in chronic heart failure with anemia and without anemia ( $p < 0.01$ ). This was indicative of a fibrosis process occurring in the kidney. After complex treatments with the addition of iron, the TGF- $\beta_1$  index decreased by 2.25 times ( $p < 0.01$ ), the clinical condition, quality of life and resistance to physical exertion changed significantly positively.*

**INTRODUCTION**

Chronic heart failure is one of the leading causes of morbidity and mortality in the world and a disease of significant social and economic importance. Despite advances in the treatment of cardiovascular disease over the past 20 years, this serious complication remains an unresolved clinical problem. According to the epidemiological survey, the prevalence of chronic heart

failure ranges from 0.4% to 2% in the U.S. and European countries, a significant increase with age, reaching 10% in those over 60 years of age.

At the same time, the incidence of chronic heart failure on the planet has been steadily increasing, reaching a level comparable to the most dangerous infectious epidemic diseases in terms of scale and speed of spread (1). About 5.8 million people in the United States and 23 million in the world suffer from Chronic Heart Failure (7.S. 9-13).

It is known that the development of systemic organ damage in CHD, the remodeling of the left ventricle of the heart from its earliest period plays an important role (16. S 107-110).

### **THE MAIN FINDINGS AND RESULTS**

According to the recommendations of the European Society of Cardiologists (ESC 2016), from 2016, patients with CHD are divided into 3 groups, taking into account hemodynamic disorders. According to the indicators of the left ventricular hematopoietic fraction, its reduced (<40%), intermediate (40-49%) and preserved ( $\geq 50\%$ ) types are distinguished. The standard composition of pharmacological treatment gives a relatively positive result in patients with a decrease in blood drive fraction. In contrast, almost no positive effect is observed in standard pharmacological treatments, with the exception of nitrates in the CHD where the driving fraction is preserved. Therefore, the decompensation phase of the disease leads to negative consequences in almost all cases. Indeed, a number of authors have suggested that left ventricular diastolic filling disorders play a more important role in the pathogenesis of CHD than systolic dysfunction, the severity of the disease, and its consequences. The process of diagnosing diastolic SLE is complex and its pathophysiology has not been fully studied (12 pp. 1444 - 1451; 6 pp. 1-12; 3 pp. 36-46; 15 pp. 1742-1749; 10 pp. 1354-1360). ).

As mentioned above, in addition to the prevalence of CHD, it is distinguished from a number of other diseases by its adverse effects and high rate of disability [13]. The average 5-year mortality rate in the population of patients with CHD (I-IV FS) was 59% in men and 45% in women, and was 6-7 times higher than in the general population of the same age (5s.20-26 88s-99- 107.58 pp. 27-36). This is because the degree of damage to the myocardium, along with other organs and systems, ie comorbidity, plays an important role in this complication, which determines the fate of patients and the consequences of the disease (15 p.93-102). Among them, anemia has a special place and is often accompanied by CHD (2016; 11 (1): 37-46). Anemia not only exacerbates the symptoms of CHD, but also worsens quality of life by prolonging hospitalization, reduces resistance to physical exertion, and increases the risk of death by 2 or more times (175 pp.93-102). It should be noted that there is a weak (weak) feedback between hemoglobin and the left ventricular blood drive fraction (28.p.106).

A number of observations have shown that in patients with CHD, anemia is an independent risk factor, in which myocardial oxygen supply is significantly reduced (176 pp. 101-106).

It is known that in addition to anemia, a number of other polymorbid diseases are also detected in patients with CHD. Among them, renal dysfunction plays a leading role not only in the pathogenesis and development of CHD, but also in the exacerbation of anemia (48 pp. 13-24). (2014. T. 112. № 8. S. 7-37.)

## THE AIM OF THE STUDY

To evaluate the effectiveness of antianemic therapy based on standard therapy in renal and cardiac fibrosis processes in patients with different hemodynamic types of chronic heart failure with anemia (preserved interval and low).

## MATERIALS AND METHODS OF RESEARCH

The 120 patients with CHD involved in the study were divided into 2 groups (75 of them with anemia and 45 without anemia) and underwent excellent clinical and laboratory examinations. In order to carry out the tasks set before us, 75 patients with CHD anemia were divided into 3 groups (in each group there were 25 left ventricular hemorrhage fractions, intermediate and low ones). Their ages ranged from 50 to 70, with an average of  $64.0 \pm 5.0$ . All patients were followed up in an outpatient setting after treatment in a hospital setting. The clinical classification of the patients in follow-up is given in Table 1.

**TABLE 1 CLASSIFICATION OF PATIENTS INVOLVED IN THE STUDY**

№	Indicators	Group I n=75		Group II n=45	
		Absolutely	%	Absolutely	%
1.	Men	32	42,7	25	
2.	Women	43	57,3	20	55,5
3.	Ischemic heart disease	45	60,0	36	44,5
4.	Ischemic heart disease, post-infarction cardiosclerosis	25	33,4	8	17,8
5.	Hypertension	5	6,6	1	2,2
6.	Obesity	12	16	11	24,5

Group I patients were given 200 mg of iron III hydroxide sucrose complex (venofer) intravenously as an antianemic treatment based on standard treatment of CHD during hospital treatment. The total dose of the drug administered to eliminate iron deficiency, using a special formula adopted for the treatment of venofer [total iron deficiency = body weight, kg x (150 - patient hemoglobin index Hb, g / l) x 0.24 + 500 mg] calculated.

Group II patients were prescribed the generally accepted standard treatment for CHD.

As standard treatment for CHD, patients in both groups received angiotensin-converting enzyme inhibitors or angiotensin receptor antagonists, b-adrenoblockers, and mineralocorticoid receptor antagonists (as an eplerenone-antifibrosis drug).

The diagnosis of CHD and its functional classes in the patients included in the study were determined on the basis of their complaints, anamnesis, objective examination and laboratory-instrumental examinations, and according to the criteria of the New York Heart Association (New York Heart Association, 1964).

It was also based on the recommendations of the World Health Organization (hemoglobin <13.0 g / dl for men and <12.0 g / dl for women) as the primary criterion for anemia in group I patients.

## RESULTS AND ANALYSIS

Serum ferrokinetic parameters, cardiac and renal fibrosis markers, hemodynamic types, and the presence or absence of anemia were compared in all groups of patients involved in the study. Information about them is given in Table 2.

**TABLE 2 DIFFERENT HEMODYNAMIC TYPES OF CHRONIC HEART FAILURE ARE INDICATORS OF CARDIAC AND RENAL FIBROSIS AND GLOMERULAR FILTRATION RATE IN THE ABSENCE OF ANEMIA AND ANEMIA**

Indicators	Patients with chronic heart failure anemia and anemia

In the groups where the left ventricular hemorrhage fraction was maintained and anemic, hemoglobin, iron, ferritin, and transferrin levels were found to be 29.6%, 61.3%, 39.1%, and 8.8% lower ( $p < 0.001$ ), respectively, than in non-anemic groups. The left ventricular hemorrhage fraction was 26.9%, 55.8%, 43.1%, 13.5% in the intermediate group, and 29.5%, 64.2%, 72.1%, and 33.3% in the decreased ventricular fraction decreased, respectively, with a reliable difference ( $p < 0.001$ ). These indicators indicate that patients are reliably distributed in groups based on hemoglobin indicators.

In recent years, galectin-3 has been proven to be a reliable marker of fibrosis in pathological processes in the body and primarily in the heart. However, although this marker has been studied in CHD, there is no data in the available literature on its change in anemia. In the left ventricular

hemorrhage fraction observed in our observations, in the intermediate and decreased groups, when they passed with anemia and without anemia, the galectin-3 values were  $22.5 \pm 1.1$  and  $19.23 \pm 1.1$ ,  $19.55 \pm 1.3$  and  $18.5 \pm 1.5$ ,  $19.02 \pm 1.2$ , and  $13.2 \pm 1.4$ , respectively. ng / ml was equal to ( $p < 0.05$ ). At the same time, its indicators were 1.2, 1.1 and 1.4 times higher in different hemodynamic types, respectively, than in those who did not have anemia.

It is known that aldosterone is actively involved not only in water-salt metabolism in the body, but also in fibrous processes, which has been proven in numerous studies. In recent years, there have been reports that this hormone is produced not only in the adrenal glands, but also in other internal organs, including the kidneys and heart. Numerous studies have been conducted on the modification of CHD under the influence of various FS and a number of drugs. However, data on aldosterone levels in the blood are insufficient when this severe complication occurs in comorbidity with anemia. In this context, we studied its indications in patients with CHD anemia and anemia.

At the same time, aldosterone was 1.1, 1.1, and 1.2 times ( $p < 0.05$ ) significantly higher in patients with left ventricular hemorrhage, interstitial, decreased, and anemia than in non-anemic patients, respectively. The indicators confirm that not only the hemodynamic types of CHD but also the presence of anemia increases aldosterone in the blood, and therefore fibrous processes increase.

TGF- $\beta_1$  plays a leading role in the development of fibrous processes in the body and primarily in kidney tissue. However, there is insufficient data in scientific sources on the change of this cytokine in CHD with anemia. In patients with left ventricular hemorrhage fraction, intermediate, decreased, and anemia and anemia without follow-up, TGF- $\beta_1$  values were  $2554.7 \pm 125.4$  and  $2209.4 \pm 122.2$  ( $p < 0.05$ ),  $2832.7 \pm 176.0$ , and  $2194.3 \pm 75.8$  ( $p < 0.05$ ), respectively.  $2332.8 \pm 167.8$  and  $1994.2 \pm 73.1$  pg / ml ( $p < 0.05$ ).

Cytokine levels were 13.5%, 22.5%, and 14.5%, respectively, in the presence of anemia and in the absence of anemia.

It is known that in recent years, special attention is paid to cystatin-C in the assessment of renal function. It has a number of advantages over creatinine. Therefore, we determined cystatin-C levels in the blood of patients in our follow-up and assessed glomerular filtration using it. Cystatin-C rates were 10.1%, 24.6%, and 4.54% higher, respectively, in patients with left ventricular hemorrhage fraction, intermediate, decreased, and anemic groups than in anemic patients.

It has been shown that early development of fibrous processes in the kidneys of patients with anemia and the process adversely affects the functional state of the kidneys.

Cystatin-C-assisted glomerular filtration rates also confirm these changes, i.e., a significant decrease ( $p < 0.05$ ) of 4.3%, 7.4%, and 20.2%, respectively, compared with non-anemics when anemia was detected in all hemodynamic types.

In the next phase of our study, the correlation between cardiac and renal fibrosis markers and fibrosis markers with the identified ferrokinetic parameters was studied. The relationship between the 6-minute walking test and aldosterone levels among all hemodynamic types of CHD with anemia is shown in Figure 1.

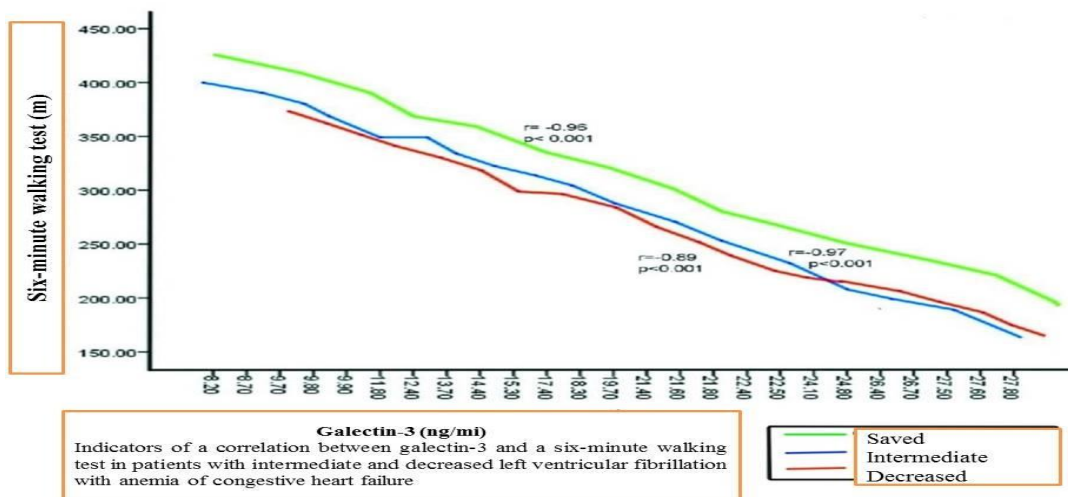

FIGURE 1

In which the left ventricular hemorrhage fraction was preserved, the correlation between the indicators recorded in intermediate and decreased patients was  $r = -0.87$ , respectively;  $p < 0.001$ ,  $r = -0.95$ ;  $p < 0.001$  and  $r = -0.2$ ;  $p < 0.01$ . In all cases, a reliable negative correlation was found between aldosterone and the 6-minute walking test. This confirms that an increase in aldosterone in the blood, which is one of the markers of fibrosis in the kidneys and heart, has a convincing negative effect on patients' resistance to loads.

Also, among all hemodynamic types of CHD with anemia, the correlation between the 6-minute walking test and galectin-3, which is a reliable marker of fibrous processes in the heart, was  $r = -0.95$ , respectively;  $p < 0.001$ ,  $r = -0.97$ ;  $p < 0.001$  and  $r = -0.89$ ;  $p < 0.01$  was equal to (Figure 2).

FIGURE 2

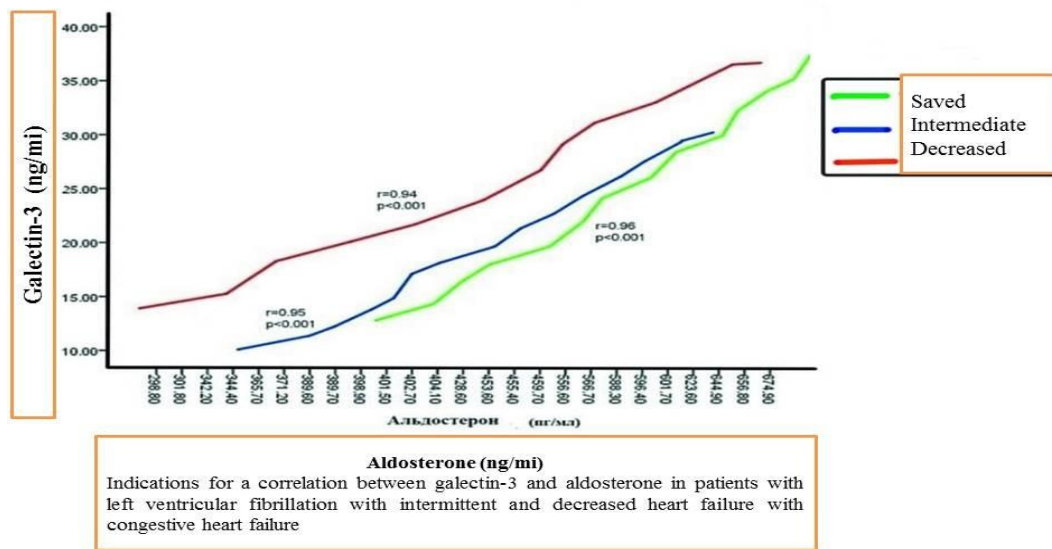

This analysis showed that there was a reliable inverse relationship with galectin-3 in all hemodynamic types and in 6-minute walking synapses.

Although the figures in Figures 1-2 above showed a reliable correlation between fibrosis markers in all types of CHD and patient resistance to physical activity, the high correlation was more pronounced in CHD left ventricular hemorrhage fraction preserved and in intermediate types (respectively  $r = -0.87$ ;  $p < 0.001$ ,  $r = -0.95$ ;  $p < 0.001$  and  $r = -0.95$ ;  $p < 0.001$ ,  $r = -0.97$ ;  $P < 0.001$ ). These results confirm the data in the literature on the fact that the diastolic type of CHD is accompanied by more fibrous processes.

In the next step, we studied the interaction between galectin-3 and aldosterone, which are reliable markers of fibrosis processes in the body (Figure 3).

**FIGURE 3**

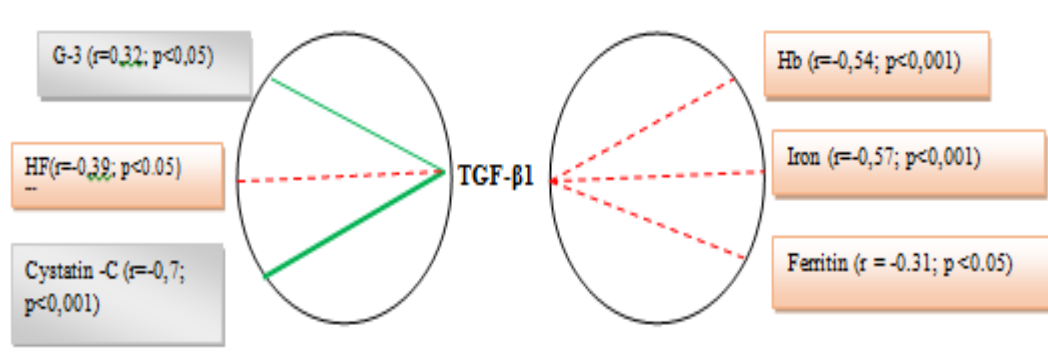

As shown in the diagram, these markers have a mutually reinforcing effect on each other, so an increase in one leads to an increase in the other. This process is confirmed by the existing positive correlation between them in all hemodynamic types of CHD ( $r = 0.94$ ;  $p < 0.001$ ,  $r = 0.95$ ;  $p < 0.001$  and  $r = 0.96$ ;  $p < 0.001$ , respectively). Therefore, when CHD is observed with anemia, fibrous processes in the body coexist and have a strengthening effect on each other.

A reliable negative correlation was also found between ferritin and fibrosis markers galectin-3 and aldosterone ( $r = -0.43$ ;  $p < 0.05$  and  $r = -0.42$ ;  $p < 0.05$ ) in the group with anemia in which the CHD hemorrhage fraction was preserved.

In the next stage, patients with CHD anemia and decreased left ventricular hemorrhage fraction were identified in the blood and correlated with ferrokinetic indicators and cardiac fibrosis marker galectin-3 and cystatin-C, widely used in recent years in the assessment of renal functional status; with TGF- $\beta_1$  we studied the dependencies (Figure 4).

FIGURE 4

HF - hemorrhage fraction

### Correlation between TGF- $\beta_1$ and ferrokinetic parameters, galectin-3, cystatin-C, and hemorrhagic fraction in patients with decreased left ventricular hemorrhage fraction in chronic heart failure anemia

As shown in Figure 4, an increase in TGF- $\beta_1$  in the blood leads to a reliable decrease in the left ventricular hemorrhage fraction ( $r = -0.39$ ;  $p < 0.05$ ). It was also noted that TGF- $\beta_1$  is negatively correlated with ferrokinetic parameters. In this case, it is correspondingly with a hemoglobin index  $r = -0.54$ ;  $p < 0.001$ , with serum iron  $r = -0.57$ ;  $p < 0.001$ , with ferritin  $r = -0.31$ ;  $p < 0.05$  was detected. These indicators confirm that the renal fibrosis marker interacts with the markers confirming anemia, leading to the development of fibrous processes.

A study of ferrokinetic factors affecting ball filtration rate (BFR) revealed a number of correlations as shown in Figure 5. In particular, an increase in hemoglobin in the blood leads to a parallel increase in BFR ( $r = 0.517$ ;  $p < 0.01$ ). A similar correlation was observed between CFT and serum iron and ferritin ( $r = 0.66$ ;  $p < 0.001$ ) and ( $r = 0.45$ ;  $p < 0.05$ ), respectively. These figures confirm that a positive correlation between ferrokinetic parameters and BFR has a positive effect on renal function (Figure 5). Therefore, the elimination of iron and ferritin deficiency in the body has a positive effect on the functional state of the kidneys, stabilizes the general condition of patients and improves quality of life.

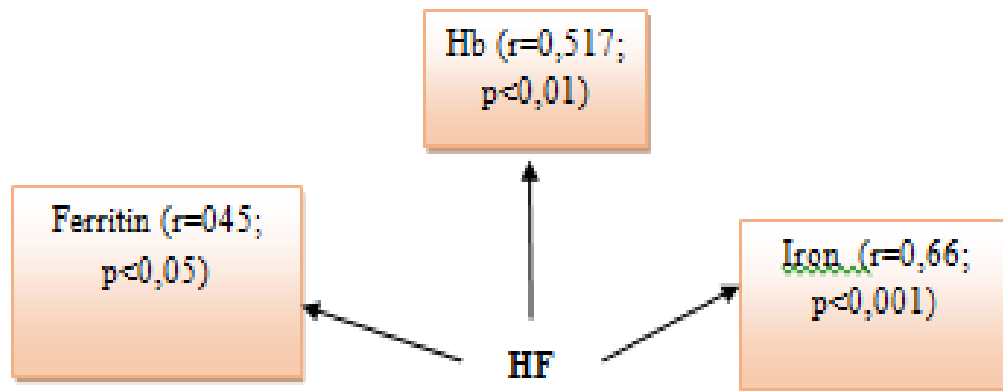

FIGURE 5

### Correlation between the rate of glomerular filtration rate and ferrokinetic parameters in patients with decreased left ventricular hemorrhage fraction in anemia with chronic heart failure.

The association between cystatin-C and ferrokinetic parameters, which have been widely used in the assessment of renal functional status in recent years, has shown that an increase in it in the blood leads to an increase in anemia.

In particular, an increase in cystatin-S in the blood leads to a reliable decrease in hemoglobin ( $r = -0.30$ ) and serum iron and ferritin ( $r = -0.48$  and  $r = -0.29$ ) ( $p < 0.05$  in all cases) (Figure 6).

FIGURE 6

### Correlation between cystatin-C and ferrokinetic parameters in patients with decreased left ventricular ejection fraction with chronic heart failure anemia

The results confirm that anemia is synchronized with an increase in cystatin-C levels in the blood and that they have an aggravating effect on each other.

It was also found that there was a negative correlation ( $r = -0.96$ ;  $p < 0.01$ ) between the hemorrhage fraction and the endurance index in patients with decreased left ventricular hemorrhage fraction (Figure 7).

FIGURE 7

It has been proven in numerous studies that a decrease in the left ventricular hemorrhage fraction leads to a decrease in the level of endurance of patients to physical exertion.

The results confirmed that galectin-3 and TGF- $\beta_1$ , which indicates fibrosis processes in the heart and kidneys, and aldosterone, a marker of fibrosis in both organs, increased in parallel when CHD was associated with anemia. At the same time, the increase in the marked markers was more pronounced in the CHD hemorrhage fraction was preserved and in the intermediate hemodynamic types, ie diastolic dysfunction. In cases where CHD was accompanied by a decrease in left ventricular hemorrhage fraction, a clear reliable negative correlation between renal fibrosis marker TGF-b1 and cystatin-S and ferrokinetic parameters was found. This confirms that the development of fibrous processes when CHD is accompanied by anemia and an excess of cystatin-C in the blood leads to an exacerbation of existing anemia. The results show that mononitric and antifibrosis treatments should be performed on the basis of standard treatment in CHD with anemia.

## CONCLUSION

1. An increase in galectin-3 levels in the blood led to a reliable decrease in the six-minute walking test in all hemodynamic types (preserved, intermediate, and decreased) with chronic heart failure anemia.
2. A positive reliable correlation between aldosterone and galectin-3 confirmed in all hemodynamic types of chronic heart failure with anemia confirmed the synchronization of fibrous processes in the body.
3. An increase in galectin-3 in the blood resulted in a correspondingly reliable decrease in the six-minute walking test in all hemodynamic types (preserved, intermediate, decreased) with chronic heart failure anemia.
4. Negative correlation between TGF-b1 and ferrokinetic parameters, i.e. hemoglobin, iron and ferritins, they have been shown to have a mutually reinforcing effect.
5. High levels of aldosterone were detected in patients in the group where the left ventricular hemorrhage fraction was maintained.

**ABSTRACT**

*This article analyzes the social features of the transformation of the family institution on the example of Uzbekistan. In order to solve and prevent family problems, a psychological service is offered, and models of psychological assistance are recommended as necessary factors for strengthening families. For psychological assistance, the need for explanatory work, psychological counseling and appropriate recommendations are substantiated.*

**KEYWORDS:** *Family, Types Of Family Transformation, Psychological Assistance To The Family. Psychological Service To The Family, Models Of Psychological Assistance, Psychological Counseling, Psychological Factors, Recommendations.*

**INTRODUCTION**

It is well known that the family is a miniature model of the state, the basis of society. Since the second third of the twentieth century, family issues have come to the fore in both science and politics, becoming one of the global problems.

Family and marriage is a complex social institution, the problems of which are studied and practically solved by specialists in various fields: lawyers, sociologists, demographers, psychologists, teachers, sexologists, narcologists. Family and marriage issues in the humanities are explained not only by the expansion of the problems and objects of these sciences, but also by the need to strengthen the family as the basis of society.

However, humanity has entered an era of radical change. The traditional institution of marriage is in crisis, the number of civil marriages is growing, family formation is giving way to career growth, people's traditional gender identity is being distorted, gender reassignment operations are being carried out, family formation and divorce are becoming commonplace, same-sex marriages are registered. etc.

It is known that the atmosphere in the family is a mirror of the state of society, forms the basis of a strong, stable and prosperous state. As a result of the transformation of social norms, the forms and functions of the family and its psychological characteristics change.

The world is divided into adherents of traditional values and radical liberalism.

Based on world practice, in recent decades in the development of the institution of the family there have been transformations: an increase in the number of divorces and single-parent families, a decrease in the number of children in families, the nuclearization of families. The modern type of marriage is characterized by a decrease in the share of registered marriages and the postponement of marriage to later ages, the only type of marriage is replaced by many types of marriage. All this affects the processes of family formation, family values, attitudes in interpersonal family relationships, etc.

It should be noted that the transformation of the family is illustrated by such an indicator as a change in family structure: mass nuclearization of the family, a decrease in the share of three-generation families, an increase in the share of elderly single people, an increase in divorces and single-parent families. families where one parent is not a relative.

The dynamics of the transformation of the institution of the family is influenced by the traditions of peoples, the preservation of the continuity of generations, the cohabitation of young families with their parents, grandparents, and an increase in the level of satisfaction with life related to children and grandchildren[18].

But in world practice, there are cases of a fall in the status of the institution of the family. According to experts, this is explained as the influence of social networks, high sexual liberation of modern youth, etc. As a result of this practice, the number of registered marriages is decreasing and the number of births of illegitimate children is growing.

To analyze the socio-psychological features of the transformation of families in Uzbekistan, Table № 1 is compiled, which provides statistics on family values: monogamy, divorce, early marriage, infidelity, multigenerational and the expected consequences of these family values on society.

**TABLE № 1 SOCIAL FEATURES OF THE TRANSFORMATION OF THE FAMILY INSTITUTION IN UZBEKISTAN**

<b>Family values</b>	<b>Unified marriage</b>	<b>Divorce</b>	<b>Early marriage</b>	<b>Treason</b>	<b>Multigeneration</b>
<b>The condition of families Of Uzbekistan</b>	Marriage as the first union: 92.0% men, 96.0% women	Divorces per 100 marriages: 10.4 Single-parent families:	Married before the age of 18: fourteen %	4.5% (Courts and Civil Registry Office)	together with parents, 68.0% young families

		1.8			
<b>Influence</b>	Born extramarital children	Social orphanhood is on the rise	Influences the growth of divorces	Affects divorce	Violation of the continuity of generations

**Source:** the table was developed based on the statistics of the State Statistics Committee of the Republic of Uzbekistan. and sociological surveys, within the framework of an applied project on the topic: "Research of priority areas of socio-economic development of the family in Uzbekistan" No. П3-2017-0928584, ID: C20140913000821 (2018-2020)

Cheating in marriage is becoming more common not only for men, but also for women. Compared to the last century, women have much more rights. The negative effect is associated with the fact that women are increasingly becoming "breadwinners of the family" and accept the model of behavior of men. Thus, among the most frequently named reasons for divorce, as shown by surveys, the majority of respondents consider regular infidelity or long-term extramarital affairs of one of the spouses to be a sufficient reason for divorce.

Nevertheless, in the context of globalization, no state is immune from the influence of transformations and negative phenomena associated with the institution of the family. In Uzbekistan, it is still not uncommon for such phenomena as: early and related marriages; divorces among young families; female crime, homelessness of minors.

## MAIN PART

We believe, given the aforementioned negative and crisis situations of families, it is necessary to introduce urgent necessary measures in the family policy of the state. Relying on state support, it is necessary to create centers for psychological assistance to families, where the main goal will be to help families in the spiritual and moral education of children and youth, to preserve marriages and family values, to support those families who need material, legal, social, psychological assistance.

Psychological assistance involves getting rid of suffering, restoring a person's ability to a normal life through various influences.

Socio-psychological service to families should be aimed at overcoming destructive social and psychological factors that impede the full functioning of the family, at supporting and strengthening families. Most often, the reasons for the need for psychological assistance to families are the following problematic issues of relationships: the uncertainty of the family roles of the husband and wife, the inconsistency of family values, marital fidelity, the problem of the style of relationships and communication with each other, overcoming conflicts, relations with the spouse's relatives, the problem of understanding each other.

Socio-psychological service to families should be aimed at overcoming destructive social and psychological factors that impede the full functioning of the family, at supporting and strengthening families. Most often, the reasons for the need for psychological assistance to families are the following problematic issues of relationships: the uncertainty of the family roles of the husband and wife, the inconsistency of family values, marital fidelity, the problem of the style of relationships and communication with each other, overcoming conflicts, relations with the spouse's relatives, the problem of understanding each other.

In Uzbekistan, for the first time, the scientific-practical and socio-psychological aspects of the psychological service in the education system were substantiated by Sh.R. Barotov [7, p. 37]. In the field of family psychological service, it is advisable to note the scientific work of such researchers as M. Argoil, A. Bodalev, V. Stolin, V. Karimova, G. Shoumarov, S. R. Barotov and others [8, c. 102]. It should be noted that at present, psychological assistance is carried out in the health care systems, physical education and sports, transport, family relations [12, p. 128].

An express survey was carried out among families to the question "Do you have conflicts in your family?" 17.0% of respondents answered that there are rarely quarrels, 76.0% - sometimes and 7.0% - constant conflicts. This result shows that families need psychological help, which is influenced by social, psychological, and economic factors. Social factors include a low level of legal literacy, a lack of knowledge about the true orders and norms of family relations, the rights and obligations of the parties, the conditions for divorce, etc.

In this direction, it is advisable to conduct explanatory work and provide assistance to the family:

- a) conduct educational work among adults and young people, form in their thinking, consciousness, the spiritual world a sense of responsibility in the family for its material well-being, education and upbringing of children, a favorable psychological climate in the family, etc.;
- b) to raise the level of the family according to family law;
- c) Explain to families about the psychological characteristics of family and marriage relations, etc.;
- d) To conduct explanatory work about the verses of the Koran, which regulated family relations;
- e) Introduce norms governing relations between spouses, moral and legal obligations of husband and wife, parents and children.

It should be noted that the types of counseling psychological assistance to families existing today in world practice are extremely diverse. They may differ in the nature of the assistance provided.

According to its orientation, psychological assistance can be carried out:

- a) Mainly to one family member due to problems that are directly or indirectly caused by his family life or its absence;
- b) a married or premarital couple;
- c) the family as a whole;
- d) parent or parents; parents and children; child or teenager [13].

Psychological assistance can be carried out in the form of psychodiagnostics, psychological counseling and psychological corrections [5].

Also, in practice, the following models of assistance are used: diagnostic, social, pedagogical, medical, psychological.

The psychological model considers family relationships, disharmony, including those associated with the development of the child's personality, his behavior. Psychological assistance involves

the analysis of the client's family situation and his personality and the creation of a "diagnosis" on its basis, which allows the counselor psychologist to help the family and its members. [3], [4].

In order [4] to effectively solve the problems of families, it is proposed:

1. Take measures to create state psychological centers to help families.
2. Take measures to form a positive image of the family and family traditions among the population.
3. In order to prevent divorce, practice the provision of psychological and practical assistance to families.
4. In cases of identification of problems (which is inevitable) to form a sense of responsibility for the preservation of the family and family values.
5. Organize constant psychological counseling in the prevention of stressful situations and the prevention of adverse situations in the family.

## CONCLUSION

In conclusion, we can say that psychological service to the family is a promising area of psychological practice, an important direction in the work of the family and marriage service. According to some reports, as a result of psychological help, 2/3 of married couples improved their relations, changed their decision to divorce, and began to treat their problems differently. Thus, the psychological service makes a real contribution to the overall social task of strengthening the family.

### ABSTRACT

*The article discusses the psychological state of adolescents and opportunities for developing «creative thinking» skills in them. For indirect knowledge that is important for the natural sciences, including physics: - The role of idealization, modelling and scientific experimentation is great. These experiments deal with physical quantities. The values of the physical quantities are determined in units. The article presents an intellectual map of the International System of Units.*

**KEYWORDS:** *Methods, Developing, Interest, Opportunity, Imagination, Mind, Law, Quantity, Unit, System, Direct, Indirect, Measre, Skill, «Full Thinking».*

### INTRODUCTION

In this paper, we conseive modern methods of developing students' "creative thinking" in teaching physics to secondary school students.

10th and 11th form of pupils (teenagers) are more familiar with scientific concepts and can use them to solve some mathematical problems. This shows that theoretical and logical thinking skills have been developed in them. They have "adult" motives that require in-depth reflection on the goals and objectives of future activities. In other words, the "games" that were once the leader will begin to disappear and move to the next place. Activities such as education, communication and work will continue to grow. General intellectual abilities, especially comprehension and thinking, are formed.

As a result, jumping and sexual growth in psychological and physical development occur serious changes in the body. They become physically stronger, their abilities increase, their mental development continues, their identity develops, and their interests expand.

At this age, a new self-reliant development factor develops in children. As a result, the contradiction between his objective position and his inner world increases. They have a sense of their own ideas, proving their point, showing their growth. [1]The manifestation of creativity is curiosity. It serves as an incentive to explore the unknown world. Focusing on the unknown events provides a link between the outside and the inside. Involvement in the creative process helps to increase the activity of each person in all areas, to develop his creativity. Increased mental and physical activity during adolescence has a more positive effect on student activity. Now they are more interested in mind-numbing games and exercises that require effort and independence. This allows them to develop their mental abilities, ie "creative thinking" skills. At the same time, the "teaching methods" used in the educational process play an important role in the formation and development of "creative thinking". These styles should encourage students to think freely and increase their independence. Allowing students to enjoy their success will allow them to discover their creative talents and gain strength and confidence. This requires solving problems that require increasing levels of difficulty, a creative approach, discussing and analyzing problem situations, and so on[2]. Solving such problems allows students to assess their own creative potential, to activate their inner potential, that is, to understand themselves. The environment and science teachers in the educational institution will play an important role in the success of these processes.

The following elements should be considered in order to form a creative personality in the educational process:

- Believing that every student is gifted with creativity;
- to achieve a wide range of student development;
- increasing creative work in education;
- being the creative approach of the teacher.

### **Developing students' "imagination" and "creative thinking" skills in teaching physics**

Given the fact that adolescents' brains are well-formed, that is, they can analyze data well, and now they are taught foreign languages, natural subjects such as physics, chemistry, biology, English, German, Russian, etc. Applying existing knowledge in one subject to another gives good results[3]. In teaching most subjects in the natural sciences, including physics, have to rely on students' "imagination." Because they can only be studied indirectly, that is, by results or by some means. Indirect knowledge is knowledge gained by enhancing or facilitating the observation of human senses. An example of this is the knowledge gained through experimentation or modeling. At the same time, to analyze this knowledge, man is endowed with the ability to "think" and reason. These abilities do not mean that man is physiologically limited, and with his help man was able to look from a distance into space to the bottom of a nucleus 10-15 m in size. There are many ways to acquire indirect knowledge. These are:

- **idealization** - an ideal object is created with some limitations, and with its help the properties of a real object are studied. For example, the concepts of material point, ideal gas, absolute solid.

- **modeling**-analogy-based method. In this case, the object that is difficult to study is replaced by another object that is similar to it, but easier to study.

- The knowledge gained from studying the model is applied to the initial object. This method is used to study objects that are difficult to study directly. For example, the micro and macro worlds, which are difficult to see.

- **Experiment (a scientific experiment)** - a method of studying an object that is difficult to know directly. In this situation, human uses devices that enhance the human senses or make it easier to observe. This method transformed man from an observer of nature to a researcher. For example, Rutherford's experiment to determine the structure of the atom.

Imagination is proof that the human brain is the most advanced computer. The computer brain has "electronic literature" about many events. It is not surprising if these "electronic publications" are written in our computer brains through some genes. Our life experiences and knowledge awaken and activate these "e-books" that are "dormant". When we call this "electronic data", events unfold before our eyes. An inner voice describes events, and we can only write down what we hear and see on a piece of white paper.

Each artist depicts a scene differently. This is due to the fact that the landscape made a different impression on them. Similarly, the "electronic description" of a process in the brains of different individuals varies. This is due to the knowledge, experience and previously activated "electronic data" of the "computer brain" owner. Thinking hard about a problem, looking for something new, can activate new "information" that was previously unknown to anyone. This is called "creative thinking." These data can be proven in experiments and turned into "scientific discoveries". Einstein and Bohr's famous intellectual experiments are a good example of this. These experiments were performed in a "computer brain", their "electronic versions" were activated and only then tested in practice. Then it goes into a long memory and becomes "knowledge". As a result, this information creates a template in the brain. Subsequent information is compared with this template, and similarities and differences are noted and converted into new knowledge. The imagination divides and reconstructs the object until it finds the necessary "electronic information", which predicts the result of creation. In other words, it allows things and events that did not exist before to occur.

In addition to acquiring new knowledge using existing knowledge, imagination also helps a person to transfer knowledge from one field to another and use its conclusions to solve new problems. The elements of thought in imagination and imagination in thought complement each other.

According to A. Einstein, imagination is more important than knowledge. Knowledge is limited, "imagination" pervades the whole universe, creating development.

There is a close connection between 'creative thinking' and 'imagination'. Therefore, to improve 'creative thinking', it is recommended to practice painting, imagine the studying process, and draw a picture.

Physics is the study of the simplest and most important laws of natural phenomena, the properties of matter, its structure, and the laws of its motion.

The questions of why, why not, are the basic questions of physics.

Like all-natural sciences, the main goal of physics is to study the laws of the material world around us, the laws of nature.

What are the laws of nature?

It turns out that everything in the material world is closely intertwined. The most important of these connections are the laws of nature. The law shows exactly how changes in nature happen. For example, day alternates with night, summer with autumn, winter with spring. Why is that? It turns out that the reason for the change of day and night is that the Earth revolves around its own axis, and the reason for the change of seasons is that the Earth revolves around the sun. We know that the laws of physics are manifested by looking closely at natural phenomena.

Any physical body changes. For example, a tortoise moves, water evaporates or freezes. Such changes were noticed in ancient times: "It is impossible to enter the same river twice", - said Heraclius 544-583 BC.

**The changes that take place with physical objects are called events.**

**When the composition of a substance changes as a result of a change, such a change is called a chemical event.**

**If the changes do not change the composition of the substance, such changes are called physical phenomena.**

How to understand the meaning of physical phenomena. What methods do physicists use. The basic method of physics is the scientific method of investigation.

**Physics, not only in physics, but in all-natural sciences, has the function of a "window to the world" - to see, hear, feel (touch), feel, feel and taste.**

Because our senses are imperfect, the information we receive from them can be deceptive. One thinks about what one sees and hears and makes hypotheses. In other words, observation encourages thinking. How do you know if the Hypothesis is right for sure? To do this, special experiments are conducted, and as a result of these experiments, certain knowledge is gained.

Thus, not only physics, but also other natural sciences move along the chain of observation - thinking - experience - knowledge.

Visualization of processes in the teaching of natural sciences, including physics, to students is important in the educational process. Because visual information is recognized and recovered faster. The human brain analyzes visual information sixty thousand times faster than verbal information. Even when people were shown more than two and a half thousand images in 10 seconds, their image recognition rate was no less than 90 per cent. After a year, the figure was 63 per cent. If the information is given orally, after 72 hours, people will remember only 10% of it. If the text is presented in the form of an image, this figure increases to 65%. The colour, location, size, and movement of the image are striking. Therefore, it is advisable to use animations in the lessons. Therefore, it is advisable to use information technology to increase the productivity of education [4].

---

One of the most effective ways to visualize information and develop 'creative thinking' skills in education is through the 'Mind Map', which is widely used in education today. [5-7]

Teaching topics in all subjects using Mind Maps helps students to explore topics independently and develop their 'creative thinking' skills. The use of "intelligence maps" in activities activates the right hemisphere of children's brains, and they learn to work in the process of "full thinking". [8-9]

### **Results. System of international units of physical quantities**

#### **Mind map "System of units".**

As noted, the main method of verification in physics is experiment. Scientific theories are created in order to explain and justify the results of experiments. All this leads to the study of objective laws that exist in nature and, as a result, to the creation of physical laws related to them. The laws of physics are expressed through certain relationships between physical quantities.

**Physical size is a quantity that is quantitatively specific to each physical object, but qualitatively common to many objects and represents one of their properties. [10]**

A quantity that fully expresses a physical quantity, both quantitatively and qualitatively, is called its true value.

The values of physical quantities are determined by constantly improving experiments, and their comparison requires the introduction of agreed units (system of units).

The system of physical quantities consists of basic and derivative quantities. There are seven basic physical quantities, three of which represent the basic properties of the material world: length, mass, and time. The other four: current, thermodynamic temperature, amount of matter, and luminosity are derived from a branch of physics.

The value of a physical quantity indicates its magnitude and depends on the unit selected.

**A unit of physical quantity is a physical quantity that is used to quantify each physical quantity, conditionally denoted by a numerical value equal to one.**

Typically, the unit is denoted by the size symbol: [s] = 1m; [m] = 1 kg and so on. The set of basic and derivative units of physical quantities forms a system of units.

The International System of Units (SI) was adopted at the General Conference on Weights and Measures in 1960 and consists of seven basic units - meters, kilograms, seconds, amperes, kelvins, moles, candelas, and two -the unit is composed of radians and steradians:

meter (m) - the length of the path of light in the space at  $1/299792458$  s;

kilogram (kg) is the value of the kilogram determined using the Planck constant. [11]

second (s) is the time equal to  $9192631770$  of the radiation periods corresponding to the transition between the two ultra-thin surfaces of the basic state of the caesium-133 atom;

Kelvin (K) - a unit of temperature equal to one part of the thermodynamic temperature of the tertiary point of water from 273.15;

ampere (A) is the interaction force of  $2 \cdot 10^{-7}$  N per meter of length between these thin, infinitely long conductors located parallel to each other in space at a distance of 1 meter is the alternating current that generates;

mol (mol) - the amount of matter in the system, the components of which are equal to the components present in  $^{12}\text{C}$  nucleate with a mass of 0.012 kg;

Candela (cd) - light intensity in the direction of a source of monochromatic radiation with a frequency of  $540 \cdot 10^{12}$  Hz, energy intensity  $1/683$  W / sr;

radian (rad) - an angle between two radii and the length of the opposite arc is equal to the radius of the circle;

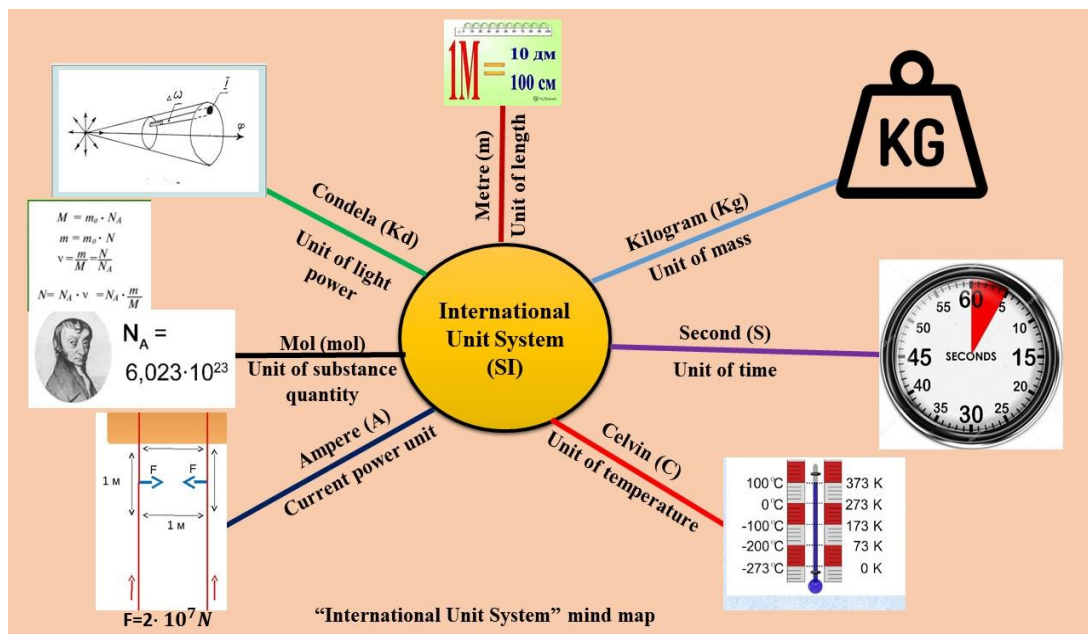

steradian (sr) is the spatial angle at the centre of a sphere, separating the surface from the surface of a sphere equal to the surface of a square whose side is the radius of a sphere.

Derivative units are determined according to the laws of physics.

There are two types of measurements:

- Indirect - the numerical values of physical quantities are determined directly using measuring instruments.
- Indirect - numerical values of physical quantities are calculated using the results of measurements of numerical values of other physical quantities.

Using a mind map to teach physics without putting a lot of information together can help students not only develop their “imagination” and “creative thinking” skills, but also their “full thinking” skills. [12-15]

## CONCLUSION

The mental states of the 10th and 11th forms were discussed and their sense of greatness, self-demand, and interest in learning about the world.

- Given their interests, it is expedient to use indirect methods of learning, which are important in the teaching of physics, to develop the skills of "creative thinking".
- It is based on the importance of improving the "imagination" and visualizing information to improve the skills of "creative thinking".
- The main method of physics is experiments, in which the values of physical quantities are clarified. The International System of Units (SI) is used to determine the relationships between physical processes.
- The article provides a mind map of physical quantities "International System of Units". Instead of concentrating information on basic physical quantities on a mind map, it allows students to develop their "imagination," "creative thinking," and therefore "full thinking" skills.
- It is advisable to use the "mind map" to improve the methods of developing "creative thinking" skills in students.

**INTRODUCTION**

Educating and educating young people has always been one of the top priorities of any state. In the same way, in our country, such cases are always in the focus of attention of our leaders.

The Action Strategy on the five priority areas of development of the Republic of Uzbekistan, adopted on the direct initiative and under the leadership of the President of the Republic of Uzbekistan Sh.M. Mirziyoyev, has launched a new stage of development in the republic. The

practical results of this process are reflected today in all spheres of our lives, and most importantly, in the minds, aspirations and actions of our people.

Particular attention is paid to the improvement of the education system, which is one of the priorities of the fourth strategy of action - the development of the social sphere.<sup>1</sup> In his speeches and conversations at various meetings, the head of our state stressed the need to raise the issues of upbringing a harmoniously developed generation and a healthy lifestyle for young people.

<sup>1</sup>Decree of the President of the Republic of Uzbekistan "On the strategy of further development of the Republic of Uzbekistan". Tashkent, February 7, 2017. PF-4947.

As the President said: "If we do not bring up our children properly, if we are not aware of their behavior and mood every day, every minute, if we do not teach them science and profession, if we do not find a decent job, this deposit will be rich. We can give it away"<sup>2</sup>.

As you know, "On Education" and "On the National Training Program"<sup>3</sup> The laws also set the task of training highly qualified specialists in our country who can meet the requirements of world standards. In particular, the goal of the National Program of Personnel Training is to radically reform the education system, to completely rid it of the ideological views and deviations of the past, to develop a national system of training qualified personnel at the level of developed democracies. is to create.

The modern education system is a single purposeful process of education and upbringing. It is also the variability, as well as individualization, of the knowledge, skills, values, functions, experiences and skills acquired and implemented. If we turn to the pedagogical dictionary, we find the following definition: "Education is an integral part of society and at the same time a product of social development." This means that education is constantly evolving and must always meet the goals and objectives that society shapes.

In the recent past, the teaching of English has focused mainly on grammar. It took a lot of time to read and translate texts, and sometimes to memorize "topics" and write dictation to revive the monotony, and this process is hard work. Today, the main supply in the language market is formed depending on consumer demand.

According to SG Ter-Minasova, a leading specialist in linguistics and methods of teaching foreign languages, "Today, as a result of functionalization of language teaching and integration processes, the study of foreign languages, especially English, has become even more important.

<sup>2</sup>Mirziyoyev Sh. Let's work together for the fate and future of our country. // "People's speech", June 16, 2017.

<sup>3</sup>Laws of the Republic of Uzbekistan "On Education" and "On the National Training Program". – T.: "Sharq", 1997

But modern language learners are not interested in the history of language or its theory. English became necessary for them to meet their vital needs"[1, 27].

Modern teaching methods are widely used in the educational process of the educational institution. The use of modern teaching methods leads to high efficiency in the teaching process. When choosing teaching methods, it is advisable to choose each lesson based on the didactic task [2, 39].

Education and upbringing of a harmoniously developed generation and training of qualified personnel depend in many respects on the teacher-educator. A qualified teacher is a responsible person who has high professional skills, knowledge and skills, can use information and communication technologies, purposefully uses educational technologies in teaching, responds to the content and quality of teaching. Enrichment of training sessions with methods that activate learners depends on the level of their mastery leads to the rise of This requires a rational organization of the teaching process, increasing the interest of students in the learning process by the teacher and constantly encouraging their active participation in the learning process [3, 10-12].

In his work, the author emphasizes that the teacher in the modern lesson is not the only dominant source of information, but, as K. Rojeres (USA) emphasizes, it should be a facilitator, that is, a condition that facilitates independent learning of students, creating favorable conditions for them [4, 103].

The author has learned that the grammatical differences between the British and American versions of English are very small and insignificant in phonetic, lexical, and other terms. Much has changed since British researchers introduced a ridiculous language called “English into New Worlds” 400 years ago. The misleading part is the richness of vocabulary, and the same English words have a special meaning in the United States [5, 187-188].

This literature identifies modern methods of teaching English, which are widely used today in higher education institutions of the country, non-governmental educational institutions, comparative analysis of fundamental, linguistic, sociocultural, communicative methods, their role and importance in the educational process [6, 100].

In the first phase of our research in secondary schools, it was found that increasing students' interest in the science of English during the study of systematic program materials gives effective results.

During the 2010-2020 academic year, pedagogical experiment - test stages and its final type were conducted. Pedagogical experiments - tests In secondary schools No. 11 and 13 in Termez, classes 5a, 6a, 7a were selected as experimental, 5b, 6b, 7b as control classes.

The results in the basic experimental classes (5a, 6a, 7a classes experiment, 5b, 6b, 7b classes control) of the general education schools where the experimental training was conducted were compared with the results obtained from the control classes.

366 students took part in the experimental work: 180 students in experimental classes and 186 students in control classes.

Classes were conducted by teachers of English in secondary schools on the basis of methodological developments of the dissertation.

A comparative analysis of the results of the substantiating and concluding stages was conducted to study the final level of activity of the experimental and control class students.

Based on the experimental work and the results obtained, we came to the following conclusions:

1. The model developed for the development of English language science fully confirms the hypothesis we put forward.

2. Criteria for the effectiveness of the development of English language science in accordance with the developed model and didactic conditions.

3. Based on the conducted experimental work, the following results were noted on the criteria a) cognitive criterion - the level of knowledge of students in English is as follows: in experimental classes: quality indicator - 28.75% and 36.45% each; mastering rate - from 70.84% to 100%; average score - increased from 3.2 to 4.05; in control classes: quality indicator - from 24.55% to 30.28%; mastering rate - from 69.25% to 98%; the average score increased from 3.00 to 3.95 (see Table 1).

**TABLE-1 THE LEVEL OF DEVELOPMENT OF KNOWLEDGE OF ENGLISH IN EXPERIMENTAL AND CONTROL CLASSES**

Academic year	Experimental class			Control class		
	Quality indicator, %	Assimilation indicator, %	Average score	Quality indicator, %	Assimilation indicator, %	Average score
<b>2019-2020</b>	28,75	70,84	3,2	24,55	69,9	3,0
<b>2020-2021</b>	36,45	100	4,05	30,28	98	3,95

b) need-motivation criterion - the level of development of value orientation in students was distributed as follows: in the experimental class: the high level increased from 17.7% to 21.6% (3.9%); the average level increased from 69.6% to 71.9% (2.3%); low levels decreased from 12.7% to 6.6 (6.1%); in the control class: the high level increased from 13.5% to 17.1% (3.6%); the average level decreased from 69.3% to 68.5% (0.8%); the low level decreased from 17.1% to 14.3 (2.8%) (see Table 2).

**TABLE-2 LEVEL OF DEVELOPMENT OF INTEREST IN ENGLISH SCIENCE IN EXPERIMENTAL AND CONTROL CLASSES**

Academic year	Experimental class			Control class		
	High, %	Medium, %	Low, %	High, %	Medium, %	Low, %
<b>2019-2020</b>	17,7	69,6	12,7	13,5	69,3	17,1
<b>2020-2021</b>	21,6	71,9	6,6	17,1	68,5	14,3

c) operational-practical criterion - substantiated experimental work development of professionally significant qualities compared to the results the level ranged from 3.33 points to 4.65 points (1.32) in experimental class students points), in control class students from 3.27 points to 3.51 points (0.24points) increased (see Table 3).

**TABLE-3 A COMPARATIVE RESULT OF THE LEVEL OF DEVELOPMENT OF PROFESSIONALLY SIGNIFICANT QUALITIES IN EXPERIMENTAL AND CONTROL CLASSES**

Academic year	Experimental class	Control class
2019-2020	3,33	3,27
2020-2021	4,65	3,51

Thus, a significant increase in experimental class results was observed compared with the control class.

The analysis of the quality of knowledge, skills and competencies was carried out using evaluation criteria: the quality of mastery, the transition to automation, the completeness of scientific and conceptual mastery.

The above criteria are based on the coefficient of efficiency, the essence of which is suddenly exceeded in the situation under consideration, which once again confirms the effectiveness of the introduced areas of study in relation to their contemporaries.

The effectiveness of the developed directions of teaching optimization was evaluated using the Student t-criterion, and the results of the research showed that they were statistically significant and not random.

In the experimental and control classes conducted at Termez Secondary School No. 11, the mastery rate was 67% in the control classes, while in the experimental test classes this figure was 90% (see Table 4).

**TABLE-4 TERMEZ CITY 11TH GRADE STUDENTS HAVE MASTERED ENGLISH IN EXPERIMENTAL AND CONTROL CLASSES**

Classes	Experimental test class (class A)					Control class (class B)				
	Number of students	Good rating	Average grade	Low prices	Assimilation, %	Number of students	Good rating	Average grade	Low prices	Effort, %
5	33	26	3	4	84	28	9	8	11	60,7
6	27	20	5	2	92,5	29	10	9	10	65,5
7	25	19	4	2	92,0	31	13	10	8	74,1
<b>Total:</b>	85	65	12	8	90,0	88	32	27	29	67,0

■ an indicator of what has been mastered in the experimental test class. ■ mastered in the control class.

■ an indicator of mastery in the experimental test class. ■ not mastered in the control class.

In the experimental test and control classes conducted at Termez Secondary School No. 13, the mastery rate was 64.2% in the control classes, while in the experimental test classes this figure was 89.4% (see Table 5).

**TABLE-5 TERMEZ CITY 13TH GRADE STUDENTS' ENGLISH LANGUAGE PROFICIENCY IN EXPERIMENTAL AND CONTROL CLASSES**

Classes	Experimental test class (class A)					Control class (class B)				
	Number of students	Good rating	Average grade	Low prices	Assimilation, %	Number of students	Good rating	Average grade	Low prices	Effort, %
5	33	26	4	3	90,9	35	10	11	14	60,0
6	32	22	8	2	93,7	32	7	14	11	65,6
7	30	23	4	3	90,0	31	8	13	10	67,7
<b>Total:</b>	95	69	16	8	89,4	98	25	38	35	64,2

■ an indicator of mastery in the experimental test class. ■ mastered in the control class.

■ an indicator of those who have not mastered the experimental test class. ■ not mastered in the control class.

---

## CONCLUSION

The system of using intensive methods in teaching English in general secondary schools has been improved, the level of mastery in the experimental and control classes has been found to be high, and the number of low-grade students has significantly decreased.

## ROLE OF SMALL SCALE INDUSTRIES IN ECONOMIC DEVELOPMENT

**Syed Waliullah Quadri\***

\*Department of Commerce Kakatiya University,  
INDIA

### ABSTRACT

*For any economy there are three sectors plays an important role.. After the independence agriculture sector, industrial sector and service sectors increased their performance and their contribution to the economy. After the independence government of India has taken the initiative of mixed economy. After the 1991 reforms made Indian manufacturing sector to take a major role in development. The globalisation and liberalisation which removed the import restrictions, brought in foreign competition led to privatisation of certain government owned public sector industries and liberalised foreign direct investment. The industrial sector is the one which is playing has taken a steady growth after the 1991 reforms, as Indian is a populated country more number of products and services are required. Industrial sector can provide products but somehow difficult to reach all the rural people due to lack of awareness , cost and distance from the towns. The growth of population has pressured the small sector to increase more and more contribution to economy. As they mainly depends on the products available in local market prepared by the small tiny farmers. These small scale industrial farmers can produce a large number of products to meets the needs of the both the customers as well as the companies. Companies also depends on the small scale industries for MRO (Maintenance, Repair and operating )goods, small products used in produce a big products. These small sectors also a plays an important role in employment generation and economic development. Therefore it became necessary to address the importance of the small scale industries. Present study will focuses the impact of small scale industries in economic development. It also studies the role of small scale industries in providing employment generation in Telangana. Data for this study would like to collect from the secondary data sources.*

**KEYWORDS:** *Gross Value Added, Women Enterprises, Entrepreneur Memorandum And Intellectual Property Rights.*

### INTRODUCTION:

Counties economic development government should actively promote, among the industrial sector small scale industries plays an important role. These small scale industries needs less investment but provide significant contribution to economy. Globalisation its impact is larger phenomenon but small scale industries is a local phenomenon but there is a relationship between these two. There two acts as the main drivers of the economic development of Indian economy. These small scale industries existed in India since ancient times in the form of silk and knowledge based products made by people for their self-sufficiency of rural people. The income which comes from the small scale industries can be distributed among all. For many families its is the only source of lively hood. These small industrial products are Eco friendly which produces less pollution and require locally available material.

### SMALL SCALE SECTOR:

Definition of small scale sector is different from one country to another country based on their economic development , policy formulation and administrative set up. But maximum all countries follow the same formula to define the small scale sector based on the capital investment volume of production and employment status. Government of India has taken more number of steps to define the small scale industries.

In India small scale industry is defined in terms of investment in plant and machinery (excluding the plant and machinery) and further classified into micro small and medium enterprises. Enterprises engaged in the manufacture or production of goods pertaining to any industry specified in the first schedule to the industries (Development and regulation) Act, 1951) or employing plant and machinery in the process of value addition to the final product having a distinct name or character or use.

The Manufacturing Enterprises are defined in terms of investment in Plant & Machinery. These are the industrial undertakings having fixed investment in plant and machinery, whether held on ownership basis or lease basis or hire purchase basis not exceeding Rs. 1 crore.

<b>MANUFACTURING SECTOR</b>	
Enterprises	Investment in plant & machinery
Micro Enterprises	Does not exceed twenty five lakh rupees
Small Enterprises	More than twenty five lakh rupees but does not exceed five crore rupees
Medium Enterprises	More than five crore rupees but does not exceed ten crore rupees
<b>SERVICE SECTOR</b>	
Enterprises	Investment in equipment's
Micro Enterprises	Does not exceed ten lakh rupees:
Small Enterprises	More than ten lakh rupees but does not exceed two crore rupees
Medium Enterprises	More than two crore rupees but does not exceed five core rupees

### REVIEW OF LITERATURE:

- Dividend policy is one of the most important financial policies,

- Anna Patil: Role Of Small Scale Industries In Economic Development: research concluded that small scale industrial sector is next to the agricultural sector in terms of employment generation.
- Dr. V.K. Gupta and Abhishek Chaturvedi : Role And Contribution Of Small Scale Industries In Economic Development In India. the present attempt to focus the present status of performance of MSMEs in India & future prospects. It is concluded that this sector contributes significantly to manufacturing output, employment, exports of the country. Research concluded that small scale sectors not only provide lower labour intensive production but also industrialisation of rural backwards.
- V.Mallika., Assistant Professor: The role of small scale industry in reduction of poverty in India: small scale industries are providing the employment opportunities , rise of industrial productivity , rise of exports and also rise of very impressive growth of GDP. The government that the state should provide the financial assistant to the small scale so that the contribution will increase.
- Shyambathi: India: the role of small-scale industries in an emerging economy: the study focuses Various factors affecting the growth and development of small-scale industries and the problem faced by this vital sector of Indian economy is examined. The contribution of small-scale industries in employment growth, production, export promotion and other economic indicators are discussed. Conclusions drawn from the analysis of the data suggest that the various policy initiatives taken by the Government of India since independence have helped this sector to grow considerably.

#### **OBJECTIVES OF THE STUDY:**

- To study the role of small scale industries in economic development of Indian economy
- To study the role of government in providing the assistance to growth of small scale industrial sector.
- To study the role of small scale industries in providing employment generation and women empowerment.

#### **RESEARCH METHODOLOGY:**

The data has been collected from secondary sources comprising of micro small and medium Enterprises annual reports, Ministry of Commerce and Government of India, ministry of micro small and medium from. Collected data scrutinised and classified in a systematic manner.

Assessment of MSME conducted mainly by two ways:

- By conducting of periodic All India Census of the Sector.
- By collecting the number of Entrepreneur Memorandum Part-II (EM-II) filled at DICs. (Replaced with Udyog Aadhaar online filing system since September, 2015).
- For the purpose of the present study data is collected from the report published in MSME report 2015. MSME presents its data every year based on the some base year. The data for the. The CSO published its sixth annual report in 2016.

### **MSME Establishments**

It is observed from the annual report the growth of the number of EMII fillings changed from 1.73 in 2007 to 4.25 in 2015. It means there is a steady growth in MSME sector. The growth rate is 17 percent from 11377. As per the Sixth Economic Census (2013), 58.5 million establishments were found to be in operation. 34.8 million establishments (59.48%) were found in rural areas and nearly 23.7 million establishments (40.52%) were found to be located in urban areas.

Livestock was the major economic activity (86.74%) of agricultural sector. Retail Trade (35.41%) followed by Manufacturing (22.77%) were the dominant ones within the non-agricultural sector. Among the States, maximum growth rate of establishments during 2005-2013 was observed in Manipur (121.07%) followed by Assam (107.99%) and Sikkim (100.07%)

### **MSME in Employment Generation:**

It is observed from sixth economic census that MSME sector alone generated 131.29 million persons in 58.5 million establishments. Out of the total 131.29 million persons, 67.89 million persons (51.71%) were employed in rural areas and 63.4 million persons (48.29%) in urban areas. While employment in Own Account Establishments was of the order of 58.15 million persons (44.29%), the employment in establishments with at least one hired worker was about 73.14 million persons (55.71%). Agricultural establishments provided employment to around 22.88 million persons (17.42%) and the non-agricultural establishments provided employment to around 108.41 million persons (82.58%). The growth rate of employment since 2005 was of the order of 38.13%.

### **Role of SSI industries in providing women empowerment:**

From the report it would be evident that establishments owned by women entrepreneurs 8.05 million (13.76%). These establishments provided employment to 13.45 million persons (10.24%), out of which 83.19% were without hired workers. About 88.8% of the workers were employed in the establishments hiring less than 10 workers. Total number of Self Help Groups (SHGs) were 0.19 million out of which all women Own Account Establishments were 89%. → Out of establishments under women entrepreneurs, about 34.3% belonged to agricultural activities, with livestock dominating therein having a share of 31.6%. Average employment per establishment for women owned establishments was found to be 1.67.

### **CONCLUSIONS:**

Micro, small and medium sector players are among the worst hit as banks continue to practice caution in lending to the industrial sector. Small scale industries are very important in providing employment generation, entrepreneur development, export generation, creation of livelihood and balanced regional development. The sector plays a role in achieving sustainable development goals of the nation. The industries also played a role in innovative technological development by providing engineered products. The sector some time faces problems like unwillingness of banks in providing financial assistance, lack of technology, market uncertainty and lack of planning. There needs to be regular dialogue between the stakeholders of the sector and government should provide the assistance to strengthen the sector. The government could consider dedicating

specialised financial schemes for addressing difficulties in assessing and providing credit for small enterprises, as also providing line of credit to firms which are under financial stress.

 Namangan State University,  
 UZBEKISTAN

### ABSTRACT

*In the article the ideological struggle of the Soviet government against the Islam religion in the first half of the XX century, persecution of religious people, finishing “vaqf” properties and the situations in Fergana valley are described. Also, negative consequences of the religious politics of the Soviet government in Uzbekistan is criticized in the article.*

**KEYWORDS:** *Soviet State, New Economical Policy, Islam Religion, “Vaqf”, Madrasahs, Temple, Mosque, Mutavalli (A Staff In Mosque), Bolsheviks, Ideology, Policy, Religious Organizations, Courts Of Sharia, Old-Styled Schools, Jadids.*

### INTRODUCTION

The struggle of the Soviet state against Islam rose to its new stage in the 20 years of the XX century. This can be explained by the violation of Muslim temples, which was considered a new wave of religious policy carried out at that time, the construction of pigeons and mineral fertilizers in their place, the persecution of the cultists.

In order to deprive the religious institutions of material resources, Soviet power issued a decree “on the abolition of foundations” with the order of December 14, 1918 № 6486 [1: B.287]. According to him, in Turkistan, in the Fergana Valley, the use of the properties of the foundation, which was formerly a material base of education and culture and was managed by trustees (from 1918 to 1920 years, foundations were included in the budget of state and local organizations and madrasahs, garages were closed, Sharia courts were liquidated), the policy of confiscation of them. At that time, the foundation lived in land properties, the material conditions of thousands of peasants who were engaged in the farm deteriorated, a large part of the land lost its fertility, became abandoned, neglected places. Returning the peasants to their land, paying

attention to the economic crisis in the country, the Soviet government left the issue of the complete liquidation of the foundations later.

Due to the trustees management of the property of the foundations in Madrasah and mosques, the rulers of religious institutions, whose activities were in existence, received a wide outbreak in the hands of individuals subordinate to the Bolshevik order. For example, the former Soviet of Margilan deputies accused the Imam of the Yorota mosque and the White Madrasah of appropriating the income of the foundation in his personal favor, and on July 19, 1919 he was dismissed.

At the meeting of the Namangan city Executive committee, which was on August 27, 1918, the Ayritom mosque trustee Ismoilkho'ja Eshon was dismissed for giving false information about his "crimes", that is, the income and expenses that came to the mosque. In the same year, Kholkhoja Eshon madrasa trustee Mulla Abdukahhor, Abduvahobboy madrasa trustee Mulla Ashur Rahimov (Andijan), Imam of Sabirkhoja mosque in Shakhrikhan Mulla Sadullakhoji were also taken from the case on charges of looting the foundations.

According to the sources of the archive, the madrasah, located in the Fergana region in 1918-1921 years, a large part of the mosques were destroyed and they were separated from their sources of income.

On November 17, 1920, following the Charter of the Turkestan ASSR NCC and the "Russian Federation on land use in the Republic of Turkistan", the foundation began to transfer lands to the state and completely abolished [2: B.35]. In the law, the foundations belonging to the mosques were not temporarily touched.

At the beginning of 1921, the Religious Department of the Cabinet of Ministers of the Republic of Uzbekistan became interested in the construction of mosques and madrasahs and began to lead them to their maintenance and repair. The offices of this department in major cities such as Tashkent, Fergana, Andijan, Margilan, Namangan, Kokand, Khujand, Osh, Samarkand were operating and holding its influence in the rural areas. That is, the activities of the mosques in the villages were focused on issues such as fasting and the spending of charity and fitr charity from the population of Kurban Eid days, the arrival of saints on the pilgrimage to Khaj [3: B. 43].

In 1922-1924, the opening of some way to religion and the activities of religious institutions was associated with the activities of Soviet power in the period of a new economic policy (NEP). Factors such as the complete destruction of the farm due to ruthless military clashes, the terrible famine, the process of resistance to Bolshevik procedures, had forced the authorities to work in a compromise way in the management.

The decision of Turkestan ASSR MIK on the right of substitute-tooth controlled by the educational department of the foundation offices and the activities of the religious department of the Cabinet of Sharia further aggravated the situation of religious institutions. The old method was reformed by the Educational Department of schools and orphanages.

All regional activists took part in the meeting of the Fergana district executive authority held on 4 December 1928, in which mainly the religious issue was discussed. At the meeting, issues such as the complete liquidation of the properties of the foundation, the Prevention of the activities of old-style schools, the immediate transfer of the buildings of the pulled religious institution to the state, and the formation of a special commission, their functions were determined. The

transparent aggression of Soviet power in 1928 against the activities of religious institutions and organizations caused not only spiritual and religious, but also members of society as a whole.

The head of the Soviet state after I. Stalin stated in his speech on 3 March 1928 year that “the fight against the ears, the decisive struggle against religion”, religion and the pious became victims of a brutal repression. The adoption of the above-mentioned decisions also put an end to the activities of the religious department of the Cabinet of Sharia. To this extent, the aggravation of the policy of secularism of Soviet power led to the fact that, even in accordance with Article 158 of the criminal code of the USSR of Uzbekistan, criminal liability was established in relation to persons who tried to establish religious organizations and open old-fashioned schools. The above decisions of Soviet power in relation to religion and religion began to show the practical foundations of its rapid integration in Uzbekistan. The income of foundations, the material basis of religious institutions and organizations, was confiscated, 90 percent of the income from the property of the former foundation was transferred to the construction of Soviet-type schools, 10 percent to the account of the people's educational commissariat [4: B. 225].

In the history of Soviet society in the late 20s-early 30s of the XX century, religious institutions and organizations, as well as religious leaders, attitude towards the pious were extremely reactive, mercilessly characterized by a large scale decline of the atheist movement. The ideas of the all union of godless gods, carrying out its propaganda and propaganda work, trying to prove the “falsity” and “groundlessness” of holy places in the villages between the working and peasant masses, condemning the pious as supporters of the bourgeoisie and the petty bourgeoisie, accusing them of hostility to socialism, visiting the tombs of the holy saints, widely propagating the harmfulness of religious.

In 1938-1939 in Andijan city there were 71 mosques, 1 Russian church, 3 Jewish synagogues, which prevented the performance of religious ceremonies in various ways. In order to preserve its religious values and Islamic institutions, the work of raising funds through the hashar of the population is also understood as the propagation of scribes by government agencies. And this was one of the excuses in the queue, which was conceived to persecute the pious.

In the Fergana region of the Republic, literature and manuals containing 79 166 sums of the fight against religion were purchased in 1940 for the wide propaganda of anti-religious propaganda. In 1940, on the territory of the only Fergana region, the number of “wrestling godless” yachts reached 2 243 units, and the number of members was 45 824 people. There were also 272 agitators in the country, 210 lecturers in the cities and villages, who carried out anti-religion propaganda [5:p. 225].

At the meeting of the party of Fergana region, which was held in September 1940, it was noted that the chairmen of the Council of Soviets of all cities and villages will be given strict control over religious institutions in their territories, re-registration, demolition of unsuitable mosque buildings and the use of construction materials derived from them for other purposes to

In the 20-40 - ies of the XX century, the drastic changes aimed at finding a mini-decision on administrative-command in the sphere of socio-economic and cultural policy of Soviet power dealt a huge blow to religious scholars, as did all strata in society. The transparent aggression against the people of religion and the people of religion has long had a negative impact on them, which they cannot cope with.

In 1940, more than 3 000 printers were registered in Fergana, one of the largest regions of the Republic. Most of them were mosque imams, neighborhood mullah, qori and Otinbibis, who were secretly or openly operating in cities such as Kokand, Andijan, Margilan, Namangan, Chust, Asaka, Kuva, and some were forced to engage in farming or crafting because of the tax burden, while some were forced to give up their religious duties. In 1939, 316 scholars in Fergana region were taxed 621511 soums, in 1940 367 of the scholars were taxed and 798754 soums were imposed upon them [6: p. 162].

Another of the factors that contributed to the repression of Muslim scholars was also due to personal hostility of the heads of government by members of the Soviet local government in the localities. There have also been cases of retaliation from such scholars when the time comes of mutineer leaders who have criticized some religious scholars for their lack of justice in power, bribery, moral corruption, hypocrisy. Religious scholars have been accused of giving young people a religious education and starting them wrongly, as if they are being distracted. “Meliboy khalfa, who lives in the village of Big-yaydak in the Naryn District of Fergana province, at the same time, without working anywhere, is seducing young people with religious propaganda, taking money from some as a talisman. It also organized religious conversations, gathering people of many different ages at home. In the village under its influence, fasting people have increased”, many can meet the charges.

Well, thanks to the inhuman, violent policy of Soviet power on religious scholars, scribes perfectly aware of Islamic knowledge and spirituality in the Republic were completely lost, instead of them blind performers, persons who were superficially aware of religious knowledge, took the leadership of religious institutions. Such people performed their duties and were the executors of the orders issued from above. Religious scholars have been trampled on by spiritual values in the process of repression. Religious and secular sciences preserved by the scribes, as well as rare manuscripts reporting from the past of our country were confiscated or lost.

The collapse of the independence movement, the mass penetration of the entire layer of the peoples of Turkestan into the path of this struggle forced the Soviet authorities to conduct a cautious policy. Turkestan ASSR MIK with the aim of shifting foundations to madrasahs and mosques and entering into the trust of local residents with the purpose of repairing religious institutions, stabilizing life in the country in favor of the Bolsheviks. Turkistan ASSR MIK on June 20, 1922 year 75-digit, on October 23, 1923 year 164-digit. Although the soviet governorship returned the foundations to religious institutions and organizations, their activities were controlled by the state legislature [7: p. 227].

The above decisions of the Soviet authorities in relation to religious institutions will soon be the conduct of a national-territorial boundary in Turkistan. also, with the solution of domestic political and economic problems, he again returned to the path of his policy, which consisted of ingenuity in relation to religious organizations. The activities of Muslim institutions in the Fergana region were completely reflected on the basis of the decisions of the measures to end. The religious policy of the Soviet government of Uzbekistan conducted in the USSR, like other spheres, was based on the requirements of communist ideology, and consisted in the restriction and prohibition of religious belief, one of the centuries-long values of the people. During this period, not only the religion of Islam, but also the struggle against other religions was escalated, which, due to the political situation in the country, sometimes pave the way to a certain degree of freedom of religion, in some periods it was completely subjected to oppression and prohibitions.

Nevertheless, it was not possible to completely abolish religion from the people's hearts, life and household life, which were loyal to their values. Religion, as in all times, remained an important part of the spiritual life of the people.

### INTRODUCTION

"The struggle for national spiritual identity, mastering the cultural heritage is a gross social movement" [1] and plays an important role in the spiritual perspective of our people. After all, various traditions and rituals, the image of fire, which is reflected in folk works, and its analogs symbolic-alligatorial interpretation in terms of mythology, which forms the ancient layer of people's artistic thinking, plays an important role in the study of archaic texts on the symbolic-ritual essence, collecting and researching them is an important issue facing folklore studies.

The religious and mythological views of the Uzbek people on the fire cult, the fire cult are reflected in the composition of wedding, mourning, treatment ceremonies, folk performances, folk poetics. In the surah of the Koran Karim "Yasin" it is said about Allah: "he is the one who

made for you fire from a green tree.”[2] plowing the fire, worshipping it-the zardusht religion, is also very developed in the life of the ancient Turkic peoples. For example, according to Narshahi, Muqanna throws herself into a heated oven for three days, going up to heaven, bringing Angels of fire and trying to defeat her enemies.[3]

Namrud was sure that Abraham alaihissalom was burning ash in the fire. Riding on the animal, the fire passed by. Collected firewood to activate Abraham my carpet was burning. Looking at the fire, Namrud saw Abraham sitting there with a stick.[4] confidence in the people of Uzbekistan in the cult of fire ,the above-mentioned examples of the processes of treatment with fire were the religious basis. Folklore scientist A.Musakulov said that in the science of ethnography the spirit of being the owner of an oven is imagined to be female sex, the cult of fire is associated with cult of trees, and most importantly with the cult of fertility[5] according to the interpretation of S. Chagdurov, the cult of the letter-fire and the suffix of the letter-fire and the.[6]

In Khorezm, the fire burned in the oven itself cannot be extinguished until it is extinguished. In particular, it was considered indecent to extinguish the fire by pouring water into the oven. According to this act, “pour water into your furnace”, there is a matal, on the basis of which the family of the furnace in which water is poured, will die. In turn, this expression is also used as a crow. Here, the cult of fire is combined with the cult of generations. In many peoples there is a view that the family hearth is a mask of the spirit of ancestors.[7]

In Uzbek folk songs it is observed that fire and its attributes such as wood, comb, smoke, furnace, candle, lamp, poetic images such as burning burns are interpreted in specific artistic and aesthetic tasks. First of all, we must say that in Uzbek folk songs the image of fire can come both in its own meaning and in its portable meaning:

Damla palovni dam yesin,  
Tortgil olovni dam yesin,  
Bepul odamlar g'am yesin,  
Tekin desa –shalg'am yesin.

Or:

Chimmati yo'q chiroylik,  
Yur, klubga boraylik.  
Paranjilarni yig'ib,  
Olovda kuydiraylik.

In these songs, the meaning of fire is used in its own meaning. If the first song describes the action of lowering the flame under it, pulling it, before the rest of the pilaf, the second song refers to the fact that the historical event that took place in March 1927 in Uzbekistan burned women's offensive movements, that is, in the fire they collected their claws. In many songs, the interpretation of the flame in a portable sense is overlooked.

For example:

Anor uchu ichim to'lib,

Olov yonar,yor-yor.

Do'stim, senga aytar bo'lsam,

Mehrim qonar,yor-yor.

The concept of “burning fire inside” of a person expresses a portable meaning. This means that a person with this suffers deeply in the soul, suffers from the inside, suffers. In folk songs, the question of fire is also given by the words “grass”, ”fire”, which are its synonyms:

Ochildik hur zamonda,

Ko'ngillarga o't qo'ydik.

Boshdagi paranjini,

Olib o'tlarga yoqdik.

In these Egyptians, the herbivore suddenly guides in two different meanings – both its own and portable. The concept of ”burning fire in a dream” in a portable sense means that the soul is full of dreams and uplifting sensations.

Ro'molimni teng bo'laman,

Ammamga kelin bo'laman.

Ammam kelin qilmasa,

Otashga tushib ketaman.[8]

In this song, in place of the word fire, the suffix “fire”, which is its synonym, is used. The symbol of fire (fire, fire) in a portable sense expresses spiritual suffering, inner suffering and suffering.

Uchakka chiquvdim soz sasi keldi,

Soz bilan jaranglab yor sasi keldi.

Iloj bo'lsa borar edim yoniga,

O'zi kelmay o'tlar soldi jonimga.[9]

In this song, it is not difficult to understand that the grass that was killed by beloved is called “fire of love”. After all, the “fire of love” in folk songs is one of the traditional logos that most often come across.

Yordan kelmadi darak,  
Ishq o'tiga solgan falak  
O'ttizida yor tutib,

Yorga to'ymagan yurak[10]

Or:

Yoningdan ketolmayman,  
Ishq o'tini solgandek.  
Xayolim ketar har yon ,  
Tariqlar sochilgandek [11]

In both of the songs presented, beloved embodies the motivation of negation, from the passionate love grass. They come to parting because of love, heartache for not seeing beloved, longing for his mistress's path, dreams of him saying oh-u screams of disheveled lover are being interpreted. In a word, if a burn in a natural flame brings physical pain and suffering to a person, then the fire of love causes a person to suffer from it, which is also painful. He suffers not due to the body, but the spirit, love and even discredit man it's not for nothing that he makes him mad, mad. This is evidenced by the image of Majnun in our national literature.

Yuragimni kuydirdi,  
Ishq o'tida o'ldirdi,  
Yorim juda nozikdir,  
Meni jondan to'ydirdi.[12]

In the song presented, love is interpreted as a heart-burning, soul-nourishing and lethal powerful force. So it's not that there is no mystical content on the basis of this song. In the song presented, love is interpreted as a heart-burning, soul-nourishing and lethal powerful force. So it's not that there is no mystical content on the basis of this song. So, in mysticism, love is interpreted as a means of reaching God. The spirit of the one who achieves it leaves the material world, the second one goes to the other-to the divine world, and man achieves true love, the love of Allah. In it, love performed the role of the instrument .

Etiging o'kchasi o'n ikki parda,  
Men qaydan duch bo'ldim oshiqlik darda.  
Ikkimiz ham ishq o'tida yonamiz,  
Bermasmikan shu bolaga onamiz.[13]

In folk songs, sometimes the love, sometimes the lover's love, sometimes the lover's love is reflected in the riddle. In particular, in the above quartet, it is stated that the girl, who is in love with the lover, is striving for her boyfriend, dreams in this way. Often parents forcibly transfer their daughter. They do not allow her to be loved and married. As a result, the family foundation, built without love, in most cases quickly cracked. The couple can quickly break up, causing misunderstanding, disinterestedness to each other, warmth in the middle, lack of love awakening. In this song, created on the basis of this life-long truth, it is said that the girl is experiencing the pain of love. He very much wants his parents, especially Hamish, to understand himself, to feel his soul and to marry his beloved, his mother, who has become close to him.

Sen tirik dersan meni,  
Xuddi tirik o'lgandirman .  
Tirik ayrilgan yorimning  
O'tida kuygandirman.[14]

It is a bad situation for people who love each other, who are fond of something, to divorce from each other alive because of life reasons, to face parting and separation. In the song above there is a hint of exactly the same life reality.

Sochini yuvganlar orqaga tashlar,  
 Oshig'in ko'rganlar kunda bir yashar ,  
 Orada dushmanlar o'tday tutashar,  
 Dushmanni kuydirib kunda kel,yorim.[15]

The symbol of the hair in poetry usually refers to the symbol of the mystery of God. The concept of "washing hair" in the song is always a sign of the fact that lovers have their own secret. Because, to wash the hair, it is spread out. So the state of hair washing in the song is equal to the state of spreading the glaze. If the enemy finds out the secret of the lovers, then, of course, he will try to put a between them. Therefore, the secret will belong only to two people (lover). And the third (enemy) is over.

The verse in the song "Come on the day of burning the enemy, beloved" recalls our habit of going to slavery (making a game of slavery), which was passed before the wedding in connection with our past household life. The essence of this custom is reflected in the great epic of the Uzbek people - "Alpomish" poem: "since the Uzbeks have their own picture, they have expressed their own destiny.

It turns out that the groom on the day of the wedding goes. If I do not marry on the day of shul that I have not given the goods, it turns out that the man who is ashamed will remain dry from the wife, as long as his daughter will be sick. Their rust – picture is so that the symbol of immersion in folk songs much. Through it, the sadness of the soul is expressed:

Yurakka cho'g' –olov tashladingiz ,  
 Cho'g' olov-itdan olov, alla.  
 Tutunlari yo'qdir ,uxla.  
 Yuraklar sadporadir ,alla,  
 Butun joyi yo'qdir uning alla[16]

Drowning in the heart-fire is a mental pain that awakens in the heart due to the occurrence of death, separation. Death puts the entered apartment in agony, as it burns the place where it fell. In the song it is emphasized in its own way that the drowning fire that fell on the heart is a dog fire, that is, the fire of death. It is noteworthy that the combination of "dog Fire" has preserved in itself an ancient concept, which consists in the view that the dog is an intermediary of death, as it is highly stressed. The image of the choir is also in its meaning in folk songs, that is, in the meaning of the piece from the fire. For example:

Olaqarg'a o'g'zing to'q ,  
 O'choq to'la pista cho'g'.  
 Kelayotgan kelinchak,  
 Yoring bormi, yoring yo'q?[17]

Firewood is also one of the analogues of fire. Often it is regarded as one of the sources of the flame.

Qoshing qora to'tiday,  
 Saksovulning o'tiday.  
 Ikkalamiz o'ynaylik,  
 Dalada o'sgan qo'ziday.[18]

The Saksovul fire is kept long, and the heat is slightly higher. This very real character, characteristic of him, was the basis for comparing him in folk songs to the degree of the power of love grass.

O'tin yorib o'tirsam,  
 Sarjin boshimga tushdi.  
 Mozorboshidan o'tsam,  
 Dadam yodimga tushdi.

In Real reality it is known that chopping wood is not a light work. Because, when burning wood, it can fly and injure the head. Therefore, special care is required in chopping wood. In this song, the fact that (in the day) falls on the head and damages the head has a symbolic essence. Through this, the idea of the fact that the father dies in the family, and the duties assigned to him by him fall on the head of the eldest son is expressed artistically.

Well, in folk songs there are a lot of such images as fire, grass-related Ash, Ash, wood, three. Through them, mainly, love has four, punishment is expressed artistically.

In place of the conclusion, it should be said that in folk poetry it is possible to observe that the creation of an artistic image from the fire has become a tradition. In poetry, fire is used in many figurative meanings. The symbol of fire is associated not only with the family household, but also with the folklore of calendar or seasonal ceremonies. Trust in the cult of fire has been spread among our people for some time in the form of a wide and certain holistic system. Folk songs are distinguished by their beautiful form and content, beautiful and content, richness and high artistry of beautiful, resonant and impressiveness. In songs, people's life is manifested in all its facets, people's mood is manifested in all its manifestations. Despite the fact that folk thinking, worldview, customs in songs were formed even in the most ancient times, the belief views that have been preserved so far are often manifested through symbolic images. In particular, one of such symbolic images is associated with the e'tigodic concepts of the cult of fire.

 UZBEKISTAN

### ABSTRACT

*This article analyzes the philosophical, social, legal aspects of the concept of Word land, its role in society, human development, development, freedom of speech. The concept of freedom is considered a philosophical concept, widely used in such areas of Social Humanitarian knowledge as ethics, aesthetics, jurisprudence, political science, and its lexical meaning is that a person acts on his own will. In particular, he wrote that we can learn the truth only by comparing all the existing points of view, and there is not enough wise people in the world to determine the truth for everyone in one person. Word freedom is its natural and inseparable right, which is inherent in the inner world of man, forms the basis of all spiritual life and does not allow any aggression and interference of man without his own consent.*

**KEYWORDS:** *Word, Freedom, Word Land, Society, Man, Law, Citizen, Democracy.*

### INTRODUCTION

The word land has so far been practically expressed from the early stages of development of society. First of all, in order to fully understand the concept of the word freedom, it will be necessary to touch on the concepts of words and freedom. In the Explanatory Dictionary of the Uzbek language, the word is interpreted as such a unit (in the language, as a means of expression in speech), consisting of sounds or sounds, a unit of speech that expresses a certain meaning, a section of speech, or a kind, style of meaning. Hence the word is considered to be a means of expression not only a meaningful unit of speech, but also in language and speech. According to A.A.Popov, "word freedom is a unique way of existence of a person and any social subject, connected with his ability to choose a decision himself and act according to his own goals. Freedom is the fundamental, in general, and in particular, the social basis of a person, because it reflects such an attitude of the subject towards his actions, and in this it is the reason that determines them, and therefore they cannot be directly related to conditions, natural, social,

persons communicative, individual-internal or individual - general factors. Word freedom seems to be a way out of a given circle and a creative impetus to something new, but it will not be complete if it does not realize itself externally in the sphere of publicity.[1]

The concept of freedom is considered a philosophical concept, widely used in such areas of Social Humanitarian knowledge as ethics, aesthetics, jurisprudence, political science, and its lexical meaning is that a person acts on his own will. By connecting freedom with different spheres of society, concrete concepts are formed. For example, conscience freedom, will freedom, thought freedom, word freedom, press freedom etc. Freedom is the desire of man, the duty of which is important to society, to insist that other people can do it, to demand. Freedom is the protection of a person from political, spiritual tension, violence. [2] it can be understood from this that the concept of the word freedom is closely related to the two elements described above, and it is purposeful to think of the freedom of speech as part of freedom.

### **LITERATURE AND METHODS**

Consider the philosophical, social, legal aspects of freedom of speech. The word freedom is considered a philosophical category and means "the right to understand", or the ability of a subject to go beyond the limits of emotional knowledge, to discover the surrounding world for himself, and to assimilate his reflected image to the extent necessary for practical appropriation and change in accordance with the needs and interests of people.

From a social point of view, the word freedom "the right of man to communicate with society" is an opportunity for the subject to become an asset to the Real world, including to another person, as part of this world, entering into contact with him.

Legally, however, it is a natural, legally recognized and normalized opportunity for everyone to independently choose the type and measure of speech behavior-to express ideas, thoughts and beliefs (written or oral, in whole or in part, in any question and in any other subject, unless of course this threatens the values protected by law). [3]

Word freedom has not been before, it is inappropriate to think that this concept came into being later. If there were no ideas, ideas and views, society would never have developed. A wide road to freedom of speech can be opened or its limitations began from ancient times. For example, the speeches of the speakers at the public meetings in ancient Greece, Rome, explained their personal recommendations on how to solve the issues that were being discussed, and the people of the camp believed that they were right. The activities of the people's tribunes in Rome can be evidence of our opinion. Also the word earth can begin its history with Socrates's self-defense speech from 399 BC or with the Magna card (the great harp of liberties) from 1215-th year. Or we can refer to the developed Muslim culture of pluralism and tolerance of the VIII-IX centuries. But an attempt to interpret ancient cultures from the point of view of the current concept of human rights would not have been successful. The principle of the word freedom is more suitable in modern historical circumstances, after church reform and religious and political debates accompanying it.

The word freedom is a person who conducts research in the field, according to scientists believe that it began in Europe in the middle ages of BC. But if we take a broader approach to this issue, we can see that it is recorded in the works of eastern scribes and statesman figures or in various historical sources. In particular, in the book Avesto, which is considered the main source of the

religion of Zarathustra, it is noted that faith is based on three pillars. Of these, the first is the purity of thoughts. Based on this base, it can be expressed in any way and method, if the idea is correct. [4] Also in the era of Amir Timur, great attention was paid to the issue of Word land and played an extremely important role in decision-making. Sahibkiran A. Temur wrote: "my experience is past, although how the completion of the work is hidden behind the thing of fate, it is necessary to know the thoughts of the wise and kind people, wishing a council event.... I did everything on board. Every time the councilors gathered and the Assembly was hungry, I would ask them for an opinion by opening the words of good and bad, profit and loss, whether to do things in front of us or not".[5] It should be noted that at that time the word was freedom, which means that each council member had to express his or her opinion freely based on how he or she understood the issues being discussed.

The first truly influential work on the word freedom was the work of John Milton "Areopagitika", written in 1644 year. Areopagitics were created in response to British Parliament's attempts to ban publications that were deemed unacceptable for various reasons. Milton cites a number of arguments to support freedom of speech. In particular, he wrote that we can learn the truth only by comparing all the existing points of view, and there is not enough wise people in the world to determine the truth for everyone in one person. Different opinions are the decisive factor of the development of consciousness in accordance with the search for truth - its main purpose. Therefore, Milton writes that "a person who destroys a good book kills the mind himself" [6]. This argument plays an instrumental role in the freedom of speech in our constant truths conditions. The essence of freedom of speech is the right of a person to express thoughts before the public. Word freedom any authoritative speech means that it must have certain boundaries. In addition, in any authoritative work on the word land of our time, it is emphasized that freedom of speech is important because it is one of the pillars of a democratic society.

It is considered free when the thought can be expressed for a person without negative or dangerous consequences. Thought can be learned from words, because the word is considered to be an objectification of thought for others. By expressing their thoughts in words, texts, a person becomes their public property. If people had not used the right of the word husband, they would not have been able to fully communicate with each other and would not have been able to transfer knowledge and experience to each other. Russian philosopher as V.L.Solovev correctly noted: "neither science, nor art, nor civil society could have been formed" [7].

Word freedom is its natural and inseparable right, which is inherent in the inner world of man, forms the basis of all spiritual life and does not allow any aggression and interference of man without his own consent. In addition to rights such as residence permit, freedom, dignity, personal inviolability, etc., the right to think and the word land is a necessary condition of the life of a civilized society, which must be recognized unconditionally and protected by the state.

Word freedom is the ability of a person to express in any way his thoughts and beliefs in public, to make it public, to disseminate. However, we must understand that there is a difference between discussing political news with a neighbor and talking to a journalist on television. That is why one person's face-to-face or casual communication with another person on any issue does not have social consequences, such as a person's regular speech in front of a group of people. Therefore, the essence of human freedom of speech lies in the realization of the possibility of open communication with its listeners. The essence of freedom of speech is in finding the truth.

Finding the truth is a continuous process. Word-language-thinking mechanism, this is a program of consciousness. According to Hegel, freedom is a substance of consciousness, "While world history is considered to be a development in the understanding of freedom"[8]. The activity of the brain is aimed at finding the truth that is realized with the help of thinking, language; it cannot be done without the freedom of speech. Thinking is a continuous process of collecting and analyzing information about the world around us and the person himself. The word husband is necessary in order to share information that can be both real (socially useful) and false (socially negative). Misunderstood information can lead to the death of both man and all mankind.

### CONCLUSION

In place of the conclusion, we can say that the word freedom is a philosophical category that characterizes the essence of the existence of mankind, which is characterized by the ability of a person to think independently, not to confuse his thoughts as a result of internal or external factors, but to freely express himself in accordance with his ideas and desires.

### ABSTRACT

*In this article, euphemism the application of alternative words instead of forbidden (tabulated) words, during the application of these alternative words, an unfavorable environment that may arise as a result of the application of units banned (tabu) by the speaker is thought to be loosened. Also euphemism, in the opinion of many authors, is regarded as the exchange of non-unity into a reasonable unity, reveals that they are not only a dictionary unit used in place of taboos, but also units used in place of words that are not suitable for the cultural circle.*

**KEYWORDS:** *Euphemism, Alternative Words, Expressive, Impressionable, Thought, Linguistics, Speech Etiquette, Text, Rude, Term, Lexical Unit, Cultural, Phrase.*

### INTRODUCTION

The emergence of euphemism is associated with the conception of mankind and the development of its moral values. It is manifested not only as a phenomenon of language, but also as a tendency for a person to change his speech situation to some extent. While the acceptable word can be used, the unfavorable environment that can arise as a result of the application of units

forbidden by the speaker (taboo) is softened. And when forbidden words are said to be equated with humanity, there is no exaggeration.

The term euphemism is derived from the Greek language and, in the opinion of many authors, nouns are regarded as the exchange of unity into reasonable unity. A.A.Reformatsky gives the definition that “Euphemisms are words that are allowed to be used instead of forbidden (tabulated) words”.

And in the “linguisticheskoy encyclopedicheskoy slovar” it is called “euphemism is an emotional neutral word and expression that is used in place of words and expressions that are rude, uncomfortable in the point of view of the narrator, meaningfully to them”.

In linguistics about euphemism, so many opinions are put forward. Much more controversial issues have also arisen among linguists in this regard. The phenomenon of euphemism softens the rudeness of the meaning of words having a nominative meaning in the language on the basis of a metaphor. Also in euphemisms, impressiveness of images becomes extremely strong and gives a cultural tone to thought. Euphemisms are not only a dictionary unit used in place of taboos, but they are also units used in place of words that are not suitable for the cultural circle. Some thoughts about the feature of euphemism were noted by a number of linguists. Euphemisms are a kind of semantic migration, more precisely, they also occur through the migration of the word meaning. Usually many understand the combinations that are used in place of words that are not suitable for the cultural circle when they say euphemism. For example: instead of saying that he died, he passed away from the world, closed his eyes, died; instead of saying that he gave birth, expressions like a blindfold are used. The use of euphemism in the language was formed as a historical ethnographic phenomenon in connection with the phenomenon of taboos. Euphemism is associated with the development of customs, cultural level, aesthetic taste and ethnic norms in peoples. With the development of the language, its euphemistic layer also develops. New forms of euphemism are emerging on the basis of new norms of morality, new worldview. In the language there is also euphemism, which arises with the demand of a certain speech situation, the meaning of which is often understood through the text. For example, “*Раънони эгасига топирмагунимизча, — деду Низор ойим, — қуйилмайдиганга ўхшайди*“ it is like pouring” (A.Kadiri) in the sentence, the phrase euphemism in the form of an assignment to the owner in place of the phrase giving to the ground from the point of view of speech etiquette is used. Euphemism is widely used in scientific and official methods.

German languages, that is, German and English, are also very rich in euphemism and euphemistic phraseology, and speakers use this tool very widely in implicit use of different meanings.

Especially in the current period, euphemisms are used in the performance of all functional functions of the language—from oral colloquial speech to the language of official documents. Below we will refer to examples that include quite extensive socials in German and English, which have appeared in the next decades, in the sense that they are now commonly used and meant.

Examples in English are accident-unhappy event instead of incident-unpleasant event; disaster-unpleasant event instead of distress; Addict-substance instead of cocaine-drug abuser or chemical dependency-chemical taboo case phrases; Arrest-append instead of prison sentence-resort to action, words restricting freedom; illegal-illegal words instead of criminal-criminal;

Death penalty-death penalty capital punishment instead of soy-the word combination of higher punishment; drunk-intoxicated instead of intoxicated soy tispy-drunk, shot, drank words; Fat-fat soy instead of overweight-heavy-weight, chubby-drum. portly-the word; instead of informer-squeal-suffix, the words confidicent source-reliable source are used.

What is the history of the emergence of euphemisms? In what situations do we use euphemisms? In the application of euphemisms, an interesting regularity is observed in English, that is, a large part of euphemisms came into the English language from the Latin language, and the words they replaced, softened or concealed are the words of the native English-Saxon. This process began in 1066 year, marked by the desire of Norman, and the English historian Farb observes one very interesting thing in this regard:.. "the community began to make a distinction between a genteel and an abscent vocabulary between words of the upper class and the lusty Anglo-Saxon of the lower that is why a duchess pired and menstruated-while anitchen maid sweated and spat and bled" (Farb 1974.the r.80)-"... the team began to distinguish between cultured and vulgar words. The high flight of the upper class is silent, and the simple, heel language of the English-saxsons, belonging to the lower class, begins to move away from each other vividly. Therefore, the Countess wakes up, sees the saliva, the pharynx, and the moon, and the white man sweats, spits and experiences the arrival of blood from the vagina, that is, he sees menstruation. This is what the content of this observation consists of. The sociolinguistic situation caused by the Norman invasion was characterized by the fact that the English-Saxon people's language with Latin and French kept its dictionary wealth completely. Representatives of the upper classes tried to use new words created from the Latin core, instead of simple words of the English-Saxon language.

Now we will consider the euphemisms in German examples: das Zeitliche segnen instead of die Fe, das Weite suchen instead of Sone Fe, nicht auf dem Damm instead of sick so, in anderen Umständen, Stilles Örtchen instead of toilet so, Allgemeinmediziner instead of Hausarzt so, Abschiebung so instead of Aufenthaltsbeendende Maßnahmen, Vertreter außendienstmitarbeiter instead of Sor, vormund Sor instead betreuer, Dumm Sor instead bildungsfern, vielredner Sor instead gesprächspartner, Hausmeister Sor instead facility manager, Zensuren verteilen Sor instead fördergespräch, entlassen Soi instead freisetzen, Tod Soi instead heimgang, gewerbeinheiten Soi instead industriepark, Fett Soi instead korpulent, pedantisch, besserwischerisch Soi instead korrekt, teuer Soi instead kostenintensiv, bilanzfälschung Soi instead Kreative Buchführung, Bauer Soi instead landwirt, Bauernhof Soi instead landwirtschaftlicher Betrieb, Linien instead of Falten Su, Mimikfältchen, the words liquidieren instead of ermorden Su are more used.

At present, several euphemisms are emerging, especially in the next decade in Uzbek, German, English. We will witness that this phenomenon occurs before our eyes, in our speech. Of course, it is a difficult phenomenon to give up suddenly from the words that are learned, that is, they are usually used by people in oral speech. Even so, in written speech, we are forced to apply euphemisms. And in colloquial speech, the prepositional alternative of words is more used. If the new alternative of some of the words that we use in our speech comes out, it would seem that the old alternative of this word is rude to use in our oral speech. Because the new alternative somehow seems to be gentle, imaginative, touching.

We will refer to examples. The hostel term instead of student accommodation, instead of the word combination orphanage sor-children's house, instead of the orphanage Sor, instead of the word combination orphan Sor-lost the breadwinner, instead of the word combination

commandant sor-the head of the building, instead of the word combination library-term-the center of information resus are using new terms.

Usually the phenomenon of euphemism is accompanied by a softening of the rudeness of the meaning in the word, and it has the property of pronouncing objectivity and impressiveness in speech. And this process is characteristic of fiction-literature.

In the latter times, the cases of applying euphemisms in the performance of all the functional functions of the language, from colloquial speech to official documents, are more common.

We will analyze the following examples: cocaine, cocaine-consuming a lot of drugs instead of words; user words more than the norm of medicines; the term of blockade-take action instead, restricting freedom of speech combinations; bombardment-word combinations instead of supporting air; the term of the demon-illegal term; the term of orphanage-instead of the term-a combination of words of the house of a garbage collector is a word combination of a person who provides purity instead of a word combination; killing innocent people-a word combination instead of a word combination-a word combination of unforeseen victims; poor-a word combination instead of a word; prisoner-a term rather than a term of a prisoner; imprisoned-a word combination instead of a term; poor children-a word.

All of the above examples can be seen in official documents or diplomatic documents.

In summary, it is necessary to emphasize that euphemisms are not only used in the process of speech or in the artistic literature to replace coarse, shy words with other milder, more beautiful words, but also it is customary to use some words in official documents or diplomatic documents instead of vocabulary, terms, phrases.

As a rule, in official documents or diplomatic documents, specific vocabulary terms and vocabulary should be used. This point of view has changed considerably by the present time.

The use of euphemisms in official documents is typical in the current era of globalism at a time when cultural communication between people is developing.

This process, however, has led to the emergence of alternatives to new euphemisms, but further the use of euphemisms in official language or documents.

UZBEKISTAN

### **ABSTRACT**

*The education sector is one of the most innovative industries, which largely determines the creation of an innovative climate and the competitiveness of the economy as a whole. Modern realities of life make traditional methods and technologies of teaching subjects ineffective and uninteresting. Computer science has always been in an advantageous position relative to other subjects, as the use of ICT is an integral part of the subject itself. But how to correctly use this advantage is decided by the teacher himself. In this article highlights of innovative approach to ensuring the continuity of teaching computer science in the system of continuous education of the new Uzbekistan.*

**KEYWORDS:** *Innovation, Innovative Approach, Computer Science, Education, Quality Of Education, New Uzbekistan.*

### **INTRODUCTION**

In the modern conditions of reforming the educational system of Uzbekistan, various innovative processes are becoming increasingly widespread. The testing and introduction of new forms and methods of work is a constant need for education. At the same time, the development, testing and implementation of innovations in the education system should be considered as a continuous process, as a component of everyday educational activities.

At the beginning of the twentieth century, a new field of knowledge was formed - the science of the new, innovations, which studied the patterns of occurrence, development and introduction of innovations in material production. However, in a short time, innovations have moved into the

social sphere, and, consequently, into education, which lays the foundations for pedagogical innovation. In the literature, the concept of innovation is interpreted in different ways.

Today, innovations in education consist in the introduction of new goals, content, methods and forms of training and education, in the organization of joint activities of teachers and students; changes in the style of professional pedagogical thinking. The term we use in the educational environment: innovation activity-refers to the process carried out in order to ensure the modernization and development of the education system, taking into account the main directions of socio-economic development of the Uzbekistan, the implementation of priority areas of the state policy of Uzbekistan in the field of education. This term is used in the federal law on education. Innovative activity is focused on improving both scientific and pedagogical and educational-methodical, as well as organizational, legal, financial and economic, personnel, material and technical support of the education system. If we consider the typology of innovative approaches to learning, we can distinguish two main types of innovation: innovation-modernization, innovation-transformation, corresponding to the reproductive and problem orientation of the technological approach in the educational process. Innovations-modernizations that modify the educational process are aimed at achieving guaranteed results within the framework of its traditional reproductive orientation. The underlying technological approach to learning is primarily aimed at communicating knowledge to students and forming ways of acting on a model, and is focused on highly effective reproductive learning.

Innovations-transformations that transform the educational process are aimed at ensuring its research nature, organizing search-based educational and cognitive activities. The corresponding search approach to teaching is aimed, first of all, at forming students' experience of independent search for new knowledge, their application in new conditions, the formation of experience of creative activity in combination with the development of value orientations. According to many scientists, innovative educational technologies should be focused on the formation of systematic creative thinking of students, their ability to generate non-standard ideas when solving educational, practical or creative tasks, which in turn is a formative factor of professional competence of future specialists.

At the same time, the main requirement for the modernization of education is the transition from an informative learning model to a developing one, which involves the formation of students not only subject knowledge, but also the ability to independently acquire them. It is important that computer science and ICT, due to the universality of its system-forming concept of "information" and the information approach generated by it in scientific knowledge, contributes to the construction of interdisciplinary connections in the educational process, and can be adapted to the professional needs of the future specialist, and also implies an independent deepening of practical knowledge and skills.

In our innovation activities, we use the case technology method. The essence of the case technology is that the student is given a description of a certain situation that a real organization has encountered in its activities or that is modeled as real. The student should get acquainted with the problem on the eve of the lesson and think about ways to solve it. In the classroom, in small groups, there is a collective discussion of the above case from practice. Each case is a complete set of educational and methodological materials developed on the basis of production situations, forming students' skills of independent design of algorithms for solving production problems. The case activates the students and allows them to perform practical work, developing

analytical and communication skills, leaving the trainees "one-on-one" with real situations. The use of cases in the study of information technologies allows you to learn how to organize object surveys, work with input and output data, be able to understand, create, analyze and process them, as well as work with unstructured information - its search, verification, formalization, processing and storage. The trainees quickly develop the necessary skills to enable them to carry out actions and procedures in the field of information technologies that they will have to face during their practical activities. The case-based learning method is a method of active learning based on real-world situations.

The advantage of case studies is the ability to optimally combine theory and practice, which is quite important in the preparation of students. In the process of teaching computer science and information technology, the case acts as an object of study (students themselves develop their multimedia varieties) and as an effective means of teaching. The introduction of the case method in teaching computer science and information technology allows us to implement a competence-based approach in practice, which develops the methodological system of computer science, enriches the content of the educational discipline. Within the framework of the subject of computer science, case technologies can be applied to such topics as: "Forms of information representation", "Types of graphics", "Text aesthetics. Fonts", "Tabular information models", "Object information model", "Viruses and antivirus programs", etc. The greatest effect can be achieved with a systematic approach to the choice of traditional and innovative learning technologies, with their reasonable combination, complement each other and with effective leadership of group and inter-group discussion.

Summing up the use of case technology in teaching, it should be noted that this method contributes to the activation and development of cognitive abilities and creative abilities of students in computer science lessons. Also, the creation of an educational and methodological complex, the main part of which is implemented in the form of an electronic manual, can be attributed to innovative activities. We implement this technology to work with students during the course of the following topics: "Information Theory", "Information coding". The peculiarity of Information theory as a scientific and educational discipline is that its applied component is in demand by many people, including those who are very far from the scientific sphere. Information theory is a science that studies the general properties of information, methods and means of its processing (collection, storage, transformation, movement).

The role and place of the discipline is determined mainly by the following factors:

- informatics as a science of natural, technical and social significance is rapidly developing today, based on the practical needs of increasing the level of scientific, technical, organizational and methodological support for the sustainable development of the world community in the conditions of the emerging and predicted "information explosion";
- Continuous scientific support of the increasing volume of practical developments related to the creation, implementation and operation of information systems is required;
- Theoretical foundations of computer science a worldview science because the subject of its study is information. Therefore, the study of the main sections of the discipline should not only provide the necessary theoretical training of the future computer science teacher directly to practice, but also form the basis for further education and education of information culture, which determines its integration, ideological and methodological functions.

Information theory deals with the study of information as such, its appearance, development and destruction. This section is closely related to the theory of coding, whose task is to study the forms of representation of information when it is transmitted through various communication channels, as well as during storage and processing. The topic "Information encoding" is the basis for the formation of concepts about the content of the processes that occur inside the computer when the user works on it. It is not related to the formation of computer skills, so it is most interesting for the organization of independent and individual work of students to study the ways of encoding information.

The formation and development of competence in the field of working with information in computer science lessons occurs mainly through the content, since the discipline itself involves working with information in different directions. For conducting computer science lessons, the following technologies are used:

- activity-based learning-expressed through the method of practical work;
- problem-based learning-expressed through a partially searchable method, a method of solving problem situations;
- project training-the project method is used;
- game training-the business game method is used;
- discussion training – the methods of discussion and "brainstorming" are used.
- In the training sessions such techniques are used to form and develop information competence:
- counter-arguments of the teacher to the alleged opponent in the process of presentation;
- presenting students with a deliberately broken logic of presentation, proof and analysis of the results obtained by the teacher;
- disclosure by the teacher of the causes and nature of failures encountered on the way to solving problems;
- teacher's discussion of possible consequences made from incorrect assumptions;
- dividing the material presented by the teacher into developing semantic moments;
- fixing students' attention on the sequence of contradictions that arise in the course of solving problems;
- an intriguing description by the teacher of the object being presented, followed by a question statement;
- the teacher's attitude to the students ' mental solution of the logical task put forward in the course of the presentation;
- rhetorical questions of the teacher during the presentation;
- presenting students with a conflict example.
- inclusion of students in the argumentation of the hypothesis put forward by the teacher;

- task for students to find the hidden nodal links of the reasoning proposed by the teacher;
- assign students to solve several subtasks selected from the difficult original one, after which the students return to the original problem;
- leading questions to students, helping them choose the right ways to solve the problem, while simultaneously pointing out different approaches to it;
- task for students to find errors in reasoning, which requires an original thought;
- organization of specific observations of the student, prompting the formulation of the problem;
- task for students to summarize the facts presented by the teacher in a special sequence;
- showing a method of action with a partial disclosure of its internal connections with the student;
- task for students to advance the next step of reasoning in the logic set by the teacher;
- demonstration of an object, a phenomenon, prompting the separation of the essence;
- color selection of a part of the drawing, diagram, record, orienting students to advance the problem, etc.
- I constantly use the Internet resources in my teaching activities as for myself:
- when selecting material when creating a website or presentation and when preparing for a lesson;
- for personal professional development;
- to increase the motivation of students to learn.
- I organize the work of students in the classroom using Internet resources as follows:
- front-end (virtual trips, excursions, network projects);
- individually (search, selection and analysis of information);
- in groups (implementation of a common training project).

When using information resources on the Internet in the organization of cognitive activity of students in the classroom and in the course of independent work, it is necessary to take into account their level of preparedness and the conditions available for this.

The most popular and effective technologies are currently the following:

1) Interactive technologies that allow you to: first, to establish contact between children and their peers in the group and with adults; secondly, it allows you to be involved in the learning process; third, it helps to create different learning situations in the group (taking into account the individual characteristics of each child), for which various options can be used.

These technologies allow teachers to independently create educational material for the child, taking into account its features and needs, as well as to make the necessary changes as quickly

and flexibly as possible. When selecting topics for individual projects, I take into account the interests of students and their inclinations and hobbies.

The project method allows students to master the ability to build a chain: from an idea through goals, tasks, brainstorming to the implementation and protection of their project. When completing a project, students use a plan that defines the project criteria. Computer modeling also provides great opportunities for using the project method. Here we are already talking about the fact that the development of a computer model of a particular process or phenomenon is in itself a kind of projective activity. If the student knows the techniques of programming, then in this case he has the opportunity to deeply penetrate not only into the very essence of the phenomenon, but also into its mathematical model, which then needs to be embodied in a visual image. Working on the project encourages the student not only to study in depth any topic of the course, but also to master new programs and software products, use the latest information and communication technologies.

## 2) Remote technologies

Modern computer technologies completely change the concept of distance education. After all, now, despite the fact that the student is outside the classroom, he can gain knowledge and actively participate in the educational process. It is also extremely important to constantly and effectively support and support specialists and teachers, because it is on them that the successful education of children depends. During the pandemic, these technologies have shown their effectiveness and the possibility of using them as additional to the main technologies.

I will focus on some of the teaching methods that I use in the lesson and which are innovative in nature: the method of research or "problem solving" is at the heart of educational collaboration, because it is a reproduction of the natural process of discovery or cognition of reality. In order to create such conditions in the organization of the educational process that allow students to develop the skills of search and research activities and develop their independent activity and interest in the subject, I include tasks in which children try to independently explore and analyze a combined text with elements of description and narration. Group communication in educational activities is of particular importance for the development of the child. It promotes the creation of business, collective, and interpersonal relationships. In the process of communication, it is possible to supplement the general activity with individual interests and inclinations. Working in groups, students are responsible for the success of each, learn to help each other. The inclusion of students in the computer science lesson in business communication provides high cognitive activity, which undoubtedly has a positive effect on the effectiveness of the learning process.

Group activity in a computer science lesson consists of the following elements:

1. Preliminary preparation of students for the implementation of the group tasks, setting training tasks and a brief briefing.
2. Discussion and preparation of a plan for the implementation of the training task in the group, distribution of responsibilities.
3. Work on the implementation of the training task.
4. Monitoring the work and adjusting the work of the group and individual employees students.
5. Mutual verification and control over the performance of the task in the group.

6. Students' report on the teacher's call about the results obtained, general discussion in the classroom under the guidance of the teacher, addition and correction, additional information from the teacher and the formation of final conclusions.

7. Individual assessment of the work of groups and the class as a whole.

The technology of learning in collaboration can be largely implemented in group work using a computer and other technical means. Training programs and computer models, virtual laboratory work, and the creation of multimedia presentations are the best suited for working together in pairs or groups of students. At the same time, the participants of the work can perform both the same type of tasks, mutually controlling or replacing each other, and individual stages of the overall work. When performing tasks in pairs or groups, the same level of technical skills is not required, and in the process of working together, the practical skills of students who are more "weak" in this regard are also improved.

### ABSTRACT

*This article is devoted to the history of the judiciary in Bukhara, based on written sources that the judiciary was created in the 7th century and operated on the basis of Sharia law. It is argued that during the reign of the Mangit dynasty in Bukhara, the official who held the post of Qozi kalon was given great powers, and a corresponding scientific conclusion was made.*

**KEYWORDS:** *Amir, Qozi, Qozi Kalon, Sharia, Mufti, Imam, Fiqh, Mudarris, Sheikhulislam, Chairman.*

### INTRODUCTION

The term "qozi" is Arabic, meaning decisive, executive, judgmental. With the formation of Islamic teachings and the formation of Muslim communities, the post of Qazi was established from the VII century. Appointed by the ruler in Muslim countries, he served as a judge on the basis of sharia, that is, he was considered the chairman of the sharia court.

In the Arab Caliphate, the first caliphs were appointed by the Prophet Muhammad, and then by the caliph Umar. During the time of Khulafoi Roshidin, the veterans only considered civil affairs, the resolution of the jinoi cases was in the competence of the caliph or regional governors. The office dealing with the complaints was headed by the head of state whom he appointed.

The judge ruled the affairs of non-Muslim citizens on the basis of their religious books. It was possible to appeal to the Caliph over the judge's judgment. In the period when the Arab Caliphate was ruled by the abbosi caliphs, the post of supreme qozi (Qoziul-quzzat) was introduced.

From a practical point of view, the position of the judge did not stain his reputation, was scientific, knew enough of the laws of sharia, which every free (non-slave) Muslim without physical defects and justice could occupy. According to the dish, the veterans were provided with state treasury supplies. [1]

During the reign of Somoni, the minister of amir Abu Muhammad Nuh (in 940-ies), Abu Zar, was actually the ruler of Bukhara, the scholar of fiqh science.

Sometimes the judge had a general authority, and also had the right to judge by the whole country. Sometimes there were also cases when his authority was limited to one province or urban area.

In Bukhara, during the reign of the mangit dynasty (early XX century), the chairman of the Bukhara Qozikalon Sadri Ziyoy - Muhammad Sharifjon ibn Qozi Abdushukur - Shakur, wrote in his memoirs that the judicial power in the emirate, that is, the work of the Qozikalon, was specially organized, for such a post were appointed ulamo and sodot (Sayyids), and they were equated to the governors. They are sheikhulislam, qozi ul-huzzot, qozi askar and voliyi askariya.[2]

In the Central Asian khanates there is a post of qozikalon, which was considered the chief judge, the highest judge of the highest rank, that is, the chairman of the supreme founding. The qozikalon was the head of all the rulers, the pious and the mullahs, who controlled over them. It should be said that the Chief Judge carried out both religious and judicial works.

The functions of the qozi kalon were not the same in the khanates. For example, in the Khiva Khanate, qozi kalon was also considered the chairman of all law issues and the army administration. Also with the calls and scandals of citizens, the qozi kalon was engaged. But the work, which may require a higher punishment, was considered by the Khan himself. In the first half of the XIX century, in the Khiva Khanate, it was noted in the sources that the Qozi kalon had 11 navkars. At the official reception, the qozi kalon was on the right side of the Khiva Khan, on the first place. [3]

As shown in the work of Muhammad Yusuf Munshi "History of the Muqimkhan", the first place was occupied by the right of the Khan was sheikh-ul islam, then the qozii buzruk (the great judge), then the khojas, the sadr, after them the qozii askar, then the alam and chief of staff.

The Qozii askar was considered the qozii of military service in the Muslim Eastern countries, and on the right side of the Khan at the official reception after the qozikalon, in second place. [4]

In the later period of the rule of the mangit dynasty, the appointment of the imam to the mosques of mudarris to the provinces, the chairman, madrasahs, etc. were also included in the task of the Bukhara qozikalon.

During the reign of Amir Abdulahadkhan, the qozikalon Badiuddin of the emirate of Bukhara, after his death, Baqokhan, Burhoniddin during the reign of amir Olimkhan, Muhammad Sharif sadr, then again Burhoniddin worked in this position. It is also possible to know from the following that qozikalon has a high position in the emirate: qozikalon Burkhoniddin's brother

Karomiddin is in Chortoy, his brother's son Aminjan Mahdum Sadr in Khayrabad district, his older son Umarkhan is in Pirmast district in career of Avraqi, his younger son Usmonjon is also in the career of Avraqi in the Zandana district.

According to the order established in the emirate of Bukhara, governors and veterans of the regions once a week officially filed for the state of the country. The applicant, who brought the application to the amir palace, could not return until his answer came out and was obliged to wait for this answer. [5]

In the XIX century, about 300 officials served in the palace of the emirate of Bukhara, received salaries from the state treasury and was completely dependent. And in the local government system, about thirty thousand officials served, and the governor and his officials were not paid by the state, they would spend the day off from the account of taxes, fees collected from the people. The governor said there was no clear law that would determine the activities of the tax collector and diggers.

According to the information of 1915 year, the emirate of Bukhara consisted of 27 provinces (principalities) and 11 districts. With the tax affairs of 9 districts, the veterans subordinated to the qozikalon were engaged. According to the established procedure, the district or province was governed by the bek, the judge and the chairman appointed by the amir, who were employed by the amir, but could not execute a citizen without the amir's decree and the consent of the muftis. [6]

The court, which carried out the judicial proceedings by the judge, was called the qozikhona. Although according to Islamic rules, the Kazakhs should be at the mosques, in most cases the judicial work was carried out in the Houses of the Kazakhs, and on Sunday in the markets. In the khanates, including in every genius of the emirate of Bukhara, there was a qozikhona. The Kazakhs worked under the control of the people's courts from 1917 year. Gradually, the stakes decreased: in 1925 year 87 units, in 1926 year 27 units, in 1927 year 8 units. In 1924 year 5 January "regulations on the construction of a court" the judicial system in force in the BPSR was established. [7]

For the local population, as a result of this change in the judicial case, the form of the court of judges was changed and the existing single-headed judge was formed instead of the collegial judge. Subsequently, by the decree of February 18, 1928 of the SSR XKS of Uzbekistan the courts of the Republic of Uzbekistan ceased their activities.

After the introduction of Turkistan into the Russian Empire, special attention was paid to the regulation of the management of the country. The goal was to adapt it to its own interests by thoroughly studying the national values of the people. Russian Orientalist Ilminsky in his time wrote the following: slowly it is necessary to interfere with the people's trust. Such conclusions should be sought from them themselves, so that they gradually learn to think Christian, Russian. Only then will they unite with the Russian people not only in language, but also in thought and writing. For this purpose, a member of the Russian government – senator, graf inspection by K.K.Palen began with 13 July 1908 year, and continued until the beginning of 1909 year. The main attention was paid to the study of the legal and economic life of the Turkic country. As a result, in Central Asia, the rules of law, the basics of sharia, which were in force at the end of the XIX beginning of the XX century, were studied. The activities of fiqh (jurisprudence) and mufti (fatwo) were analyzed. [8]

Legal education was carried out in madrasahs in Central Asia, including the emirate of Bukhara. Dozens of luxury madrasahs were also built by khans and amirs who were rulers in Bukhara. Only in the XIX century more than 60 madrasahs were built. It is known from sources that at the beginning of the XX century in Bukhara there were more than 200 madrasahs. [9]

To a certain extent, attention and funds have also been paid to the preparation of people with knowledge for the Gazi courts, Kazakhstanis. Muftiyids, muezzins, imams and have been allocated a share of the funds received from the foundation to the mudarris who teach shariah science. For example, muesli were given a shekel a year, a hundred nuqra coins. At the end of the XIX and early XX centuries, the amir of Bukhara allocated one hundred thousand rubles a year for madrasahs and their mudarris and teachers. [10]

The sciences taught in madrasahs are divided into three groups:

- 1) Arabic grammar.
- 2) Theology and jurisprudence
- 3) Philosophy

The future diggers were also forced to study the sciences that were divided into these groups. After mastering Arabic language by madrasa students, the course is divided into two sections: the general education course - the course of difficulties and the course of law. The reading of which of these sections is determined depending on the desire of the madrasah student. That is, students could finish reading either both departments or separate coursework if they wanted to.

When Khayyam calls for joy, pleasure in his moral views, he says that his views should be human duty in a person, abandonment world refuses to enjoy real life, that personal happiness is not the main goal of life, but that personal happiness in human society depends on collective happiness [11].

During the course of the course of the issue in madrasah, books such as Fiqhi Kaydani (the doctrine of the actions of compulsive and non-binding factors, which are approved and prohibited), Mukhtasar ul-viqaya (a brief description of religion and civil law), Sharhul-viqaya (the interpretation of the fact), Hidoya-i sharif (a perfectly given book on the issues briefly considered in Mukhtasar ul-viqoya) were read. For example, Sadridin Ayni in madrasah studied Muslim jurisprudence from mudarris Mulla Abdusakoi - "Mukhtasar ul viqoya".

Who was in Bukhara in 1840 year while N.Khanikov was writing about the madrasahs, in order to read the full course in the madrasah, he was asked to study 137 books from students, of which most corresponded to the sciences of philosophy and logic.

In conclusion, along with Islamic education, Islamic belief and Islamic culture, the legal culture formed in our country, has its place in our spirituality and history of a specific judicial system and the study of this does not always lose its relevance. After all, the deeper we study our past, the more just conclusions we draw from it, the greater and more perfect our future will be.

### ABSTRACT

*This study examined the impacts of using ICT devices in education and for teaching and learning the English language. It is vital to mention that the article is devoted to highlight the effects of utilizing ICT tools to improve learners' vocabulary and their oral performance. The English language is one of the languages in the world which is rich with words, phrases and expressions. Most of language learners have difficulty to learn new words and to remember them for long time, for this reason the researcher gave some examples to enrich students' vocabulary by the help of ICT tools.*

---

## INTRODUCTION

As it is fact that the English language is considered to have the most enormous vocabulary in the world and knowing vocabulary of any languages is vital part of learning second or foreign languages. Vocabulary learning is emphasized by most computer assisted language learning (CALL). Many vocabulary exercises, such as gap filling, matching, crosswords, chain words, text-reconstruction, vocabulary games are considered as exercises of CALL application.

One of the celebrated linguists David Wilkins claimed that: “without grammar little can be conveyed, without vocabulary nothing can be conveyed”. Therefore, vocabulary is one of the most essential parts of teaching and learning any language. People need words in order to express their opinions, feelings and ideas in any language. Vocabulary is considered as a main and vital tool for learners to use English fluently and effectively. It is fact that, words, phrases and sentences are necessary while communicating with a native English speaker, while writing a letter to somebody, while listening one’s conversation or speech or listening your favourite English songs and while reading foreign books, or just a text in English. It goes without saying that most students find out difficult to speak English fluently and accurately. They are always dissatisfied with their speaking and writing in English as they keep on using the same words, expressions and phrases very often while writing or speaking. The lack of vocabulary is the main reason for such communication. Some of them stated that they forget the words instantly after sometimes, and it is also the cause of lack vocabulary. However more students can easily learn new words and memorize them well.

Some centuries ago there were such approaches as Direct Method, Grammar translation Method and Audio lingua Method or Audiolingualism, and teaching grammatical structures were important part in three of them. In that period the main accent was on the grammar, few words were used and only grammar rules were taught. But in the beginning of the 1970s, in teaching English was observed a great change as Communicative approach was used. In that method vital part was teaching and learning vocabulary. During the courses number of new words were introduced and utilized while communication and learners used in order to express their thoughts.

It is visible that the role of a teacher is essential in enriching students’ vocabulary. ICT is one of the main tools for implementing this task. As there is main barrier in learning and remembering new words is memory problem. It is known that any new topic begins with large or small amount of vocabulary which students have to learn by heart in order to understand and realize the theme or context. Most teachers know that it is somehow impossible to learn all new words of the topic and remember them for a long time. It is obvious that students learn the words mechanically as a parrot and do some tasks and exercises and after sometimes they easily forget them. If a teacher wants to check up the new words, most of students cannot remember at all. In order not to forget vocabulary of each lesson, a teacher should have appropriate, modern and interesting method with the help of ICT applications for satisfying the new generation of our century.

In order to draw students’ attention to the lesson a teacher should be creator and skillful in using modern technologies. As it has been mention that “ICTs are important for our young generation as the breath”. For this reason it is possible to hold vocabulary lessons in a computer class with the internet access. A teacher can easily download important materials, handouts and activities for students beforehand and learners may do the tasks with great interest. In addition, they may

do online some vocabulary activities such as, gap filling, matching, finding synonyms and antonyms of the given words and others on the computers, in few minutes they may get feedback and they may know their scores about their tests in the same time. These kinds of lessons will be motivational and interesting, while using IC devices students enjoy and satisfied with their doings.

Pronunciation is one of the basic components of the language which always goes with vocabulary. I would like to call them as brothers in any language. In order to pronounce the word correctly language learners should know the transcription and pronunciation of the word. According to linguist Dr. Raval, there are two types of ICT applications: they are Non web based learning and Web based learning [23,26]. Non web based learning includes itself radio and television, films, overhead projectors and language lab. Therefore language lab is one of the modern and useful technological teaching aids for learners to improve their vocabulary and pronunciation. Language lab has multi functions as students can listen to the tracks, audios and understand the different accent used and are able to speak and even they may record their voices. The learners' pronunciation level could be improved day by day by listening the materials and be enriched their English proficiency. It is worthy stating that language laboratory can make friendly atmosphere than a traditional classroom.

Language learners find out some difficulties of English vocabulary. There are some words which are easier to learn and to use them in their speech while other words' pronunciations and spellings are more difficult to pronounce or to write. They are called as "false friends" in a language. "False friends" are words which have identical forms with Romanian words but they have different meanings. For example, while writing the words "admissible" or "accessible", most of students write them as "admissibil" or "accessibil". In order not to make a mistake with "false friends" learners should have enough experience. There are words as "do" and "make". It is true that they may have the same meaning, but they are utilized differently, with different expressions. Learners may have hesitation or confusion to use these words in expressions as "do homework", "make a decision" and so on. That's why teaching vocabulary is very significant to the students. There may be faced some problems with teaching vocabulary. Teachers sometimes have problems while teaching new words as they don't know how to select the words to teach and how to teach them, what vocabulary should be taught and for what level. It is easier to teach more concrete words rather than abstract words to language learners. As there are such words "book", "pen", "flower" which are stood in front of students. There are some words as "kind", "polite", "honest", "love" which are not represented in front of them or in the classroom and they are very difficult to explain them. Therefore in order to explain such abstract words for students teachers should utilize ICT applications such as with Power Point presentations, videos which express attitudes and relations among people.

There is another problem of vocabulary teaching as many words have more than one meaning, however they have one form of writing. For instance, the word "can" refers in one dictionary as "modal auxiliary verb, to know how to, to be able to, to be possible", but in another dictionary it reflects as "a container used to carry and dispense water for plants". So we will have to say that "can" sometimes refers as a tin-plate canister for preserved foods and in the USA it has another meaning as "toilet" or "bathroom" as well as "buttocks". When we run across a word, we try to translate and understand its meanings, as there are number of meanings of a word so that we should realize the current meaning from the given context. Some years ago, students were used

to present with reading texts, text books with pictures in order to learn new words, but nowadays thanks for ICT applications it is very easy, interesting and more suitable way to show vocabulary of the topic to students. The result of ICT and computer devices' development teaching and learning vocabulary and activities become more different and fun. According to Dudenney, Chapelle, Young and Melor Md Yunus, "the use of technology as a tool to develop the different language skills has received great attention, so that, teachers are frequently exposed to new materials" [24,11].

ICT devices are considered as main tools and helpers of teachers in education, they can provide many solutions for teachers. Teachers know that when new topics are presented students should learn all new words of the given texts. But it is not easy to learn all words for a long time, in order to remember necessary vocabulary, students should be encouraged by the help of ICTS and teachers should have some new techniques and approaches to interact and satisfy the learners who are living in the era of modern and new information and computer technologies. ICT tools are very vital applications to enhance teaching and learning vocabulary, not only for the language learners but also for teachers. For tutors ICTs are professional and new aids and resources to explore number of methods and different ways of teaching vocabulary, for students they can provide with any facilities and opportunities to improve their vocabulary by doing a lot of activities and tasks. Using ICTs is somehow complicated in a class, therefore teachers should be skillful and have specific ability to teach vocabulary with the interaction of ICT tools. Teaching vocabulary is not just presenting only new words, but also to teach students how to utilize new phrases and expressions in their every day speeches. Language learners are introduced amount of new vocabulary in the course of a week. Some of students can use the words, but others cannot to utilize them, they do not know how and when the words should be used. In order to solve these kinds of problems teachers should use computer technologies such as overhead projectors (OHP), Power point presentations (PPT), DVDs, video materials as most of students are visual type of learners, so that visualizations should be used with authentic examples and the new words should be used on them.

According to a scientist Hulstijn, there are two methods of learning vocabulary, as implicit learning paradigm and explicit learning paradigm [25,2]. Words can be improved by the repetition many times and with reading given contexts in implicit learning paradigm. It is also called as the process of acquiring vocabulary and grammar through communicative activities as listening and reading. In explicit learning paradigm contexts are important source for introducing new vocabulary. There are two categories in the approach of explicit learning paradigm. They are known as explicit instruction and strategy instruction. Teachers use different direct memorization techniques in order to teach vocabulary to students. As it is pity that we can come across with low level learners, teachers should give more attention to them to possess enough vocabulary for reading fluently and extensively. It goes without saying high level learners and low level learners should be taught vocabulary in different ways. As for high level students teachers can easily use direct teaching method, for example, by utilizing word cards, peer teaching or pair working, teacher' explanations are enough for the students to obtain knowledge. However, the students who are low level they should be taught in different way, through videos, animations and music. In this case ICT tools are significant aids for teachers and learners. In order to draw learners' attentions, teachers use interesting materials on the computer technologies while presenting a new word rather than using fixed materials and presentations

from the books or dictionaries. Computers can combine texts with pictures, graphics and visuals with listening materials and movies. Low level learners will find out them interesting and challenging. By the help of watching videos or movies with subtitles they can easily learn new words in a fun way. The given vocabularies are shown in the real situations, they will remember all new words for long time. ICTs are considered as variety and creativity tools in students' life to present new words.

### **Methodology.**

The participators of the small investigation are twenty eight of second year students at the Institute of Samarkand state of foreign languages. This study was conducted with two different groups, one of their first foreign language (FFL) is Spain, and another FFL is Italian, however their second foreign language (SFL) is English. The investigation was aimed at to teach vocabulary in two different ways as with the help of ICT tools and in a traditional method.

Three materials for the research were chosen, they were word lists, vocabulary and ICT devices. Word lists were prepared from the book "504 absolutely essential words" sixth edition by Murray Bromberg, Julius Liebb, and Arthur Traiger. The book was published in the USA. Each word list contained 12 words and they were taught by two groups' students in a week. The experimental group taught the new word with the help of ICT, and the control group used traditional way of vocabulary learning.

After learning new vocabularies they were examined. Each of the test consisted of 40 questions and tests on vocabulary items. They had only 30 minutes in order to fulfill the task, for each question were given 1 point. The items were pre-testing, post-testing, multiple-choice and gap filling.

The results of the experimental group were 9 from pre-test (90%), for post-test they got 10 (100%), for multiple-choice they obtained 9 (90%), and for the last activity 8 was their scores (80%).

The controlled group who used traditional method achieved for pre-test activity was 7 (70%), from second test they got 8 (80%), for multiple-choice they obtained 6 (60%) and 40% of activity was done by the controlled group. The results were given in the following diagram:

**Diagram1. The results of both groups in learning new vocabularies.**

A teacher used some ICT applications such as OHP (overhead projector), IWB (interactive whiteboard), TV set, a computer with the internet, CD rooms in order to show new words with real examples. Teaching with ICT tools was very fruitful and fun for both a teacher and learners and the results were visible from the diagram. The experimental group was satisfied with the teaching way and their results as well.

So, it means that teachers of the English language should utilize from the modern and new educational tools as ICTs, the lessons will not be boring and can draw the attentions of all students even the low levels.

## A NEW APPROACH TO VOCAL-CHORAL SKILLS

**Botirova Xilola Tursunbaevna\***

\*Acting Associate Professor of the faculty of Art History,  
 Andijan State University,  
 UZBEKISTAN

---

### ABSTRACT

*This article explains how to set the tone and shape the sound when singing correctly. It outlines the steps that need to be taken to develop singing skills. However, in addition to the above qualities, the singer must also know how to comprehend the song. The song should be full of sincere feelings of the performer, it should come from the heart. A song that is memorized and sung in a dry way, that is, without the feelings of the performer, does not reach the heart of the listener.*

**KEYWORDS:** *Song, Skill, Art, Singer, Education.*

---

### INTRODUCTION

It also increases the aesthetic impact of a song number what instruments are used in a song, and how well they are chosen,

Instruments should be appropriate to the nature of the melody and the music in general. For example, M. Burhanov was the first to add lyricism and sincerity to the song. The melodic performance is also an important factor that has a positive effect on the aesthetic power of the song.

Harmonious good performance and it's vigor, high technique are one of the conditions for increasing the aesthetic impact of the song on the audience. The lyrics and the ideological content of the song are a powerful tool for aesthetic education. It is a tool that affects not only the emotions but also the mind, arouses feelings of compassion, stimulates thinking, creates a variety of spiritual assessments, that is, helps to educate the audience morally and aesthetically.

Among the elements of the structure of singing skills, the artistic features of the song, such as language, style, rhythm, and poetic perfection, are also of great importance. Sometimes the melody of a song is good, but also if it is performed flawlessly, its lyrics are far from perfect, and

it is characterized by inconsistency of form or absurdity of content. Such songs do not satisfy the audience, but irritate them.

There is another important element in the system of singing art, which is the pleasant performance of the singer, and this element also ensures the aesthetic effect of the song. However, singing is more important than performing. As a result, a well-tuned song loses its value due to the singer's inaccuracy, sometimes incorrect performance.

What is a singer's skill? In our opinion, this skill is first and foremost about having a good voice, being able to control it, a high level of performance technique, a pleasant timbre. But even with all this, some singers can't really impress their listeners. However, in addition to the above qualities, the singer must also know how to comprehend the song. The song should be full of sincere feelings of the performer, it should come from the heart. A song that is memorized and sung in a dry way, that is, without the feelings of the performer, does not reach the heart of the listener. So, the sincerity and enthusiasm of the singer is one of the necessary conditions for the high influence of the art of singing in the aesthetic education of the people.

Each real singer has his own style of performance. The great singer Caruso said, "There are as many ways to perform as there are singers. But these particular tracks, even if used correctly, may not be suitable for all other singers." Thus, when all the elements in the structure of the art of singing are sufficient, this art serves as the most important means of educating the general public in the spiritual and aesthetic spirit.

All the elements of the art of singing form a whole, and even the distortion of one of them reduces the aesthetic value of the song and the level of impact on the audience.

Now, let's look at song as an art genre. The songs reflect the spiritual world, life, history and whole life of the people.

The themes of the songs are rich and varied, and include love, joy and worry, aspiration, honoring greatness and heroism, narrating historical events, and so on.

The songs express people's attitudes, views, feelings and worldviews towards life.

Many songs in our country are translated into Uzbek. Songs of other nations are also sung and listened to. Russian, Ukrainian, Belarusian, Kyrgyz, Kazakh, Tajik, Tukman, Azerbaijani, Indian and other national songs are popular in Uzbekistan.

Songs have a strong place in the life and work of the people. They are the faithful companions of the people at all stages of their historical development. The song is important not only for expressing the feelings and aspirations of the people, but also as a very effective educational force.

The songs help to "build and live", encourage and lead to "labor and energy".

It is known that the songs of all nations have their own theme and ideological direction, and each nation expresses this theme and ideas in its own national form. In this context, we will consider the songs currently performed in Uzbekistan and express their role in the spiritual and aesthetic education of the general public.

The repertoire of Uzbek singers is rich and diverse. This richness is reflected in the diversity of themes, genres, melodies and performances.

Let's look at the themes that characterize the richness and diversity of Uzbek songs. The theme of patriotism and love for the Motherland is widely used in the songs of the Uzbek people. The songs praise the unparalleled heroism, courage, endurance, strength, will, confidence in victory and other qualities of our people, born of sincere, deep, boundless love for the Motherland, the desire to protect the Motherland and preserve its freedom.

These songs are characterized by high patriotism, enthusiasm, civic lyricism and deep emotion. That is why they play an important role in educating students in the spirit of patriotism. The educational power of these songs is that they truly and deeply express the feelings and aspirations of the people, have had a great aesthetic impact on people. The songs have become a powerful educational tool, especially as they affect people's minds and emotions.

The patriotic theme is reflected in the songs created at all stages of the development of the republic.

Patriotic songs are full of enthusiasm, lyricism and civic spirit. During this period, many songs about the Motherland were written in Uzbekistan. The "Song of the Motherland" written by M. Burhanov in the poem Shuhrat became a lyrical anthem honoring our Motherland. Many warm words can be said about songs D. Zokirov's "Flourish my dear Uzbekistan", S. Boboev's "The land of sun", A. Muhamedov's "Live long, free motherland".

M. Ashrafi's "My Uzbekistan", H. Izamov's "My Glorious People", S. Hayitbaev's "Flowers of Uzbekistan" are created in the traditional style of Uzbek folk lyric song. The most important features of such songs are lyricism, freedom, deep emotionality. These features correspond to the spirit of folk music and the character of our people, which is distinguished by its love of poetry, poetry and music.

S. Yudakov's song "Dear Uzbekistan" based on the poem by A. Mukhtor has a special place among the songs about the Motherland. It is a wonderful song that combines poetic text, music and rhythm. It reflects the development of our republic, peaceful labor, the labor of a happy, full-fledged man who strives for great heights.

A. Mukhamedov's songs "Beautiful Fergana" composed by the poet P. Momin, I. Hamroev's "My Uzbekistan" are the most popular songs about patriotism.

Songs about Tashkent, the city of international friendship and brotherhood, are also included in the series of patriotic songs.

In general, the theme of patriotism in the art of singing in Uzbekistan is very broad and comprehensive. If patriotic songs glorifying Uzbekistan are performed by singers with high skill, they will play an important role in educating workers.

The theme of labor is widely and comprehensively covered in the works of Uzbek composers and poets. Such songs reflect the hard work and respect of our people. It is said that labor is a source of happiness, joy, a measure of social wealth, a means of increasing the welfare of the people, an important factor in the prosperity of the country.

Songs praising work and hard work are also important in educating people, especially young people, spiritually and aesthetically.

The songs express the beauty and glory of the creative and selfless work of our people.

The theme of the art of singing is rich and multifaceted. It has a wide range of love themes. This topic is ancient and at the same time always young. It has existed throughout the history of the development of Uzbek singing, from the oral works of our past generations to our current lyrical songs.

Folk musicians and singers have written many songs about women's freedom and their new, happy lives. These include "Girl's Word", "Curly Hair", "Free Girl" and so on.

Composers of Uzbekistan "Poems", "Seven girls" based on the poems of A. Muhamedov's poet Polat Mumin, "Dongdor qiz" based on the poem of the poet Kamtar, many songs, such as "Heroic Girls", "Song of the Collective Farm Girl" by M. Kosimov, are about free women.

We have listed above the main, leading themes of the art of singing in Uzbekistan. But the issues of life expressed in the songs are not limited to these.

Modern songs cover and express all aspects of the life of the peoples of our republic, their feelings, life and spiritual world. This requires increasing the popularity and educational value of the songs. There is no doubt that the educational potential of songs is the result of poetry, music and singing.

Concert activities of TV, radio, cinema, variety, philharmonic, ensembles, amateur choirs and singers' groups, lectures-concerts, as well as concerts of representatives of music culture of other republics and foreign countries are the main ways to use the art of singing in the spiritual and aesthetic education of the working people. All these ways form a certain system of spiritual and aesthetic influence on each person and on our people in general.

Experimental work was carried out with students of 2nd "A" class, and below they read the song "Diyor Madhi" with music by N.Norkhodjaev, poem by H.Rakhmat, which was held with them in the II quarter. We refer to the development of the training process.

### 1. Voice adjustment exercises.

Voice adjustment exercises begin with controlling sitting position. When sitting, one should keep body straight and hands on ones knees without leaning on the chair.

The breath is inhaled through the nose without lifting the shoulders (as if smelling a flower) and exhaled through the mouth. This exercise is repeated several times. After that, one will learn breathing techniques while singing musical sentences (Exercise 1).

To breathe

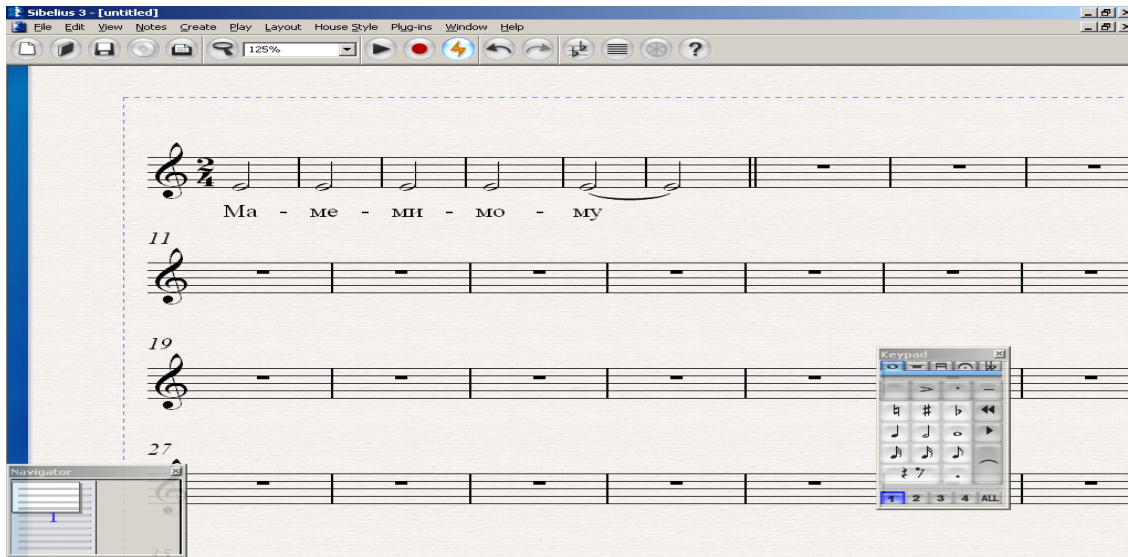

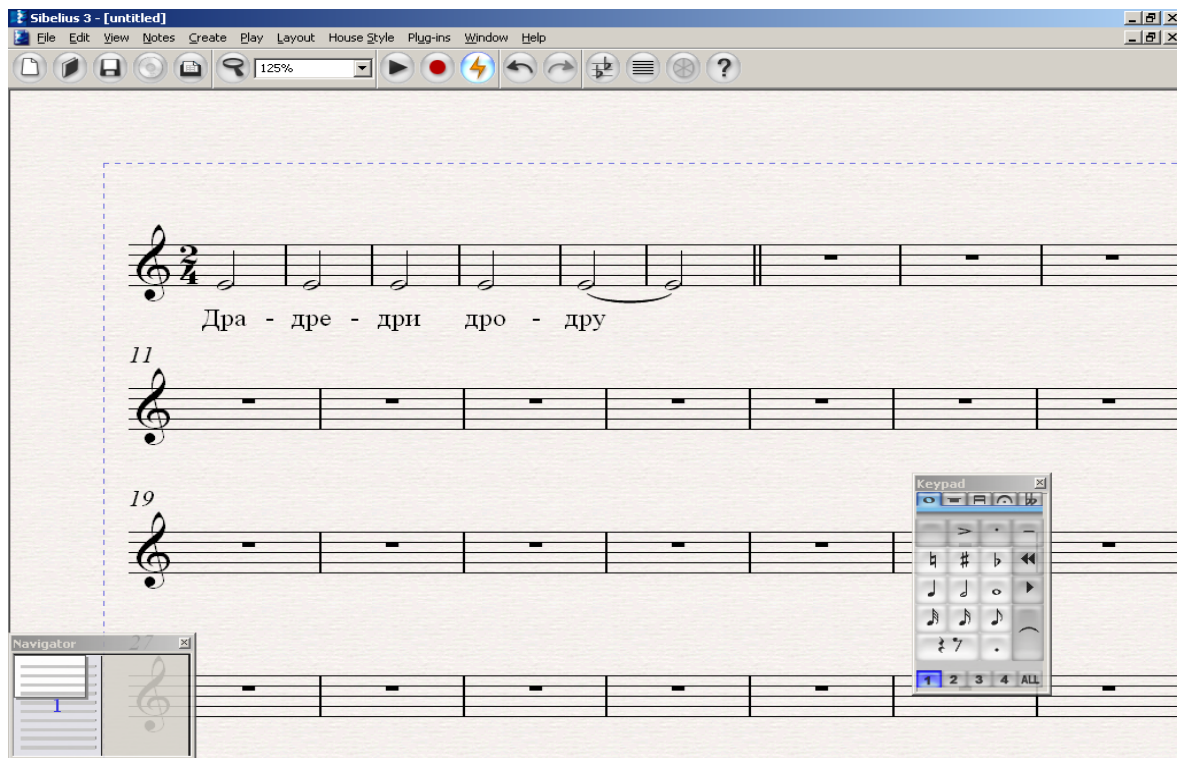

They are taught the rules of singing in unison, listening to their friends perform in a soft voice, not breathing between words.

Vocal sounds should be performed in a clear, resonant, high position (Exercise 2).

To pronounce vowels correctly (Exercise 2).

Consonant sounds should be sung short, clear, and understandable (Exercise 3).

A variety of fun exercises can also be used to achieve clarity, clarity, and purity of pronunciation (Exercise 4).

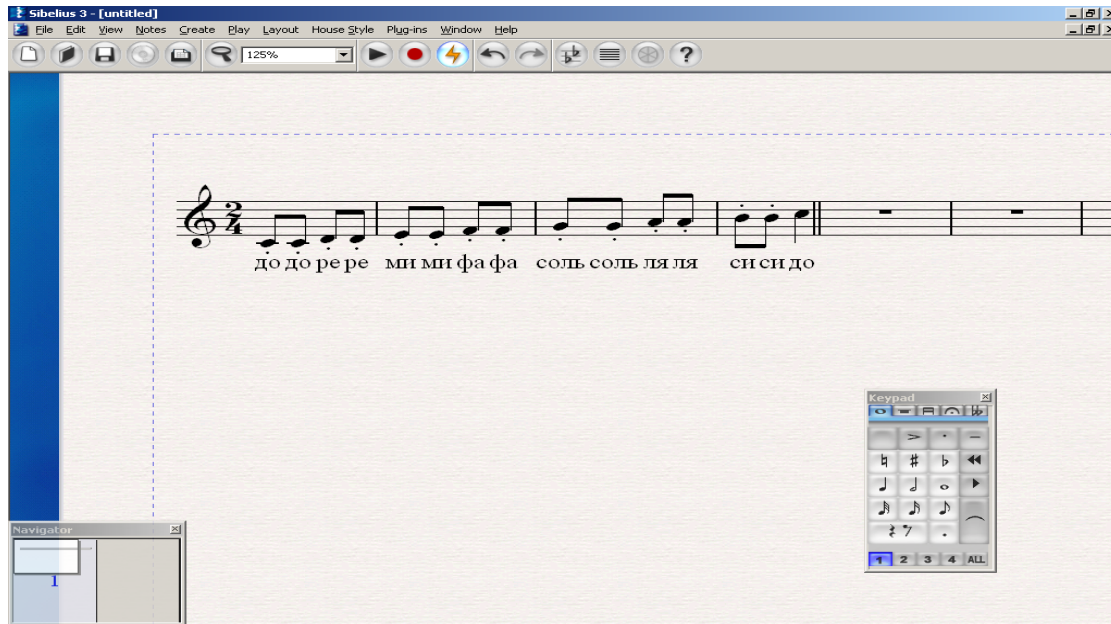

It cannot be heard unless the exercise or song is sung in pure intonation. To achieve pure intonation, it is first necessary to achieve pure unison. Pure intonation or word is divided into 2 types, harmonic and melodic. A harmonic word is a simultaneous performance of vertically structured chords or sounds. Melodic sozesa means pure and clean performance in major or minor tones of horizontal intervals (Exercise 5).

Melodic

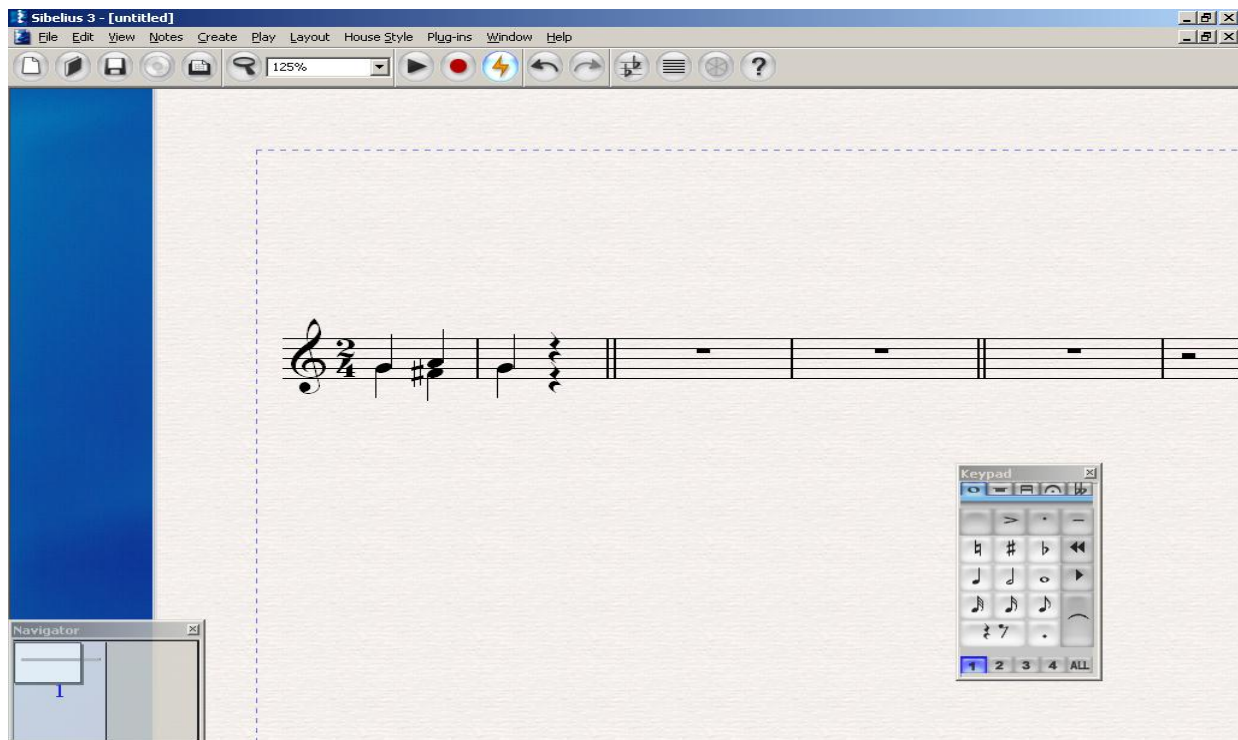

Harmonic

It is sung in the form of a gamma stokatto in a melodic state to develop diction and articulation (Exercise 6).

Singing in two voices develops students' ability to hear harmoniously. Exercises start with simple elements and become more complex. The exercises are sung in the form of a solfeggio with the names of the notes (Exercise 6).

The screenshot shows the Sibelius 3 interface with a musical score in 2/4 time. The notes are: C4, D4, E4, F4, G4, A4, B4, C5. The lyrics are: до до ре ре ми ми фа фа соль соль ля ля си си до. A keypad window is visible in the bottom right corner.

The screenshot shows the Sibelius 3 interface with a musical score in 2/4 time. The notes are: C4, D4, E4, F#4, G4, A4, B4, C5. The key signature changes from C major to D major. The lyrics are: до до ре ре ми ми фа фа соль соль ля ля си си до. A keypad window is visible in the bottom right corner.

## 2. Singing is done in four stages, just like listening to music:

Step 1: Provide information about the work, prepare for listening.

At this stage, information about the authors of the work is told to the students and a goal is set for them before listening to the work. Students should answer the following questions while listening to the work in order to learn more about the work being performed by the teacher:

- What is the nature of the work?
- What images are represented in the play?
- What are the means of expression of images?
- What is the tempo of the song?
- What can you say about the rhythmic features of the song?
- For what choir was the work written?

Step 2: Listen to the piece. Students are given a work by the teacher to listen to, expressively, accompanied by a musical instrument or using technical means (tape recorder, computer, programmer, etc.).

Step 3: Musical-theoretical and ideological analysis of the work. At this stage, students will be asked to answer the above questions. The answers were as follows:

Jahongir: - The character of the work is melodic, pleasant and lively.

Dildora: - The play reflects the love of students like us for the homeland, our honorable duties to the country.

Shokhrukh: - The work is expressed using musical-theoretical means of expression, such as tempo, dynamic characters, timbre and tone.

Sayyora: - The work is intended for children's choir.

Step 4- Introducing the final information and start teaching by the teacher.

Sounds 1 and 2 are used together because they are unison at the beginning of the melody. Care should be taken to ensure that the intonation is clear, crisp, and clear. It is also worth noting the rhythmic difficulty that occurs in the first phrase and during the melody - syncope. When you have finished working on the phrases, you can add them together and start playing them as a whole.

The two-part part of the song is taught separately for both sounds.

Sound 1                      Sound 2

A - - -                      Ni-yat-lar ul- kan, kat- ta.

Particular attention should be paid to the phrases of the two-part part of the song in refrain. Only when the first and second voices have a clear intonation can they be switched to two voices together. Repetition of phrases without choir to achieve accuracy will be a factor in achieving better results.

After completing the above steps, the text of the work will be worked on. It is important to note that the words in the text are pronounced according to the rules of diction and articulation.

O- na -Va- tan er- ta- si, Ke- la- jak- ning me- va-  
si, Bi- lim, hu- nar e- ga- si

Once the tone and text of the work have been mastered, work is done on its artistic aspects, such as character, dynamics, and rhythmic features. Care should be taken to ensure that other activities in the lesson are relevant to the content of the work being presented. The use of this work as an object of movement in the rhythmic movement activities of the lesson also ensures a more effective work.

Also, during the internship, I conducted experimental work in grades 4 "A" and 4 "B" on "Development of children's voices in the performance of choral works." In doing so, I conducted separate vocal and choral exercises on each child's voice. In order to successfully develop the characteristics of the voice of adolescents, it was necessary to resort directly to professional guidelines for the formation of choral and vocal skills.

An important way to develop your vocal skills is to take the right breath to sing. Students usually considered it the right way to breathe by raising their shoulders and chest to sing. They also quickly exhale and become accustomed to singing with the rest of the breath.

The following conditions must be met in order to breathe properly:

1. Get into the habit of not lifting shoulders while breathing.
2. Inhale not only through the nose, but also partially through the mouth.
3. Don't hold breath too much or too short.
4. Be able to focus breath on a musical phrase.
5. Breathe mainly into the abdomen.
6. Hold breath.
7. To be able to use the breath in a formal, economical way.
8. Be able to breathe with your classmates and start spending it at the same time.

In order to use their breath properly, students had to take into account the phrase they were singing. The breath vibrated freely in the vocal cords and was directed toward the mouth. It is important to avoid choking and making a muffled sound.

An important aspect of directing the breath to singing was to be able to form the words to be sung in the mouth. Proper pronunciation of vowels and consonants through the teeth, lips, and tongue is also important in singing. It is recommended to pay attention to the following important aspects of sound formation:

1. Know that singing aloud is an important part of sound production.
2. Consonants in short and sharp pronunciation.
3. Be able to spell words correctly.
4. Getting used to the free flight of the breath while providing sound flight, and so on.

4 Singing as a group, which is one of the activities typical of music lessons, played an important role in the development of singing skills of students in grades "A" and "V". During the group singing, all students had the opportunity to sing at once. And that gave the students a world of joy. As they sang together with all their classmates, the students felt the power of this union. Singing in a choir was a pleasure for people of all ages.

Like all human beings, children's voices are not always the same. Much depends on the mood, health and well-being of the students. That is why when they sing a certain note, the first one is noticeably lower, the second one is louder and the second one is more stable. In this case, the set of pronunciations is called a natural tuning. The piano has a certain agar-toned note that does not tend to decrease or increase. That is why the tuning of this instrument is called a flat tuning.

Because children's voices are as natural as adults', there were some shortcomings in the pronunciation of the intervals.

Choir experts with many years of experience have shown that it is necessary to use certain intonation features to pronounce intervals.

He proved that it is possible to pronounce the intervals in the process of singing by following these rules.

To sing melodic intervals correctly, it is recommended to sing their stages as follows:

1. All pure intervals should be sung in a stable manner on both stages of the pure-1, pure-4, pure-quintet, and pure-octaves (i.e., down and up notes).
2. All small intervals small-2, small-3, small-6, small-7 The first stage of the intervals was stable, and the second stage was reduced, that is, striving downwards.
3. All large intervals were sung by the 1st stage of the large-2, large-3, large-6 and large-7 intervals, and the 2nd stage was sung by raising.

The major and minor scales were also sung mainly in accordance with the above rules.

One of the most important elements of the choir is the ensemble, which is derived from the French language and requires all choir members to sing together.

Melody is the most important means of musical expression. Musical melody is like human speech. Man expresses his emotional state to others through the tone of speech, the tone of speech is expressed through the pitch, lowness, vibration, weight of the voice. the tone takes on a whole new artistic quality. The tone of human speech is the basis of the artistic language of

music and serves as a means of expressing the composer's attitude to reality in music. Centuries of experience in the field of speech have created a person's musical sensitivity and perception, the ability to comprehend music.

The collaboration of teachers and students in the music education process is used as a specific aspect of education. Students sing in groups, listen to music, and perform musical activities. Students share experiences, emotions, successes and failures. The teacher, with his teaching methods, makes a great contribution to the formation and development of musical abilities in students. Music culture classes have a number of tasks for the teacher.

The analysis of the music education system and the generalization of its positive aspects allowed to develop new types of music lessons.

The use of new pedagogical technologies to make music lessons more interesting with the challenges of our time is yielding good results. To make the lessons more interesting and uplifting, we offer the following types of lessons.

Concert lessons, quiz lessons, interview lessons, competition lessons, orientation lessons (using illustrative material), "around the table" lessons, self-awareness lessons, defense lessons, picture gallery lessons, the smart and the merry. Each of these courses has its own structure, function, and methodological basis.

The most widely used types of courses are:

1. Organizational lessons.
2. Mixed lessons.
3. Dominant (one type of activity in the class - singing, listening to music, music literacy, musical creativity is superior to others).
4. Control lessons.
5. Complex lessons.
6. Interview lessons,
7. Defense lessons.
8. Closing lessons

Music teachers base their choice of repertoire on specific styles. These methods include:

**1. Explaining the content of musical works is one of the most important methods** Because the reader cannot comprehend the work if he does not have an understanding of its content, requirements, and means of expression. This style requires them to take into account their cognitive abilities and to complicate the work as the possibilities increase. From simple to complex, from known to unknown, the effective use of visual aids is a means of ensuring the comprehensibility of musical works. For example, in the lesson "Working on the means of expression" on the work "Diyor Madhi" (music by N.Norkhodjaev, poem by Habib Rahmat) the tempo (Andantino), dynamics, strokes (ligato, nonligato) and information about the role of the piano accompaniment in revealing the content of the work makes the lyrics even more impressive. With the help of Habib Rahmat's text, the content and essence of the idea of a perfect man can be fully revealed.

**2. To focus on the development and upbringing of students' spiritual world of musical works.** Any musical work requires students to cultivate mental thinking in their mental activity, to observe the peculiarities of things and events in life, to determine its boundaries in relation to human life and lifestyle, as well as to understand everything. requires the ability to evaluate the place of an event in life. This requires constant attention of students, attention, observation, attitude to spiritual and cultural life, knowledge and skills. Like any other art form, music has the potential to develop a unique spiritual worldview. In particular, many examples of folklore (alla, lapar, terma and yalla), patriotic musical works written by composers, arouse the feelings of teenagers about the Motherland and make them feel at home. and increases love for national values. It also develops aesthetic taste, that is, the ability to feel and understand beauty. In this way the moral qualities are settled in their thinking. The manifestation of this principle is closely connected with the scale of educational influence, which consists in the nationality of musical works, their essence, which motivates them to love and protect the Motherland. This approach makes it necessary to include in the curriculum the knowledge that develops students' attitudes to reality through music and develops their skills system.

**3. In visual works of music,** although the content and essence are conveyed through artistic means, the artistic image of the idea embedded in those melodies is still visible. Demonstration plays an important role in the musical perception of adolescents. The use of musical instruments, teaching aids, and computers facilitates musical comprehension. For example, equipping a music room with specialized visual aids, equipment, pictures and photographs, the use of recorded musical illustrations in the process of mastering musical works gives positive results. The main source of the exhibition is the use of existing opportunities for students to visualize the artistic images that express the ideological ideas inherent in the content of the work.

**4. Relate musical works to the topic of the lesson.** Musical works are systematized within a specific topic and are aimed at imparting musical-theoretical, practical and ideological knowledge to them, helping to develop their worldview and knowledge, making it much easier to understand the content of the lesson. For example, in the process of imparting theoretical knowledge about the natural major and the natural minor lads , it is easier to master by analyzing the current musical work, identifying signs of alteration, showing the relationship of steps, stable and unstable sounds.

**5. Adapting musical works to students' real cognitive abilities.** This method is primarily based on the theoretical and practical knowledge acquired by primary school students. If they have the theoretical foundations of music in the educational process and the level of norms set by the standards, then it will be easier to work on them. Students' ability to learn realistically is also closely linked to their age and personal mental characteristics. Of course, the chosen work should be appropriate to the age of the student and should be aimed at increasing their interest. There are some works that help students to think independently and use their abilities to develop their singing skills. For example: "Vatanginam" (My lovely motherland) music by A.Mansurov, poem by P.Mumin, music by F.Alimov "Ahillik - dostlik" (Solidarity-friendship), poem by P.Mumin, "Song of young soldiers" Jalil's music, S.Barnoev's poem, R.Abdullaev's "Navruzqoshigi" (Navruz song) , Nazarmat's poem, etc. are among such works. Musical works usually express the social and spiritual environment that is familiar to students and directly surrounding them, as well as events related to their daily activities in such a way that they develop ideological thinking, and attention to the situation requires them to be, increases their spiritual wealth. As a

result, students' ideological thinking expands. It is known that the idea described in almost all musical works is familiar to students. For this reason, musical works, while expressed through a variety of artistic means, are always in tune with the students' explicit musical cognitive abilities. In addition, the emotions and experiences that are familiar to students are enhanced by the music.

**6. The method of gradually complicating the selection of musical works is important.** For example, the use of educational and pedagogical works for students is in the form of development from simple to complex, musical works based on theoretical knowledge, systematized, requiring thinking, comprehension and drawing conclusions are recommended. These works are recommended not only in terms of performance, but also in a structured form that evolves in content.

**7. A way to increase student engagement in learning music.** This style is determined primarily by the interest in folklore, composition and various areas of art. Because at the heart of any activity lies interest. Through curiosity, the student strives to develop. Striving is a mental state of a person, it is a way to look from the unknown to the known. Only when the selected pieces of music are of interest to the students will they become active. Interest is inextricably linked to the level of complexity of the chosen work, cognitive abilities, and relevance to the scope of theoretical knowledge.

By working on the content of the piece of music being studied, students begin to understand the nature of socio-political and economic events in life.

The formation of students' singing skills depends in many ways on the effective use of Uzbek folk customs and traditions. Because through them, the student, on the one hand, acquires musical-theoretical knowledge, on the other hand, is brought up ideologically. Traditions, customs and values are a key factor in educating students in the national spirit and developing their thinking. The use of holidays, customs, and values in daily life as a means of education allows students to instill a deeper spirit of respect and devotion to national ideas. Most importantly, as students perceive the content of an idea through artistic means, it is possible to explain the essence of the first ideas and views of our ancient ancestors.

By singing, students learn the secrets of art. The use of artistic means is primarily related to the perception, thinking, and worldview of students. In particular, musical works in the form of concise form, deep meaning of life, artistically harmonious, patriotic spirit can quickly attract the attention of students on the themes of peace, development of the homeland, family, parents, friendship, brotherhood. . Through such works, the student learns to observe, compare, and justify events.

The artistic means are rich in educational and didactic possibilities as they cover almost all spheres of spiritual life. Therefore, it is possible to use a wide range of musical genres in the comprehensive education of students. Musical works provide information about the spiritual and cultural relationships in life. Through this, one feels the supremacy of spirituality.

Singing helps students to understand figurative logic and musical language. They also instill in students a love for their homeland and encourage them to cherish its material and spiritual riches. Therefore, it is expedient to make effective use of its educational potential.

The patriotic music created by Uzbek folk composers depicts the attractive nature, ancient lands, rich culture, Uzbek reality of our ancient and sunny Uzbekistan. evokes a sense of nurturing beauty.

Singing has a special value in cultivating in students important features of national character and national spirit. It is important to note that since students do not yet fully understand the many events and relationships in life, they need to choose a repertoire that is interesting, ideologically influential, and theoretically understandable. Otherwise, students will be left in the lurch and tired of studying music.

Ideological education has social, economic and aesthetic significance in human life. The social significance of ideological upbringing is that a person lives in the midst of direct human relations, in constant contact with all ideological influences between people. This complex system of relations between them is called "Life". So, the idea is a guarantee of the existence and continuity of human life. But at the same time, man is the main force behind the change of ideas. He can enrich the spiritual life with his mind and intellect.

The economic significance of ideological upbringing is that since man is a part of society, his economic needs are also met through the material wealth of the country. The basic means of human existence are economic and spiritual. Thus, the economic development of the country is a guarantee of the improvement of spiritual life. Man's use of material wealth, his influence on spiritual wealth, makes ideological education not only a socio-economic, but also an aesthetic necessity. Because when a person enjoys beauty, his heart opens and his creativity develops. Therefore, approaching spirituality on the basis of ancient folk traditions increases its aesthetic value.

Based on the above, the following conclusion can be drawn. Today's demand sets specific tasks for schools in the field of music and aesthetic education:

- students understand the beauty of nature, works of art;
- formation of aesthetic taste and emotion;
- to pass a full understanding of the concept of beauty in life;
- formation of artistic creativity in students;
- Teaching students to bring beauty into their lives, their activities, etc.

It is important to study the psychological basis of music education for its successful implementation. In our lives, music has entered every home. Since the theme of music has its own character and does not cover all aspects of man and reality, it first of all expresses the inner spiritual world of man, his feelings and moods. Unlike art and sculpture, music creates emotions and moods, not perceptions of the world. In music, emotions are not the real feelings of life, they are selected, cleared of random moments, and understood in terms of specific dreams. Music is able to reflect all the colorful glitter of the state of human emotions. It can express the most complex emotions, the most delicate experiences and moods. Music is about time, covering the ups and downs of experiences.

Music, along with the emotional aspects of the inner world of man, can express the spiritual world as a whole, creating his mental and will power, a holistic image. It also has the ability to

express the characteristics of the mental system, to create states of national spirit. In the works of great composers, the uniqueness of the features of the mental system, the state of emotions and the ability to reflect reality, which is characteristic of a nation, is obvious. Folk music plays an important role in the process of reflecting the national spirit in musical instruments.

One of the characteristics of students' emotions is that they are related to a particular situation, that is, the emotional experiences that occur in children occur only under certain conditions. Therefore, the most important condition for the development of their aesthetic sense and musical culture is to create conditions that interest them. As students listen to a piece of music, they become more emotionally aware of the different sounds, means of expression, character, and mood of the music, the genre of the music they hear, and the ability to distinguish between classical, pop, or other music. In other words, their musical tastes take shape. The taste of music, the degree to which extracurricular and extracurricular activities are organized in the formation of the musical worldview, the living conditions of students, the family environment and the family's attitude to music, the attitude of parents and other family members to music. important in the verse. When a person perceives something, one of the senses comes to the fore in relation to what is being perceived. For example, when drawing, the visual organ is the main organ, and when listening to music, the auditory organ is the main organ. Several sensory organs may also be involved in perception. Such perception is an example of mixed perception.

## CULTIVATION OF RADISH AND TURNIPS

**Kamilov Murodjon Mukumjonovich\***

\*Junior Research Fellow of the Andijan Scientific Experimental Station of the Scientific,  
 Research Institute of Vegetables, Melons and Potatoes,  
 UZBEKISTAN

### ABSTRACT

*The article provides recommendations for the introduction of new modern agrotechnical measures, which are one of the main factors in increasing the gross harvest and productivity of the cultivation of radish and turnip. In the current pandemic, one of the important factors in increasing the immunity of the human body and providing it with various essential vitamins is to pay attention to the medicinal properties of these crops, to fully meet the needs of consumption.*

**KEYWORDS:** *Agricultural Technology, Growing Season, Planting, Feeding, Sowing, Motherhood, Watering, Rooting, Harvest.*

### INTRODUCTION

Decree of the President of the Republic of Uzbekistan dated January 28, 2020 No. PP-4575 "On measures to implement the tasks set in the Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030 in 2020" and May 11, 2020 No. PP-4709 "Agricultural products of the Republic" The current task is to provide the population with quality, vitamin-rich vegetable products, based on the tasks set out in the resolutions "On additional measures to specialize in cultivation." Based on these tasks, it is no exaggeration to say that the efficient use of arable land, as well as double and triple cropping is a modern requirement. Growing radishes and turnips as a secondary crop in the early vegetable crops and grain-free areas will not only meet the demand of the population for vegetable products, but also have a positive impact on food security. In the current pandemic, one of the important factors in increasing the immunity of the human body and providing it with various essential vitamins is to pay attention to the medicinal properties of these crops, to fully meet the needs of consumption. The following varieties of radishes and turnips are zoned in Uzbekistan:

Rapid-ripening varieties of radish Andijan-9 and Margilan, fast-ripening varieties of Namangan, Samarkand and Muyassar are included in the state register. Let us briefly consider the classification (characteristics) of these naals.

Andijan-9 variety of radish is fast-ripening. Root fruit round, size 9x9; 10x10cm. The flesh is tender, juicy. The root is located almost in the upper part of the soil, this part is green, the color of the part below the soil is light green or white. Flesh dense, color white root fruit weight 300–310 g. [3] The growth period is 96 days. Yield is 48-50 tons per hectare.

Margilan local variety of radish - fast ripening. The shape of the root fruit is broadly cylindrical, the sides are slightly slender, sometimes blunt size 10x17cm and 8x10cm, the surface is flat, the color of the side of the fruit band is green, the green towards the tip of the fruit alternates with white. The color of the flesh varies from white to green towards the center, dense, juicy, juicy. Root fruit weight 230-236 gr. Productivity is 30-40 tons per hectare.

The Namagan local variety of turnip is fast-ripening. Growth period is 54-60 days. The rhizome is flat-round, juicy, sweet, white, sometimes pale yellow, fleshy, with many lateral roots, completely submerged in the soil. Root fruit weight 138-140 gr. The tasting score is 4.5 points. Yield is 40-42 tons per hectare.

The Samarkand local variety of turnip is fast-ripening. Growth period is 53-55 days. The leaves are trimmed, hard, dark green. The rhizome is flat-round, the skin is raspberry-pink, pink, the surface is transversely blistered. Root fruit weight 120–130 g. The flesh is white, dense, tasting 4.5 points. Yield is 30-34 tons per hectare.

Muyassar variety of turnip - early ripening. Growth period is 45-60 days. The root is white, juicy, sweet, tasting 3.8 points. [4] The root fruit is edible when it weighs 60-70 g. The leaves are also consumed at a young age. Yield 35-40 tons per hectare.

Radishes and turnips are mainly planted in summer. Seeds will be sown in the central regions on August 1-15, in the northern regions on July 25-August 10 and in the southern regions on August 20-September 20.

Radishes and turnips can be sown in rows and ribbons. In both methods, the distance between the edges is 70 cm. Seeds are sown in SON-2.8 seedlings. When spraying in two rows, the drill bits are set in pairs. [5] The distance between each pair is 20 cm. Okuchniks are attached to the sieve. Each hectare consumes 4-5 kg of radish seeds and 2-3 kg of turnip seeds. Radish seeds are sown at a depth of 2 cm, turnip seeds at a depth of 1.5 cm. Once the seeds have germinated, they need to be transplanted and sown quickly. The first is carried out with the emergence of a single seed from the ground, the second with the emergence of 2–3 leaves. In this case, between the bushes are left 10-12 cm wide.

Radishes and turnips are weeded and fertilized and 400 kg of superphosphate and 150 kg of ammonium nitrate are applied per hectare. Further care includes timely watering of crops, cultivating between rows, loosening the furrow, and pest control. Radishes and turnips are damaged by aphids. It is recommended to spray Detsis at the rate of 0.5 l / ha or Mospilan at the rate of 0.3 g / ha.

## LINGUO-STYLISTIC PECULIARITIES OF FOOTBALL DISCOURSE IN MODERN SPORT PUBLIC ISM

**Egamov Sohiv Amonovich\***

\*Teacher of the Department of English Integrated Course,  
Uzbek State University of World Languages,  
UZBEKISTAN

### ABSTRACT

*The article describes linguo-stylistic features of football discourse in modern sports. Football is an event of cultural significance and it is not only an integral part of the social, cultural and cognitive direction in the modern world, but also a special linguistic reality. The concept of football as a linguistic-cultural phenomenon of modern reality reflects important features of language. In this article we tried to define the linguistic and stylistic features of football discourse by examining football as a linguistic-cultural concept that is an important element of language.*

**KEYWORDS:** *Discourse, Concept Of Football, Linguistic And Stylistic Features, Consciousness, Language, Football.*

### INTRODUCTION

Today, the concept of discourse is widely used in modern linguistics. The importance of a discursive approach in the study of concepts is very clear. The sports discourse discussed in this research paper represents the scope of the football concept and demonstrates itself as a specific means of implementing it.

The concept theory, based on modern scientific research, forms the basis of work on the concept of sports. This area of sports communication is poorly understood and in practice does not cover speech events specific to different sports. Most researchers have studied the language of the sports sector without distinguishing its individual areas, but our observations suggest that there are unique speech phenomena in different sports. For instance, a series of similar events may include the names of equipment in different sports. The frequently used names of the same

realities do not differ from each other for the listed sports, which allows us to talk about the fact that there is actually a unique perception of the sport.

Research materials show that the concept of football can be derived from the general concept of sport, which can be specific to any other sport depending on the state of a person's lexical consciousness, "the part of the human mind that responds to verbal communication, it is formed and defined.

In this work, text is a unit of discourse. In turn, the discourse is manifested as "a complex communicative unit of language with its own structural and semantic features, such as connection, integrity, completeness, understood as the fragmentation of all reference questions in the text". The level of mass communication enriches the text concept with new or semantic colors, which arise from one or another means of mass communication. Thus, the ratio of discourse and text can be expressed as a certain relationship of learning perspectives.

The concept of football actually represents a basic concept, around which the thematic content of the discourse is gathered.

The approach used in our research work has already been developed by Yu.N. Karaulov's work, its distinctive feature is that speech is expressed in all verbal and nonverbal complexes. As in other areas, sports-related nonverbalism is a major component of discourse, and the discourses that make up sports discourse (journalistic discourse, sports commentator discourse, and athlete discourse) have not been adequately studied.

Dutch linguist T. van Dyke interprets discourse as a system of genres. For example, he believes that political discourse creates a system of genres that interact with a particular social sphere, politics. In this regard, sports discourse forms a particular genre system that is most in demand in the field of sports communication. One of the important indicators of the field of sports today is the development of this sport, the impact and direction of certain sports on the lexical reality of the language.

The sports discourse aims to exert a special influence on the recipient in order to form a clear idea that corresponds to the author's idea of a particular event / person / action in the field of sports communication. However, the idea of a sports text author is to introduce the reader / listener to a particular sports circle (active or passive fans). In carrying out this process, a specific sports team is brought in, using.

In sports discourse, it is important to take into account the interaction of verbal and graphic components, which results in the formation of specific information about the sport.

It is especially important to divide sports discourses into several sub-discourses, specifically football game discourse, sports commentator, and sports journalist speeches. All of the above sports discourses have linguistic-stylistic features. In our opinion, at the level of linguistic expression for the recipient of information, sports journalism is the most convenient for discourses and sports commentators. These types of discourses are an effective means of entering the field of sports, using existing language tools such as general and sports jargon, general and sports phraseology, as well as terminology. It should be noted that it is difficult to say in detail about the fact that lexical means related to sports reach a non-sporting public place. Thus, the frequently used phraseological units that fall within the scope of football discourse lose their original meaning and acquire additional semantic additions.

---

As for the player's speech, according to our observations, this sub-discourse is unique. These types of discourses employ highly specialized football lexical units that are very difficult to understand for people who have nothing to do with football, so they are in many ways understandable to professionals in the field.

Thus, sports discourse is a specific type of discourse, because in its composition it is possible to distinguish the dominant features inherent in this discourse.

The discourse of football is a voluminous and multi-layered formation that combines the verbally expressed part of a text with the specific features of a particular medium. Thus, the texts that make up the football discourse are combined with pictorial and graphic commentary. In football discourse within the interview genre, one or another moment recorded at the speech level of a football game can be described, even with the help of resonant means, with strict football terminology. This largely depends on the type of sport, its purpose, and the specific sports information it is directed at to the recipient.

The fact that sports journalism is the most important component of information communication today explains why this type of work is formed in a rigid system of closely related elements and forms a whole that can be defined as the world of sports.

As mentioned above, an important criterion in the selection of topics and linguistic materials that serve a particular area of description is the recipient's interest in this or that information, covering a particular area of social relations specific to journalism in general. In turn, sports journalism also takes this factor into account. Consideration of the consumption factor is equally important.

Sports journalism has a specific audience, which can be conditionally divided into three groups: professionals in the field, active and passive fans. A preliminary study of the genres and linguistic materials of football discourse suggests that this type of discourse is an active group of fans representing the target audience.

At the same time, universal, specialized, professional sports publications can be highlighted. The first group includes universal sports publications

In the field of sports discourse, "it was and remains the most influential group". This type of sports journalism, as a rule, covers all areas of sports life, so it is not advisable to use the language tools of the sports subculture in these publications. This type of publication is not intended to attract the attention of a wide readership (because such a publication has a very large readership), but rather to provide accurate and timely information about sporting achievements, events, and individuals. An example of this is the newspapers that cover sports life in our country. In describing or commenting on any sporting event, this publication prefers to use general terminology in many ways. Research materials show that foreign language equivalents (mostly English) are more common in football discourse. Except for interviews with athletes, coaches, and others, who often have spontaneous and emotional feelings.

The unique popularity of football and the high level of development of the sport in general determine the choice of topics for universal publications. Universal publications covering all spheres of sports life, first of all, cover sports events in the football life of our country. The target audience for this type of publication is mostly men. Although the concept of a football fan is beyond the gender factor, an analysis of the language tools of football proves the predominance of the muscle principle in football discourse.

---

The second group consists of specialized sports publications that cover a specific area of sports life, which in turn are divided into different sports. Thus, compared to other sports, the most published ones are mainly dedicated to football. These are "Football", "My Football" and others. According to our observations, the readers of such publications are mostly men. In describing sporting events / situations, communication participants mainly use slang sports speech as well as sports and general jargon.

The third group is professional publications aimed at sports professionals. Football coaches and professional players are required to cover these or other topics, where language description tools are mainly focused on sports terminology (general and football). For example, the journal Football Theory and Practice is devoted to the game of football.

The fourth group includes time sports publications that pursue the same goals as blank sports publications in many respects. It combines the application with basic recommendations for action, terminological, basic linguistic-stylistic tools of a jargon nature. Thus, in football discourses, general and football jargons, on the one hand, serve to attract the reader's attention to follow the recommendations, on the other hand, to convey useful information about football to the sport in a clear and understandable language.

The text of sports journalism differs in structure and language level. This general interest is related to the author's approach on the one hand, and functional-stylistic orientation on the other. Due to the popularity of football in general, as well as the complexity of the linguistic and stylistic complex of modern language tools, the role of football in modern journalism plays an important role.

The distinctive speech genres of journalism are constantly evolving and meeting modern needs. An important feature of modern sports journalism is the feature that affects most parts of these texts, which is related to creating a certain attitude of the reader to the information being transmitted.

Most sports discourses are based on information and journalistic genres. In our opinion, the reporting genre is of great importance for the football genre.

This genre is distinguished by the fact that the author is on stage and is the most popular among sports journalists. The potential of the reporting genre allows journalists to fully understand the needs of the sports industry. First, the reportage genre type allows you to dynamically describe events using stylistically colored language tools. Second, the role of the sports journalist / commentator is to present this or that sporting situation / event / specific action in a way that evokes a sense of being in the recipient, so that he or she feels that he or she is a witness to the events described.

As a rule, a sports journalist prepares in advance any football-related facts that engage the reader / listener. Sports journalism requires a high level of attitude to the event / situation that takes place on the football field.

The linguistic-stylistic tool of football within the interview genre contributes to the fulfillment of the above tasks. For example, it incorporates general sports and football jargon into the description of game actions, making a special impression on the receiver and making him his interlocutor.

The use of general sports and football terminology allows the journalist to acquaint the reader with the professional environment in the field of sports. Sports phraseology is a vivid figurative component of a football game and is also a key component of a sports discourse.

According to our observations, sports jargon reveals its stylistic and text-forming features in a specific direction of football, and the reporting genre is the most excellent means of accomplishing these.

Thus, despite the rich spectrum of modern journalistic genres, the most important and effective for sports discourse is the informative reporting that can meet the needs of both the journalist and the recipient of sports information.

Modern sports reporting is often a mixed genre - informational and analytical, combining a description of any issue / problem (e.g., interviews with witnesses, participants in sporting events) and a description of the journalist's active efforts to analyze the problem. An example of this would be the discussion of the problem of losing a physical or other football team that has all the chances (both technical and physical) to win.

In sports journalism, it plays an important role in the interview genre, especially in the group of specialized sports publications. Examples include various interviews with coaches, players, and other prominent sports figures.

As part of sports journalism, the interview genre is multifaceted (e.g., questions about any sporting event, past or future football game to the interviewee), i.e. it can serve as an informative genre. In certain communicative situations, this genre is analytical (e.g., a conversation about the exchange of players between football clubs under certain conditions).

A distinctive feature of the interview genre is the dependence of the language that serves this genre on the social context, that is, the main pragmatic discourse - the acquisition of information about a particular type of recipient (sport).

The variety of styles using linguistic tools, the interconnectedness of the statements of the interlocutors (participants of special dialogues), the focus on information about involvement in the sport, as well as the orientation to the public - all this serves to popularize the genre in modern sports discourse. .

The expressive language of sports communication allows a journalist's speech in general to focus more on sports, especially football, which contributes to a deeper understanding of it. As a result, a language working within sports discourses will be able to go beyond the boundaries of highly specialized use, proving itself as an active and popular component in everyday language.

Within the genre of conversations, the personality of the interlocutors is of particular importance. The high social status of some individuals in sports, the popularity of achievements of individuals in sports (high game potential, achieved sports results, special physical shape, etc.) encourages recipients to accept certain language sports elements in everyday life from their speech to their language. This fact determines the high level of linguistic communication, expanding the scope of activities of language tools in sports.

Thus, it can be concluded that the genre of modern sports, football journalism today is a reporting genre that combines informational and analytical types of text. The genre of interview, which depends on the social context, also plays an important role. Of particular importance is the

type of sport given in the text, where the modern reader can find parts of different genres that do not violate the integrity of the text, but retain a certain independence of its parts.

Thus, within the genres discussed above, it is possible to realize only the specific features inherent in the textual types of sports, which determines the importance of these sports genres in football discourse.

**ABSTRACT**

*This article explores the trend of globalization of environmental relations, requiring radical qualitative changes not only in lifestyle, worldview, environmental knowledge, legal culture, but also in the worldview of people in a particular country or region. In addition, the time to resolve these problems is very short. At the same time, the global human impact on the environment is very strong. To solve the problem, which is extremely important all over the world, people with high intelligence, intellectual potential and huge economic resources, technical and technological base are required.*

**KEYWORDS:** *Globalization, Environmental Knowledge, Legal Culture, Ecological Worldview, Phenomenon, Ecological Thinking, National Values, Universal Values, Environmental Values, Central Asia, Globalization Of Environmental Problems.*

**INTRODUCTION**

Today, the criteria that determine the ecological conditions of the world and the mutual co-operation of transformation processes, determine the characters and contents of global problems. Humanity is living on the brink of global problems. "Today we live at the historical stage of the development of mankind, in which Dramatical changes are taking place.

In the following years, there have been drastic geopolitical changes on earth, the international system of security and stability is being disrupted. The ever-growing globalization era is not only expanding the opportunities of mankind, but also leading to the escalation of conflicts, an increase in the discrepancy between developed and undeveloped countries. As a result, Various

actions, which undermine peace and stability and are transnational in essence and scope, are being committed"[1], said Shavkat Mirziyoyev, President of the Republic of Uzbekistan.

In the aspect of ecology, as in other areas, The process of globalization led to a different explanation of the role and significance of the phenomenon of environmental outlook in the system of values that were formed in the minds of people, their groups, social communities, and society as a whole. The role of ecological values in the individual outlook associated with the protection of nature, rational use of its resources, and the assignment of integration into the minds of the younger generation, are actual problems.

### **METHODS AND LEVEL OF STUDY**

Recently, it is noticed that there are two approaches that differ from each other in the research of national and international values. In the first, the existence of national and international values are confessed and they complement and develop each other. In the second – on the other hand, there are only national values, there are no international values, they are concretized in the context of ecological values through the evidence they bring to prove alternative ideas which the abstract generalization of human consciousness, the product of abstract thinking, the diversity of national values.

When denying the existence of universal ecological values: Firstly, all people and communities have been living in accordance with their specific, diverse and conflicting interests, goals and beliefs; Secondly, any form of outlook, like its type and form, cannot have a single solution that satisfies everyone in the matter of ecological value; Thirdly, the solution of ecological problems is largely due to the significant and differently concrete historical conditions of the period; Fourthly, ecological values have always been locally in a particular social space and historical time; fifthly, it is an artificial construction designed to divert public opinion from a particular point of view and It aims at submitting national and environmental interests of various social units to the common goals; Sixthly, the recognition of the dominance of environmental "elitist" values in the universal values causes a rejection of the progressive national environmental values. Seventhly, in any society, different social units, cultures and civilizations cannot live in isolation, but they try to justify but they try to justify the need to reconcile them on the principle of tolerance caused to emerge the concept of universal values.

Defenders of this view think that the abstract "universal values" dominated by nationalism are fabrications invented by the United States and their allies. (This is evident in the skeptical approach to global climate change).

Because they are carrying out military, economic invasion and ecological aggression aimed at the exploitation and ecological exploitation of people, who seek to develop their ideas, under the guise of protecting "universal values" (such as mental freedom, democracy, human rights, etc).

In other words, the "universal value" is true euphemisms invented by the Western world to integrate economic globalism, "popular culture", multiculturalism and other demerits into the minds and lifestyles of the peoples of the world to accomplish their goals and protect their interests.

There are the following basics for recognizing the existence of universal ecological values, namely:

- a) Natural and social events that serve to meet the environmental, material and spiritual needs of human beings and to preserve the world's civilization;
- b) The moral and spiritual content of ecological universal values is an objective phenomenon in the genesis of origin, even if it is a subjective factor in the stable development of society;
- c) The universal ecological values are the result of the synthesis and integration of material and spiritual cultural directions at the national, regional and global levels of environmental protection;
- d) They operate within the global ecological outlook that serves the survival and activity of humankind, regardless of their presence in any historical period or socio-ecological space;
- d) Their status is strengthened by justification of humanistic and democratic principles and choosing the natural evolutionary way to integrate nationalism with humanity.

In general, according to the established historical tradition, it is methodologically correct to divide ecological human values into material and spiritual directions. The first of them includes all types and areas of practical activity: production of material wealth, economic relations, methods, technologies, results of experiments of changing the social life of the community and so on.

Spiritual areas include: knowledge and emotional, psychological and ethical aspects of assessment.

In the process of ecological thinking, the scientific representations that are the result of knowledge of ecological reality are processed, analyzed, compared, regulated, systematized, and summarized. This, in turn, provides the basis for the adoption of certain decisions and tasks.

It is worth confessing that: "today people do not have enough ecological knowledge and some even don't have it. Most people are aware of environmental problems and some people think that they need to make urgent decisions and they need to take a decisive step towards protecting the environment, while others don't consider as that[2].

In this context, it should be classified as the process of identifying the purpose, motives, mechanisms of the formation and development of new knowledge on the basis of processing, analyzing, accumulating, summarizing the ecological theoretical knowledge, results of practice in the process of knowledge of the ecological thinking of a particular ethnicity[3].

Ecological feelings are caused by the scientific knowledge of the ecological reality and are a major factor in the formation of the ecological outlook of the individual. His emotional perception of the eco-consciousness empirically reflects some aspect of objects and predmetns and cognition is his holistic ideal image. In the process of restoring the ecological image and emotional image of the ecological reality, the person becomes the main subjective factor of the ecological outlook and goes to logical-abstract level of ecological consciousness and serves as its source of information.

However, the complexity of forming an individual's environmental outlook, the limited use of existing environmental knowledge in the social practice of the individual, and the limited ability to provide theoretical and practical information to all individuals, prevents from making the right

decisions to solve environmental problems. In this issue, the importance of the ecological worldview is revealed.

It is necessary to look for ways and opportunities for enriching the ecological outlook in each person to overcome the sentiments of technocratic, utilitarian, mercantile approaches that still remain in the human psychology.

When Assessment Aspects in the Transformation of National Ecological Values to Universal Values and its Status, answers is searched the following questions "true or false?", "necessity or accident?", "useful or harmful?" "good or bad" "goodness and evil".

Certainly, only the well-known features of national environmental values can serve as a basis for assessing their role in the global ecological outlook. The objectivity and reality of any assessment depend on, first of all, depth and level of knowledge of the environmental situation and phenomena being evaluated; secondly, the status of the national environmental outlook as a part of universal ecological values; Thirdly, compliance of global environmental problems with human interests.

It is well-known that the realization of human living, political, economic and cultural rights depend on the level of development of the ecological outlook of the individual. Man changes and assimilates nature to satisfy his material and spiritual needs and create himself the necessary tools, wealth and comfort from the blessings of nature.

### **RESEARCH RESULTS**

However, these processes of change and assimilation are not based on the ecological scientific outlook and it creates environmental problems of global importance due to its spontaneous and extensive implementation and is recognized by the international community as a threat to human life. One of the leading Russian globalist scientists I. N. Fedoseev justify this, "in all complexity of global problems, the ecological problem is one of the most important problems at present"[4]. Indeed, according to the UN, environmental protection is the second largest global concern after the nuclear war.

Most importantly, the system of global problems nowadays is interconnected in the field of ecology, which is a global problem, not only within a specific nation and country, but it is also international problem. In particular, as a result of the opposite effect of anthropogenic impact on the environment, new natural disasters (eg, global warming), threats to human health (for example, new diseases), deviant behavior in lifestyle and other negative impacts on life.

Based on the developing trends and forecasts of these events, the following logical conclusions are drawn: the first is the escalation of national, local, regional and environmental problems, which become globalization opportunities; the second is the integration of national and international ecological values, an important subjective factor in preventing their globalization; third a - geographical parameters of the use of ecological values are conditional and relative and have direct or indirect meaning for the whole humanity; Fourth - integration of national and universal ecological values corresponds to global goals and interests and it does not exclude their individuality; the fifth - nature protection, which is the basis for human life, has a certain meaning in human social activity and becomes a product of human activity[5].

Because of the emergence of global problems, humanity's goals, in particular the environmental outlook, are being adequately matched. Indeed, the problem of globalization, are taken into account, on the one hand, their identification (adaptation to a particular environmental situation), and on the other hand, their differentiation (adaptation to a particular situation) of the human community's global environmental values.

This puts the issue of rational use of natural resources at the center of outlook. Because, if the use of these natural resources continues at this rate, it was calculated that oil reserves will be exhausted in the next 40-50 years. In order to change the current situation, it is necessary to change the national, regional and global ecological outlook of humanity. In other words, the introduction of energy saving technologies should be considered as a feature of the environmental outlook[6].

It should be noted that the disturbance of the harmony in the “nature-society-human” relationship as a result of the human antiecolological negative effects on the environment is also reflected in the environmental outlook. Therefore, at the present stage of human historical development, the issue of overcoming the contradictions in nature, society, and human relations, move the next the alternative environmental outlook.

Man, as a part of nature has caused global environmental problems as a result of anthropogenic influence on it. These problems, inevitably, should be the basis for the elimination of both the causes and effects of the negative changes in the ecological balance of the biosphere by changing its ecological outlook. Because the subjective nature of this basis is characterized by the stimulation of objective factors that influence the state of the natural environment. Determining the directions and criteria for this impact on the state of the natural environment should also be considered as a functional feature of the environmental outlook.

In addition, the definition of factors that have a positive and negative impact on the natural environment is identified respectively according to a particular environmental outlook. The social environment created on the basis of ecological criteria has a universal character and it is also a moral and spiritual factor that contributes to the overall well-being and sustainability of universal environmental security, with a positive impact on each member of society. As Philosoph-scientist Salomova H.Y. said, “Natural-ecological criteria mean firstly, natural laws, secondly, legal relations between environmental components, stability or volatility relationships, environmental regulations. Thirdly, it represents the natural quality characteristics of each environmental component and factor, the limits of adaptation, variability, and resilience”[7]. Factors that adversely affect the ecological conditions cause the atmosphere to emerge deterioration of human morale and the emergence of various diseases in the body. They have a negative impact on the physical and mental health of the person.

It should be noted that the diversity of some experts' views on environmental knowledge and outlook makes it difficult to reach a general decision.

In particular, their definitions have not still been formed general, unified position, even contradictory opinions are being given. This interfere the international and national environmental outlook being understood scientifically. For example, N. M. Noralieva's definition about environmental knowledge reveals such ambiguity.

In the N.M. Noralieva's opinion, the connection between theoretical and empirical levels was not considered: "Environmental knowledge is the information that people have created about protecting the natural environment, the rational use of natural resources, and the restoration of disturbed natural complexes, that is, the extent to which this reality is reflected in human thinking"[8].

In addition, the information provided in this definition is not related to "knowledge about the restoration of degraded natural complexes" but "degraded nature complexes". However, not all information can be knowledge. Only information which was put into practise can be a cause to emerge knowledge in particular areas.

A. Nigmatov relied on abstract concepts to explain the commonality of consciousness, knowledge and outlook in the structure of environmental culture ignoring the dialectical link between nationalism and humanity in the nature of the ecological outlook. Therefore, objective conditions that ensure the commonality of the goals of nationalism and humanity, a set of subjective factors were ignored in the definition of "environmental outlook and culture is the solution to environmental problems for present and future generations, realizing that it is a huge responsibility and acting on this basis is an advanced stage and component of a particular state and world culture"[9].

In addition, although it is well known that the conclusion that "a specific stage of development of a particular national and international culture" is a globalization of environmental relations around the world, the author did not include this in the context of a scientific description. Based on above-mentioned analyzes, it is necessary to lay the theoretical and conceptual foundations of the development of the ecological outlook on the strongly scientific basis.

Individual and social factors - based on systematization of theoretical and scientific-methodological approaches improving the ecological outlook of the individual can be combined and enriching the environmental outlook of people. Therefore, the increasing globalization of the world, and the growing environmental situation in Central Asia, makes it a matter of approach based on deep philosophical thinking.

It is not a secret that at present the emergence and exacerbation of global problems in the world happened causing, in essence, a "poverty of the ecological outlook". In particular, "The main cause of the environmental crisis is that the natural systems of metabolism and energy are violated in the ecological system. To put it in simpler terms, it can also be described as a violation of the chain of nature by man"[10].

For this reason, the problems of natural, economic, socio-political, ideological, and human health are threatening the lives of many peoples, nations and regions as a catastrophe. Hundreds of thousands of people die each year as a result of these antropotechnogen disasters[11].

Unfortunately, despite the fact that man has a high intelligence and the formation of noosphere, he has played a key role in creating such a crisis in global ecological conditions. The change in the system of nature-society can be followed by two laws: 1. The antropotechnogenic impressive pressure of society on the environment is increasing. 2. The tendency of the society's dependence on the natural environment is increasing. In this case, the first law creates the second law[12].

Therefore, the Millennium Summit, which was held by the UN in 2000 with 189 heads of state, identified the most important problems we are facing at the beginning of the 21st century, four of which, are related to directly ecological problems. These are: 1) reducing child decease; 2) improving maternal health; 3) The fight against AIDS and other eminently dangerous diseases; 4) the importance of environmental sustainability is crucial to the future of the world's population[13].

At the same time, the ecosystems of each part of the world are inextricably intertwined. As the First President of Uzbekistan Islam Karimov said: "The problem of ecology is relevant in all parts of the world, but its severity varies across countries and regions. One can clearly state that the Central Asian region has one of the most dangerous zones of ecological disaster. The complexity of the situation is that it has been caused not only by the neglect of this problem for decades, but also by the fact that virtually all areas of human activity in the region are exposed to environmental hazards. It is inadmissible to treat the nature rudely and arrogantly. We have a distressfull experience in this regard. The nature will not forgive this attitude. The pseudo-socialist ideologically false claim that "man is the lord of nature" became a tragedy for the lives of many people, nations and peoples, especially in the Central Asian region. Their extinction led to threat to be the destruction of the gene pool"[14].

In general, as a result of poverty, helplessness and lack of environmental outlook, extensive economic activities on our planet have turned 7% of the land into desert, the energy output of producing has declined day by day, and energy consumption spended on producing has increased fourfold in 10 years. For example, in the most developed country of the world, the United States consumes 0.5 liters of fuel to produce one liter of milk[6].

This is not only the result of human mismanagement of technological processes of changing and assimilating nature, but also due to the ignorantly environmental awareness. Their different manifestations at the national level indicate an uneven, discrete and fragmented development of the environmental outlook.

The philosopher V. Alimasov explained that the ecological situation is aggravating not only in a particular region, but also in the world. "Today, mankind is facing more than 13,000 global crises. If the world community didn't spend ten years to solve these crises, it would take one hundred and thirty thousand years to get rid of them. However, It has not been more than 6,000 years since humanity entered the civilization"[15].

These data also indicate the level of development of today's ecological outlook. As a result, the environmental situation not only affects the health of people, but also changes their gene pool. At the same time, the President recalled former UN Secretary-General Ban Ki-moon's words about the Aral Sea tragedy. The Secretary-General burst into tears seeing such situation.

"I have seen so many places in the world that have been destroyed", he said. - But this is the first time I've ever seen such a severe environmental situation. I admire the patience of the people who work in the face of such a harsh situation[16].

From the bottom of the Aral Sea, over 11 billion tons of sodium, magnesium, calcium and other compounds that pose a serious threat to the life of other living organisms are risen by the wind and spread to distant regions[17]. As the President of the Republic of Uzbekistan Shavkat Mirziyoyev said in his application to the Oliy Majlis, "Currently, the Aral Sea desert has arisen

on more than 5.5 million hectares due to the Aral Sea disaster. Every year, 100 million tons of sand and salt are taken into the air. This again proves that the Aral Sea disaster is a global problem"[18].

Today Investments in the social sector are an important direction for the country to build a strong economic foundation for a society with an environmentally strong, promising and high intellectual potential. As such, civil society and its institutions support activities to raise awareness and culture for the protection of the natural environment.

An effective solution of these problems is closely connected with the formation of a rich ecological outlook for each individual, development of active participation and responsibility of the population, legal knowledge and culture in this area. If these problems are resolved in practical way, it will allow to determine the level and quality of life of the present and future generations.

It is also connected with the formation of global consciousness, which is the basis for maintaining the ecological balance of the planetary biosphere. The most important feature of the global consciousness is the preservation of the priority of international values along with national and regional interests[19]. At the same time, it is necessary to continuously enrich the ecological knowledge, outlook and culture of the people living in each region, both in the global and regional context. Unfortunately, the measures being taken in this regard did not work well enough.

The tendency of globalization of ecological processes require coordination of environmental activities. While doing this, spiritual life of the individual and nation, way of life, role in family environment are learned, Expansion and deepening of international environmental policy globalization takes a different approach to the national development features of each country and region.

## CONCLUSION

In summary, the tendency of globalization of ecological relations demands radical changes not only in the lifestyle, outlook, environmental awareness, legal culture, but also in the world-wide vision of the population of a particular country or region.

It should be noted that the time for solving the above problems is very short. At the same time, the global antropotechnogen impact on the environment is continuing fastly. It requires people with high intelligence to solve the problem and at the same time, importantly great in the whole world, and intellectual potential and huge economic resources, technical and technological basis.

The integration of national and international ecological outlooks, on the one hand, will lead to their globalization, and on the other hand, their development in the process will be dialectical. In the process of globalization and exacerbation of ecological problems, national and international ecological values are identified and differentiated and their impressive directions are concretized by history.

While ensuring the harmony of the natural and social environment, which is the object of ecological national and international values, It is important to create the general and theoretical basis and reach perfection of the international criteria.

## WHAT IS MOTIVATION AND ITS PECULIARITIES IN LEARNING A FOREIGN LANGUAGE

**Rahimova Charos Odiljonovna\***

\*Student of UzSWLU,  
UZBEKISTAN

### ABSTRACT

*It is well known that learning motivation is a specific type of motivation that is incorporated into a particular activity - in this case the learning activity. Like any other type, learning motivation is determined by a number of factors specific to the activity included in it. Learning motivation, like any other type, is systemic and characterized by focus, sustainability, and dynamism. In this regard, it is necessary to highlight the signs of motivation. Here we have given a general idea of motivation and its specific features in the study of a foreign language.*

**KEYWORDS:** *Learning Motivation, Learning Activities, Foreign Language, Structure, Stability, Dynamism.*

### INTRODUCTION

Motivation is one of the main problems in Russian pedagogy. Its importance for the development of modern pedagogy is related to the analysis of the sources of human activity, the motivating forces of his activity, behavior. What motivates him to act, what is his purpose, what is the answer to the question of what he must do to make it happen, is the basis for interpreting it adequately. "When people communicate with each other ... then, first of all, the question arises as to the motives, the reasons that motivate them to have such contact with other people, as well as the goals they set before them with greater or lesser awareness. " In general, a motive is something that identifies, motivates, and motivates a person to any action that is included in an activity that is defined by that motive.

Thus, we can give a specific definition of motivation. Motivation is a complex, multi-level process of psychologically heterogeneous motivators, including needs, motives, interests, ideals, aspirations, views, feelings, norms, values, etc., that determine a person's behavior and activities. heterogeneous system, their structure.

O.S. According to Grebenyuk, the signs of motivation are its educational selectivity, reflects what attracts the learner to the learning activity and the dynamic characteristics of motivation. These characteristics of motivation are intensity (motivation of motives, level of overcoming difficulties, etc.), stability (level of desire to learn) and effectiveness of motives (implementation of the necessary motive in a given situation, making the right decision) ability to do). Characters that can judge the level of development of motivation.

Thus, learning motivation is a special type of motivation, characterized by a complex structure, one of its forms is the structure of internal (for process and result) and external (reward, avoidance) motivation. The features we have identified allow us to rationally assess the state of motivation, set goals for its improvement, measure changes in the development of motivation in the pedagogical process.

It should also be noted that the movement of external motivations of education by parents, teachers, class, society often responds to an individual's internal resistance. That is why the inner motivation of the student is a decisive factor in motivating learning.

Important aspects of motivation include its functions. First, it encourages behavior; secondly, it governs and regulates it, and thirdly, it gives it personal meaning and significance. Thus, the motivational functions are:

1. Incentives;
2. Manual;
3. Emotion formation;
4. Improving teaching effectiveness.

All of the above discusses the complexity of educational motivation as a psychological phenomenon. Moreover, the essence of learning motivation lies in the content of goals, needs, and motives, and in the nature of the connections and relationships between them. Motivation, which is understood as the source of activity and at the same time as a system of incentives for any activity, is studied in different ways, so this concept is interpreted differently by the authors. Researchers define motivation as a specific motive, as a unique system of motives, and as a specific field that includes needs, motives, goals, and interests in their complex interactions and interactions. The most complete is the definition proposed by one of the leading researchers of this problem - LI Bozhovich. According to LI Bozhovich, the objects, representations, ideas, feelings and experiences of the external world, in a word, everything that is needed can act as a motive. Such a definition of motive removes many of the contradictions in its interpretation, where energetic, dynamic, and meaningful aspects are combined. At the same time, we see that the concept of "motive" is already a concept of "motivation", which "works as a complex mechanism of correlation of external and internal factors of behavior by the individual, the emergence of specific forms of activity, determines the direction and methods of implementation".

The above facts prove the relevance of our study. Therefore, as M.A. Aryan points out, understanding the need to optimize the teaching of foreign languages leads to the idea that it is important to choose the best combination of teaching methods and techniques and apply them in the most effective situations.

Many studies are devoted to the problem of motivation formation (VG Aseev, Yu.K. Babansky, LIBozhovich, SM Bondarenko VK Vilyunas, LSVygotsky, IA Dzhidaryan, BI Dodonov, IA Zimnyaya, AN Leontiev, AA Leontiev, AK Markova, A. Maslow, SI Rubinstein, D B. Elkonin, PM Jacobson, etc.), emphasizes the role of positive motivation, which is one of the most important conditions for achieving good learning outcomes. However, it should be noted that there is little research on the problem of increasing motivation to study FL under the influence of the media.

Recently, for many students, the only motive for learning a foreign language was to get a good grade. But today, knowing a foreign language is becoming one of the mandatory components of professional activity and makes leisure time more complete and interesting. Therefore, more attention is paid to language learning. Managing the motivation to learn FL is one of the central challenges of teaching methodology. As an IL object, it has a number of unique features, one of which is the mastery of IL by teaching the ability to communicate in IL. Unfortunately, learning in FL is now largely artificial and educational in nature, due to the fact that there is no “natural need” for students to communicate in FL. In this regard, the teacher has the task of creating an environment for foreign language speech communication in the process of language teaching, as close as possible to the natural conditions.

There are several types of external motivation and internal motivation. External motivation, as a rule, directs the student to achieve the end result of a long, long study. The main type of internal motivation is communicative motivation. Students, regardless of age, formulate their needs unanimously as a clear communicative, i.e.: talking to a friend, an adult, reading to expand their worldview, with a professional purpose and pleasure, and a letter write. However, despite such a clear desire of students to communicate, it is most difficult to maintain this motivation. The fact is that FL emerges as an artificial means of communication in the assimilation of the mother tongue atmosphere. Hence, the natural conditions used in teaching are essentially artificial. According to GV Rogova, interest in the process of learning a foreign language depends on internal motives arising from the activities of a foreign language.

Scholars studying the motives for mastering FL have identified a number of types of motivation that take into account the individual development of students.

1. External motivation, as a rule, is aimed at achieving the final result of students' learning;
2. Internal motivation has a strong motivating effect on the learning process. And for that, the teacher needs to build the learning process in such a way that at each stage, the students feel that they are moving towards the goal.

Analyzing the existing approaches to the concept of the essence of motivation, we came to the following conclusions:

1. Motivation is one of the main tools of personality development, a regulatory and a prerequisite for successful learning.
2. Important aspects of motivation include its functions:
  - ❖ incentives;
  - ❖ manual;

- ❖ semantic;
  - ❖ stimulation of thought processes;
  - ❖ improving teaching efficiency.
3. The essence of learning motivation lies in the content of goals, needs and motives, the nature of the connections and relationships between them.
  4. There is cognitive motivation and communicative motivation in the study of FL. Communicative motivation plays a leading role in foreign language teaching.
  5. We identified the following types of motivation:
    - a) external motivation;
    - b) internal motivation.
  6. The main features of motivation are its orientation, stability, dynamism.

The theory of the combined effects of the effects of mass communications. According to this theory, people in modern society perceive media messages in the same way, i.e.. they have very similar reactions. In practice, this effect occurs under certain conditions and in relation to a specific audience. The aggressiveness of the audience (person) may increase when watching some programs.

Theory of Social Education (Albert Bandura and his colleagues). This approach has emerged in the gut of behavioral psychology. It is based on the claim that mastering a model of human behavior is imitated by the behavior of others. Depending on how they behave in a particular situation, a person imitates them and assimilates their own experiences. In this context, the media provides examples and becomes a source of learning. For a person to receive social education, the following is necessary:

1. the presence of an example;
2. memorize patterns of behavior;
3. understand actions;
4. motivation;
5. Implement a behavioral model.

Cultivation theory (gradual formation of a way of thinking) (George Gerbner and colleagues). The proliferation and repetition of the media (primarily television) over a long period of time will help their consumers to gradually change their perceptions of events, processes, and social reality. Such an effect on the audience helps to form (shape) certain positions, views in accordance with the information created on the TV screen.

Theory of socialization - (theory of social development). Through the long-term impact of the media on consumers, they become a source of knowledge about the world. Modern children often spend 2 to 4 hours watching TV, which makes it an important element of social development. With the help of television, they learn about the adult world, their behavior, and begin to play adult-specific social roles. Children and young viewers are helped to make the greatest impact on the TV audience by using methods that focus on their psychology (elements

of entertainment, competition, novelty, excitement, etc.). It is no coincidence that the positive and negative role of the media is more perceptible to children.

In summary, the study of a large number of literature on the problems of motivation formation, as well as diagnosing the level of motivation formation of students suggests that in modern conditions it is possible to teach a foreign language using the media and thus increase motivation to learn a foreign language allows us to conclude. proper use of the media to present you the process of language acquisition as an understanding of the culture of a living foreign language, individualize the learning process, acquaint adolescents with the cultural values of native speakers and, consequently, the skills of speech activity and allows him to develop his motivation. The complex solution of practical, educational, upbringing and developmental education problems is possible not only by influencing the minds of students, but also by penetrating their emotional realm. This helps to activate students' interest, increase their English rating compared to other subjects and, most importantly, increase students' language skills.

### **ABSTRACT**

*The pathomorphological changes in the hoof were studied in case of purulent pododermatitis in productive cows. It was revealed that with pododermatitis in the pathological focus of the hoof, the blood vessels in a state of acute hyperemia, the development of emigration of erythrocytes and leukocytes, around the vessels - blood plasma, numerous leukocytes and single erythrocytes in the exudate, destroyed tissues, disordered arrangement of reticular cells and threads atrophied tissues.*

### **INTRODUCTION**

Timely diagnosis of purulent-necrotic pathologies of the distal limbs, common in productive cows, the pathogenesis of the disease, the identification of pathomorphological changes in the hooves in the development of effective methods of treatment.

Surgical diseases of the legs were studied in dairy cows [4, 8, 9, 10], and surgical diseases in high-yielding cows accounted for 84% of the total number of diseases. In most cases, bursitis, especially bursitis of the tarsal joint, is noted. Blood serum biochemical tests showed an increase in total protein, globulins, urea, cholesterol and phosphorus.

Scientific studies have been conducted to determine the effect of motor activity on the quality of cow hooves, [6] and high physical activity reduces the thickening of tubes and long-term erosion. In cows with Rustergolz's ulcer, a decrease in motor activity was observed by an average of 36% as a result of the decomposition of the hoof substance, and in pododermatitis by an average decrease in motor activity by 56%.

The inclusion of natural sorbent diatomaceous earth in the treatment of cows with lesions in the distal part of the legs has led to the restoration of clinical indications in animals. When using this experimental scheme of treatment, the duration of treatment was reduced by 2-3 days [1, 7].

Scientific research has been conducted on the diagnosis of diseases of the legs of cattle with farm conditions [2], precarpal bursitis in 10 cows, whey-fibrinous fibrinosis of the calf joint in 14 cows. According to the authors, acute aseptic subcutaneous bursitis is characterized by swelling, pain and fluctuations, passive movement, numbness, elastic edema in chronic serum-fibrinous bursitis, crepitation in perforation, bursolitis and fibrin in the bursa wall, fibrin in the bursa wall. Purulent bursitis has been found to be primary or secondary as a result of metastases and infection of surrounding tissues.

The etiological structure of pathogens in purulent-necrotic lesions of the distal part of the skin of the horns of cattle has been studied [3, 5], and studies have shown that the distal part of the legs of cows is purulent (67%), purulent-necrotic (P8%). (49.3%), *Staphylococcus epidermitis* (42.7%), *Proteus vulgaris* (38.4%), *Streptococcus pyogenes* (27.8%) were identified.

Object and methods of research. Scientific research on the etiology of purulent pododermatitis in productive cows, pathomorphological changes in the hooves.

Results obtained and their analysis. As a result of the development of hoof diseases in productive cows, they have their own pathomorphological changes. In particular, as a result of changes in the shape of the hooves, the development of deep pathomorphological changes in the hoof wall, hoof heel, at the base of the hoof skin and hoof bone was observed. This is a major factor in the development of hoof diseases. Weakening of the protective layer of the hoof wall, hoof heel, soft foot under the influence of external factors leads to the formation of lesions, foci of necrosis, the development of purulent pododermatitis and other diseases. Studies have shown that in productive cows with pododermatitis, the pathological process is exacerbated by necrosis of the skin base of the hoof, the tips of the hooves, the hooves, the soft hoof and the hoof bone.

The clinical status of animals in the pre-treatment groups was typical for purulent pododermatitis, with purulent-fibrinous inflammatory process.

When the hooves of sick cows were visually examined, they were found to have defects in the palms and in the following cases: erosion of the stratum corneum, the formation of pathological ducts leading to the skin of the hoof, from which a large amount of odorous exudate. Inflammatory tumors formed in the surrounding tissues and spread to the soft palate and the surrounding area, causing local fever and redness of the skin.

Destructive and dystrophic changes are developed in the underlying skin and surrounding tissues, in which the process of necrosis and necrobiosis spreads to the epidermal, dermal and hypodermal layers. Pathological tissue with necrosis under the fibrin sheaths was formed in large numbers around the defects of the hoof sole. It was observed that the resulting discharge is purulent, exudate containing a large number of leukocytes, inflammatory infiltration has the property of aggressively spreading from the hoof to the deep layers of the drug. The microhemodynamic type in the dermal and hypodermal layers is similar to venous-capillary vessels filled with blood.

Signs of depolymerization were detected in the connective tissue of the mature granulation tissue near the base of the wound.

Cows with purulent pododermatitis in the experimental group developed a strong support by the seventh day, and hyperthermia and tumors developed in the tissues of the pelvic area. Despite the exudative process in the tissues, it was found that the intensity of inflammation decreased.

On the fifteenth day, a positive dynamics was observed in the process of finishing the hooves of the cows in the experimental group, which shows that the condition of the animals has changed in a positive way. Palpation revealed a decrease in pain in the surrounding tissues, although it was limited, and the hoof was noticeable, mainly in the palm. Examination of the hoof bandage showed a decrease in the amount of exudate released, which is a characteristic feature of the dehydration stage. Defects in the palmar part of the hoof revealed the formation of healthy granulation tissue.

Visual examination of the hooves of cows with purulent pododermatitis in the control group revealed the formation of atypical granular tissue with swollen granules in the lower extremities. This tissue was characterized by the presence of a turbid fluid and a layer of fibrin on the surface, which bleeds rapidly, and the appearance of wounds on the surface. Therefore, they noted a slow maturation process and no significant changes in the general condition of the animals.

By the twenty-first day, it was found that the morphofunctional changes in the pathological process shifted to the positive side. The condition of the animals in the experimental group was satisfactory, swelling, local temperature and pain were reduced. Morphological examination of the tissues revealed that reparative-regenerative processes and defragmental epithelialization were clearly visible on the surface of the wound in the hoof defects.

Cows with purulent pododermatitis in the control group were observed for 24-25 days, their general condition and appetite were satisfactory, there was no support, and the cows moved completely on the affected hooves. Local heat and pain are not felt when the hooves are swollen and palpated in the surrounding tissues. Defects in the hoof palm were completely covered with healthy granulation tissue, and due to the completion of the epithelialization process, the growth of newly formed horn tissue at the edge of the wound was observed to close it.

It was found that cows with purulent pododermatitis in the control group had a partial pathological granulation in the hoof defects, which lasted for 4-5 days. Therefore, for 24-25 days in this cow, as a result of partial growth of the horn tissue around the wound, its complete closure was not observed, as the regeneration process was slower than in the experimental group.

One week after treatment, different stages of healing of purulent pododermatitis were identified in all experimental animals. In animals, strong whitening, the formation of fine-grained granulation tissue in the solid foci in the injured foci was noted. Partial bleeding was observed when the hooves were cleaned. In some animals, purulent exudate components were observed on the surface of the wound. In other animals in the experimental group, improvement in general condition, weak lameness, correct position of the legs were found. A dry, weakly painful, branched substance was found around the injured tissue.

Two weeks after treatment, it was found that in some animals, the injured lesion was filled with granulation tissue, and a purulent coating formed on its surface. Part of the wound is filled with horny tissue, hard, partially painful when pressed, lameness is weak. In other cows in the experiment, the purulent-necrotic lesion was filled with dry, completely granulation tissue. A

partial painful reaction in the pathological lesion, the general condition of the cows was found to be good, no lameness.

On the 21st day of treatment, the same characteristic changes were observed in 4 heads of cows in the first experimental group: formation of branched tissue in the wound, growth of granulation tissue at the site of inflammation, surrounded by a hard-to-move film. This condition was characterized by the shrinkage of the injured furnace.

A complete recovery was detected on day 21 of treatment in 4 head of cows in the first experimental group. In the remaining head, it was noted that open wound defects were formed, filled with bright red granulation tissue, and a branched layer was formed around it.

Examination of the hooves of cows in the second experimental group revealed the following changes in the hoof wall and heel heel: foci of animals with purulent pododermatitis were found to have foci of necrosis in the stratum corneum and purulent discharge in some, from which white-yellow pus flowed.

Pathohistological examination revealed acute hyperemia of the blood vessels in the pathological lesion, the development of emigration of erythrocytes and leukocytes, different manifestations of blood plasma and trace elements around the vein and purulent exudate foci, as well as the presence of large numbers of leukocytes, numerous erythrocytes and connective tissue in the exudate. fibers and reticular cells were found to be disordered and atrophied.

Connective tissue cells are broken down, in case of necrosis, the fibers are divided into fragments, as well as fibrinoid and mucoid swelling in collagen and elastic fibers, mucoid and fibrinoid substances are absorbed in the fiber walls, the fibers are broken into fragments.

The foci of necrosis are painted a bright red in the eosin, and the nuclei appear in a state of rexis and picnosis. Dystrophic changes in the cells, the walls of the connective fibers are indistinguishable and necrotic.

Collagen fibers are swollen, mostly fibrinoid necrosis, hyperplasia of elastic fibers and accumulation of fibrin between collagen fibers, hyalinosis, fibrinous changes in connective tissue, the formation of hyaline in the connective tissue instead of broken collagen fibers, elastic muscle dystrophy, smooth muscle cells it was noted that most elastic fibers were eroded.

It was found that serum fluid and large amounts of polymorphonuclear leukocytes emigrated from the vascular walls.

Dystrophic and atrophic changes were observed in the suction layer of the dermis and in the epidermal layer. Dystrophic changes in vascular endothelial cells, foci of necrosis and microabscesses, infiltration of polymorphic cells in some areas of the incision, and acute inflammation characterized by neutrophil granulocytes were detected.

On the third day of the experiment, fibrin was absorbed at the site of inflammation, purulent necrotic tissue was limited, and tissue hypoxia led to the development of tumors. Hygropic dystrophy in desquamated epithelial cells, hyperemia of collarbone vessels under ruptured tissue, interstitial hemorrhage were observed.

On the seventh day of the experiment, not only quantitative changes in cell composition but also qualitative changes were detected. Absorption of degraded tissue occurred as a result of

increased blood circulation. Multiple hemorrhage of the sinusoidal capillaries was observed, and some collagen fibers were not formed by uninjured tissue as a result of cessation of exudative inflammation. In the control group, leukocyte infiltration and advanced hemorrhage were observed under the foci of necrosis.

On the fourteenth day of the experiment, qualitative development of granulation tissue, no fibrin coatings on the surface of the wounds were observed, leukocyte infiltration between the nuclei was observed.

In the control group, necrosis and fibrosis in the center of the wound foci, and in the granulation tissue were noted inflammatory infiltrates rich in plasma cells, lymphocytes, neutrophils.

At the end of the experiment it was found that complete epithelialization develops on the wound surface, granulation tissue between the epithelial components, connective tissue formed inside the wound, lymphoid infiltrates at the edges, fibrous structure developed, in the control group vascular density, scarred epithelial cells recovered.

### CONCLUSION:

- The development of tissue necrosis as a result of the development of a complex necrotic process in the palms of the hooves of productive cows with purulent pododermatitis, circulatory disorders lead to the spread of pathological processes and the addition of microorganisms to it causes purulent pododermatitis;
- purulent pododermatitis in the pathological foci of the hoof, the presence of acute vascular hyperemia, the development of emigration of erythrocytes and leukocytes, various manifestations of blood plasma and trace elements around the vein and purulent exudate foci, as well as the presence of large numbers of leukocytes, erythrocytes and erythrocytes characterized by irregular placement of connective tissue fibers and reticular cells, atrophy.

## SOURCES OF TSARIST RUSSIA'S RESETTLEMENT POLICY IN TURKESTAN

**Sultonova Maxfuza Ibroximovna\***

\*A teacher at Andijan State University,  
 UZBEKISTAN

### ABSTRACT

*The article discusses the policy of resettlement of the Russian Empire in Turkestan, the Russian settlements built in the country, their way of life, the main goals of the resettlement policy of the colonial authorities, the conditions created for the resettled population through primary sources. illuminated. Many more Russian settlements have sprung up in Turkestan, in remote areas, around military fortifications or forts. The IDPs were initially exempted from any fees and obligations, and were given cash and an unlimited amount of land.*

### INTRODUCTION

History has shown that the socio-political development of nations varies according to historical circumstances. If it develops at some stage, there is a period of decline in development at some stage. Social change is always based on certain factors and causes. The standard of living of the peoples of Central Asia also changed after the invasion of the Russian Empire. One of the main factors in this dramatic change was Tsarist Russia's policy of resettlement in Turkestan.

The main goal of the colonial government's resettlement policy was to strengthen the colonial system in Turkestan, as well as an important step towards achieving its economic, political and military goals. Throughout history, many invading nations have consolidated their power and introduced their own culture by relocating their inhabitants to the occupied territories. Tsarist Russia also took advantage of this policy. Initially, the resettlement policy was applied in Siberia and the Caucasus, but also in the territory of the Governor-General of Turkestan. After the abolition of the serfdom system in the Russian Empire on February 19, 1861 [1.193], new problems arose before the Russian government. One of the main problems was to provide land for the people freed from serfdom. The abolition of serfdom led to the development of capitalist

relations in Russian socio-political life, the intensification of the workers' movement, and the emergence of new problems in the lives of peasants. When the peasants were liberated, new forms of labor activity appeared in their social life. In particular, they were transformed into workers, peasants and Cossack troops.

Prior to the resettlement policy, Russian Empire officials thoroughly studied the potential of Turkestan and identified fertile, water-scarce, low-cost areas as possible, but no legal basis for resettlement. not developed. There were plans to relocate people from the central districts of the empire to remote areas. It should be noted that there is no special system for the formation of the first Russian settlements, no instructions for the formation of administrative units. It was only in a charter adopted in 1886 that the first normative basis for the resettlement of Turkestans in Turkestan was enshrined in law [1.193].

According to many historical sources, the policy of resettlement of the Russian-speaking population in Turkestan began in 1875 with the resettlement to Avliyota. It is said that the first Russian residence was established in Avliya. However, the analysis of sources confirms that the first resettlement policy began with the occupation of Tashkent by the Russian Empire and the establishment of the Turkestan region. According to sources, the first Russian settlement was established as a result of the occupation of Tashkent. In 1865-1867, the issue was resolved by the military governor of the Turkestan region, and the area between the Bozsuv and Chauli rivers was taken from the indigenous population and vacated for the Russian population. As the Russian-speaking population grew, the settlement expanded to the area from Chauli to Solor, at the behest of von Kaufmann [2.72]. Land in the area was developed in a variety of ways: occupation, seizure, and acquisition by the Russian administration at various times. However, Russians have also expanded their settlements by buying land from locals in and around Chauli, Salar and Salar.

Tsarist Russia initially relocated troops and their families to Turkestan. This can be seen in many sources from that period. Tashkent has been home to Russian settlers since the year the city was occupied. In 1865 General M.G. After the conquest of Tashkent, Chernyayev began to establish a Russian settlement. M.G. In order to prepare the army for the winter, Chernyayev ordered the construction of a fortress and buildings for the winter from August 1865, and by October the construction would be completed. At the military base, a company for 6 infantry companies, a battalion commander, a warehouse for storage of military uniforms and weapons, a powder warehouse, and a medical facility were built. In the Tashkent arch there is a place for the headquarters, the Orenburg artillery battalion, 250 Cossack regiments, Siberian and combat battalions [2.72].

After the conquest of Tashkent on June 17, 1865, M.G. A separate courtyard was built for Chernyayev. This place later served as a hotel for all the colonial leaders who came. Later, a garden was built around the yard and it was called Chernyayev Park. M.G. After Chernyayev was called to Russia, Romanovsky, who was appointed military governor of the Turkestan region, chose a territory in Tashkent in early 1866 for the Russian population. It was taken from the local population of the city, and the eastern part of Tashkent was the area between Bozsuv and Chauli. In June of this year, a commission was formed under the leadership of Romanovsky to build a new city, which will carry out construction work for 18 months (from June 1866 to January 1868). During this period, all buildings in the area, including the arch, were demolished. Instead, European-style streets, barracks, houses for Russian officials, parks, market squares, and housing

for 500 farms will be built. Between 1866 and 1867, 200 private residential buildings were completed. From 1867, General von K.P. von Kaufman, other officials settled with their families in these settlements, and the Russian-speaking part of Tashkent grew rapidly, and between 1868 and 1869 several administrative offices and 500 private houses were built [2.73]. The border between the new Russian-speaking city and the old local city was the Bozsuv River. As Tashkent was the administrative center of the Turkestan Governor-General's Office, it was difficult to provide housing for all Russian citizens. Therefore, the governor-general decided to issue loans for the construction of houses in the amount of 1,500 rubles for a period of 10 years at an annual rate of 2%. This loan was widely used, with a loan of 100,000 rubles in 1868-1869 [2.73].

By 1909, there were 3,000 households in the new part of Tashkent. According to sources, in 1867 the first Russian settlement in Tashkent, the village of Chernyayevka, was established by colonial authorities. The resettlement policy was accompanied by the annexation of the occupied territories [3.144]. The first evacuations began with the relocation of Russian officials and their families. The town of Chernyayevka, home to a large number of colonial administration leaders, was one of the first steps toward Russification.

The settlements are separated from the local population. Many political, cultural and trade events were held in the new part of Tashkent, and representatives of the local population were invited. By the 19th century, Turkestan's business community, intellectuals, and merchants were in contact with the Russian-speaking population, the Russian administration, and immigrants, as well as cooperating in various fields.

Many more Russian settlements have sprung up in Turkestan, in remote areas, around military fortifications or forts. The IDPs were initially exempted from any fees and obligations, and were given cash and an unlimited amount of land. In return, they are required to perform military service in emergencies or to supply a certain number of troops. In order to encourage the resettlement, an unlimited amount of land, loans, and many opportunities for production were introduced.

The colonial administration also initially pursued a policy of relocating Russian peasants to the Seventies. As the administration did not have special instructions on resettlement and resettlement, and no vacancies were identified, the resettlers were housed in rented areas from Kazakhs living around the town of Verny [7.114].

As the issue of land supply to farmers in Russia was not completed, a new form of Russian colonialism in Turkestan - the policy of resettlement - accelerated. The migration of many Russian peasant families to Turkestan was an additional military force for the colonial administration. That is why the colonial authorities urged to pay attention to the creation of conditions and protection of the immigrants in the region. Hence, the governor of the Seventy, G.A. In 1869, Kolpakovsky developed temporary rules for Russian settlements in the Seventies, creating favorable conditions for the mass migration of the Russian-speaking population to the Seventies. As a result, by 1868-1882, 29 Russian settlements with a population of 25,000 were established in Yettisuv [7.114].

Poor farmers from Russia's southern provinces of Astrakhan, Kharkiv, Voronezh, Samara, and Orenburg were relocated to what is now southern Kazakhstan, often suffering from crop failures. In the Orenburg desert, poor peasants set out with their families and belongings.

In 1873 the Governor-General of Turkestan, K.P. von Kaufmann signed a master plan for the mass resettlement of Russian peasants. According to him, Kaufman forbade Europeans, as well as Russians, to buy land from locals. It is planned to establish Russian peasant settlements along the rivers and on the communication lines from Orenburg to Tashkent via Verny to Semipalatinsk. Initially, the resettlement policy was slow, as the resettlers faced many problems. These include leaving the place of residence, the unfamiliar environment in the new place, the hot climate, new ways of cultivating the land, and so on. Not everyone was able to adapt to the new environment and conditions, and there are reports of some returnees. On Friday, an interview with a passenger returning from Turkestan to Kazalinsk was published in Rodina magazine in 1880. It describes the opinion of a Russian farmer who was relocated to Turkestan: "The land is dry, barren and grassy. They said that no matter how we run, neither the plow nor the plow will pass, but it will soften after the rain. It rains in the winter and sparsely in the spring, so the ground is very wet. That is why we are returning to Moscow "[7.114]. Apparently, those who could not adapt to the local conditions were forced to return.

In 1881, the tsarist government issued temporary rules for the resettlement of Russian peasants. In Turkestan, except for poor peasants, lower-ranking military officials were allowed to call their families and stayed with their families in Turkestan at the end of their service. The administration used land and various privileges to keep the military in the area. Each family received at least seven tithes (7.63 ha) of irrigated land, with all paid and other obligations exempted for 15 years. The resettled lands were privatized 10 years later if they were harvested here every year. In 1912, Krivoshen, one of the colonial rulers in Turkestan, said, "Future Russian villages must be richer than local villages. In any case, it is better for the local population to work in the hands of immigrant Russians than to do the opposite." he pointed out.

The colonial administration introduced new rules on resettlement in 1883, now allowing only the Slavic people to migrate to the Orthodox Church, thus limiting the number of immigrants.

In 1886, the "Regulations on the management of the Turkestan region" were adopted. The rights of large landowners and Muslim believers were restricted under the statute, and the state land fund increased dramatically by declaring all lands state property.

By the end of the 1980s, many new Russian settlements had been established in Turkestan, creating all the conditions for the adaptation of the immigrant population. Immigrants are now given 7-10 tithes of land, benefits and loans. On July 13, 1889, the government passed a new law on resettlement, which remained in force until 1904 [7.114]. According to the law, free movement was prohibited, and immigration was subject to permission and order, but arbitrary immigration continued, no matter how legally persecuted.

In many cases, the Russian government treated Russian settlements as military garrisons, including some retired soldiers. In the 1980s and 1990s, the colonial administration took additional measures in response to the national liberation movement and uprisings in Turkestan. Governor of Syrdarya region N.I. According to Grodekov, the evacuees were armed in 1892.

N.I. Grodekov uses the phrase "... every new Russian village is equal to the strength of the Russian battalion" [8.5], which is a call to arm Russian muzhiks. The idea of arming Russian peasants was first put forward by an ordinary ensign Mayev in 1867, two years after the conquest of Tashkent. The idea was prompted by fears of a surprise attack by locals. Russian villages began to be built in strategic places, along rivers, on roadsides. Mayev was offered a place in the

lower echelons of the army, in the settlements along the Syrdarya military line. Mayev explained the strategic advantages of this idea as follows: "The continuous establishment of settlements of retired lower militias, as well as Cossack villages, throughout the region will be of great benefit during the riots in Turkestan" [8.8]. These settlements should be built close to each other to help each other in an emergency. It should be noted that Russian villages have been selected as comfortable, trouble-free areas for living.

The view of the first Russian settlements as a military force began two years after the occupation of Tashkent with the formation of the Governor-General of Turkestan. Retired servicemen have been appointed to administrative positions in Russian towns because of attacks by locals. They were tasked with organizing the first defense. N.I. Grodekov said arming Russian villages in the Syrdarya region was also important for border security in Afghanistan and China. One of the most pressing issues was to ensure that the Syrdarya region was the main military base of the Turkestan Governor-General's Office, as well as a reliable additional force for Russian villages. Beginning in 1889, Grodekov succeeded in arming the Russian population in Turkestan on several grounds, and finally, at his suggestion, on November 29, 1891, the government signed a law on arming the Russian population in Turkestan [8.16].

In the Syrdarya region, the formation of settlements under the command of retired soldiers was planned and arming of the displaced population began in 1892, but this policy was very slow. The reason for this was that the administration was very careful in distributing weapons, fearing various conflicts between the local and Russian population. The first armament took place in the Syrdarya and Fergana regions. Initially, weapons were distributed to retired ex-servicemen, and the rest were distributed to civilians. In 1892, 1,500 weapons were distributed to the displaced in the Syrdarya region, and by 1897, 1,231 had been distributed to the displaced population [8.18].

In 1894, there were 17 weapons in the village of Pokrovsky in the Fergana region, and in 1897, more than 50 weapons from the Syrdarya region were distributed in the village. If we look at the number of weapons, we can see a small number, but if we look at the population, we can see that more than half of the population is armed. As of 1892, the Turkestan Governor-General's Office had 3,000 displaced families in 42 Russian settlements, mostly in the Syrdarya region. In 1897, there were a total of 3 villages in the Fergana region, and by 1899, there were 166 families, 67 of which, or 40.3%, were armed [8.19]. The purpose of the Russian armament was to keep the state of emergency ready. Despite the measures taken, the deteriorating socio-economic situation of the local population forced the Russian administration in Turkestan to take new measures.

1896 Finance Minister S. Yu. Witte came up with the idea of stopping the deportation. Secretary of Defense P.S. Because of Vanovsky's support, the imperial government forbade the relocation of the population to the Seventies. In 1897 the Governor-General of Turkestan, A.B. Vrevsky, without waiting for the emperor's consent, canceled the resettlement to the provinces of Turkestan [7.113].

However, this was a temporary situation. A famine in Russia in 1891 caused a mass exodus of landless peasants to Turkestan. No matter how dense the Syrdarya region, 17 Russian villages were formed in two years. Until the 1990s, there was a shortage of poor among the displaced, but between 1891 and 1892, there was an increase in the migration of the poor. From 1891 to 1892, migration from Russia to Turkestan increased again. The local administration was not ready for

that. The governor-general of Turkestan demanded that the military governor of the Syrdarya region report on the vacant lands on June 17, 1892, in order to establish new settlements. [8]

According to 1890 statistics, 1,300 families were relocated to the Syrdarya region. According to the report, there were no vacant plots of land in Shymkent district, and as of 1892, 360 families had been resettled. From 1875 to 1895, there were 52 Russian villages in the Syrdarya region, 17 of which were in the Shymkent district. One of the reasons for the mass migration of Russian peasants from the central provinces to Turkestan was the normative documents adopted on July 13, 1889, March 15, 1896 and December 27, July 10, 1903 and June 6, 1904. In the early 1990s, more than 15,000 people emigrated to Turkestan as a result of famine in Russia. By the Governor-General of Turkestan, 2,000 of them were relocated to lands confiscated from the local population [6.29]. The migration of the Russian-speaking population not only led to a dramatic increase in the population of Central Asia, but also to an increase in national unity. In 1897, the first census was taken in the entire Russian Empire. In particular, the population of Turkestan is 5.3 million. of which 35.77% - Uzbeks, 44.36% - Cossacks and Kyrgyz, 6.73% - Tajiks, 4.98% - Turkmens, 3.75% - Russians, 2.26% - Karakalpaks, 2.15% - other nationalities [6.29].

The main goal of the colonial administration's resettlement policy in Turkestan was to increase its political influence by Russifying the country. The state of the Russian language, which was transferred to Turkestan, was satisfactory at first sight. However, the resettlement was difficult at first, as Russian farming methods were not suitable for Central Asian conditions. This was stated by an ardent fan of Russian colonial policy in Turkestan, I.I. Geyer also acknowledged that "Russians who have been displaced have had to re-educate themselves from the earliest days to cultivate the land." The displaced Russians initially felt helpless. Because cultivating the land he learned from his father was not appropriate in this area "[9.26].

The Russian Empire sought to solve its internal problems through the policy of resettlement, but the consequences of this policy in the resettled area were a secondary problem for them. The resettled people felt uncomfortable from the very beginning, because their farming activities were radically different from their traditional farming activities.

According to sources, not all of the evacuees were able to use the land or understand the techniques of farming. The tsarist government, although aware of their negligence, continued the policy of resettlement. In an article in the November 1890 issue of *Russkiy Vestnik* entitled "Russian Colonialism in Turkestan," Mr. Ivanov lamented the resettlement policy: "It should be noted that the number of displaced people is growing. In 1886 315 farms were relocated, in 1887 twice as many 789, and in 1889 1006 farms were relocated.

In 1879, the population of the three Christian settlements was 2,000, and 10 years later, in 1889, the number of displaced people in the Syrdarya, Zarafshan and Fergana regions increased to 25,000 "[4,369]. Arriving in these areas, Ivanov described the living conditions of the displaced people as follows: "As we toured several Russian settlements, we were not happy with the information gathered about their living conditions. Despite the fact that the settlers have lived here for several years, the locals have not mastered the use of natural resources. They are like orphans waiting for someone to take care of them and you can't do anything about it "[4.370]. Apparently, most of the displaced people did not love the place because it was forced to do so, but just wanted to use it. Historical experience shows that the use of landowners is beneficial not only to the state, but also to the state in terms of income, employment and welfare of the

population. In the formation and development of the property of the owners lies their tireless work, talent, patience and perseverance. Poverty is often self-inflicted, caused by a lack of innovation, incompetence, and a lack of appreciation for time.

The majority of those deported to Central Asia were poor and faced personal illiteracy in running their own farms. The displaced population is the blackest and poorest part of the Russian population, and the Russian administration controls their activities and expresses its opinion: "Without outside help, without a wise manager, you cannot start your own economy. Since the state does not always provide financial assistance, resettlement policy should be organized in such a way that it benefits the economy. The best way to do this is to relocate the displaced population to private landowners"[5.392].

Thus, the agrarian policy of the tsarist government and its sharp-edged resettlement policy eventually led to an increase in the number of rusars in the province, strengthening their economic position and increasing their dominance over the local population. This created the socio-economic basis of the great Russian chauvinism.

**ABSTRACT**

*In this article, we will show how polymers are taught in the section on this topic. Information on the history of the Department of Polymers at the Faculty of Chemistry is provided at universities. Polymer science courses at the University of Concept are an integral part of the curriculum in seven programs - chemistry, biochemistry, bioengineering, civil engineering in materials, chemical analysis, chemistry and civil engineering in chemistry. A detailed description of the polymer-based courses included in the curriculum, as well as the scientific and methodological basis for the integrative improvement of the course "Polymer Chemistry" in the bachelor's degree program "Chemistry" in universities.*

**KEYWORDS:** *Polymer Chemistry, Methodology, Chemistry, Integrative Improvement, Teaching Methods, University, Curricula.*

**INTRODUCTION**

Polymers are a part of our lives; scientists dedicated to polymer science are developing new materials, thinking about environmentally friendly methodologies and meeting people's needs. In many universities, polymer science is taught by academics associated with traditional chemistry departments (organic, analytical, physical, and inorganic chemistry). Like various sciences, polymer chemistry has its own language and terminology. Poly- means many, inheritance- means

size. Also, the molecular mass of polymers is very large. Their exact scientific name is called high-molecular compounds. However, you are well aware that the so-called "polymer" is synonymous with science, technology and is widely used in life. The molecule of polymers is also called a macromolecule because they actually have a molecular mass. Polymers are high-molecular compounds whose macromolecules have a chain structure, consisting of groups of atoms (joints) that repeat many times.

Due to the interdisciplinary nature of teaching polymer chemistry to undergraduate students, there are specific difficulties in conveying the topic clearly. It aims to propose a new curriculum for teaching this core course to overcome some major barriers. In particular, new integrative research methods are being added to the professors responsible for teaching first-year polymer chemistry. Starting with the simplest chemical pathway, i.e. live anionic polymerization, we intended to facilitate polymerization. In addition, some pedagogical challenges are highlighted in this article. These new scientific methods of polymer teaching are based on knowledge of organic chemistry.

What is the purpose of the science of "polymer chemistry"? In fact, it is to acquaint undergraduate students in the field of chemistry with the basics of polymer chemistry and its important practical features, which the chemist-bachelor should know, and to help them to test their theoretical knowledge in practice. The general course focuses on explaining the properties of polymers that differ from ordinary submolecular compounds due to the large size and chain structure of macromolecules. The general theoretical course of the subject "Chemistry of Polymers" is carried out by students through laboratory work.

Teaching improvement processes:<sup>1</sup>

- Strategies for providing teaching and workshop opportunities to improve teaching staff;
- Creating opportunities to improve academic courses and research through conferences;
- Update by reading more books and articles related to the course;
- Improving methods in the classroom and allowing students to focus on the learning process through relationships such as improving and enhancing the teacher-student relationship. World experience shows that the relationship between teacher and students certainly affects the quality of education.

Polymer chemistry course materials and learning outcomes should be reviewed periodically and modified. The development of scientific and methodological bases for the integrated improvement of the course of polymer chemistry and the introduction of innovations in this area require the use of modern and interactive teaching methods, mainly through the initiative. Pedagogy is a fundamental and applied science. First fundamental applied research and is characterized by the expression of fundamental priorities. The strategic goal of fundamental research is to identify laws and regularities, to create theories and concepts, to systematize the properties and significance of real objects.

The increasing use of IT or web directories will also make it easier to educate students through changes in content as a result of new research. Polymer Chemistry course materials will be posted on the website, which students can access and can easily use both intensive and integrative coursework. Electronic materials and computer-based software are used to support the course material.

It is necessary to continuously use traditional and interactive methods during the teaching of students, mainly in the course of Polymer Chemistry. It is also important in this area, as it is in every field. The laboratory room is a place where students test their theoretical knowledge in practice. Chemistry is a complex science and we need to be able to explain it to students in a simple and easy way through various interactive and interactive lessons, using modern methods. Fundamental research performs not only prognostic, ontological, but also heuristic and methodological functions to reveal new aspects of the problem in the education system that need to be explored and to develop heuristic technologies and strategies for applied research.

In the context of information globalization, the enrichment of science with different information, a high degree of freedom to analyze and interpret information, like other disciplines, determines the sense of looking at the science of pedagogy from different angles, ie perspectives. An understanding of the course of polymer chemistry that is incompatible with its nature, and attempts to forcibly assimilate approaches, may also be overlooked. The main way to preserve the fundamental nature of this science is to clarify and correctly explain its methodology.

Why is the motivational method necessary for the course of polymer chemistry ?!

Motivation for everyone is a power and a power that inspires a sense of inner confidence that can empower you to take a bold step toward your goal. I believe that the most important result will be a good result if teachers and professors teach students using motivational methods during the course. These methods and integrative scientific methods have been tested in my own teaching activities.

According to the results of the new research, lessons are organized on the basis of interactive methods by introducing the content of the course and giving assignments to improve the overall skills of the student. The main purpose of this course is to acquaint students with current methods of spectroscopic analysis. They are used in a variety of analytical applications by studying and linking their performance, design, problems, and using the following methods with data:

- Instrumental integrative research methods;
- Analytical interactive methods;
- Methodology of analysis and thinking.

The result of science as a system of scientific knowledge and scientific activity is reflected in new scientific knowledge of theoretical and practical type. In general, the existence of truth and novelty is the most fundamental value for scientific knowledge. Science as a component of culture is based on a socio-cultural perspective, a specific historical and cultural context, develops in an axiological context; on the other hand. - serves as a basis for the development of science and culture.

Based on the need for a scientific and methodological basis for the integrated improvement of the course "Chemistry of Polymers" in the bachelor's degree program "Chemistry", which fully reflects the methodology of scientific and pedagogical research, the creative team provided textbooks, methods and manuals. was created. Because this science is complex, understanding a textbook can certainly be a little harder at the beginning. You will have to rely on philosophical and logical thinking in situations like this. According to pedagogical, methodological and

scientific research, using the results of scientific research on the course of polymer chemistry, it is possible not only to understand the essence of the course of polymer chemistry, but also to study the lessons intensively.

In conclusion, I can say that the educational process is always in need of innovation, new teaching and learning methods. A solution to this problem can be found mainly through the scientific research of university students and teachers. In teaching the science of polymer chemistry to young people on the basis of interactive, integrative scientific methods, which have become popular in recent years, it is necessary to conduct lessons with students, both collectively and individually.

By studying the scientific and methodological basis of the integrative improvement of the course "Polymer Chemistry" in the bachelor's degree program "Chemistry" in universities, we see both the quality of education and its level. Basically, it is necessary to conduct research in this area and use the power of modern technology, as well as to guide students in this regard. In the future, we intend to develop new methods in the field of polymer chemistry and to train mature and knowledgeable personnel through lessons based on each of the integrative scientific methods used in the further development of these fields in our country.

## THEORETICAL FOUNDATIONS OF DIGITAL ECONOMY

**Turaev Khurshid Bakhridinugli\***

\*Student of Bukhara Engineering and Technology Institute,  
 UZBEKISTAN

### ABSTRACT

*Before embarking on our journey into the exciting and engaging digital economy, we will try to get a closer look at the information society and a number of key concepts that are inextricably linked to it. Because only then will it be possible to understand the issues, problems and concepts presented in this article.*

**KEYWORDS:** *New Digital Economy, Techno-Economy, Information Economy, Innovation, Digital Skills, Development.*

### INTRODUCTION

The theory of the digital economy is in its infancy, as the transition of civilization to the digital information stage began only a few decades ago. The term "digital economy" was introduced into scientific practice by Manuel Castels, a Spanish and American sociologist and leading researcher in the information society. He has published a three-volume monograph, *The Information Age: Economy, Society, and Culture*. To date, the theory of the digital economy has not yet been fully formed and is being studied extensively by many economists. In the scientific literature, the modern "New Digital Economy" is called by various terms. For example, "post-industrial economy" (D. Bell), "information economy" (O. Toffler), "mega economy" (V. Kuvaldin), "information and communication-based economy" (I. Nihiluto), techno-economy or digital economy (B. Gates), "knowledge-based economy" (D. Tapskott). The unifying factor of these concepts is the fact that information technology plays a key role in the globalization of economic processes. When talking about the digital economy, it is appropriate to describe the information society., most of the people who work in it are told to a society that is engaged in the production, storage, processing and sale of information, especially knowledge, which is its highest form. This stage of society and economic development is characterized by the growing importance of information, knowledge and information technology in society. Economists use a variety of technological, economic, labor, spatial, consumption and creative criteria to describe

the information society in which the digital economy predominates. We will try to look at each of them in more detail below:

**1. Technological criteria.** New technologies in an informed society is considered a birthmark. These include cable and satellite TV, computer networks, personal computers, new office technologies, and more. This amount of technological innovation is thought to lead to social reconstruction, as their impact on society will be very significant. In Japan, the Ministry of Communications and Telecommunications has been using sophisticated technology since 1975 to measure and record telephone conversations. The following objections to the technological criterion are raised:

- Lack of a rational unit for measuring the volume of information and communication technologies in society; - the problem of not finding a valuable solution to determine the point at which the society can be called informed in the indicator of the technological level; - technologies are inseparable from the social sphere, they are an integral part of society. For example, the decisions that are made in the matter of this or that research and scientific development represent social priorities, and various technologies are developed on the basis of these evaluative considerations. Technological determinism places undue importance on technology, but technology as a non-social phenomenon cannot serve as a major, social factor in the development of society.

**2. The economic criterion is to take into account the growth of the economic value of information.** The increase in the share of the information business in GDP means that the development of society is moving towards an informed society. To determine the level of development of the digital economy, scientists are proposing to introduce the indicator "Gross Digital Product". It reflects the market value of information, goods and services that are useful to the consumer, created in economic sectors using information technology or the information and intellectual component. science, law, publishing, media, and computer manufacturing. Mark Porat, on the other hand, is one of the American scholars who has made a distinction between the primary and secondary economic sectors. The primary sector can be clearly valued economically because it directly creates market value. Although the secondary sector is important to the economy, its economic evaluation is more difficult because it involves information activities within companies and state-owned enterprises.

The economic criterion for defining the information society has found its theoretical basis in the work of the American scientist, Professor Herbert Schiller. He said that "the role of the market will be decisive in any innovation related to information and communication: information must remain a commodity, that is, access to them will be only on a commercial basis." he concludes.

In this case, the information is more like any other product. According to Schiller, market principles work as fully in the field of information as in a capitalist society. According to this criterion, the quantity and quality of information produced directly depends on the availability of useful information. At the same time, it is natural to be faced with the question of what kind of information should be produced in accordance with market principles, for whom and under what conditions. The following objections are raised against this economic criterion:

- In deciding what to include in the information sector, it will be impossible to avoid covert commentary and costly judgment. As a result, the economic importance of the information sector may be exaggerated. For example, F. Makhlop includes in his "field of knowledge" the

construction of "information buildings", which is in stark contrast to the construction of similar buildings, such as universities and libraries, warehouses for food storage. implies that When M. Porat studies his "secondary information sector", he divides any field into information and non-information parts. However, in such a division as "thinking" and "doing", for example, it becomes difficult to determine in which section the work of the operator of control computer systems, which includes various tasks, should be included;

- A valuable approach to measuring the amount of information equates different types of socially significant economic activities. In this approach, for example, \$ 1 spent on advertising is equated to \$ 1 spent on publishing a scientific journal. 3. Labor criteria. It examines the employment structure and trends in this structure. When most members of an active society work in the field of information, it is understood that the society enters the digital information stage of its development. In this approach, information serves as a raw material for non-physical labor.

- The driving force of the modern digital economy is people, whose main task is to create and use information. The criterion of labor has its theoretical basis in the works of the American sociologist Daniel Bell. He proposed a series of social structures that were determined by the priorities of labor as a whole and at all stages. According to him, in pre-industrial societies agricultural labor was the main type of activity, in industrial societies the most common labor was in manufacturing, while in post-industrial society the main type of employment was in the service sector.

- Bell explains that the main reason for such changes is the increase in production efficiency. As productivity increases, so does the number of teachers, doctors, hospitals, and so on. The more goods an industrial society creates, the more types of services it provides, and the more industrial workers move into the service sector. As it is difficult to automate labor in the service sector, the number of workers in the service sector will continue to grow as industrial productivity increases. Therefore, there is no room for a sharp decline in employment, says Bell. The following objections have been made to the above criteria:

- There is no objective way to divide labor into information and non-information types. For example, railroad conductors need to have a great deal of knowledge about tracks, train schedules, and routes. Nevertheless, they are included in the workers of the industrial age;

- In the digital information society, a new class of intellectual and technical intellectuals will serve as a factor in the development of society. No matter how much the number of members of this class grows, their number will remain much smaller than the working population.

Once we have clarified the issues related to the information society above, we will begin our journey into the world of cryptocurrencies. One of the main types of fast-growing digital economy in all developed countries today is a variety of financial transactions with blockchain and cryptocurrencies, in which to know the meaning of active and knowledgeable participation in them. very important. It should be noted that the main difference between blockchain and cryptocurrencies is that their structure is decentralized.

There is no single hub or bank in the blockchain and cryptocurrency systems, and the entire network is based on a P2P (peer-to-peer) peer-to-peer architecture. That is, such a network consists of client programs with the same rights. Each blockchain and cryptocurrency client program, in turn, consists of a self-supporting structure that connects to the global

cryptocurrency network and is fully automated 24 hours a day. The issuance of cryptocurrencies is based on the principle of mining. "Mine" is the process of using the computing power of computer systems to create a chain of cryptocurrency transactions. In this case, each block must have some criteria of accuracy and level of complexity. For this, hashing algorithms are used. Thus, miners find new cryptocurrencies at the same time and perform all possible types of cryptocurrency transactions. If the miners stop working, the cryptocurrency will disappear. The resources of today's modern personal computers are not enough to mine the largest number of circulating cryptocurrencies (Bitcoin, Litecoin).

That's why miners, or "farms," use high-speed, high-performance computer stations with huge computing power. Cryptocurrencies are protected from counterfeiting by hashing algorithms, and their decryption (breach of protection) is currently practically impossible. Digital money - cryptocurrencies We go back to shed some light on the issue and first answer the question of what money is: Money is a currency that is accepted as a common equivalent for the purchase of goods and services by one country or several countries under an agreement. 'lib, it applies in today's economy in paper, metal or electronic form. One of the most important aspects of the currency is that it issues an institution issuing (issuing money) (Central Bank of Uzbekistan) and strictly adopts its value in the territories specified in the payments in accordance with the relevant legislation.

In the United States, for example, it costs only 14 cents to issue a single \$ 100 bill. If half a century ago the value of money was provided by the gold equivalent, today it is determined that they are provided by the total sum of goods and services created in the country. However, every transaction with non-cash money (money transfer practice) is carried out directly through a financial institution. There is a special control, and financial intermediaries (banks, stock exchanges, etc.) are charged a fee for security and services.

## CONCLUSION

And of course, cash can be counterfeit. Given global trends and foreign policy developments, Uzbekistan faces the challenge of global competitiveness and national security, and the development of the digital economy in the country will play an important role in addressing this issue. Some elements of the digital economy are already working successfully in our country.

**ABSTRACT**

*The article emphasizes the socio-economic importance of creating competitive production chains and increasing investment projects using the opportunities of the investment environment within the framework of reforms aimed at further enhancing the country's economic growth. In addition, an analytical approach to the state of production of industries has been developed and proposals and recommendations have been developed to increase the volume of investments based on investment projects to ensure a competitive production chain.*

**KEYWORDS:** *Economic Growth, Competition, Production Chains, Investments, Investment Climate, Investment Projects, Direct Investments, Economic Complexity Index.*

## INTRODUCTION

The Address of the President of the Republic of Uzbekistan Shavkat Mirziyoyev to the Oliy Majlis summarizes the results achieved this year, the work was done in the framework of the State Program "Year of Science, Enlightenment and Digital Economy" and the next year, as well as the most important tasks for further development. Priorities for domestic and foreign policy were identified [1].

It is no exaggeration to say that 2020 has been a dangerous year for the countries of the world, in particular, the whole of humanity is experiencing a global catastrophe called the COVID-19 coronavirus pandemic. It is true to say that such an unexpected catastrophe has not occurred on a global scale in the last hundred years.

## LITERATURE REVIEW

In order to combat the coronavirus pandemic and the global crisis in our country, on March 20, 2020, Decree PD-5969 "On priority measures to mitigate the negative impact of the coronavirus pandemic and the global crisis on sectors of the economy" was adopted.

According to the decree, the Republican Anti-Crisis Commission headed by the Prime Minister was established to mitigate the negative effects of the coronavirus pandemic and the global crisis in various sectors of the economy, and the Anti-Crisis Fund was established. In addition, 10 trillion soums were allocated to the fund from the state budget.

The funds will be directed mainly to measures to combat the spread of coronavirus infection, support entrepreneurship, and employment, including the implementation of infrastructure projects, ensuring the sustainable operation of sectors of the economy and expanding social support [2].

At a time when strict quarantine measures have been strengthened in connection with the pandemic in our country, there is a need for targeted support to needy families in the regions. It is safe to say that the effectiveness of the "iron book" system, introduced at the initiative of the President, has become a program to maintain stability in social issues, such as employment and the provision of state assistance to needy families, and such good measures have yielded positive results.

In the context of the pandemic, one of the important tasks is to ensure economic growth of the country based on the priorities set by the President, to combat the crisis and mitigate it by creating competitive industrial chains, especially in the pandemic. and ensuring the functioning of the service sector is one of the urgent tasks. Therefore, the development and implementation of effective investment projects in the radical solution of the problems of employment and prevention of unemployment, poverty reduction in the regions of the country are of great importance.

Another important issue raised by the President in the Address is to ensure high economic growth in the country in the coming years. As the President said, economic growth requires constant development of new goods and upward advancement in the global production chain.

In his address, President Shavkat Mirziyoyev said that the oil and gas, metallurgy, machinery, electrical engineering, pharmaceuticals, construction materials, textiles, leather and footwear industries, which are based on in-depth scientific and practical research and have all the potential, should become the "drivers" of our economy. They also expressed their views on what to do in 2021, focusing on the following, in particular [1]:

- ✦ Development of investments totaling \$ 23 billion in the sectors involved in the creation of competitive industrial chains and the commissioning of 226 large industrial and infrastructure facilities;
- ✦ reducing the state participation in investment policy, ensuring the priority of increasing the share of private and direct investment;
- ✦ to determine the list of promising industrial clusters by April 1, 2021, and to develop a separate program for their development;
- ✦ Increased production of industrial products under the "processing regime in the customs territory";
- ✦ In the field of geological prospecting in our country, 50 deposits and promising areas will be sold to investors through auctions.

Uzbekistan ranks 80th in the Index of Economic Complexity, an increase of 9 points over the past decade. For comparison, this is the best indicator among Central Asian countries. Another important aspect of this index is that the higher the index, the higher the income level of the country.

Based on this ranking, Uzbekistan expects an average annual economic growth of 4.5% over the next 10 years, ranking 23rd out of 133 countries analyzed. Another noteworthy aspect is that since 2003, the number of exported goods has increased by 23 new goods. During these years, the number of new products in Kazakhstan - 15, in Pakistan - 21, in Tajikistan - 10 [4].

## RESEARCH METHODOLOGY

The main purpose of the study is to develop scientific and practical proposals and recommendations for the development of the industry based on the analysis of the current implementation of reforms to create competitive industrial chains and increase the socio-economic importance of increasing investment projects, as well as analysis of investment in industrial enterprises. Comparison, grouping, and empirical research methods were widely used in the study.

### Analysis and results

Increasing investment projects is crucial in ensuring the country's economic growth and creating competitive industrial chains. In this regard, the development and effective implementation of

investment projects, taking into account the country's resource potential, will serve to deepen structural reforms in industry, increase its competitiveness through modernization and diversification of key sectors of the national economy.

In particular, comprehensive measures are being taken to further intensify investment policy aimed at modernizing and organizing high-tech industries that provide deep processing of local raw materials and production of finished products with high added value. Extensive work has been done to radically improve and simplify the implementation of investment projects, to expand the attraction and development of investment, especially foreign direct investment [3].

Within the framework of this decision, the Ministry of Investment and Foreign Trade of the Republic of Uzbekistan jointly with the relevant ministries, departments, and other organizations developed 850.5 trillion soums on the basis of the Investment Program of the Republic of Uzbekistan for 2020-2022 soums of investments, including 35.5 bln.

Aggregate forecast parameters for the development of capital investments in 2020-2022, which provides for the development of foreign investment in the amount of US dollars, as well as the development and attraction of investments and loans in 2020-2022, the creation of 206 new production facilities and more than 31 thousand jobs in 2020 issues of launching large production facilities and capacities, have been identified.

Positive work is being carried out in the country with the support of our Government on the development of industrial sectors and attracting direct investors. In particular, investment relations with the World Bank, the European Bank for Reconstruction and Development, the Islamic and Asian Development Banks, and other international financial institutions are changing for the better. In addition, foreign investments in 2020 amounted to 6.6 billion US dollars in fixed assets [5].

It is the development and implementation of investment projects that are of great importance for our country as well as for investors. In this regard, the implementation of investment commitments is set to be carried out mainly in Phase 2. Today, the implementation of investment projects is important for every country. It is no exaggeration to say that investment as a "driver of the economy" is the "heart of the economy" - the driving force.

Along with investment in ensuring economic growth of the country, new technologies, advanced foreign experience, highly qualified specialists, small business and entrepreneurship are rapidly developing in various industries and sectors, as well as in the regions.

According to preliminary data, in January-November 2020, the enterprises of the republic produced industrial products worth 322.3 trillion soums, compared to January-November 2019, the volume index of industrial production amounted to 100.1%. The largest share in the structure of industrial production fell to the share of the manufacturing industry, which accounted for its share in total industrial production (83.1%).

The main factor in the decline in the physical volume of total industrial production was a decrease in mining and quarrying - by 22.5% and in water supply, sewerage, waste collection and disposal - by 6.2%. There was also an increase in manufacturing (processing) by 6.3% and electricity, gas, steam and air conditioning supply by 12.9%.

**TABLE 1 THE VOLUME OF PRODUCTION OF CERTAIN TYPES OF INDUSTRIAL PRODUCTS BY LARGE INDUSTRIAL ENTERPRISES IN THE MINING INDUSTRY AND OPEN-PIT MINING<sup>1</sup>**

<i>Industrial products</i>	<b>January-November 2019</b>	<b>January-November 2020</b>	<b>The difference +/-</b>
Coal, thousand t.	3 513,5	3 710,4	196,9
Oil, ming t.	640,7	673,4	32,7
Natural gas, mln. cubic meters	55 252,4	44 926,1	-10 326,3
Gas condensate, thousand t.	1 932,3	1 268,4	-663,9
Pebbles, thousand t.	1 773,3	1 677,7	-95,6
Gravel, thousand t.	470,2	235,0	-235,2
Kaolin, thousand t.	<b>296,4</b>	<b>351,8</b>	55,4

The volume of products produced by industrial enterprises in January-November 2020 amounted to 267.8 trillion soums or 83.1% of total industrial output. The share of high-tech industry in the structure of manufacturing industry is 1.9% (in January-November 2019 - 1.5%), medium-high-tech - 23.1% (26.1%), medium-low-tech - 40.5 percent (36.6 percent) and low-tech - 34.5 percent (35.8 percent) (Table 1).

Foreign investment is mainly applied to solve financial problems. The use of funds by financial departments of foreign corporations for the purpose of obtaining high returns, including short-term investments, leads to the determination of material interest. Such investments are often based on the capital of private entrepreneurs, who sometimes issue their own securities and buy foreign securities.

**TABLE 2 DYNAMICS OF CERTAIN TYPES OF INDUSTRIAL PRODUCTS PRODUCED BY LARGE INDUSTRIAL ENTERPRISES IN THE INDUSTRY<sup>2</sup>**

<b>Industrial products</b>	<b>January-November 2019</b>	<b>January-November 2020</b>	<b>The difference+/-</b>
<i>Cars, pcs</i>	253421,0	260862,0	<b>7441,0</b>
<i>Trucks, pcs</i>	5 056,0	3 726,0	<b>-1330</b>
<i>Car engines, thousand pcs</i>	186,4	210,4	<b>24</b>
<i>Thousand tons of soft wheat and spelta it</i>	1 485,6	1 685,7	<b>-200,1</b>
<i>Cotton fiber, thousand tons</i>	367,1	510,7	<b>143,6</b>
<i>Thousand tons of vegetable oil (refined)</i>	<b>160,2</b>	<b>146,2</b>	<b>-14,0</b>

In January-November 2020, the industry produced 919.0 thousand tons of gasoline (decreased by 0.8% compared to January-November 2019), 407.1 thousand tons of yarn (9.1%), 1,685.7 thousand tons of soft wheat and spelta flour (13.5%), 226.6 million liters of beer (13.0%) and high growth rates were observed.

An analysis of the structure of foreign investment attracted today shows that the bulk of such investments are in export-oriented sectors: fuel and energy, oil and gas, chemicals, gold mining, and cotton processing, or short-term and large self-repayment. the fund focuses on high-yield

projects that do not require: trade, telecommunications, catering, construction of office and hotel buildings in major cities, food industry, and financial services.

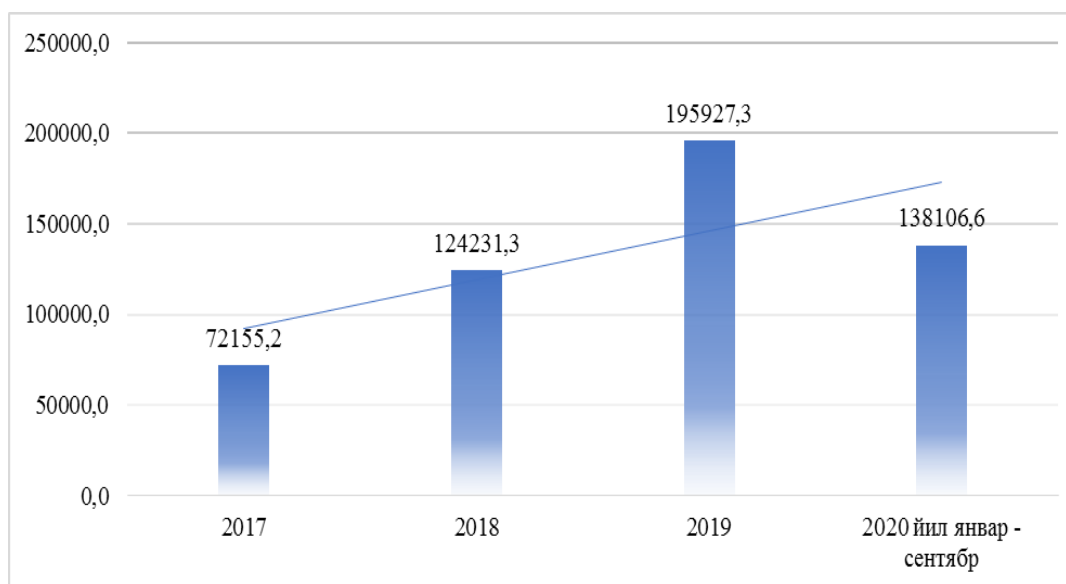

Ensuring the sustainability of production in all sectors is important in ensuring the chain of industries. In this regard, special attention is paid to the implementation of an active investment policy aimed at modernization of production, technical and technological renewal, production, agriculture, transport and communications and social infrastructure projects.

For this purpose, emphasis is placed on the use of centralized, decentralized funds, foreign investments and loans, as well as their effective use.

Of particular note is the work being done to attract investment for the implementation of projects on the structural restructuring of the economy, modernization of industries, technical and technological renewal.

As of 2020, it is planned to create 62,972 new jobs as a result of the disbursement of 16.7 trillion soums of investment funds on the objects of control over the inflow of fixed capital investments in the Republic of Uzbekistan.

**Fig 1.**

**The volume of investments in fixed assets (in current prices, billion soums) [6].**

The total volume of investments in fixed assets in the Republic of Uzbekistan in 2017 amounted to 72,155.2 billion soums, in 2019 - 19,5927.3 billion soums, in the three-quarters of 2020 - 138,106.6 billion soums (Figure 1).

Analysis of the factors and sources of economic growth in the country shows that in the pre-crisis period, high rates of economic activity were achieved mainly due to the acceleration of export potential, the volume of investments in the economy, systematic and gradual renewal of the economy.

Economic growth has been ensured by the deepening and expansion of economic liberalization, the stabilization of the foreign exchange market, and the rapid development of the small business and private entrepreneurship sector.

## CONCLUSION

The economic and social significance of creating competitive industrial chains and increasing investment projects is growing, especially as a result of deeper processing of raw materials, implementation of structural policies aimed at increasing the share of high value-added goods, reducing the share of agriculture and industry, services an increase in the share of industries is observed.

In conclusion, the measures taken to ensure the economic growth of the country, the creation of competitive industrial chains and increase investment projects, as well as technical and technological modernization of enterprises, expansion of the range of products and further increase the competitiveness of competitive industries. serves to create chains.

### ABSTRACT

*The modern information society raises new requirements to the process of training of a future primary school teacher as a component of a lifelong education system. An important role in providing of lifelong learning is given to distance education, which promotes self-motivation and self-actualization, enhances independent cognitive activity, and contributes to the acquisition of fundamental knowledge and the formation of skills to use it in professional activity. In this regard, the article analyzes the course "Teaching future primary school teachers to train students on the basis of modular technologies" that contributes to the training of future primary school teachers to the successful use of distance learning technologies in the system of lifelong education. The course consists of two modules. The first module provides theoretical information on a distance learning technology in primary education, and the other – individual research assignments. Also, the paper presents the topics of lectures, practical classes and independent activity and describes the system of student performance evaluation.*

**KEYWORDS:** *Lifelong Education System, Distance Learning, Fundamentals of Distance Learning In Primary Education.*

### INTRODUCTION

#### Problem statement

In the modern information society, when technologies require the new system of thinking, school should teach students communication skills, the ability to work with any information and to think flexibly, depending on a situation. Therefore, modern primary school teachers must possess innovative teaching technologies that requires a school reform according to the State National

Program “Education” (Ukraine XXI century) [8] the National Doctrine for Development of Education in Ukraine [9], the Conception of Continuous Pedagogical Education [1], the National Standard of Primary Education [2], the Regulations on Distance Learning [7].

The use of distance learning modular technologies in all areas of educational activity requires from a modern pedagogical higher education institution the creation of appropriate conditions for forming readiness of future primary school teachers for distance learning in a lifelong education system. In our study, we define primary school teachers’ readiness for DL as possession of knowledge and skills to study in a lifelong education system.

**Recent studies analysis.** The analysis of recent studies and publications, in which the attempts to solve to the problem are found, shows that modern scholars pay much attention to the introduction of distance learning into the educational process , particularly in the process of continuous education of primary school teachers.

The problem of primary school teachers training for professional activity in the modern information society was studied by V. Bondar, N. Bibik, M. Hordiichuk, O. Kyvliuk et al.

**The purpose of the article** is to analyze the content of the course “Fundamentals of Distance Learning in Primary Education” which is taught to future primary school teachers in a lifelong education system

**Main material statement.** The learning technologies that are based on information and pedagogical technologies change the functions of a future primary school teacher in the educational environment of universities, increase the requirements for knowledge, skills and personal qualities. Therefore, great importance is attached to the questions of forming students’ readiness to solve learning and self-study tasks, search, analyze, and present the necessary information using computer tools and technologies. There are objective reasons for the formation and development in a future specialist structural components of learning activity (learning tasks, learning actions, reflection, control), psychological readiness (activity, motivation to self-study, interest in educational and professional activity) and competence in information and communication technologies.

The main objective of the course is to train future professionals for the successful use of distance learning technologies in a system of lifelong education of primary school teachers.

In accordance with the goal and objectives of the course “*Teaching future primary school teachers to train students on the basis of modular technologies*” and considering the complex of requirements for a primary school teacher in the DL [1], we formulated the requirements for knowledge and skills of future primary school teachers that should be acquired and practised in the process of mastering the discipline.

On learning theoretical material of the course, a future primary school teacher must know:

- nature, kinds, functions, tasks, models and technologies of DL on the modern stage;
- development of DL in pedagogical theory and practice;
- conditions of organization of DL in a pedagogical higher education institution; – requirements for the use of DL technologies;
- basic principles of DL in a system of lifelong education of primary school teachers;

- forms and methods of organizing DL in a system of lifelong education of primary school teachers.

On completing the tasks for practical classes and independent work, a future primary school teacher should be able to:

- be familiar with DL models and technologies;
- work with a web-site of lifelong education of primary school teachers;
- organize and conduct DL in a system of lifelong education of primary school teachers;
- develop distance learning courses for primary school teachers, including such elements as forms, glossary, tests, etc.;
- create electronic didactic tools using hypertext, multimedia technologies and technologies of Web 2.0;
- search and select information on the Internet.

The content of the course “Fundamentals of Distance Learning in Primary Education” is determined in accordance with the goal and objectives of the course. The structure of the course consists of two modules.

Module 1 includes two content modules which reflect the topics of lectures, practical classes and independent work (see Table 1)

The modular control has two components: the control of the independent practical assignments completion and taking tests.

In the first case, students load on the distance course webpage completed practical assignments in the form of files; a lecturer checks these works, assesses and analyzes, and then sends the results to students for revision or rewriting if necessary.

Tests are carried out on all topics. Each student, taking a test on any topic, has one attempt and 8 min. to complete it, after he or she can see the number of correct answers and earned points.

In the distance course “Fundamentals of Distance Learning in Primary Education” tests on each topic consist of 10 questions developed in a closed form: select one or several answers.

- The Final Testing. The goal of this stage is to test and evaluate the knowledge and skills of the course as a whole. During this stage, students take closed-form tests, consisting of 15 questions. To complete the test they have only one attempt.
- Conclusions, analysis and reflection. This stage combines two complementary processes:

the analysis of a student’s activity by a lecturer and by other students, reflection (the analysis of their own activities) students. The teacher concludes the study of the distance course, examines the activity of students, and calculates the final score.

## CONCLUSIONS

Thus, the analyzed training course “*Teaching future primary school teachers to train students on the basis of modular technologies*” takes into account the following peculiarities of the DL organization in a system of lifelong education of primary school teachers: the shift from teaching to independent cognitive activity of students; the necessity of forming abilities of distance interaction by means of information technologies (compulsory computer literacy of teachers and students); the change of interaction between the subjects of educational activity caused by the advent of information technologies which leads directly to changes in the educational process; flexibility where residence and class hours do not matter, since the classes can be conducted at time and place convenient to everyone.

We believe that this training course contributes to fundamentalization of education, the development of systems thinking of future specialists, the study of theoretical, methodological and practical problems of forming, functioning and development of a lifelong education system, building readiness of future specialists for DL in a lifelong education system.

**Prospects for further studies** are in improving the course “*Teaching future primary school teachers to train students on the basis of modular technologies*” in all forms of organizing the educational process of a pedagogical higher education institution by means of modern DL technologies.

## LINGUISTIC ANALYSIS OF COMPUTER TERMINOLOGY

**Zulfikorova Zuhra Allaberdievna\***

\*English Teacher,  
Karshi Engineering Economic Institute,  
UZBEKISTAN

### ABSTRACT

*To date, the Internet term system needs to be streamlined, which can be implemented through the use of various models of representation of conceptual structures. The development of the principles of defining Internet terms, as well as a complete complex parametric description of the term system and a complete detailed representation of the conceptual structure is the perspective of this study. The terminology studied in this dissertation, due to both the increasing spontaneity and rapidity of formation, and the increasing importance of the field itself, its globality and incorporation into a common language, requires close attention of terminologists and appeals to normative work using effective methods.*

**KEYWORDS:** *Terminology, Internet, Term Systems Terminological Semantics*

### INTRODUCTION

The need for a deep and comprehensive study of computer terms in various languages is confirmed by modern works on the terminology of computer technology in English [Kondratyukova, 1984], Russian [Komleva, 2006], French [Telyatnikova, 2001], Spanish [Lobanova, 2009]. Computer terminology is the subject of dissertation research, which examines terms borrowed from the English language [Shumailova, 2003; Glazyrina, 2006], methods of formation of computer terms and their structural and semantic features [Antonova, 2004; Koshkarova, 2004; Belikova, 2004; Knyazev, 2006], extralinguistic conditionality of computer vocabulary [Akulinina, 2003].

The systematic nature of terminology is due to the performance of its units of the main function of designating special concepts of a certain field of knowledge, which in turn is determined by the presence or absence in their internal form of categorical, concept-forming features, the motivation of the form and semantics of the term, as well as the complexity of scientific concepts verbalized by terms. In this regard, such poorly studied phenomena as: 1) the content structure of

terms, in particular the semantics of unambiguous and polysemantic terms; 2) the causality of the inclusion in the external form of terms of elements that reflect the essential, characteristic or only distinctive features of the concept.

There are three main aspects of the study of terminological semantics: derivational, due to the component composition of the structure of terms and the attachment of individual term elements to certain categories of concepts; functional-field, exposing the semantics of terms of specific areas of knowledge using fixed means of professional speech and through their correlation in the general field space; and lexical, based on intersystem, intersectoral and inter-scientific connections and relations [Morozova, 2004:78-79]. The latter is most often stated in semantic studies of terms, but a comprehensive study of the three aspects is almost not presented.

Thus, the relevance of the research is due to the urgent need for a comprehensive study of terminological semantics in the derivational, functional-field and lexical aspects and the ordering of terminology in the field of the Internet, which penetrates into all spheres of modern life.

As a result of the conducted research, it is proved that the terminology of the Internet in the English language is an open multidimensional system of special nominations that is constantly updated and adjusted because of the intensive development of the practical application of the Internet and its active implementation in all spheres of activity.

The study showed that the dynamic nature of the term system caused by the constant migration of units affects the specific nature of Internet terms that correspond to the trends in the development of term systems (consistency of semantics, fullness and unambiguity, lack of synonyms, jargon, unusual forms, variants, motivation, internationality, euphony). However, it was noted that in specific cases, Internet terms deviate from the prescribed requirements for one reason or another, while performing the main function of designating a special concept of the Internet area.

The function of the designation of a special concept as the main essential characteristic determines the functional-semantic and structural and grammatical originality, greater informativeness and motivation of the linguistic substratum of the term.

The study of the formal, semantic, historical and functional characteristics of Internet terminology gives an idea of the studied set of terms as a relatively normalized, mainly international macroterminology, consisting of various subsystems formed as a result of the separation of a new field of knowledge from the subject area of computer technology with the simultaneous influence of a number of sciences. Extra linguistic factors allow us to distinguish six stages in the formation of a special area of the Internet, each of which corresponds to a certain stage in the formation of concepts and their designated terms with a predominance of spontaneity or consciousness at different stages. Apparently, the Internet term system is one of the few in the field of special communication, the composition of which is almost completely native in origin, although today, in connection with the development of the Internet in non-English-speaking countries, borrowings appear in the English terminology of the Internet (5% of the new terms recorded in the period from September 2009 to January 2010), but more often they have native doublets.

Considering the terminology of the Internet from the point of view of logical and linguistic coherence allows us to conclude that it contains branched derivational nests, in particular in the

form of derivational paradigms, the derived elements of which are both the result of term formation within the English language system, and the result of filling terminological gaps with the help of professionalism. Regular and productive terminological paradigms and term-forming models reflect the system connections at the level of an individual term.

The core area of the main terms of the Internet stands out clearly, as well as other groups of terms (complex, derived, involved, basic, general scientific\general technical and terms of broad semantics).

Terminology as a whole is quite ordered, which is facilitated by various factors considered in our work, including the system relations of terminological vocabulary (synonymy, antonym, hyponymy, etc.). Interaction with related term systems ("Graphics and typography", "Marketing and advertising", "Computer " Telecommunications"), the demand for phenomena and objects, technologies "and reflected in the terminology of the Internet, by different circles of modern society, explains the trends towards simplification, "comprehensibility" of special units, which has the corollary of the functioning of a large number of synonymous categories, which to some extent are not always justified, since it is impossible to clearly trace the degree of similarity\differences. However, in the systematic representation of the meanings of synonyms, which is facilitated by the structural parallelism of definitions, additional linguistic consistency, the description of specific features of differences and similarities in the reflection of paradigmatic relations, the type of definition, strengthen the system connections of terms in the term system. The analyzed definitive material from the point of view of reflection of semantic correlations of synonymy, antonym, hyponymy, "part-whole", semantic derivation and associative correlation precisely proves the presence of deep system relations in the terminology of the Internet, reflecting logical and conceptual connections. At the same time, the accuracy of the reflection of the conceptual relatedness depends on the number of system connections between the terms fixed at the semantic level in the terminological definition.

The multidimensional nature of the Internet term system can be traced in the thematic organization (six large thematic groups: web technologies, e-commerce, Internet infrastructure, distributed data processing and distribution systems, information security on the Internet, the language of chat, discussion groups, communities, e-mail), while the integrity and interconnection of individual subgroups is manifested in the ability to identify more general and large thematic blocks (networks, the World Wide Web and Internet services) and in the presence of connecting overlapping subgroups, what is presented in the holistic model of the conceptual system of the Internet. The hierarchical structure of the Internet term system is illustrated in the form of a frame consisting of subframes and numerous slots arranged vertically and horizontally. The structure of the concept of "Internet" is presented in the form of a set of 10 main cognitive features, widely represented in the blocks of terminological vocabulary. The multilevel and structural complexity of Internet terminology revealed in the course of our research is reflected in the "spherical structure", that is, in the structure of the Internet. a general representation of the consistency of a certain language set in three-dimensional space in the form of several horizontal sections (functional, technical, and problem-sociological).

Consideration of the structural relations of Internet terminology at four levels (terminology in general, term-semantic group, individual term, and individual meaning of the term) it contributed to a comprehensive description of the terminological consistency. The most promising and at the same time difficult in the description of terminological consistency is the study of the semantic

consistency of the term and the modeling of the semantic space of terminology, since it is at the semantic level that it is possible to identify the fundamental connections and relationships that manifest themselves at higher levels.

The component approach to the study of the content structure of the term and its formation, in particular the component analysis of the meaning of the term, allows you to identify deep semantic connections in the term system, describe the subject-semantic differences of terms, determine the specifics of each component of the content of the term and at the same time its similarity to the commonly used word, as well as to investigate the interdependence and mutual influence of these components (for example, in the process of terminologization or when there are regular relations between the sememes of a multi-valued term).

One of the aspects of describing the semantic consistency of a term is the study of terminological polysemy, which in this perspective appears as a regular, regular, systematic and cognitively conditioned phenomenon in terminology. A significant majority (more than 80%) of polysemantic terms of the Internet and computer technologies are formed semantically from polysemantic common words belonging to the zone of poorly developed polysemy, which allows us to conclude that the polysemy of the term is conditioned by the polysemy of its common source. Modeled homonyms in Internet terminology are also able to develop polysemy, but it is somewhat more difficult to trace the dependence of this development on a commonly used source, since it is necessary to take into account the paradigmatic relations in the semantics of the term and the connections of the OU homonyms of terms in the general vocabulary. This line of research is, in our opinion, quite promising, along with the consideration of the process of terminologization as a factor affecting the semantic development of terms.

To date, the Internet term system needs to be streamlined, which can be implemented through the use of various models of representation of conceptual structures. The development of the principles of defining Internet terms, as well as a complete complex parametric description of the term system and a complete detailed representation of the conceptual structure is the perspective of this study. The terminology studied in this dissertation, due to both the increasing spontaneity and rapidity of formation, and the increasing importance of the field itself, its globality and incorporation into a common language, requires close attention of terminologists and appeals to normative work using effective methods.

## A STUDY ON LIQUIDITY ASSESSMENT OF AUTO ANCILLARIES OTHERS IN AUTOMOBILE INDUSTRY

**Dr. R. Vidya\***

\*Department of Commerce,  
 Government Arts College Udumalpet,  
 INDIA  
 Email id: vidyapollachi@gmail.com

### ABSTRACT

*The primary aim of this paper is to analyse the liquidity assessment of Auto Ancillaries Others sector of Indian Automobile Industry. A Sample of 40 companies has been selected for the present study. The study period covers from 2004-05 to 2013-14. The result shows that As per Discriminant analysis of Auto Ancillaries sector was good in others.*

**KEYWORDS:** *Auto Ancillaries Others, Liquidity.*

### INTRODUCTION

Liquidity refers to the ability to pay in cash the obligations that are due. If sufficient liquidity is not maintained, the enterprise is technically insolvent and at least faces the financial embarrassments of renegotiating its obligations to creditors.<sup>9</sup> A higher financial liquidity would generally mean a lower risk of technical insolvency showing capability of an enterprise to pay the current debts as they become due. There are several measures with the help of which the short term liquidity of an enterprise may be assessed.

Liquidity management is necessary for all businesses, small, medium or large because it means collecting cash from customers in time so that having no difficulty in paying short-term debts. Therefore, when a business does not manage its liquidity well, it will have cash shortages and will results in difficulty in paying obligations. As a result, in addition to liquidity management is vital for on-going concerns.

### Statement of the Problem

The growing scenario of Indian economy has made a healthy development of transportation industries. Automobile industry is one of key elements in transportation industries and

automobile vehicles are a vital element for all industries and society. Finance is the life blood of the business. Therefore, when a business does not manage its liquidity well, it will have cash shortages and will result in difficulty in paying obligations. There is no study on liquidity assessment of Indian automobile industry. Therefore to cover the gaps in the earlier studies, the present study is undertaken to give an insight into the liquidity assessment of Auto Ancillaries others sector in the Indian Automobile Industry.

## RESEARCH METHODOLOGY

Automobile industry consists of two sectors. One is Automobiles and the other one is Auto Ancillaries. The Automobile Industry has 242 companies in the capital line data base. The present study is based on secondary data. The auto ancillaries others sector the number of available company is 144, out of these 40 companies have been selected. The data for this study has been selected based on stratified sampling. The study period has been chosen from 2004-05 to 2013-14 (ten years). Discriminant analysis has been used for the present study.

### Discriminant Analysis

In this study, the following two variables as reliable indicators of liquidity behaviour have been considered for the selected Auto Ancillaries Other Companies

$X_1$  = the Current Ratio (CR)

$X_2$  = the Liquid Ratio (LR)

The object is to determine weights for  $X_1$  and  $X_2$ , that is the values of 'a' and 'b' in

$$Z = a X_1 + b X_2$$

Where, Z is the discriminant index.

First of all, the selected companies have been classified into two groups. The companies, which have Current and Liquid Ratios of 2:1 and 1:1 or more respectively have been classified as good risks (Group A) and the remaining companies as poor risks (Group B). After classifying the selected companies into the good and poor risk classes, the values of 'a' and 'b' in the discriminant functions are estimated. The discriminant co-efficient was multiplied with the values of each company ratios in order to obtain the discriminant score of each company. With the help of the discriminant scores, the cut off values are calculated as follows.

$$n_1 Z_1 + n_2 Z_2$$

$$\text{Cut off value} = \frac{\quad}{n_1 + n_2}$$

Where  $n_1$  and  $n_2$  are the size of sample and  $Z_1$  and  $Z_2$  are the mean of the discriminant score of Group A and Group B respectively. Actual Z scores of the individual companies are compared with the discriminating Z scores. If the Z scores are found to be more than the discriminating Z scores, it can be said that such companies have good liquidity position.

The following financial ratios are used to make discriminant analysis.

### 1. Current Ratio

## 2. Liquid Ratio

### 1. Current Ratio

The Current Ratio is a measure of the company's short-term solvency. It explains the relationship between the Current Assets and Current Liabilities. The Current Ratio is calculated by dividing Current Assets by Current Liabilities.

$$\text{Current Ratio} = \frac{\text{Current Assets}}{\text{Current Liabilities}}$$

This ratio indicates the availability of Current Assets in rupees for every one rupee of Current Liabilities. A ratio of greater than one means that concern has more Current Assets than Current Liabilities. As a conventional rule, a Current Ratio of 2: 1 or more is considered satisfactory.

### 2. Liquid Ratio

It is a measurement of a company's ability to convert its current assets quickly in to cash in order to meet its current liabilities. Thus it is a measure of quick or acid liquidity.

$$\text{Liquid Ratio} = \frac{\text{Liquid assets}}{\text{Current liabilities}}$$

Liquid Ratio of 1:1 is considered satisfactory as a company.

2013-14	17	23	18	22

**Source: Computed from the Annual Reports of the Indian Automobile Industry**

As per the rule the selected Others sector falling in the good and poor risk groups are presented in Table No. 1.1. The Discriminant Functions of the selected years are presented in Table No. 1.2, where the Co-efficient for 'a' and 'b' indicates values for Current and Quick Ratios respectively. It is evident from the table that the Current Ratio appeared to be stronger than the Liquid Ratios during the year 2004-05 to 2013-14. The Table No. 1.3 presents the data relating to the Discriminating Score of both the groups. The good risk companies as indicated by Z value are Auto Ignition Limited, Auto Line Industries Limited, Banco Products (India) Limited, Brakes India Limited, Fiem Industries Limited, JBM Auto Limited, LG Balakrishnan and Bros. Limited, Lucas Indian Services Limited, Lumax Automotive System Limited, Lumax Auto Technologies Limited, Munjal Auto Industries Limited, Spicer India Limited, Stanes Motor Parts Limited, Subros Limited, Suprajit Engineering Limited, Tractors Engineers Limited, Triton Valves Limited and Varroc Engineering Private Limited in 2006-07, Auto Line Industries Limited, Brakes India Limited, Fiem Industries Limited, Jay Ushin Limited, JBM Auto Limited, LG Balakrishnan and Bros. Limited, Lucas Indian Services Limited, Lumax Automotive System Limited, Lumax Auto Technologies Limited, Rico industries Limited, Schrader Duncan Limited, Sharda Motor Industries Limited, Spicer India Limited, Stanes Motor Parts Limited, Subros Limited, Sun Beam Auto Private Limited, Suprajit Engineering Limited, and Swaraj Automotives Limited in 2007-08, Auto Ignition Limited, Bharat Seats Limited, Brakes India Limited, Canara Workshops Limited, CMH Tools Limited, Harita Seating Systems Limited, Johnsons Control India Private Limited, KEW Industries Limited, Lucas Indian Services Limited, Mipco Seamless Rings (Gujarat) Limited, Rico Auto Industries Limited, Schrader Duncan Limited, Sharda Motor Industries Limited, Spicer India Limited, Sun Beam Auto Private Limited, Swaraj Automotives Limited, TML Drivelines, Tractors Engineers Limited, Triton Valves Limited and Victor Gaskets India Limited in 2008-09, Canara Workshops Limited, Johnson Controls India Private Limited, KEW Industries Limited, LG Balakrishnan and Bros. Limited, Lumax Automotive Systems Limited, Mipco Seamless Rings (Gujarat) Limited, Perfect Circle India Limited, Rico Industries Limited, Schrader Duncan Limited, Sharda Motor Industries Limited, Spicer India Limited, Sunbeam Auto Private Limited, Suprajit Engineering Limited, Swaraj Automotives Limited, Talbros Automotive Components Limited, Varroc Engineering Private Limited, Victor Gaskets India Limited and WABCO India Limited in 2009-10, Alicon Castalloy Limited, Auto Ignition Limited, Canara Workshops Limited, CMH Tools Limited, Harita Seating Systems Limited, Jay Ushin Limited, LG Balakrishnan Bros Limited, Lumax Automotive Systems Limited, Mipco Seamless Rings (Gujarat) Limited, Perfect Circle India Limited, Remsons Industries Limited, Schrader Duncan Limited, Simpson and Company Limited, Stanes Motor Parts Limited, Suprajit Engineering Limited, Swaraj Automotives Limited, Talbros Automotive Components Limited, TML Drivelines, Varroc Engineering Private Limited and WABCO India Limited in 2012-13, Auto Ignition Limited, Auto Line Industries Limited, Banco Products (India) Limited, Bharat Seats Limited, Brakes India Limited, JBM Auto Limited, Johnson Controls India Private Limited, Lucas Indian Services Limited, Munjal Auto Industries Limited, Rico Industries Limited, Sharda Motor

Industries Limited, Spicer India Limited, Subros Limited, Sunbeam Auto Private Limited, Tractors Engineers Limited, Triton Valves Limited, Victor Gaskets India Limited and XLO India Limited in 2013-14. The rest of the companies are poor risk in all the years.

The number of good and poor risk companies as per the criteria of Current and Liquid Ratios and as per the Discriminant Scores are presented in Table 1.4. It is clear from the table that the misclassification occurs in all the years from 2004-05 to 2013-14. It means that there is a significant difference between the criteria of Current and Liquid Ratios and the criteria of Discriminant Scores in all the years. Generally, companies with lower Current and Liquid Ratios in the good risk groups and the companies with higher Current and Liquid Ratios in poor risk group have been misclassified under the criteria of Discriminant Score. It is also inferred that the poor risk companies under the criteria of Current and Liquid Ratios appeared to be good risk under the criteria of Discriminant Score. Such companies are Auto Ignition Limited, Auto Line Industries Limited, Banco Products (India) Limited, Brakes India Limited, Fiem Industries Limited, JBM Auto Limited, LG Balakrishnan and Bros. Limited, Lucas Indian Services Limited, Lumax Automotive System Limited, Lumax Auto Technologies Limited, Munjal Auto Industries Limited, Spicer India Limited, Stanes Motor Parts Limited, Subros Limited, Suprajit Engineering Limited, Tractors Engineers Limited, Triton Valves Limited and Varroc Engineering Private Limited in 2006-07, Auto line Industries Limited, Brakes India Limited, Fiem Industries Limited, Jay Ushin Limited, JBM Auto Limited, LG Balakrishnan and Bros. Limited, Lucas Indian Services Limited, Lumax Automotive System Limited, Lumax Auto Technologies Limited, Rico Industries Limited, Schrader Duncan Limited, Sharda Motor Industries Limited, Spicer India Limited, Stanes Motor Parts Limited, Subros Limited, Sun Beam Auto Private Limited, Suprajit Engineering Limited, and Swaraj Automotives Limited in 2007-08, Auto Ignition Limited, Bharat Seats Limited, Brakes India Limited, Canara Workshops Limited, CMH Tools Limited, Harita Seating Systems Limited, Johnsons Control India Private Limited, KEW Industries Limited, Lucas Indian Services Limited, Mipco Seamless Rings (Gujarat) Limited, Rico Auto Industries Limited, Schrader Duncan Limited, Sharda Motor Industries Limited, Spicer India Limited, Sun Beam Auto Private Limited, Swaraj Automotives Limited, TML Drivelines, Tractors Engineers Limited, Triton Valves Limited and Victor Gaskets India Limited in 2008-09, Canara Workshops Limited, Johnson Controls India Private Limited, KEW Industries Limited, LG Balakrishnan and Bros. Limited, Lumax Automotive Systems Limited, Mipco Seamless Rings (Gujarat) Limited, Perfect Circle India Limited, Rico Industries Limited, Schrader Duncan Limited, Sharda Motor Industries Limited, Spicer India Limited, Sunbeam Auto Private Limited, Suprajit Engineering Limited, Swaraj Automotives Limited, Talbros Automotive Components Limited, Varroc Engineering Private Limited, Victor Gaskets India Limited and WABCO India Limited in 2009-10, Alicon Castalloy Limited, Auto Ignition Limited, Canara Workshops Limited, CMH Tools Limited, Harita Seating Systems Limited, Jay Ushin Limited, LG Balakrishnan Bros Limited, Lumax Automotive Systems Limited, Mipco Seamless Rings (Gujarat) Limited, Perfect Circle India Limited, Remsons Industries Limited, Schrader Duncan Limited, Simpson and Company Limited, Stanes Motor Parts Limited, Suprajit Engineering Limited, Swaraj Automotives Limited, Talbros Automotive Components Limited, TML Drivelines, Varroc Engineering Private Limited and WABCO India Limited in 2012-13, Auto Ignition Limited, Auto Line Industries Limited, Banco Products (India) Limited, Bharat Seats Limited, Brakes India Limited, JBM Auto Limited, Johnson Controls India Private Limited, Lucas Indian Services Limited, Munjal Auto Industries Limited,

Rico Industries Limited, Sharda Motor Industries Limited, Spicer India Limited, Subros Limited, Sunbeam Auto Private Limited, Tractors Engineers Limited, Triton Valves Limited, Victor Gaskets India Limited and XLO India Limited in 2013-14. It is to be noticed that the number of good risk companies as per the criteria of Discriminant Score is more than the number of good risk companies as per the criteria of Current and Quick Ratios in the year 2005-06, 2008-09, 2011-12, 2012-13 and 2013-14. The remaining years the number of good risk companies as per the criteria of Discriminant Score is less than the number of good risk companies as per the criteria of Current and Quick Ratios.

### **Findings**

The number of good risk companies as per the criteria of Discriminant Score is more than the number of good risk companies as per the criteria of Current and Quick Ratios in the year 2005-06, 2008-09, 2011-12, 2012-13 and 2013-14. The remaining years the number of good risk companies as per the criteria of Discriminant Score is less than the number of good risk companies as per the criteria of Current and Quick Ratios.

### **CONCLUSION**

The study result shows that as per Discriminant analysis, repaying capacity was good in Auto Ancillaries Others sector. It is more important for on-going concerns. It is necessary for all companies either small or large because it means collecting cash from customers in time so that having no difficulty in paying short term debts. Auto ancillaries sectors are rising continuously. It should continue the importance given to this industry to have a better growth of our economy.

## TRANSPORT AND ROAD CONSTRUCTION ISSUES IN BUKHARA

J. J. Majidov\*

\*A lecturer of the Department of World History  
Bukhara State University,  
UZBEKISTAN

### ABSTRACT

*This article deals with the state of transport and communication systems in Bukhara region in the 50s of the XX century, future projects, measures taken and the elimination of problems and shortcomings.*

**KEYWORDS:** *Transport Structure, Roads And Bridges, Railways, Freight, Passenger Traffic, Motorcade, Bus Depot, Auto Inspection Office, Road Technical School, Village Council, Railway Station, Bus Stop, Bukhara Haqiqati Newspaper, Road Management, Uzkhloptrans.*

### INTRODUCTION

Over the past century, in almost all countries of the world, a lot of news and engagements have been achieved for the household lifestyle of the population. Of course, this is a practical achievement in the field of Science and technology, as well as the evasion of many economic resources.

In the years of Soviet power, the transport sector has become one of the most important sectors of the economy in all republics. The development of this area as the only transport network of the country was carried out on the basis of Technical Reconstruction of all types of transport. In particular, many species of Wormwood were created anew [1].

It makes specific demands on the transport sector, where the country's economy is growing from year to year. First of all, they had to carry out economic and cultural relations inside the country, establish relations with socialist and capitalist countries.

### MATERIALS AND METHODS

Public transporting network in 1970 year (without taking into account sea routes) 1485,5 thousand km.ni made up. From this, the length of exploitation of Railways 135,2 thousand km.ni,

the length of the exploited River roads - 137,8 thousand km.ni and highways with a hard coating 511,6 thousand km.ni made up. [2].

The decree of the Soviet of Ministers of the USSR № 274 “On measures to improve transport roads in the rural areas and develop telephone communications” dated 18 April 1972 also sets out a number of tasks on the development and improvement of the sphere. In particular, the state agency for architecture under the Ministry of construction (Gostroy(State building)) is assigned special tasks.

This construction and repair work is planned to be carried out in the remote regions of all republics. The purpose of this was to develop the nation-economy by creating convenience for the movement of vehicles of all types, including public transport, trucks, agricultural machinery and other of these types.

During this period, among all the regions of the USSR, Uzbekistan could not fully meet the socio - economic needs of the population, although specific work was carried out in Bukhara in this regard. In particular, the report of the chairman of the Permanent Commission of people's Deputies of Bukhara region on transport, road construction and communications issues, dated 28 March 1978, cites a number of figures related to the sphere. In January 1978, the state was 17186 km highway in the region. It was noted that these roads are of general importance, Republican and regional importance, and most of them do not adequately meet the requirements of road traffic. Only one Zarafshan moves 15000 cars during 1 day at a large road (highway). But the road is designed for 3-4 thousand cars. Very difficult situation occurred on local highways, 14428 km of the road with a total length of 11966,2 km still has no coverage at all. Local road construction organizations are able to build a road 150-200 km per year [3].

## RESULTS AND DISCUSSIONS

According to the proposals and recommendations issued by the Permanent Commission, a number of letters were sent to the ministries of the Republic and higher organizations. Relevant recommendations have also been developed by the commission to improve passenger transportation activities.

In the case of January 1, 1978, there were 40282 cars in the region, including 1819 light cars, 1441 buses, 12202 trucks, 21173 private light cars [4].

The analysis of auto-maintenance work showed that the quality of the use of cars was incredibly low. From the analysis of the 2-month activity of the regional highway, it is known that the use of the lorry park has 0,66%, the bus 0,69%, the taxi 0,75%. It remains to be said that the public authorities have not always fulfilled their duties in full. GAI(State Road Controlling Inspection) staff noted that there have been increasing cases of gross violations of the traffic rules of many motor vehicle drivers. This suggests that there are many unresolved problems related to the industry.

When analyzing the existing problems in the railway, it was recognized that the work on increasing and unloading was not systematic, the construction of freight yards was going very slowly, the repair of roads was stopped for object and subject reasons, in the summer season the population was suffering from obtaining tickets, in particular, such a situation was observed on trains in Moscow [5].

Analysis by the Permanent Commission shows that many problems of these areas remain on the Whirlpool, which in turn is characterized by the fact that the issue of personnel is also difficult. The lack of personnel landing, that is, the constant migration of specialists of the field from one place to another, has become one of the main factors of similar problems. This was done with the aim of establishing new sovkhos (state farms), new population localities and establishing communication systems there. And this process is constantly repeated. Only by the 80-ies there are cases of stabilization in a certain sense.

In addition, some aspects that are noteworthy from the time of the former Union in Bukhara can be cited as an example of the following measures carried out in the PRC in this area.

When the press agencies of the BKHSR are acquainted with the large number of newspapers "Bukhoroakhbori(Bukhara reports)" and "OzodBukhoro(Free Bukhara)", which were published in 1920-1924, it is possible to get information about the vehicles of these years and their types, activities and ways of Transportation. It is noted that the domestic vehicles of that period were used as horses, cars, Foxes. It is stated in the news that the government agencies need to register horse-drawn carriages and foyers in the Republic, to carry out cargo transportation works, and to bring them to the disposal of the shipping company [6].

On 11 December 1, 1920 issue of the newspaper "Bukhoroakhbori(Bukhara reports)" published the 7-digit order of the Republican control of dohilia (internal affairs). This order consists of 2 paragraphs, and in Paragraph 1 it is written that whoever runs a horse in cities and does not care in opposition to the militia will be punished according to the law, paragraph 2 says that it is possible to run a horse only if there is a fire somewhere in an emergency or if there is an incident. The order was signed by the minister of dohilia Abdulhamid Oripov and the Head of General Affairs Riza Ali.

In the data of the newspaper it is written that the streets of Bukhara City are narrow, in the evenings some streets are dark and it is impossible to pass because of stagnant water. This has led to the fact that frequent emergency adverse events occur.

In the 1922 Year issue of the "Bukhoroakhbori(Bukhara reports)" published a lot of reports on the construction of road facilities and their regulation. In them, issues of Correction of roads on which cars and foothills walk, digging wells that store water along the roadways, construction of bridges are emphasized [7].

In 1923, the government paid special attention to the problem of repairing the Kagan-Bukhara Stone Road. According to information released during this year's issue of OzodBukhoro(free Bukhara), a significant amount of funding measures have been taken to correct the Stone Road between Kagan-Bukhara and launch the vehicle. It is reported that 1.933.822 soums have been spent from the government for this purpose [8], 55.000 soums have been given with gold to complete this work, [9] in addition 10.400 soums have been collected, 1000 soums have been allocated [10] by the Economic Council.

Kagan (new Bukhara)-the government paid special attention to the correction of the Kagan-Bukhara Rock Road, as it was the main railway station where goods from the states of the army were brought to the Republican Center and the goods were sent to Bukhara. From the owners of horse-drawn carriages and foytun, who use this road, that is, passing by, the road tax was levied, the accumulated funds were spent on the laying of stones.

During the years of the BKHSR, the activities of the railway connecting the former Bukhara emirate with Tsarist Russia continued, the repair of cattle-breeding, Kagan-Termez routes and railway lines of the Bukhara Railway, the continuous establishment of postal, telegraph, railway activities were also given attention [11]. Getting acquainted with the materials of the newspaper, we can imagine that the railway tracks were broken due to military actions of 1921-1922 years (armed struggle against the Red Army), there is no possibility of establishing a regular transport route between the regions. In one of the messages of the newspaper "OzodBukhoro(Free Bukhara)": "Until the book-Shahrisabz-Termiz, the divided railways were fixed. Termez-Shahrisabz has raised \$ 2 million in gold to fix this railway. The sum is assigned" [12] quota;

In 1923-1924, with the aim of connecting the regions and districts of the Republic with the capital Bukhara, the tasks related to the construction and commissioning of internal railways were put on the agenda. In the autumn of 1923, the issue of construction of the Bukhara-Vobkent-Gijduvon railway was raised. [13] Efforts have been made to link the Karakul districts with the center (Kagan Station), except for Gijduvan, Vobkent [14]. But these things have remained on the drawing board.

By the end of the year 1923, Bxsr had a relatively stable period. As a result, the construction of Behbudiy (Karshi)-Kitab, Behbudiy-Guzar Railways was initiated. "Behbudiy-the book was given 450.000 sum by the Government of Bukhara [15] for the railway", - writes "free Bukhara". "From September 2, 1924 to 24, the Behbudiy-Guzar Railway, which was called Behbudiy-Guzar, was launched and the population was saved from horse riding and Arab walking during the time of famine. Relations with Guzar and East Bukhara have become easier," [16] a second source said.

## CONCLUSION

Practical activities, such as drawing up a schedule of domestic railways that were partially commissioned, setting the time for the movement of trains and steam locomotive, were also carried out and announced to the public through the newspaper.

## HOW TO USE OF VIDEO FILMS IN THE CLASSROOM

**Yulduz Sayitmurodovna Sattorova\***

\*English Teacher of Intercultural Communication and Tourism Department,  
 Tashkent State University of Uzbek Language and Literature,  
 UZBEKISTAN

---

### ABSTRACT

*The need of increasing interest in the subject and to broaden horizons of learners, we use video films in teaching foreign languages. While watching videos in a foreign language, students make a conversation and hot discussions over the film. Additionally, they listen to the speech of native speakers and learn the history, culture, and geography of the country as well.*

**KEYWORDS:** *Motivation, Video Material, Subtitles, Listening Skills*

---

### INTRODUCTION

One of the main tasks of teaching a foreign language is the development of students' speaking skills. Mastering this type of activity is associated with great difficulties due to the complexity of the very process of generating a speech utterance. To create motivation for communication in a foreign language in educational conditions, it is necessary to use the situation, and need them to speak. In order to increase interest in the subject, as well as broaden horizons, it is advisable to show video films. In the process of watching videos in a foreign language, such conditions are created when students are encouraged to make a conversation and a discussion.

In addition, they listen to the speech of a native speaker and learn with the history, culture, and geography of the country. Taking into account the duration of a feature film, which is an average of 1.5 hours, the enormous language material, the difficulty of understanding its form and content, the use of the entire feature film is ineffective.

### MATERIALS AND METHODS

It is more productive to work with passages containing dialogues and monologues as models of speech-behavioral acts.

- the use of subtitles in different languages;
- combination of languages using sound and subtitles;

- instant access to any fragment of the film;
- slowing down the pace of video and audio playback;
- acceleration of the pace of video and audio playback.

It should be noted that the use of a video film in the lesson is one of the important forms of teaching a foreign language as the video sequence complements the audio and contains such important non-verbal information as facial expressions, articulation, gestures, etc. communications. This is due to the fact that spontaneous speech is largely mediated by external factors that affect both the topic of the conversation and the linguistic means used by the communicants. The study of listening processes shows that even when listening to a text twice without visual support, the level of understanding is significantly lower than when unambiguously perceiving a video document.

One of the main characteristics that affect the success of listening is the rate of speech, directly affects the amount of audited information. Thus, the lower the rate of speech, the easier it is to understand it; the higher, the more difficult it is. In the process of using authentic video and audio documents, as a rule, there are no problems with understanding the general meaning. The difficulty lies in the completeness and accuracy of understanding the audio text. To ensure the most complete understanding of the audited document, it is recommended to reproduce it repeatedly (5 or 6 times, if necessary) in order to master all its elements. It is also recommended to carry out pre-text work, which in practice means that the teacher eliminates grammatical, lexical and phonetic difficulties before listening to or viewing the document, in order to relieve language difficulties.

The most important criterion in the study of a foreign language is considered to be the listening comprehension of a foreign language authentic colloquial speech, that is, speech characteristic of native speakers. Unlike audio or printed text, which can have a high informative, educational, educational and developmental value, video text has the advantage that it combines various aspects of the act of speech interaction. In addition to the content side of communication, the video text contains visual information about the place of the event, the appearance and non-verbal behavior of the participants in communication in a particular situation, often due to the specifics of the age, gender and psychological characteristics of the personality of the speakers. The visual range allows you to better understand and consolidate both factual information and purely linguistic features of speech in a specific context.

Video materials provide almost unlimited opportunities for analysis based on comparing and contrasting cultural realities and characteristics of human behavior in various situations of intercultural communication (provided that the selected video texts provide the necessary basis for such a comparison). It is also obvious that the video can have a strong emotional impact on teachers, serve as a stimulus and reinforcement to create additional motivation in further educational, search and creative activities.

The conditions of real communication in a foreign language presuppose the use of all the wealth of the native language, including all the features of an informal conversational style, by a foreign language partner, taking into account the fact that each person has his own individual manner of speech. Thus, communication with a foreign language interlocutor occurs due to the possession of the foreign language learners in a complex of speech, grammatical, phonetic, lexical skills and

abilities of various levels. It should be kept in mind that at the productive and receptive levels, it is necessary to master the auditory skills to perfection.

The effectiveness of using a video film in teaching speech depends not only on the precise definition of its place in the teaching system, but also on how rationally the structure of the video lesson is organized, how the educational capabilities of the video film are coordinated with the learning objectives. In the structure of a video lesson for teaching oral speech, four stages can be distinguished:

- ✓ preparatory - the stage of preliminary removal of language and linguistic regional difficulties;
- ✓ video perception - the development of information perception skills;
- ✓ control of understanding of the main content;
- ✓ development of language skills and oral skills

To solve each of the tasks, students must know not only the general content of the video, but also remember the details, as well as be able to evaluate events, characterize the characters, using words and expressions from the speech accompaniment of the video.

The use of a video film contributes to the development of various aspects of the mental activity of students, and above all - attention and memory. During viewing in the audience (classroom), an atmosphere of joint cognitive activity arises. Under these conditions, even an inattentive student becomes attentive. In order to understand the content of the film, students need to make some effort. And the intensity of attention affects the memorization process. The use of various channels of information flow (auditory, visual, motor perception) has a positive effect on the strength of capturing regional and linguistic material.

## CONCLUSION

Summarizing the above, it can be argued that educational video courses and animations open up ample opportunities for active work in the process of developing speech skills and abilities of students and make the educational process of mastering a foreign language attractive for students at all stages of learning.

The use of video in a foreign language lesson and in extracurricular activities opens up a number of unique opportunities for the teacher and students in terms of mastering a foreign language culture, especially in terms of the formation of socio-cultural competence as one of the components of communicative competence in general.

## **DERIVATIVES MARKET: WORLD TRENDS AND DEVELOPMENT PROSPECTS**

**Orifjonova Mukhlisa Alisher kizi\***

\*Master's Degree Student,  
 University of World Economy and Diplomacy,  
 UZBEKISTAN

### **ABSTRACT**

*The article analyzes the problems of the development of the world derivatives market, which in the recent post-crisis years has increased its turnover to catastrophically huge parameters, significantly exceeding world GDP. This casts doubt on the reliability of the global financial system, since the overwhelming majority of these financial instruments are traded on the over-the-counter market and therefore are not subject to any regulation or control. The solution to these problems is associated, in the author's opinion, with the creation of a unified standardized system of exchange turnover of all types of derivative financial instruments, which should bring the volume of issued derivatives and real underlying assets in line with them.*

**KEYWORDS:** *Derivatives, Financial Market, Risk Hedging, Exchange And Over-The-Counter Turnover, World Financial System, Banks, Stock Exchanges.*

### **INTRODUCTION**

The protracted nature of the last financial crisis, which began in 2007, demonstrated the emergence of a new threat to the development of the global financial system - the uncontrolled growth of the derivatives market. Having become the cause of the crisis, derivatives came into conflict with their economic essence as an instrument of insurance and hedging of risks in the financial market. The factor of unrestricted growth of this market is the absence of state control over the issue and circulation of these financial instruments, as well as the transition of a significant part of the market to over-the-counter circulation. In this regard, the relevance of the study of modern world trends in the derivatives market and the directions of their development is increasing, which would make it possible to develop directions for regulating this segment of the financial market.

---

**Place of the derivatives market in the structure of the financial market**

When considering the market economy as a set of different markets, it is possible to single out the leading role in it of the financial market, since it is it that provides the possibility of a consistent flow of capital from one country to another, from less profitable sectors of the economy to more profitable ones. Thus, the financial market ensures the redistribution of capital between sectors of the economy and helps to level the sectoral rate of return.

The transformation of free capital into investments takes place through the stock market, in the structure of which the segment of financial derivatives (derivatives) has recently become dominant. It was developed in connection with the liberalization of the world financial system and the transition to floating exchange rates. The widespread popularity of derivatives as derivatives from stocks, currencies and commodities is due to the fact that they are used to hedge risks or engage in speculation.

If earlier derivative financial instruments acted as a standard instrument issued by an exchange, now the derivatives market is developing in two forms - exchange and over-the-counter, and the competition between these two segments of the stock market serves as an additional incentive for the development of the derivatives market, which is due to the emergence of, along with standard exchange contracts for new types of over-the-counter agreements containing special conditions for insuring the risks of trading participants.

**Research methodology of the modern derivatives market**

The issues of the development of the world derivatives market are widely reflected in the works of foreign and domestic economists. The fundamentals of the development of financial derivatives are set out in the fundamental work of W. Sharp "Investments", which reveals their nature and mechanisms of circulation [1]. With regard to Russian practice, derivative financial instruments are considered in detail by A.N. Burenin, who analyzed not only their types, but also the peculiarities of circulation on the Russian securities market [2].

The greatest attention is paid to the development of the world derivatives market after the 2007 crisis. The rapid development of this market is associated with a change in the role of underlying assets (oil, gold, grain, etc.) that underlie derivative financial instruments, namely, a significant increase in their trading volume [ 3. P. 149]. S.S. Samsonova believes that the growth of the over-the-counter turnover of these financial instruments in the post-crisis period is already 10 times higher than the nominal value of their basic assets [4. P. 71]. According to G.G. Chibrikov, the preponderance of derivatives on the world financial market in comparison with other instruments becomes the cause of financial crises, the overcoming of which he associates with the need to reduce the growth in the volume of these instruments [5. P. 11].

The point of view of K.L. Astapov on the methodology for regulating the over-the-counter circulation of derivatives [6. C. 60], proposing to introduce universal principles of investor protection, which, in his opinion, should reduce conflicts of interest and prevent market manipulation. He also believes that the creation of a system for the exchange of information between different states, which does not undermine the national banking secrecy, will help to streamline the circulation of derivatives in the global financial market. Thus, the majority of scholars studying the circulation of derivatives are concerned about the uncontrollable growth of the volume of these financial instruments and are looking for ways to regulate their circulation.

### **Features of the development of the derivatives market in the post-crisis period**

The modern derivatives market is developing as an independent segment of the stock market, and thanks to the circulation of these financial instruments outside the exchange, they have the opportunity to circulate in unlimited quantities and be issued on various basic assets, including stock indices and other calculated indicators. At the same time, the main trends in the development of the financial derivatives market are largely determined by the ongoing changes in the post-crisis period in the markets of basic assets. Thus, the multiple growth in the trading volume on the stock market entailed an equally rapid development of the market for standard contracts for stocks and stock indices. At the same time, the derivatives market continues to grow at a faster pace compared to other financial instruments, and this creates volatility on stock exchanges.

### **Derivatives as a crisis mechanism**

The main reason for the global economic crisis in 2007 and the subsequent recession in the economies of most countries was the inflated “bubble” in the US derivatives market. In the event of a series of non-payments and refusals to execute contracts, derivatives gave rise to a domino effect: the collapse of one instrument led to the fall of others. Following this, the development of the crisis in the Eurozone pushed the speculative nature of credit default swaps issued on debt obligations of the Greek government, which significantly intensified the manifestation of the crisis in the global financial system.

In the emergence of the crisis, derivatives played the role of a trigger, which is associated with the peculiarities of the circulation of this financial instrument. In essence, derivatives should create hedging instruments and infrastructure for market participants to reduce the overall volume of risk through its redistribution. In other words, the derivatives market should theoretically serve as additional support or insurance for business associated with the real movement of goods or capital.

In practice, in the last decade, there has been a huge gap between speculative players in this market and companies that really hedge the risks of their core activities. This is reflected in the fact that derivatives, in fact, began to circulate independently of the movement of goods that lie in their underlying asset. As a result, their turnover went beyond the national economies, since these instruments no longer participate in the formation of the domestic capital of countries where the goods underlying the underlying assets are produced.

In short, all threats to the development of the derivatives market for the global financial system can be formulated as follows:

- The market has become too large and does not stop growing;
- derivatives as financial instruments are not secured by anything;
- the system of derivatives circulation is almost completely uncontrollable;
- this system is dominated by the largest banks in the world;
- The uncontrolled (unregistered) and non-transparent issue of new forms of derivative financial instruments is constantly taking place;
- The derivatives market is developing in isolation from the real economy.

### **Problems of derivatives market regulation**

Due to the presence of a pronounced upward trend in financial derivatives, caused by an increase in the number of participants and the volume of attracted capital, the derivatives market needs urgent regulation. According to experts, measures to regulate the derivatives market can develop in two directions: first, through tightening the legislation of the main countries participating in the derivatives market; secondly, in the absence of a positive effect of measures to regulate the derivatives market, it is proposed to zero the market by abandoning the main currencies that provide settlements for derivative transactions [8].

In September 2013, at the G20 Summit in St. Petersburg, the G20 countries agreed to tighten the rules for regulating the derivatives market. The G20 Summit Declaration [9] pointed to the need to establish common minimum margin requirements for derivatives trading and to form a centralized clearing system for derivatives transactions based on international consensus. According to the G20 recommendations, financial market regulators should ensure that high-risk assets are traded strictly through clearing centers and exchanges. It becomes obvious that international regulation should be aimed at limiting the emission of derivative financial instruments. It should be borne in mind that a direct ban on derivatives as a financial instrument is unlikely to have a positive effect, since the overwhelming majority of these instruments are traded on the OTC market. In this regard, it is the OTC derivatives turnover, especially interbank swap transactions, that should be subject to regulation. This presupposes the transfer of all transactions to the exchange circulation system, i.e. trading these instruments only on stock exchanges. This approach will eliminate the problem of conflicts of interest among participants in the derivatives turnover, when the same trading participant in one person acts as an issuer, seller and buyer. First of all, this should apply to the relationship between banks and their clients that make transactions with derivatives, which should be carried out only with the participation of a third independent party - an exchange or a clearing center, which provide guarantees for the fulfillment of obligations by all participants in this operation.

The latest financial crisis revealed the need for strict antimonopoly regulation of the activities of derivatives market participants, which is primarily associated with the need to eliminate the dependence of a significant share of world financial flows on the management of global American banks. So, during the last financial crisis after the collapse of the Lehman Brothers bank only on CDS default swaps there were debts of \$ 400 billion [10. P. 151]. The lack of control of global financial holdings allows them to ignore all principles of risk management and continue to issue on the market new highly speculative instruments that not only fail to reduce financial risks, but also contribute to their growth by including an unlimited number of new participants in these operations.

Consequently, the main problems of the modern derivatives market are generated by the liberalization of the terms of transactions, as well as the uncontrolled activity in this market of global financial institutions, which are the main suppliers of credit default swaps to the stock market. It is this segment that operates only in the over-the-counter market mode, which is based on opaque pricing and ineffective monitoring of risks, including the risk of solvency of credit protection sellers under CDS. However, other sectors of the derivatives market operating within the framework of exchange trading (options, futures, etc.) are more resistant to the crisis, since they operate under standard contracts and constant control by the exchange. In addition, banks' CDS risks are increasing due to the lack of a unified methodology for accounting for derivatives

on the balance sheets of credit institutions. At present, banks have the opportunity, due to tricks in the accounting of derivatives, not to fully reflect the risks and possible losses associated with their circulation. Today, this aspect is most in need of regulation. In this regard, the question of the mandatory introduction of unified standard rules for accounting for credit default swaps as a necessary condition for improving the turnover of derivatives by banks arises. In this regard, it is necessary to make a decision at the state level to prohibit operations with OTC derivatives for commercial banks, which should eliminate most of the risks associated with the circulation of these financial instruments.

From the point of view of improving the circulation of derivatives, two fundamental points should be highlighted. First, there is a need to create an analogue of a central depository for the purpose of accounting for derivative financial instruments, the activity of which can significantly facilitate and streamline transactions with all types of such instruments. Secondly, it is necessary to increase the role of self-regulatory organizations in the derivatives market, which could take on such issues as interaction with state regulatory bodies, resolving disputes between market participants, etc. There is already some experience in the world in terms of self-regulation of international circulation. securities, when the Association of International Stock Market Participants (ISMA) assumes responsibility for the formation of conditions and control over the circulation of international securities and the activities of market participants [11. P. 74].

Thus, minimizing the threat of the collapse of the global financial system lies in the plane of creating a system of regulation and control of the world derivatives market, which in modern conditions has prospects for implementation with the solidarity participation of the governments of countries whose banks are active emitters and buyers of derivative financial instruments.

## THE EFFECTIVE WAYS OF DEVELOPING CRITICAL THINKING AND ITS ROLE IN TEACHING PROCESS

### ABSTRACT

*The technology for the development of critical thinking began to take shape in the 90s of the XX century. Critical thinking does not mean negative judgment or criticism, but judicious consideration of a variety of approaches in order to make informed judgments and decisions. An orientation towards critical thinking assumes that nothing is taken for granted. Each student, regardless of authority, develops his or her opinion in the context of the curriculum.*

**KEYWORDS:** *Critical Thinking, Technology For The Development Of Critical Thinking, Techniques For The Development Of Critical Thinking, Challenge, Comprehension, Reflection, Clusters, A Tree Of Predictions, Diaries And Logbooks, Thick And Thin Questions, Writing In A Circle, Marks In The Margins, Syncwine, Essay.*

### INTRODUCTION

Critical thinking is the ability to pose new questions, develop different arguments, and make informed decisions. The purpose of this technology is to ensure the development of critical thinking through the interactive inclusion of students in the educational process. Critical thinking promotes mutual respect between partners, understanding and productive interaction between people; makes it easier to understand different “world views”; allows students to use their knowledge to make sense of situations with a high level of uncertainty, to create a basis for new types of human activity.

The technology includes several stages:

Stage I "Challenge" (actualization of subjective experience).

Stage II "Comprehension".

Stage III "Reflection".

The first stage is challenge.

Her presence at every lesson is mandatory.

This stage allows:

- To actualize and summarize the student's knowledge on a given topic or problem;
- to arouse a steady interest in the topic under study, to motivate the student to educational activities;
- Formulate the questions to which we would like to receive answers; -To encourage the student to work actively in the classroom and at home [3].

At the stage of the call, the existing knowledge on the declared topic is updated, ie. even before acquaintance with the text (the text is understood as the written text, and the speech of the teacher, and the video material), the student begins to think about the specific material. At the first stage, motivation mechanisms are switched on, the goal is determined.

The second stage is comprehension.

There are other tasks here. This stage allows:

- To receive new information, to comprehend it;
- Related to existing knowledge;
- Search for answers to the questions posed in the first part [3].1

At the stage of comprehension, direct work with the text takes place - reading, which is accompanied by the student's actions: marking using the signs "v", "+", "-", "?" (as they read, they are put in the margins on the right), drawing up tables, searching for answers to the questions posed in the first part of the lesson, etc. As a result, students receive new information, correlate new and existing knowledge, systematize the data obtained. Thus, students follow their own understanding on their own.

The third stage is reflection. Here the main one is:

- holistic comprehension, generalization of the information received;
- Appropriation of new knowledge, new information;
- the formation of each of the students their own attitude to the studied material [1].

At the stage of reflection, information is generalized, the role of writing increases. Writing helps not only to understand the material and reflect on what has been read, but also to express new hypotheses. In the technology of developing critical thinking, different methods and techniques are used, which are used both at a certain stage and as a strategy for conducting the lesson as a whole. Let's take a look at some of them.

### Techniques for developing critical thinking

"Clusters". This is the selection of semantic units of text and graphic design in a certain order in the form of a bunch. Making some notes, sketches for memory, we often intuitively distribute them in a special way, arrange them into categories. Bunches are a graphic technique in the systematization of material. Thoughts are no longer piled up, but are arranged in a certain order. The principle is pretty simple. A model of the solar system is drawn: a star, planets and their satellites. In the center is a star - this is our theme, around it the planets are large semantic units, we connect them with a straight line with the star, each planet has its own satellites, and its own satellites. Clusters help students capture more information than could be obtained from regular writing work. This technique can be applied at the stage of calling, when it is necessary to organize information before acquaintance with the main source (text) in the form of questions or headings of semantic blocks. You can use this technique at the stage of reflection. This is a fix for the wrong assumptions in "Preliminary clusters", filling them in on the basis of new information, establishing causal links between individual semantic blocks (work can be carried out individually, in groups, on the whole topic or in separate semantic blocks) [2].

"Prediction tree". This technique helps to make assumptions about the development of the storyline in the story, novella. The rules for working with this technique are as follows: a tree trunk is a theme, branches are assumptions that are conducted in two main directions - "possible" and "probably" (the number of branches is not limited), and, finally, leaves are the justification of these assumptions, arguments in favor of one opinion or another. This technique also works well for the calling stage.

"Diaries" and "flight journals". These techniques are well suited for the reflection stage. In-flight journals are a generalized name for various teaching writing techniques, according to which students write down their thoughts while studying a topic. The logbook can be presented in the form of a table. 1:

What do I know about this topic?	What new have I learned from the text?

An interesting technique is the "Two-part diary". This technique allows the reader to connect the content of the text with his personal experience. Such diaries can be used when reading the text in class, but it is especially productive to work with them at home when a large text is given. On the left side of the diary, students write down those moments that made the greatest impression on them, evoked memories, associations, puzzled, etc. On the right, they should comment on what prompted them to write down this particular quote.

Quote	Comments

At the stage of reflection, students return to work with these diaries and, with their help, the text is consistently analyzed. There are "Three-part Diaries", which have a third column - "Letters to the teacher". This technique allows you to work not only with the text, but also to conduct a dialogue with the teacher about the read [2]. "Thick and thin questions." The technique can be used at any stage of the lesson: at the stage of calling - these are questions before studying the topic; on the stages of comprehension - questions during reading, listening; at the stage of reflection (thinking) - demonstration of understanding of the past.

"Thick and thin questions" can be arranged in the form of a table. 3.

Thin?	Thick?
Who...? What...?	Give three explanations: why? Explain why ...?
When...? Can...?	Why do you think...?
Will be...? Could ...?	Why do you think ...?
What's your name...?	What is the difference...? Suppose: what happens if ...? What if...?
Was there ...?	
Do you agree...?	
Is it true...?	

As you work with the table, questions are written in the right column that require a simple, monosyllabic answer. The left column contains questions requiring detailed, detailed answers. Tables of thick and thin questions can be the basis for research, discussions, essays. "Catch the mistake." The teacher prepares in advance a text containing erroneous information and invites students to identify the mistakes made [2].

It is important that the task contains errors of 2 levels:

- explicit, which are quite easily identified by students, based on their personal experience and knowledge;
- hidden, which can be installed only by studying new material.

Students analyze the proposed text, try to identify errors, argue their conclusions. Then they study new material, after which they return to the text and correct those mistakes that could not be identified at the beginning of the lesson. "Marks in the margins". The technique of "Marking in the Margins" works at the stage of comprehension. While reading the educational text, a target setting is given: while reading the article, make notes in the text. The teacher must first determine the text or a fragment of it for reading with notes, remind the rules for placing markings, indicate the time allotted for work, check the work.

Marking marks:

- The check mark marks information that is known.
- The plus sign is used to mark new information, new knowledge.
- The “question” sign marks what remains unclear and requires additional information.

"Essay". A very effective artistic form of written reflection is an essay. This is a free letter on a given topic. An essay is a small piece of work that reveals a specific topic and has an underlined subjective interpretation, free composition, orientation towards spoken language, and a tendency to paradoxes.

The technology for the development of critical thinking provides an opportunity for the student's personal growth, introduces the student to the spiritual experience of mankind, develops his mind and individuality. The technology is open to solving a wide range of problems in the educational sphere. It is a set of special techniques and strategies, the application of which allows you to build the educational process so as to ensure the independent and conscious activity of students to achieve the set educational goals [4].

## GEOGRAPHICAL ROOTS AND BASIC CONCEPTS OF ETHNOECOLOGY

**Komilova Nargizahon Urinovna\***

\*Fergana State University,  
UZBEKISTAN

### ABSTRACT

*This article provides information on the geographical roots and basic concepts of ethnoecology, the work and views of scientists on ethnoecology. He assesses the impact of climate on society as follows: The northern boundary of Oykumena crosses the Black Sea 400 miles north, above which the development of civilization is only 'around the fire', and the cold climate makes life difficult. The aim of the "cultural ecology" created abroad by J. Steward as an analogue of ethnoecology was to reveal the causes of intercultural differences, first of all, the peculiarities associated with the "face" of each cultural region.*

**KEYWORDS:** *Research, Ethnoecology, Society, Natural Conditions, Geography, Determinism, Nature, Soil, Water, Air, Anthropogeography, Ecology.*

### INTRODUCTION

The system of interactions and relationships that take place between nature and society has become much more complex when it comes to the present. This connection has been replaced by the strong influence and pressure that society exerts on nature. As a result, there is an increase in various environmental problems in nature and its transformation into socio-environmental problems. President Mirziyoyev writes about the importance of ethno-ecological approach to solving these problems, along with modern innovative approaches, based on the traditions of local people: "Centuries-old approach of our peoples to nature and conservation of its water resources. By relying on our traditions, we will achieve really great results." In addition, a number of conferences of the international community (Rio de Janeiro, 1992, Johannesburg, 2002, New York, 2015) have shown that rescuing humanity from impending environmental disasters is one of the key principles of the transition to sustainable development - "traditional knowledge and values used by indigenous peoples. , recognizing the ways in which resources are used". In such an approach, the relevance of ethnoecological research is further enhanced.

Although the term ethnoecology was first introduced to modern science by the American ethnologist G. Conklin (1954) (Greek ethnos - people, oikos - home, shelter, logos - word, doctrine), the scientific views that express this concept have existed in human society for a long time. In these worldviews, serious efforts have been made to scientifically substantiate the interaction of society and nature, their interaction. The first ethnoecological ideas were put forward by philosophers in ancient Rome and Greece.

Assessing natural conditions in geography, identifying what opportunities and barriers it has for human habitation and activity began with Strabo. He assesses the impact of climate on society as follows: The northern boundary of Oykumena crosses the Black Sea 400 miles north, above which the development of civilization is only 'around the fire', and the cold climate makes life difficult. In his time, Hippocrates (460-377 BC) divided the inhabited part of the continent into 3 northern cold southern temperate and southern warm regions, where he wrote that the peculiarities of human physical and mental development, the physical and mental development of people are determined by climate. In addition, the works of Aristotle, Geradot, Strabo, Ibn Khaldun, Abu Rayhan Beruni, and the Indian treatise Arthashastra assess the impact of natural conditions on human society.

The French thinker C. Montesquieu is mentioned as the founder of geographical determinism, which was a great impetus for the development of ethnoecological views. It turns out that the views of Montesquieu and other Western European scholars on the influence of nature on human society were influenced by the ancient world and Islamic civilization. Our compatriot Abu Rayhan Beruni, commenting on the impact of natural features of the place (soil, water, air) on human society and its activities, writes: "Differences in color, image, nature and morals of human structures are due not only to differences in genealogy from the diversity of the air and the land, the places where people live." As can be seen from the link above, Abu Rayhan Beruni was extremely careful not to exaggerate the role of the geographical factor, to allow, in modern parlance, "geographical determinism". He emphasizes the importance of the role and importance of natural factors, as well as emphasizing that human beings are primarily influenced by 'genealogies', i.e. human society. Stressing that such an approach is correct and appropriate, A. Soliev writes: "Geographical determinism is, to a certain extent, an objective state of affairs, the whole question is how to interpret it."

Unfortunately, in Montesquieu's "Spirit of Laws" the exaggeration of the influence of nature on society and its presentation as the only primary factor has led to the inclusion of this idea in the list of extremely absurd ideas. He writes that "hot climates affect the physical nature and spiritual outlook of peoples and lead to the development of slavery, while temperate climates develop people's intellectual potential and lead to the emergence of strong and resilient individuals." This worldview later became a weapon to justify imperialist expansionism, nationalism and racism, and remained in the eyes of the scientific community.

He was the founder of anthropogeography in the development of ethnoecological ideas. The works of F. Rattsel (1899) played an important role. In his view, along with their place in the development of ethnoses, population density also plays a significant role, and population density contributes not only to the physical development of peoples but also to the growth of culture.

Although he did not use the term ethnoecology, the American geographer G. Burroughs was one of the first to use the term "Human Ecology", which embodied one of the main ideas in this

direction, "human adaptation to the environment." Later, in this direction, the idea of looking at the ethnic diversity of mankind as a result of his attempt (adaptation) to adapt to different natural conditions was voiced.

The aim of the "cultural ecology" created abroad by J. Steward as an analogue of ethnoecology was to reveal the causes of intercultural differences, first of all, the peculiarities associated with the "face" of each cultural region. The views of J. Steward (1955) reveal the influence of geographical factors on human culture in the following cases: first, his ideological views are based on the concept of 'diversity of evolution' and require a very careful consideration of natural factors;

second, it is recognized that similar evolutionary processes that take place in a society with comparable natural conditions are not always the result of a cultural "diffusion," but are caused by the natural conditions of the place.

The ideas of French possibilists (P. Vidal de la Blash, 1926) also play a special role in the development of ethnoecological views. According to the model developed by them, man is seen as an active agent, not a passive one, adapting to nature. It is recognized that different people in the same living environment choose different paths of economic development under the influence of different spiritual, technical, political, economic and other unnatural factors. This idea should be applied to areas with favorable and diverse natural conditions. This approach recognizes the need to take into account the complex (natural, social, economic) reasons for how a person behaves in a particular area.

### ABSTRACT

*Geological and physical conditions and peculiarities of the development of deposits of high-viscosity oils are given. To study the causes of flooding production of wells, dependencies have been made on the development period, the utilization factor of reserves and the recovery factor of oil. It is established that the rate of watering the production of wells depends on the activity of the water-pressure system.*

**KEYWORDS:** *Deposit, Deposits, Horizon, Reservoir, Watering, Development, Dependence, Water System, Activity, Rate, Selection, Coefficient, Washing, Liquid.*

### INTRODUCTION

The specificity of drilling prospecting and exploration wells for oil and gas in the Ustyurt region is accompanied by both normal and difficult mining and geological conditions. The geological structure of the drilled areas, the depth of the productive horizons, as well as the difference in reservoir pressures, require the use of drilling fluids with different densities. One of the main tasks in well construction is the selection of rational types and formulations of drilling fluids, as well as control over their quality during drilling.

However, drilling in the interval of lowering intermediate strings is often accompanied by sloughs, collapses and grooves, which leads to the necessary study, and sometimes to emergency situations. For example, sticking a drilling tool in well. No. 1 pl. Surgil during the opening of thick clay deposits in the interval of 2550-2587 m. The cause of the sticking of the drilling tool was the collapse of the borehole walls. The elimination of the sticking was completed with the drilling of the second borehole. There were also cases of frequent wellbore reaming while drilling wells. No. 1 Shagirlik in the interval 1835-2035 m there was a deterioration in the quality

of the clay solution. As a result, the relative viscosity of the solution increased to "non-fluid", and the fluid loss also rose to 30 cm<sup>3</sup> in 30 minutes and the density of the solution reached 1.30 g / cm<sup>3</sup>. Under these conditions of work, wellbore development is required with continuous treatment of the drilling fluid with the addition of FHLS, UShchR, soda ash and NaOH, to maintain the properties of the drilling fluid within the following limits: specific gravity - 1.18 g / cm<sup>3</sup>, viscosity 60c and fluid loss 10-12 cm<sup>3</sup> in 30 minutes [1,2].

It is difficult to regulate the technological properties of drilling fluids directly during drilling, due to the lack of effective reagents to ensure the required properties.

It is known that the formation waters of this region used for the preparation of drilling fluids differ from other formation waters of Uzbekistan in their aggressive action towards chemical reagents, due to the content of sodium, calcium, magnesium and potassium ions in the water composition in large quantities. The total salinity of formation waters is 20-25%.

When preparing drilling fluids based on formation waters, chemical reagents and materials are consumed several times more than those envisaged in the well construction project in this region. However, despite this, it was not possible to maintain the parameters of the drilling fluids that meet the requirements of well placement in a particular geological section. Considering this circumstance, they abandoned the use of formation waters for the preparation of drilling fluids using fresh water.

Therefore, our experimental laboratory studies were aimed at obtaining oil-emulsion inhibited drilling mud using saline formation waters of the Ustyurt oil and gas region. The use of saline formation water excludes the introduction of inhibiting additives into the composition of the drilling mud, because these additives are in the composition of the formation water in the required amount [3].

On the basis of laboratory studies, we have developed the composition of an oil emulsion drilling mud based on a polymer composition obtained from the waste of an oil and fat plant - (PCM) with the use of aggressive formation waters of the Ustyurt region.

The proposed composition of the oil emulsion drilling mud was tested in the Severny Berdakh area while drilling a wellbore in the interval of 103-910 m.

Well No. 2 of the North Berdakh area was laid in order to clarify the geological structure and assess the effectiveness of the oil and gas potential of the upper, middle and lower Jurassic deposits. Design depth - 4100 m (Paleozoic). In the 0-100 m interval, drilling was carried out using natural clay mud based on saline formation water. The 426 mm elongated direction was run down to a depth of 103 m and cemented. The processing of the working natural circulating drilling mud of the North Berdakh-2 area with the PCM began at a depth of 103 m. Before treatment, the drilling mud had the following parameters:

Specific gravity	1,20 g / cm <sup>3</sup>
Viscosity	25 sec
Water loss	40 cm <sup>3</sup> / 30 min
Peel thickness	6 mm
PH	7,0

According to the operating flow chart, in the interval from 100 to 1600 m, the following chemical reagents were to be used for drilling mud treatment in percentage ratios of the total volume of circulating drilling mud:

Carbon alkali reagent paste	10-15 %
Caustic soda	1,0 %
Soda ash	1,0 %
Reagent K-4	2-3 %
Oil	5-10 %

Drilling of the wellbore for the surface of the Severnaya Berdakh area was carried out with bits with a diameter of 394 mm, accompanied by partial loss of drilling fluid (25 - 30 m<sup>3</sup> per day). To maintain the required volume of the circulating fluid continuously without interruption, it was necessary to prepare 35 - 40 m<sup>3</sup> of drilling fluid using the above reagents at the required rates. It was delivered to the drilling site pl. Severny Berdakh 8 tons of PCM. For the primary treatment of the working drilling mud, a 10% aqueous solution of PCM was first prepared in an amount of 80 m<sup>3</sup>. Without stopping the process of deepening the well, they began to inject an aqueous solution of PCM into the circulating solution. After the completion of the PCM injection, the drilling fluid had the following parameters:

Specific gravity - 1.12 g / cm<sup>3</sup>

Viscosity - 35 sec

Water loss - 20 cm<sup>3</sup> / 30 min

Peel thickness - 4 mm

RN - 8.0

After being introduced into the working emulsion drilling mud, the PCMs were additionally treated with a 2% aqueous solution of the K-4 reagent. As a result of the introduction of the K-4 reagent, it was possible to maintain the parameters of the drilling fluid in the required standards, which were provided for in the GTN:

Specific gravity	- 1,12-1,14 г/см <sup>3</sup>
Viscosity	- 40-45 сек
Water loss	- 10-12 см <sup>3</sup> /30 min
Peel thickness	- 1,5-2 мм
pH	- 8-9

Taking into account the absorption of drilling mud and shedding of unstable rock into the wellbore, it was decided to run the casing string with a diameter of 299 mm to a depth of 910 m. It should be noted that in the process of deepening, working out and preparing the wellbore for running the casing string, the parameters of the drilling mud practically did not change. , tripping operations were carried out without tightening and landings of the drilling tool. During the test period in the well No. 2 pl. Severny Berdakh prepared 250 m<sup>3</sup> of drilling mud based on PCM,

without the use of caustic and soda ash, and the consumption of K-4 reagent decreased several times. It should be noted that local and bentonite clay was not used to prepare the drilling mud; drilled clay was used in their place. Conductor 299 mm in diameter was lowered to a depth of 910 m without reaming and widening of the wellbore, only with gauging, after which the casing was successfully cemented. The cement slurry rose to the wellhead [4].

The results of industrial testing of emulsion drilling mud based on PCM in the Severny Berdakh area, well No. 2 showed that the process of drilling wells under conditions of salt aggression was carried out without complications and the parameters of the working fluid were maintained in accordance with the GTN ..

In the adjacent well No. 1 pl. Severny Berdakh, despite the huge expenditure of chemicals, failed to maintain the parameters of the drilling fluid provided for in the GTN. Thanks to the use of PCM in the treatment of circulating drilling mud, 2420 kg of caustic soda, 2985 kg of soda ash, 5975 kg of K-4 reagent, 36315 kg of clay and 1873 kg of oil were saved.

Based on the positive results obtained from testing oil emulsion drilling mud in well No. No. 2 on the Severny Berdakh area, this composition is recommended for industrial implementation in the drilled wells of the Ustyurt region.

### **ABSTRACT**

*Scientific research in the direction of differentiating the belonging of motor oils and lubricants to synthetic, poly- $\alpha$ -olefin or mineral containing from 20 to 70 carbon atoms, or semisynthetic consisting of their mixtures, are the main ones, since the prevention of incorrect classification by the code of one type of engine oil and lubricants to others, it is conditioned by the introduction of customs control methods based on world-class achievements in the field of science and technology, as a result of which it becomes clear that only research in this area will help to solve the above-mentioned problems.*

**KEYWORDS:** *Base Oil, Lubricating Oil, Mineral Oil, Synthetic Oil.*

### **INTRODUCTION**

Our research paper presents data obtained by using an effective method for determining the amount of base oil in an engine and lubricating oils. This method consists of several steps:

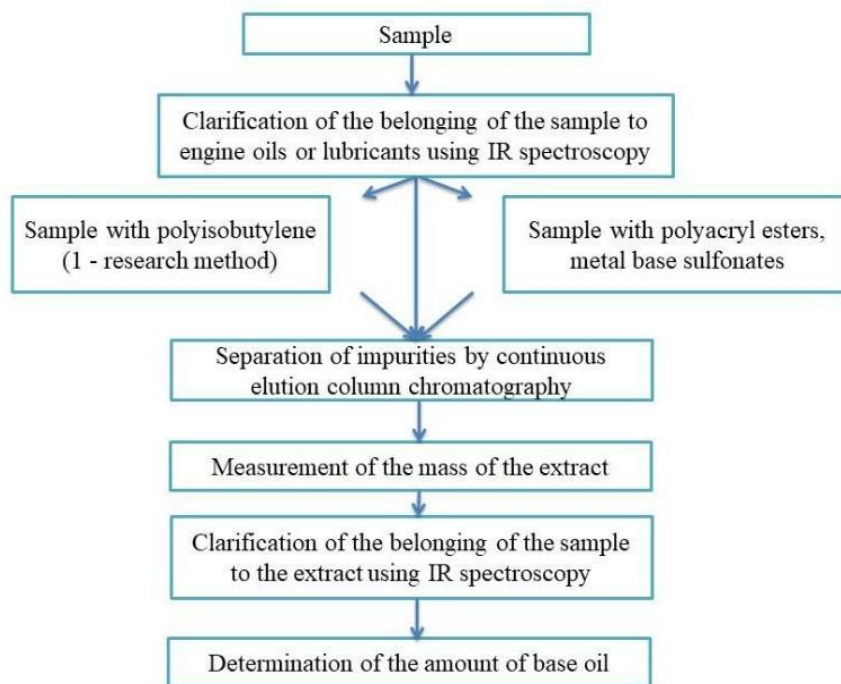

### **Scheme for determining the amount of base oil in engine and lubricating oils**

#### **THE MAIN FINDINGS AND RESULTS**

Due to the fact that this study is based on IR spectroscopy, in order to achieve the accuracy and transparency of the results, a program for metrological certification of equipment was developed, as well as an integrated approach to determining the chemical composition of engine oil in the described sequence.

For the analysis of engine oils, two types of samples with a mass of 100 g were taken. In order to make sure that the samples were engine oil, the IR spectra of the samples were taken. In some cases, knowing the frequency of absorption of the bands in the IR spectrum, one can draw conclusions about the functional groups of a substance, thus finding which classes they belong to. The IR spectrum of saturated and unsaturated hydrocarbons is observed only in absorption bands caused by stretching and deformation vibrations of the CH bond.

### Synthetic oil sample

#### Pic. – 6. IR spectrum of engine oil.

However, it is impossible to obtain information on the number of methyl and methylene groups in the hydrocarbon chain from IR spectra. Bands formed by asymmetric and symmetric stretching vibrations of methyl (-CH<sub>3</sub>) and methylene (-CH<sub>2</sub>) groups in the range 2850-2950 cm<sup>-1</sup>. Based on this case, it was concluded that the analyzed sample consists of hydrocarbons. Compared to the spectra in the Image Sample Library, the exact match of the spectra of the unknown substance indicates that the fluid being tested is engine oil.

According to the IR spectra, if it was assumed that the sample contains polyisobutylene, then it is necessary to carry out the pretreatment procedure as described in the first way.

The first method of preliminary sample preparation.

Took the first sample with an accuracy of 5 g and placed in a 200 ml Erlenmeyer flask, mixing, added 20 ml of petroleum ether. While constantly mixing, 20 ml of acetone was slowly added to the mixture. The flask was connected to a refrigerator, inserted into a condenser and heated for 10 minutes in a hot water bath. We waited until the liquid above the sediment reaches a transparent state. The decanted liquid content in the flask was collected in a 500 ml glass beaker. The precipitate in the flask was washed three times with a mixture of 20 ml of petroleum ether and acetone (1: 1), and each time the solution from the flask was poured into a 500 ml beaker. The precipitate was washed twice more with 20 ml of petroleum ether, filtered and added to the mixture in a 500 ml beaker. The newly obtained 200 ml Erlenmeyer flask was pre-weighed. The collected extract in a 500 ml glass beaker was poured into a pre-weighed 200 ml Erlenmeyer flask and the solvent was evaporated using a rotary evaporator. The remaining residue was dried

at  $100 \pm 2$  ° C in an oven and weighed on an analytical balance. The percentage of residual oil other than polyisobutylene is calculated using the following formula:

$$X \% = \frac{B_o}{A} * 100 \quad (1)$$

X is the residual part of the oil except for polyisobutylene (%);

A is the weight of the sample (g);

B<sub>o</sub> is the residual part of the oil except for polyisobutylene (g).

All processes were performed due to the fact that polyisobutylene does not dissolve in acetone and petroleum ether, and the rest of the oil sample is highly soluble in these solvents. If the IR spectra suggest that the sample contains polyacrylic esters and / or metal bases of sulfonates, preliminary preparation was carried out in accordance with the method described in method two.

Second way of preliminary sample preparation.

2 g of the sample was placed in a rubber membrane. The top of the rubber membrane was attached to the aeration clamp. The attached membrane was placed in the Soxhlet extractor column in such a way that the membrane was above the level of the extractor liquid.

120 ml of petroleum ether was poured into a flask and combined with an extractor. To ensure circulation, the immersed flask was connected to a reflux condenser, then placed in a water bath and left to boil for 10 hours. The dialysis rate of the water bath was adjusted from 6 to 8 cycles per hour. The purified ether in the flask was used as a test material.

At the same time, metal-based polyacrylic esters and sulfonates are easily adsorbed.

After dialysis, the flask was separated from the Soxhlet extractor and the petroleum ether solution was removed as a test material for further processes. If all of the aforementioned additives are assumed to be present in the sample based on IR spectra, then pretreatment should be performed first with the first method and then with the procedure shown in method two.

The procedures shown in the first and second methods were not implemented due to the absence of polyacrylic ethers, sulfonates based on metals and polyisobutylene functional groups in the sample according to IR spectra.

Method for quantitative analysis of motor oils using continuous elution chromatography.

Preparing a Soxhlet column.

50 g of weighed dry silica gel was loaded onto a Soxhlet extractor column.

The upper and lower parts of the Soxhlet column were covered with cotton wool, and the adsorbent was washed with a large amount of petroleum ether. The washed petroleum ether was removed. In a pre-weighed flask was poured 100 ml of petroleum ether and connected to the above Soxhlet column. The sample was slightly dissolved in petroleum ether. The flask was connected to a refrigerator and placed in a water bath. The temperature was set such that the rate of petroleum ether outflowing from the bottom of the column was 100 to 120 drops per minute. Thus, the solvent was circulated for 16 hours. The residue in the flask was dried in a water bath at  $100 \pm 2$  ° C until the residual mass became constant.

### Mineral oil

#### Pic. – 7. IR spectrum of motor oil extract.

Determination of volatile substances.

This method was carried out due to the presence of volatiles in base oils in the determination of the quantitative analysis of engine oils using the first method of preliminary sample preparation and the method of continuous elution chromatography.

In parallel with the process of quantitative analysis of engine oil using the method of continuous elution chromatography, 2 g of the sample placed in a Soxhlet column was weighed and dried in an oven at a temperature of  $100 \pm 2$  ° C until the mass became constant.

The losses were calculated using the following formula:

$$U \% = \frac{B}{G_o} * 100 \quad (2)$$

U is the amount of volatile substances%;

B is the amount of loss (g);

$G_o$  is the residual part of the test sample (g).

The degree of dissolution of base oils with continuous elution with petroleum ether for 16 hours (%). Calculation of base oil content in engine oil.

The mineral content in engine oil samples is determined using the following formula.

On the occasion, obtained  $T$  by the first method of preliminary sample preparation

$$N \% = P \% \times x + \frac{T}{S_o} \text{ volatile substance \% (3)}$$

$N$  is the base component of mineral oil%;

$P$  is the amount after removal of poly-isobutylene (%);

$T$  is the amount of a substance according to the analysis of engine oils using a continuous elution chromatography method (g);

$S_o$  is the collected volume of the test sample (g).

As a result, it was found that the first sample of engine oil = 95.51% - 2710, and the second sample of engine oil = 45.1% - 3403.

**ABSTRACT**

*The greatest didactic work of Mawlana Jalaliddin Rumi (1207-1273) was “Masnaviyi Manaviy”, and to understand it required a great deal of knowledge, so from the very beginning of this work, commentaries have been written on it. The play deals not only with religion and mysticism, but also with Rumi's life and work. Of course, there is more or less information about it in the comments. One such work is Ayyub's commentary on the six books of Jalaliddin Rumi's “Masnaviyi Manaviy”. This work is stored in the fund of the Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of the Republic of Uzbekistan under item number 2225 / II. In the middle of the pages of the manuscript there is a Roman “Masnavi”, in the margin there is a commentary of Ayyub “Sharhi Masnavi Mavlavi” in proportion to it. At the same time, the commentary explains some of the words, and tells stories about Rumi's life and his teachings. Some of the stories are narrated by the narrator himself. Others are interpreted on the basis of a specific source, such as the Quraan or “Manaqib al-Arifin”, and at the beginning of each commentary or story the source from which the information was obtained is noted. The narrator also narrated some of the stories on behalf of a person, and in this case the name of the person is clearly stated. In the article, these cases are classified separately and explained through examples. In the commentaries, the deeds of Mawlana, information about his relatives, Rumi is described not only as a poet, but also as the founder of the “Mawlawi” sect, a mature sage of his time, a saint who reached the highest peak of perfection. A study of Ayyub's commentary shows that he read many works on Rumi's life and work, worked with dictionaries, improved his religious and mystical knowledge, and collected information from previously*

---

written commentaries. Therefore, “SharhiMasnaviMavlavi” is one of the best sources of many other sources on the life and work of Rumi.

**KEYWORDS:** *Jalaliddin Rumi, Ayyub, Work, Commentary, Manuscript, Source, Copy, Dictionary, Mysticism, Saint, Verse, Prophet, Qur'an, Verse, Hadith, Reality, Story, And Love, Spirit.*

## INTRODUCTION

A number of works of MawlanaJalaliddin Rumi (1207-1273) have been inherited by mankind. Centuries later, these works continue to be studied by Roman scholars, while retaining their relevance. His greatest didactic work is “MasnaviyiManaviy” and since understanding it requires a great deal of knowledge, a commentary has been written on it from the very beginning of its writing.

Today, information about the work of MawlanaJalaliddin Rumi “MasnaviyiManaviy” can be found in the forewords of his published works, articles, scientific research, pamphlets and books dedicated to the life and work of Rumi, as well as on the Internet. Among them is some commentary on Rumi's “Masnavi”. In his book “MawlanaJalaladdin Rumi. Divine flute of the world. Life, personality, thoughts” [6:96], ShefikDjan gave some information about the comments written in Turkey, but it is said that this information is not a definitive number and the comments of “Masnavi” will be found again. In particular, the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan also has commentaries on “Masnavi”, some of which are described in “*Sobranievostochnyxrukopisey*” (“Collection of Oriental Manuscripts”) [1].

## THE MAIN FINDINGS AND RESULTS

One of such commentaries is Ayyub's commentary on Jalaliddin Rumi's “MasnaviyiManaviy”, one of his manuscripts (manuscript number 2225) is kept in the fund of the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan. It is given in the margin of the pages of the book (in the middle is the text of Jalaliddin Rumi's “MasnaviyiManaviy”) and is called “SharhiMasnaviyiMawlavi”; the author's name is mentioned in the form of Ayyub in the first lines of this commentary. The first brief description of the manuscript is found in the second volume of *Sobranievostochnyxrukopisey* [2]. It contains information that the work was copied in Kashmir by the secretary Obad Muhammad Siddiq in 1221/1806 by the order of Mirza Muhammad Rabikhan. This comment is one of the comments written in India [7:35]. The first study of Ayyub's SharhiMasnaviyiMawlavi was DiloromHamroeva's article “A work of immortal soul. About the first Turkish commentaries of “MasnaviyiManaviy” published in the newspaper “Uzbekistan adabiyotivasanati”, in which Ayyub Lohuri's commentary was mentioned, and the date of writing was given as 1713 [8] . Subsequent research was conducted by the author of the article [9].

Ayyub's commentary contains many stories about the life and work of MawlanaJalaliddin Rumi, which can be grouped as follows:

- a) The events of Rumi's life and work narrated by Ayyub;
- b) Phrases and excerpts from Ahmad Afloki'sManaqib al-Arifin [5];

c) A story narrated by a narrator on behalf of a person.

**Stories from the life and work of Rumi narrated by Ayyub.** Ayyub does not give information about its sources when he narrates a story commenting on some bytes. The following story is about Mawlana's great love for Allah.

جانهای بسته اندر آب و گل  
چون رهند از آب و گلها شاد دل  
در هوای عشق حق رقصان شوند  
همچو قرص بدر بی نقصان شوند [3:32a]

*Translation:*

*He melted our souls into water,  
Erusuvdin made us happy.  
In the air of love, he said, dance,  
Be as perfect as the full moon [1: 1:13].*

According to Ayyub, these verses describe the emergence of man and his joy and happiness. It is said of his abstract existence and eventual extinction: "One day Sultan Valad narrated: "My great-grandfather, in his youth, devoted himself to asceticism and ceased to participate in heaven. Then my grandfather on my mother's side invited my father to heaven. Shams Tabrizi came and called my great-grandfather to descend to heaven, and they began to descend to heaven. Mawlana Zayniddin, a great Greek scholar and official, says:

"Why do such a great Mawlana violate the rules of the sky?" Then Mawlana replied:

"Everything that is forbidden before a person dies (if he is helpless) is lawful for him. Similarly, it does not matter how a person dances if he has only Allah in his heart, that is, if he lives only in his memory. He considers himself close to God." Upon hearing this, Zayniddin took a few steps and fainted. Zayniddin Mawlana will become a murid".

In the commentary on the following verses, the narrator also gives verses from the Quraan to further enrich the content of the stories narrated by him.

چون بسی ابلیس آدم روی هست  
پس بهر دستی نشاید داد دست  
زانکه صیاد آورد بانک و صفیر  
تا فریب مرغرا آن مرغ گویو [3:15 b]

*Translation:*

*The demons are human in nature, so  
It's also not good to shake hands with everyone.  
The hunter-gatherers whistled the bird,  
The bird is also deceived by this sound [1: 1:50].*

Ayyub describes what MawlanaJalaliddin Rumi meant in this story in his commentary:

“One day, a person named Nuriddin, the deputy of MuiniddinParwana, was talking to Mawlana about the miracle of Haji BektashKhurasani. He said, “Bektash was not praying and I told him to pray. He said to me, “Bring me some water so that I may perform ablution”. I brought water. He took the water-pot and handed it to me and ordered me to pour water. I poured water into his hand. Pure water turned to blood”.

Then Mawlana said: “It would be better if he turned blood into water, because it is not a profession to turn pure water into something impure. If the word (Moses) turned the water of the Nile into blood for the Copts and the blood into water for the Tribes, it is only for him. No one else has been given such power. This conversion is called a useless conversion” [3: 15b].

The commentary is then summarized in the following verse:

ان المبذرين كانوا اخوان الشياطين

The full form is as follows:

ان المبذرين كانوا اخوان الشياطينو كان الشيطان لربه كفورا

*Translation: Because the wasteful are the brothers of the devils. Satan, on the other hand, was very ungrateful to his Lord [4:17:27].*

"The real (true) transformation is that your wine will turn into vinegar and your problem will be solved, low-quality copper will turn into yellow gold, the unbeliever will become a Muslim, and your (clay) soil will turn into pearl”.

Nuriddin bowed his head” [3: 15b].

Ayyub in “MasnaviyiManaviy”

آنکه جان بخشد اکر بکشد رواست

نایبست و دست او دست خداست [3:14a]

*Translation:*

*Whoever kills - if he kills, well?*

*The great vicegerent is the hand of God. [1: 1:43]*

hen commenting on the verses, **در مناقب العارفين مستور است** said, “I am quoted in “**Manaqib al-Arifin**”, citing the source he used, but did not say who the author was.

Based on this work, the narrator narrates an event related to the life of Ayyub MawlanaJalaliddin Rumi. According to the narration of MawlanaShamsiddinMudarris's son, MawlanaJalaliddin Rumi had a flute player named Mawlana Hamza. He played the nay very skillfully and Mawlana Rumi's love for him was boundless.

One day he gets sick and dies. They inform Rumi about this and begin preparations for the funeral.

Jalaliddin Rumi goes to his house and as soon as he enters through the door, my dear friend Hamza, gets up! They shout. Hamza gets up and starts playing the flute. They descend into the different samo (dance) for three nights - day in the melody of the nay. Seeing this, about a

hundred Roman infidels became Muslims. With the departure of Mawlana, Hamza passed away [3: 14a].

According to the narrator, the second verse of the above verse refers to the verse of the Holy Quraan:

ان الذين يبائعونك انما يبائعون الله يد الله فوق ايديهم فمن نكث فانما ينكث على نفسه و من او فى بماعهد عليه  
الله فسيؤتيه اجر اعظيما [4:48:10]

*Translation:*

*Indeed, those who pledge allegiance to sega pledge allegiance only to Allah Himself. God's hand is over their hands. Whoever breaks a covenant breaks it against himself. And whoever fulfills his covenant with Allah, he will have a great reward.*

Then, O Muhammad (saas), if they pledge allegiance to you, they have pledged allegiance to God! - the commentator writes.

Sheikh Abdulaziz Mansur's translation of the Holy Qur'an explains this verse as follows: as if his hand was placed on the hands of believers, it is as if he were placed on the "hand" of Allah. As it is said in another verse: "Whoever obeys the Messenger has obeyed Allah".

Under a bush in the Hudaybiya Valley, about one and a half thousand Muslims swore allegiance to the Prophet (saas) under all circumstances. This event is known in Islamic history as Bay'atur-Rizwan. It means an oath that is pleasing to Allah [4:48:10].

The following commentaries deal with the saintly qualities of Hazrat Mawlana:

غيب و آينده بر ايشان گشت فاش [3:34a]

*Translation:*

*The secret of tomorrow is revealed before him [1: 1: 146]*

Ayyub interprets this verse as follows: According to "Manaqib al-Arifin", one day Hazrat Mawlana raised his blessed hands and said: "A group of noble people from Turkestan and Bukhara are coming and want hot halva from us". Then a plate of hot halva appeared out of nowhere. When the nobles arrived, Mawlana said to them: "You could have asked for Jesus' share. What happened to a plate of halva? Allah, Allah! Do you come and ask the saints for halva?! Ask for something that will solve your problem as easily as a halva and give strength to your soul and body".

هست قرآن حالهای انبیا

ماهیان بحر پاک کبریا [3:35a]

*Translation:*

*The state of the saints is the Qur'an of Truth,*

*What a great ocean of fish [1: 1: 153].*

These verses point out that because of the divine power given to the saints, they were given the opportunity to appear at any time, anywhere. Ayyub interprets it as follows: It is said that one of the admirers of Hazrat Mawlana lived in Kunya. He set out with the intention of Hajj. Wherever

he stopped, wherever he went, he would see Hazrat Mawlana. When he reached Damascus, he saw Mawlana walking on top of the mosque. He would call her from there. He fainted from fear. When he regained consciousness, he saw no one there. Surprised, he continued on his way and reached the Ka'bah. As you can see, Mawlana was circumambulating the Ka'bah. During his visit to Mount Arafat, he saw Mawlana begging there. When he returned from Hajj, Kuniya came to Mawlana and Mawlana said to him: "Hoja Amir swam like a fish in the river of power. He would stick his head out wherever he wanted".

کاملی گر خاک گیرد زر شود

ناقص ار زر برد خاکستر شود [3:36a]

*Translation:*

*If you take the soil, it will be perfect, it will be dice,*

*If he takes the wrong dice, he will be reduced to ashes [1: 1: 159].*

Commenting on this verse, Ayyub narrates: "One day Mawlana used to recite this ghazal with pleasure:

"ای عشقان ای عشقان

من خاکرا گوهر کنم

وی مطربان وی مطربان

دف شما پر زر کنم"

With that, they took a handful of soil from the ground and sprinkled it on the drum of a man named Kamal, the chief of the drummers. He was also the greatest musician and singer of his time. He looked like his drum was full of gold. "

The narrator narrates another story from "Manaqib al-Arifin" and links it to the following verse commentary:

ای مری کرده پیاده با سوار

سر نخواهی برد اکنون پایدار [3:36a]

*Translation:*

*He is a horseman, you are a walker, do not argue,*

*If the head is needed, enough, then turn [1: 1: 159].*

The commentary on this byte tells the story: Sheikh Majiddin, one of the most famous sheikhs of his time, said at a gathering of scholars: He said, "Now, if Mawlana (Rumi) comes and I deny what he says, and in this way he will be gentle." Sheikh Sadriddin, who was present at the meeting, tried to dissuade him, saying, "It is forbidden in the teachings to insult the elders". But he did not listen. Hazrat Mawlana visited the meeting: He said, "La ilaha illallahu Muhammadu-r-Rasulullah". The crowd came to a screeching halt, and all at once returned, leaving them, and shouting. Sheikh Majiddin repented and bowed.

Many of the stories from "Manaqib al-Arifin" speak of Rumi's saintly qualities.

**A story narrated by a shariah on behalf of a person.** Ayyub sometimes quotes the name of a specific person and gives a quote from the life of Jalaliddin Rumi on his behalf. One of them is the Malikul Caliph **Mawlana Badriddin al-Madani**, may Allah have mercy on him, the respected caliph of Rumi, who narrated: “Hazrat Mawlana had a fat singer. One day, Mawlana was singing with all his joy, and he was playing the drums with enthusiasm. After Samo, Mawlana asked him: They said, “Why don't you stand up?” He said he was fat. Mawlana stroked his back with his hand, and immediately his body straightened up [3: 14a].

The next verse refers to a verse from the Quraan:

آیت انسوم کم ذکر بیخوان [4:23:110]

قدرت نسیان نهادن سان بدان [3:37a]

*Translation:*

*Read the verse "Ansavkumu zikriy ...",*

*So forgetfulness is rare, conscious, read [1: 1: 146].*

The full text of the verse is as follows:

فاتخذ تموهم سخريا حتى انسوكم ذكرى و كنته منهم نضحكون

*Translation:*

*So you mocked them, even though he forgot you to remember Me. You laughed at them [4: 23: 110].*

Commenting on this verse, Ayyub refers to the following story:

Mawlana **Qutbiddin Sherozi** writes in his book "Majma'i fuzaloi Tabriz":

“We have 12 people in Kunya who are very knowledgeable. Each of us was very talented in a particular subject and we wanted to talk to Hazrat Mawlana on a number of issues. When we went to them, we forgot all our knowledge and could not remember anything no matter how hard we tried. Mawlana answered all the questions we were thinking about one by one. We were amazed and admired him”.

In the commentary of the following verse, Mawlana's words about nafs are quoted:

گر تو این انبان زنان خالی کنی

پر ز گوهرهای اجالی کنی [3:366]

*Translation:*

*Put the bread aside, do not leave, gather,*

*Fill the chest with pure pearls [1: 1: 161].*

Mawlana Badriddin Bahriya narrates:

“One winter, Mawlana came to my house and went naked into the cold pool. Those who went into the water poured water from the man's head into a bucket. They stayed in that position for 3 nights and 3 days. People could not stand it. I would cry out to the poor man and say that cold water was harmful in this bitter winter. Mawlana came out of the water and spent 9 days and

nights in the sky. They did not eat and said: "O soul, be patient. Do not eat. If you do, he will eat you".

## CONCLUSION

The above analysis provides various information about the life of Jalaliddin Rumi. The stories provide information about Mawlana's life deeds as well as his close people. It is also stated that Rumi was not only a poet, the founder of the Mawlawi sect, a mature sage of his time, but also a man who reached the highest peaks of perfection and embodied the qualities of a saint. The scientific study of the life of Jalaliddin Rumi and his works "Masnaviyi Manaviy", which has become a masterpiece of the spiritual wealth of mankind, is a topical issue and provides an opportunity to reveal its undiscovered aspects on the basis of new research.

### ABSTRACT

*Democratization and renewal of society in Uzbekistan, modernization and reform of the country's economy require a comprehensive reorganization of the activities of various sectors. Because the spheres form a holistic system of interdependence, gaining specific features. The article emphasizes that the ongoing reforms in Uzbekistan are aimed at establishing a socially oriented market economy and ensure economic stability, free conditions for the activities of citizens and economic entities based on democratic principles.*

**KEYWORDS:** *Tax, Tax System, Market Economy, Commodity-Money Relations, Tax Policy, Income, Expenditure, Taxpayer, Government, Tax Reform.*

### INTRODUCTION

The ongoing liberalization process in our country is also inherent in the tax system. "The tax system, as an integral part of the reform process, as its internal driving force, must meet the goals of economic reform as much as possible" [4]. Accordingly, it should be noted that tax reform is a continuous process, which is affected by quantitative and qualitative changes in the economy. Tax reform is based on certain theoretical views, which are inextricably linked to the scientific views on market relations.

It is now important to encourage the improvement of living conditions through the tax mechanism by ensuring employment, further increasing incomes, ensuring a steady increase in the value of property and assets. In this regard, the Action Strategy for the Development of the

Republic of Uzbekistan for 2017-2021 identifies "... continuation of the policy of reducing the tax burden and simplification of the tax system, improving tax administration and expanding appropriate incentives" [3].

In the context of liberalization and modernization of the economy in Uzbekistan, priority is given to studying the problems of increasing real incomes, steadily improving their living standards and quality, stimulating consumer demand through the tax system, improving real incomes.

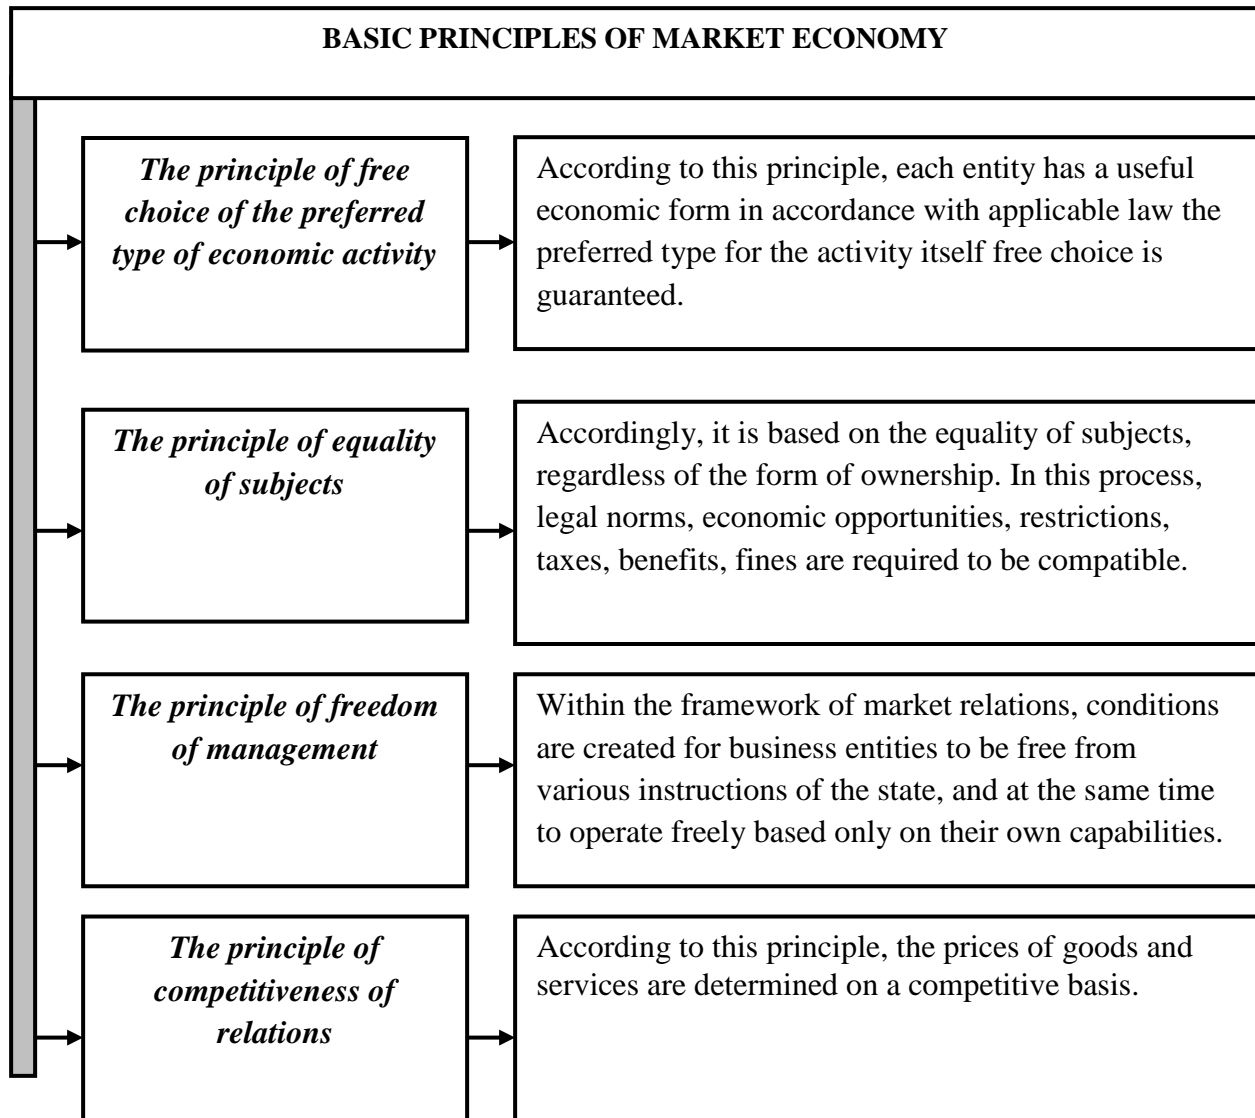

### **MATERIAL AND METHOD**

In the modern scientific and economic literature (P. Samuelson Economics, P. Haynes Ekonomicheskij obraz myshleniya, McConnell K. Bruce. Economics; Principles, Problems and Politics. Fishers., R. Dornbush Schmalenzi. Economics M. Delo.) The market system is such an economic system. It is considered that a decision is made on the use of limited production resources, subject to price targets. If a certain product is created at the expense of limited resources, it is necessary to give up the production of another such product. In a market economy, demand and costs are the main criteria for this choice. This choice involves the degree of profit and loss [6].

In the process of functioning of the market mechanism on the basis of supply and demand, it is observed that the needs of consumers are related to producers, and through them, to intermediaries. The competitive environment that arises in this process, by its very nature, requires the satisfaction of the needs of the economic entity and requires the priority of the basic principles of the economy (Figure 1.1.1). These principles apply in an interconnected, systematic way.

Market economies are viewed differently in terms of humanity and development prospects, and they are reflected in a number of views aimed at supporting market relations.

The above-mentioned functional principles of the market system also apply to the financial system. According to him, the financial system is considered in a broad sense. Such a view is also found in some dissertations. In our opinion, such views are correct. In the past, finance was understood as a state-owned financial relationship, and this reflected the real situation in the totalitarian-planned system.

**Figure 1.1.1. Basic principles of market economy**

Finance is evaluated in terms of the market system in the current view, and this is certainly true because finance has always been a link in the economy. The current economy is a two-sector structure, consisting of the real and monetary sectors, the real sector is tangible and intangible production, where goods and services are created, which are consumed through market exchange and re-produced, for which resources are taken from the market. used. This process is constantly reversed, resulting in a macroeconomic cycle.

The movement of goods and services created in the real sector from production to consumption takes place through commodity-money relations, which is why the money sector is needed.

Enterprises, farms, households and various non-governmental organizations, which are micro-level entities, receive the monetary equivalent of goods and services, satisfy their needs by purchasing resources and consumer goods.

In manufacturing firms, turnover is in the form of money→resources→goods→and money. This movement takes the form of resource → money → commodity in households. In NGOs, this movement is limited to cash and commodity flows.

When the turnover goes beyond the national sphere, there is an international, ie mega-turnover, which also consists of material and monetary movements. At any level, real turnover is primary, because through them are created branded services that have value. In contrast to their movement, the movement of cash flows arises because money serves to convert them.

Cash flows also occur between different entities, which include firms, households, government and non-government organizations. While cash flow refers to the movement of goods and services, they mean that market value is measured. When this value is distributed, income and expenses are generated, which create finance as a value category. They go in the opposite direction, i.e. the income of one entity creates an expense for the other entity at the same time.

In this sense, if taxes are revenue for the state, they will be an expense for other entities. Income and expenditure can be said to be integral categories of finance, as they are specific to all sectors of the economy and are part of the financial system.

This system is multi-tiered, it cannot be limited to pure financial relations, as it includes financial institutions and financial policy. A number of authors advocate finance in the broadest sense and incorporate it into the system [7].

Based on this, it is appropriate to look at the tax system in a broad sense. There are views on the classification of finance according to the level of production [8]. Accordingly, micro-macro-mega finance is allocated.

The macrofinance system forms two large blocks. The first is the fiscal system, the second is the budget system. These are structurally state structures, one of which represents government revenue and the other means that it is spent through the budget.

As the fiscal system is part of finance, it is appropriate to consider it as a sub-system. This system is also multi-element, each of which has its own function. But they cannot be outside the system and form integrity by requiring each other.

At the heart of the tax system is a tax relationship. The difference between these and other economic relationships is that most entities enter into a relationship with a single entity. While the majority are individuals and legal entities that pay taxes, the sole taxpayer is the state.

However, when the state spends taxes as income, it is in the public interest. The state, by means of its own mechanisms, relies on institutions that have the force of legal coercion against its own population, represented by the term "society" in a particular area, and it has the upper hand in the legislature<sup>1</sup>.

The state can coerce subordinates based on tax legislation. At the same time, the state provides the population with social benefits that are difficult for members of society to obtain through the market and have special characteristics.

The social protection function of the state is focused on maintaining security and social order. The state must prevent possible harm to each other and ensure that citizens live in peace, ensure strict compliance with applicable laws, and monitor compliance with the rules of society.

A number of problems arise when the state does not effectively perform its function. In particular, there are cases when the market mechanism can not be used to determine the actual costs of production of goods (services, works), inefficient use of resources, environmental pollution in cases where property rights are not clearly defined or protected. The elimination of the negative consequences of these cases will be mainly at the expense of the state.

Another important task of the state is to create conditions for the development of reproduction. At this point, this functionality requires funding and this is covered by taxes. The state does not replace the market mechanism, but takes measures to ensure its functioning when this mechanism becomes incompetent. The state undertakes to develop solutions to socio-economic problems that this mechanism cannot solve (sometimes through ineffective solutions). Given the need for state regulation of society, it should be noted that there are normative limits to its intervention in the economic process. Within this boundary, it primarily affects market participants through taxes.

In this ranking, the tax is the main means of influence in the hands of the state, which determines the nature and role of taxes in the current market economy. It should also be noted that there are currently a number of terms and definitions to describe the tax elements (Figure 1.1.2).

<b>Tax elements</b>
<b>Tax subject</b> - taxpayers (legal entities and individuals) involved in tax relations, as well as tax collectors (tax authorities), as well as entities that assist in their collection (banks, commercial courts, etc.);
<b>The object of taxation</b> is a property, action, result of action or other situation of value, quantitative or physical nature, in the presence of which the tax legislation creates a tax liability on the taxpayer;
<b>Tax base</b> - represents the value, physical or other property of the object of taxation;
<b>Tax rate</b> - the amount of tax calculated as a percentage or absolute amount of tax calculated per unit of measurement of the tax base of the tax rate;
<b>Tax benefits</b> - certain categories of taxpayers have advantages over other taxpayers under tax legislation, including the ability to avoid paying taxes or pay them in smaller amounts;
<b>The source of taxation</b> is the income from which the tax is paid, or in some cases property;
<b>Tax payments</b> - the amount established by law and expressed in money transferred to the budget;
<b>Tax burden</b> is the amount of all taxes and fees paid by taxpayers.

*Figure 1.1.2. Tax elements*

Taxes emerge as a means of collecting the necessary part of the national product created in the country, which is required for the state to perform its functions.

Taxes, being a financial instrument of state regulation of the economy, also determine that the state is a subject of a market economy.

When describing the modern tax system, it is first necessary to assess the essence of taxes, because on their basis emerge financial relations. Taxes are also the main financial category that reflects the commodity-money relationship.

In the current literature, taxes are traditionally interpreted as mandatory, non-equivalent payments levied on individuals and legal entities to the state budget and extra-budgetary funds in accordance with applicable regulations [10].

It should be noted that the large number of different payments, which are the sources of revenue generation of the state budget, creates certain problems in the interpretation of taxes. In particular, there is a need to select clear bases in the study and classification of tax types. At this point, we found it necessary to dwell on the special economic features of taxes, that is, the difference between them and other payments.

Taxes, unlike other payments, mean the alienation of taxpayer property in favor of the state. Taxation is based on a legal basis. Government agencies set rules and norms for taxation, and taxes are collected compulsorily. Taxes vary, they generate non-refundable payments, they become financial resources at the disposal of the state.

Taxes are payments set by the state, which is a subject of transparent law, in which the interests of the state and society are reflected. Therefore, the right to impose taxes is determined by law. The Constitution of the Republic of Uzbekistan states that the introduction of taxes and mandatory payments is the competence of the Oliy Majlis, the highest state body exercising legislative power [1].

The interpretations of the essence of taxes by economists of our country in recent years are also noteworthy. In particular, it should be noted that the interpretation of taxes as a monetary relationship representing a mandatory payment has somewhat expressed their current nature [9].

Obligation in taxes means the responsibility of the lower economic entities to society in the form of the state. This is primarily a social obligation that stems from the social orientation of the market economy.

This direction means that economic prosperity is ensured through the market through fiscal policy. The source of funding for this is the taxes levied.

Taxes differ from other payments by their non-equivalence. In our view, inequality cannot be understood as absolute inequality because there are two aspects to it. First, there is really no equivalence between the money a taxpayer gives and the social benefits he receives from the state. Equivalence occurs when goods and services are paid for according to their market value. Social benefits convertible into taxes have no market value, as the state provides them free of charge to individuals and legal entities, as well as to the general population. Since these services are social, everyone consumes them. Therefore, everyone benefits from the services of law enforcement and security agencies, education, health, beautification and normalization, ensuring a normal life.

Since these services are common consumption, it is impossible for each group to use them and the other not to use them. The presence of non-equivalent payment of taxes is relative to some taxpayers. At the community level, there is a certain equivalence, i.e. equality, between taxes and the cost of social services.

The amount of taxes should, as a rule, be sufficient to cover the cost of social benefits. Social benefits are not created for commercial purposes and for profit. In this way, they differ from the goods that are bought individually from the market and consumed. It is therefore sufficient to cover the cost of social benefits. This task is performed by taxes. However, taxes are not the only source of funding for these services, as revenues other than taxes are also involved in their creation. In conclusion, they can be interpreted by making a number of additions to the principle of tax inequality. In the scientific literature, the tax system is interpreted differently, in the narrow sense, "the sum of taxes and other payments collected in the prescribed manner constitute the tax system" [10].

### **Results**

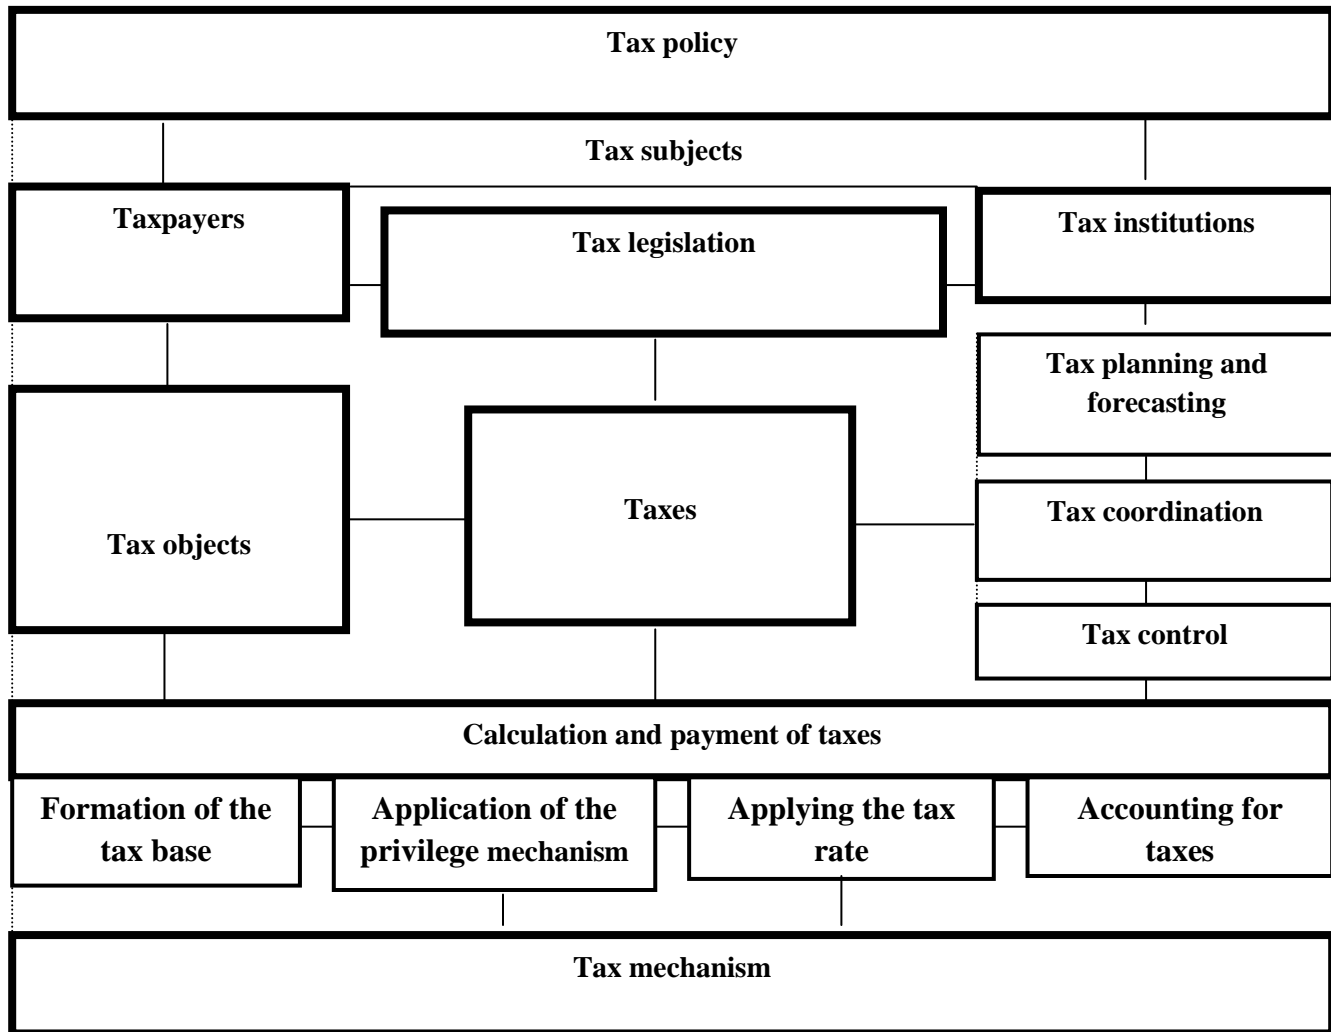

Based on the results of the study, it should be noted that the tax system is a set of principles and taxes, as well as the forms and methods of their collection, modification, abolition, collection and control.

However, the study of views on the tax system shows that in the future there will be a broader interpretation of this system and it will be considered in terms of tax practice. Such an approach also has its bases.

Recognizing this, it was agreed to evaluate the tax system in terms of the concept of economic systems. Based on this concept, the tax system should be viewed as a complex that embodies structurally complex elements

This complex includes the tax system "taxes - tax objects - tax subjects - tax mechanism, in addition, tax institutions - tax legislation - tax policy"(Figure1.1.3).

*Figure 1.1.3. The structural structure of the functional tax system*

From the author's point of view, taxes themselves do not form a system, because the system must have a set of relationships in which different elements interact. The tax system includes not only tax relations, but also tax infrastructure and tax policy. The main element in the tax system is taxes.

A leading element of the tax system is the tax mechanism. This mechanism consists of tax rates, tax benefits, tax penalties, the establishment and collection of taxes, and, if necessary, their modification and regulation. The tax mechanism includes administrative instruments in addition to economic instruments.

In the tax system, tax institutions perform the function of infrastructure, the activities of which are determined by law.

Tax legislation serves to regulate the tax system, ensures the integrity of the tax system, its state control. Legislation is the legal basis for the implementation of tax principles.

Tax policy manifests itself as a system-forming element, but tax policy, unlike other types of economic policy, is only public policy, in which economic coercion is accompanied by administrative coercion.

Each of the above-mentioned elements performs a specific function, they interact with each other as required, and one creates the conditions for the other to act. They form the basis of the tax system as a whole and serve the implementation of its functions.

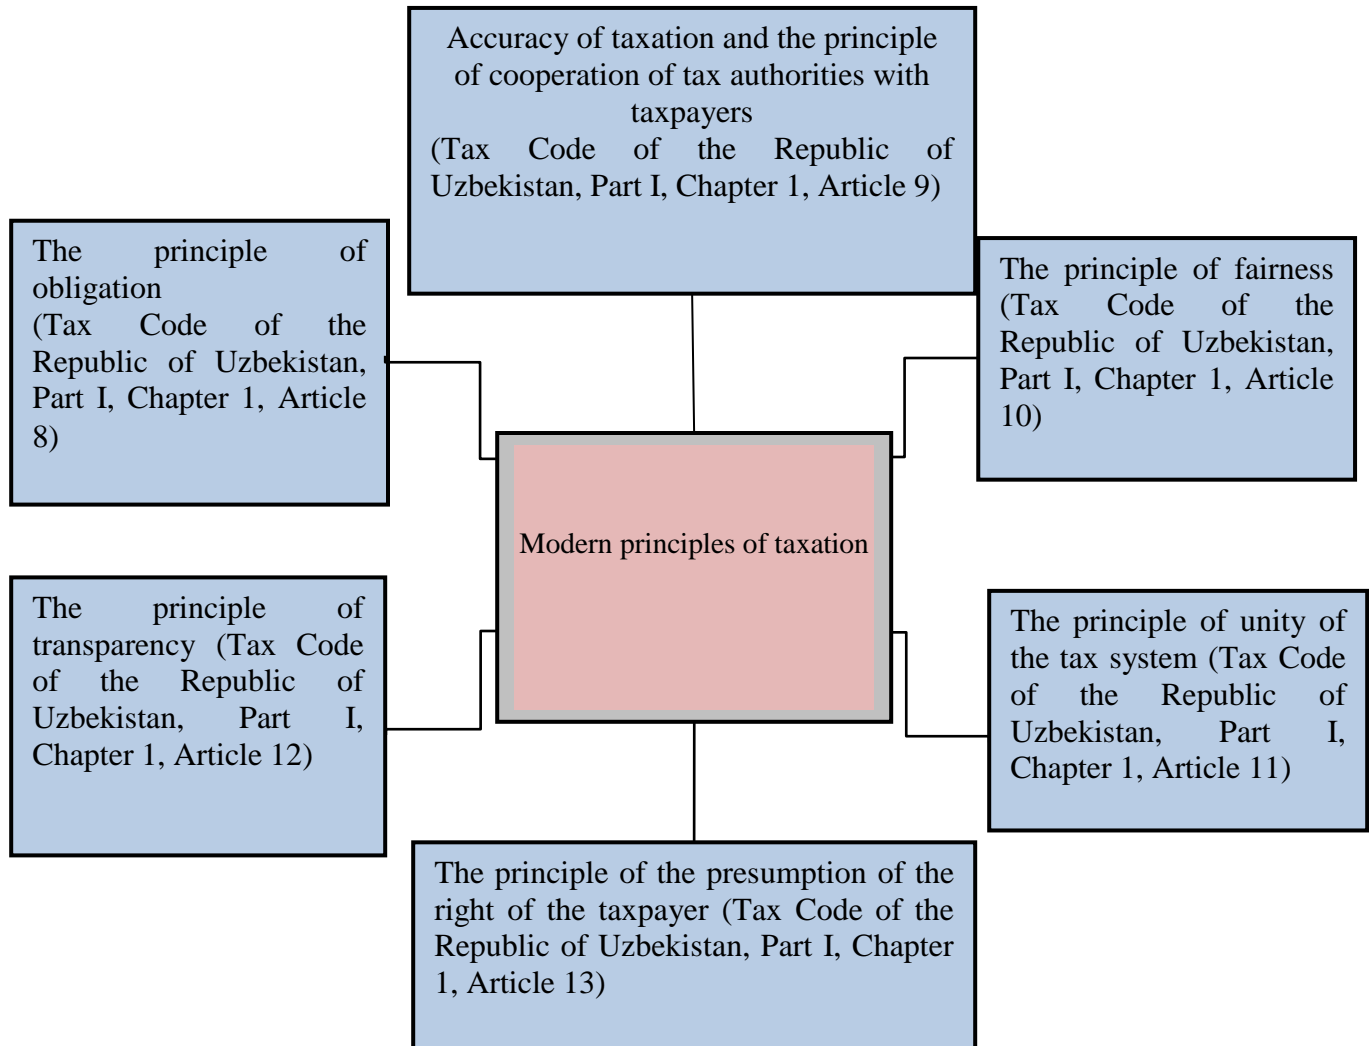

There is a traditional succession in tax principles and views in tax theory<sup>2</sup>. In particular, in Amir Temur's "Temur's Statutes" principles such as humanity - a special approach - convenience - low cost - fairness were applied to taxes. While Amir Temur interpreted tax principles in terms of fiscal efficiency, tax principles were studied by A. Smith not only in terms of fiscal but also economic impact [11]. His theory states that the tax system should be based on such principles as: generality - stability - equal distribution - obligation - social justice - clarity - neutrality.

A number of other scholars have also expressed certain views on the principles of taxation. In particular, the Russian economist N. Turgenev recognized such specific principles as equal distribution of taxes - accuracy of taxes - convenience of timing of tax collection - low cost of tax collection - the existence of a general rule in tax collection [12].

In modern tax theory, tax principles are considered much more broadly. The functionality of these principles serves the economic and social efficiency of the tax system. The newly formed tax principles in Uzbekistan have a legal basis and are reflected in the figure (Figure 1.1.4).

At the current stage of the market economy, the methods of tax collection are used, such as cadastral, declaration, source of income, administrative. Another important aspect of the modern tax system is taxation based on the natural and value base of the tax. For example, taxation on a natural basis is used in a number of countries to collect household taxes, personal taxes, special duties. Taxation on the basis of value is applied to the bases of gross and net income. An important aspect that had a significant impact on the nature and role of taxes was the wider spread of taxation as the wealth of the taxpayer increased.

This approach requires that the total amount of taxes levied on taxpayers not, firstly, exceed the income of taxpayers, and secondly, that they constitute a certain normative part of their income.

*Figure 1.1.4. Principles of taxation provided by the legislation of Uzbekistan<sup>3</sup> [2]*

## CONCLUSION

From the above, it can be concluded that the tax system consists not only of tax relations, but also of tax legislation, tax policy and tax institutions. In this system, the basic principles of taxation are followed. It is necessary to look at the tax system as an integral part of economic development, as it adapts to it in the context of economic transformation. The efficiency of the tax system and the quality of service provided to taxpayers by the staff, of course, the selection and placement of personnel, the implementation of systematic work to fill the tax authorities with highly qualified staff, as well as crime prevention among them and their service. requires the creation of conditions. In order to strengthen financial and budgetary discipline and ensure balanced execution of the budget of the Republic of Uzbekistan, it is necessary to ensure the full collection of taxes and other mandatory payments, maximum legalization of employed citizens and increase the salary fund. One of the urgent measures of the state is to expand the tax base, identify additional sources of revenue to the budget, develop, ensure and monitor the implementation of "Road Maps" by districts and cities to ensure its balance, taking into account the strict responsibility of individuals.

### ABSTRACT

*This article highlights the issue of techniques for the effective use of multimedia in improving the quality and effectiveness of primary school reading lessons. Primary education is carried out with the wide and effective use of multimedia, active teaching methods, and gaming technologies. With the effective use of multimedia, students develop the ability of active and logical thinking, attention, logical memory, mental ability.*

**KEYWORDS:** *Multimedia, Develop Ability, Logical Thinking, Primary Education, Efficiency.*

### INTRODUCTION

The main purpose of the large-scale work to improve the education system of the Republic is to improve the quality and effectiveness of education of the younger generation, their upbringing and their strong education. It is the creation of all the necessary conditions for acquiring knowledge and highly skilled professionals with the ability to acquire new knowledge, acquire professional excellence and possess professional flexibility in the context of modern technology that requires new in-depth knowledge. to improve the quality and effectiveness of the educational process through training. This, in turn, requires the organization of the learning process based on the latest scientific achievements and the effective use of modern teaching technologies.

Upbringing the young people as healthy people is one of the most important tasks in the social life of our society. At the same time, President Mirziyoyev said: "Another important issue for us is to bring up our children as genuine patriots with independent thinking, modern knowledge and skills, with a solid life position. is a function" i would like to point out that. Indeed, the stronger the knowledge, the more the student's worldview and intellectual potential develops and

matures[1]. For today, information literacy for students is an essential prerequisite for improving the effectiveness of education.

The Uzbek model of the National Program for Personnel Training, first of all, provides the students with the knowledge, skills and abilities needed to realize their potential, meet their material and spiritual needs, and promote the activities of young people. and create an education system that aims to serve the development of society, science and industry. In this regard, education should focus on teaching the development of our independent country, which is achieved by independence. It is important to remember that one of the main tasks of the present is to improve the quality of teaching through innovative approaches and the introduction of advanced state-of-the-art technologies into the learning process.

The Education Act states that "Elementary education is aimed at developing the basics of literacy, knowledge and skills necessary for general secondary education[2]." During the first three years of the elementary school, students will be able to read and understand words and expressions correctly, including emphasizing the meaning of the words. They acquire such knowledge and skills. In the fourth grade, students' learning abilities and skills will be further enhanced. That is, the emphasis on reading comprehension and working on the text is enhanced.

## **MATERIALS AND METHODS**

In the State Standard of Secondary Education By training students to develop logical thinking, mental development, worldview, communicative literacy and self-awareness, to experience the beauty of material existence, to enjoy beauty and sensuality[3]. At the same time, the aim of the primary education "to broaden their understanding of the subject, to expand their activities, to be able to think freely, to acquire the skills and abilities of others" is to guide students in creative thinking through innovative approaches. , it is important to teach changing situations, create independent activities based on free competition. This requires students to think creatively, to develop free thinking, to develop critical thinking skills, and to make learning easier.

As you know, most of the important tasks of teaching elementary school students are in the classroom. During the reading and speaking lessons, the students are given some knowledge based on the topics identified in the program. In addition to improving reading skills, the focus is on educating students in a spiritually mature human spirit. In the primary school, students are taught to read accurately, intelligently, fluently, expressively, through the lessons that follow the goals and objectives of the reading and speaking program. Children learn to work with books in this process, and they develop a love for the book. Qualitative and effective implementation of this process depends directly on the organization of training courses using an innovative approach.

According to the reading and speaking program, fourth-graders should be able to read texts that are relevant to their knowledge at a reasonable, expressive and normal speed. It is advisable to improve the reading skills of students in two ways. First, there are ways to overcome some students' learning disadvantages.

Second, special attention is paid to the further development and improvement of the reading comprehension skills of all students. The most effective way to develop children 's reading and expressive reading skills is to enhance their reading comprehension and vocabulary.

It seems that the teacher should constantly work on improving the reading skills in this class, enriching the child's speech by providing expressive reading. Innovative learning in this process, the use of various tools and innovative learning technologies throughout the classroom is an important factor in improving the quality and effectiveness of teaching.

As Professor K. Yuldashev rightly points out, "School literature is not a teaching tool but an educational tool. In fact, rather than a reader who can scarcely tell the facts about the history of literature, but lacks good moral qualities, he is able to absorb the most human qualities inherent in the heroes of fiction, even though he does not know some literary information system. readers who seem to be inactive rather than outward are more important to our society... Literature is to create a beautiful spiritual world in a beautiful world[4]." According to the scientist, the task of teaching literature is to instill in readers a sense that each nation can be perceived in a unique set of spiritual values. After all, a person who does not know how to build their own spirituality is like traveling to an unknown country without a map, and is in danger of being distracted.

Thus, a number of measures are being taken to educate teachers based on the innovative approach to the educational process, to introduce the best international practices in the educational process, to develop the professional competence of teachers.

That is why it is theoretically and practically important to focus on the innovative teaching and learning skills of teachers in the elementary school classrooms, and the problems of selecting and applying the most appropriate educational technologies.

Innovative learning technologies are a systematic way to create, apply and define technical and human resources and their interrelationships, with the goal of enhancing the effectiveness of forms of learning throughout the learning and learning process. Widespread access to modern knowledge is one of the most important requirements of today.

Providing students with knowledge and skills in accordance with the requirements of the State Educational Standard through the materials provided in the textbook of the elementary grades to instill a sense of love for the motherland and the Uzbek people; - to convey to students the knowledge required by the program during the training sessions; improving reading and speaking skills; the artistic work that is given is meant to visualize images.

The lessons are particularly important in the elementary education system, in terms of their essence, goals and objectives. Not all subject classes can be imagined without reading activities. This is because reading comprehension and reading comprehension, rhythmic and expressive reading. The training sessions provide students with the opportunity to acquire the knowledge and skills required by the State Education Standard.

## **RESULT AND DISCUSSION**

It is necessary to take into account the age and the level of knowledge of the students in order to form an idea and understanding of what is happening around them. In order to educate students in the spirit of national independence, love for their homeland and people, love and respect for workers around the world, literary literature on the motherland, its independence and its leading people and great ancestors will be taught.

In the elementary grades, especially in the fourth grade, students are treated with a sense of self-efficacy and a sense of community. and in the fourth grade, students' learning abilities and skills

will be further enhanced. That is, the emphasis on reading comprehension and reading is enhanced. In reading classes, it is important to form a desire to read a literary work on a regular basis. It is very difficult, and if it is not implemented, the learner will have little or no learning skills. The formation of an independent reading of artistic work in students depends on the ability to see, understand and feel the attractive aspects of the artistic work. The breadth of this knowledge and experience requires the student to develop his abilities in artistic observation.

Coaching is an important part of the younger generation to develop independent thinking and nurture a healthy and harmonious generation. In the future, only independent-minded students will be able to become full-fledged, fully developed people, and will bring our independent republic to the leading world countries.

In this regard, Z. Nishonova's article on Teaching Independent Thinking: It is worth noting that the present system of learning is also aimed at developing more memory. However, some teachers are more likely today to explain a subject, to make it ready for readers, and to ask for the content next day or to memorize a poem. Such a lesson does not create any problem, and it does not allow students to understand the subject matter freely and independently in the classroom. Teachers themselves know that students cannot think independently. But how can a student gain the ability to think independently in a classroom? It is difficult to answer this question [5].

The skills of a teacher in the emerging elementary grades, his ability to integrate modern technology into the learning process, to find new ways and means of teaching, to use the best pedagogical experience is very important. Therefore, it is essential to prepare future elementary school teachers for future activities and to prepare innovative teaching technologies for implementation. Because innovative educational technologies provide first and foremost opportunities for students to easily acquire knowledge, skills and abilities; One of the main reasons for the development of innovative education is the educational crisis. Different countries have the following in common: Differences between the evolving needs of social practice and the actual training of graduates in higher education institutions; set new goals for primary education and complicate organizational structure and forms of management; interests and opportunities of the subjects of the educational process[6].

## **CONCLUSION**

Thus, innovative activity is considered to be a solution to a number of problems that arise as a result of the incompatibility of traditional norms with new social requirements or the emerging norms of practice. It is organized at the expense of organizational, technological, methodological and creative readiness of the person, especially the pedagogue for the organization of the innovation process. The educational system or process is constantly evolving, allowing pedagogical innovation to consistently innovate pedagogical activity. The goal is to get the best possible results from the amount of effort and effort invested in innovation in the education system or educational activities. Innovation is different from any other innovation, and it needs to have a flexible mechanism for managing and controlling it[7].

In summary, the innovative approach of the teacher is seen as a driving force, motivation, and motivation for the teaching team, and it guarantees the quality and effectiveness of the learning process.

**INSURANCE AGENTS AND SIGNIFICANT ASPECTS OF IMPROVING  
 THEIR ACTIVITY**

**Matiyazova S.R\***

\*Independent Researcher,  
 Tashkent Institute of Finance,  
 UZBEKISTAN

**ABSTRACT**

*This article considers essential peculiarities of the activity of insurance agents. Moreover, the article analyzes the ways to improve the activities of insurance agents under conditions of pandemics. The agreement of the agency may also specify the performance of other services and duties by the insurance agent. An insurance agent is a representative of a particular insurer who buys insurance products from a particular insurer. An insurance agent may also represent several insurers at once. Therefore, the maintenance of the position of insurance companies in the insurance market during the global pandemic and the successful implementation of insurance activities depends on the organization of the activities of comprehensive insurance agents.*

**KEYWORDS:** *Insurance Market, Insurance Agent, Insurance Premium, Insurance Cover, Insurance Services, Pandemics.*

**1. INTRODUCTION**

As a result of measures taken to create favourable conditions for further development of the insurance services market in the country, the volume of insurance services is growing steadily and the role of insurers in the country's economy is becoming increasingly important, which in turn increases the interest of legal persona and individuals in insurance products.

In particular, the Action Strategy for the five priority areas of further development of the Republic of Uzbekistan for 2017-2021 (Prescription, 2017) also considers the development of banking, finance and insurance companies as a special priority, the development of the insurance market and the introduction of modern insurance services. requires increasing the role of the insurance mechanism in protecting business entities from various risks.

It should be noted that the proper organization of the activities of insurance agents plays an important role in the development of the insurance market, ensuring the popularity of insurance services, reliable protection of a wide range of legal persona and individuals from various risks.

It is no secret that today's global pandemic is putting various sectors of the economy in a difficult position due to its global spread. Therefore, the maintenance of the position of insurance companies in the insurance market during the global pandemic and the successful implementation of insurance activities depends on the organization of the activities of comprehensive insurance agents. Because today the growing demand for the services of insurance agents, both by insurance companies and legal persona and individuals who are consumers of their products, requires the improvement of mechanisms for the sale of insurance services electronically through their remote services.

## **2. Main Part**

The main task of insurance agents is to serve customers on behalf of the insurer and by organizing the conclusion and execution of the insurance contract on his behalf. Also, insurance agents play an important role in increasing the insurance culture of the population, the formation of confidence in insurance institutions, as well as in an insurer.

Payment of insurance coverage to the insured through fast and quality service: on the one hand, there is a need to increase the reputation of the insurance company and attract new customers, on the other hand - to restore production faster in case of major disasters, which is important for macroeconomic stability.

As for the essence of the concept of the insurance agent and its activities, the Glossary (2018) stipulates that on behalf of the insurer and behalf of the insurer in the interests of the insurer and within the powers granted, the legalization of the insurance contract it is emphasized that the individual is an insurance agent.

Consequently, the insurance agent carries out its activities mainly on the terms of the agency agreement concluded between the insurer and him. An agency agreement is a civil-law contract that defines the relationship, liability and powers between the insurance agent and the insurer.

In general, an insurance agent is interested in selling as many insurance services as possible by engaging in the sale of insurance services provided by the insurer. Because the insurance agent receives a commission from the insurer in the amount of a certain percentage of the insurance premiums received for the insurance services sold. The agreement of the agency may also specify the performance of other services and duties by the insurance agent. An insurance agent is a representative of a particular insurer who buys insurance products from a particular insurer. An insurance agent may also represent several insurers at once. At the time of sale of insurance products, the insurance agent must provide the insured with a document confirming the authority of the insurer to conclude an insurance contract, confirming that he is an official representative of the insurer.

Mirsadikov (2010) focused on the organization and efficiency of insurance agents, arguing that the success of an insurance contract when selling insurance services through insurance agents depends on the skill of the insurance agent, which includes the following elements, including customer satisfaction and quality. given by: establish an initial connection; introduce the company to the client; identifying customer needs; convincing the customer; explanation of

insurance terms and calculation of the cost; quick and high-quality contract execution; improving customer relationships and maintaining customer relationships, in line with the above, is based on the fact that the customer's relationship with the company is formed under the influence of the information provided by the insurance agent to the customer.

Galaguz (2008) believes that the success of an insurance company depends in many ways on the proper organization of the activities of insurance agents. In particular, it outlined the key factors that affect the effective performance of an insurance agent. In particular, the insurance agent should not ignore the following six important factors to establish a mutually beneficial relationship with the client:

- Mutual goodwill. This quality is an important condition for establishing a good business relationship. Kindness, the commonality of interests, increases benevolence;
- Mutual respect of the parties. Another important condition for a strong trade relationship is the mutual respect of these partners;
- Mutual trust of the parties. The success of sales technology is characterized by mutual trust of partners, mutual openness, conscience, "clarity" of behaviour, orderliness and reliability;
- Mutual diligence. As a seller of insurance products, an agent should make every effort to have a good relationship with the client. Indeed, without the interest of the client, the agent cannot make any change in the path of the overall set goal. In other words, the insurance agent should be friendly to the client, and on top of that help to solve his problems, try to fulfil any of his wishes. Calmness and restraint, as well as modesty, form the basis of the success of trade relations. It should also be noted that the ability of the insurance agent to communicate with the customer, mutual interest in each other's business, such qualities as flexibility, nobility and independence is some of the necessary conditions for achieving a positive result in the sales process;
- Intensity of relations between the insurance company and the client. It is important to keep in mind that relationships only improve when both sides are in constant communication with each other. If an agent selling insurance products cannot find the opportunity to maintain regular good and strong communication with customers, then all attention and efforts should be focused on high-income customers;
- To be thoroughly educated. In the process of introducing his company to the client, the insurance agent should be able to instill confidence in the client in the insurance company by giving him full information about the achievements and positive aspects of the company.

From these considerations, it is clear that the insurance agent must have a thorough knowledge of the insurance industry, be able to present himself as a fully qualified specialist in a conversation with the client, otherwise it can ruin all relationships and negatively affect the image of the insurance company.

### **3. Analysis and discussion of results**

Today, insurance is one of the most important sectors that make up the financial infrastructure of a market economy, ensuring the continuity and stability of economic growth in the country. In this regard, it is clear that the economic and financial risks that are expected to occur in all sectors of the economy due to the global pandemic will not bypass insurance companies. In particular, the expected risks in the banking system, which is the leading structure of the

financial market, the decline in incomes, the relative decline in economic development, are expected to cause various financial difficulties for insurance companies that are professional participants in the insurance market. Therefore, we believe that it is necessary to develop measures to increase the efficiency and improve the activities of insurance agents who offer insurance services to insurance companies, ie directly sell insurance services. This is because only by increasing the efficiency of insurance agents will it be possible to achieve a relative easing of the financial difficulties that are expected to occur today. At the same time, the activities of insurance agents are mainly organized based on modern information technologies. It is necessary to develop a system of remote electronic sales, establish a network of insurance agents, reduce the dependence on the sale of insurance services only to large industrial enterprises or certain industries, and expand customer diversification. For example, dependence on bank credit insurance alone may lead to a decrease in insurance premiums thereupon a decrease in lending opportunities due to a possible shortage of resources in the banking system. To prevent such cases, it is necessary to increase the ability of insurance agents to offer and promote insurance services to the general public by expanding the provision of remote insurance services.

The insurance system plays a strategic role in the modern economy of Uzbekistan, which is why the insurance system has risen to the level of public policy, the insurance market is considered by public authorities as an integral part of the market infrastructure of the country. Indeed, the sustainability of business entities in the context of deepening economic reforms largely depends on the level of development of the insurance infrastructure.

In our analysis, we rely on the data of the insurance company 'Uzbekinvest', which is a leader in the insurance market of Uzbekistan. The development of insurance activity in this company is based on continuous research aimed at developing and introducing new insurance products and improving existing insurance products. This, in turn, will ensure the diversification of insurance services, expand the consumer segment and increase the company's competitiveness in the market. In this regard, the main principle of the Company is to provide a wide range of consumers with quality and reliable insurance services by improving service and introducing modern service methods.

Due to the strict observance of such a policy in the service, the company in 2019 will receive a total of 285.6 billion. UZS of insurance premiums were collected. At the same time, of course, the share of regional branches of the company was significant, their share in the insurance premium collection was 36% of the company's portfolio.

The accumulated insurance premiums on personal insurance increased by 2 times compared to 2018 and amounted to 23.0 billion UZS. Insurance premiums in excess of UZS were collected.

To expand the coverage of the population, since last year, the organization of work in the field of tourism, insurance of outbound and domestic tourists, the development of new insurance products, the definition of specific tasks and plans for the insurance of outbound tourists from March 2019 to the end of the year. 1.0 billion collected insurance premiums in excess of UZS. This insurance service is also expected to decline sharply due to the global pandemic.

In order to further improve the quality of insurance services in the company, to create convenience for the insured, we can say that the organization has a system of online sale of insurance products.

In particular, the company has sold 7,940 insurance policies since the sale online and received 429.3 million UZS of insurance premiums.

The share of voluntary insurance in the structure of the company's insurance premiums is high, and the effectiveness of the activities of insurance agents in the receipt of voluntary insurance premiums is obvious.

**TABLE 1 DYNAMICS OF VOLUNTARY TYPES OF INSURANCE OF 'UZBEKINVEST' EIIC**

Years	Insurance premium (million UZS)	Insurance liability (million UZS)	Number of contracts
2016	88 921,39	43 581 201,06	96212
2017	113 389,04	129 899 233,56	97384
2018	149 037, 45	82 721 317,46	206147
2019	252 197,85	41 49 031,44	279716

Source: "Uzbek invest" EIIC compiled by the author based on data.

In this table, we can see the dynamics of growth of insurance premium income for the period from 2016 to 2019 by type of voluntary insurance. In particular, in 2016, the Company received 88,921.39 million UZS of voluntary insurance premiums, and in 2019 it increased to 252,197.85 million UZS. These achievements can, of course, be explained by the fact that the activities of the company's insurance agents are effectively organized.

In the insurance market, as in any other market, it is a free competitive environment that ensures the quality of insurance services and their affordability, affordability and attractiveness. The competitive environment in the insurance market is large, to a certain extent, formed by the subjects of the insurance market infrastructure - insurance agents. In addition, insurance agents are an important component in the organization of the infrastructure of the insurance market, a set of activities that ensure the effective operation of insurance and provide services in this area.

**Figure 1. Dynamics of total insurance premiums and insurance premiums collected by insurance agents in 2019 'Uzbekinvest' EIIC.**

Source: Compiled by the author on the basis of data 'Uzbekinvest' EIIC

From the analysis of the data in Figure 1, we can see that insurance premiums with the participation of insurance agents have a significant share in the formation of insurance premiums

of 'Uzbekinvest' EIIC. For example, in 2019, the Tashkent city administration paid 24.9 billion UZS in insurance premiums, of which about 12.5 billion UZS fell to the share of insurance agents. If we look at the share of insurance premiums made by insurance agents in the total insurance revenue by region, this is a much lower figure than in other provinces.

**Figure 2. Share of insurance agents in insurance premiums in 2019, %.**

Source: Compiled by the author on the basis of 'Uzbekinvest' EIIC.

The analysis of these data shows that the share of insurance agents in total insurance revenues is the highest in Namangan, Navoi and Jizzakh regions, at 88.47%, 88.33% and 85.79%, respectively. The lowest rates are in the Kashkadarya region (36.18%) and Tashkent (50.08%). This requires further development of the activities of insurance agents.

In addition to the above positive results, there are a number of problems in the activities of insurance agents in Uzbekistan that need to be addressed. In particular, the activities of insurance agents are insufficiently developed and they do not have sufficient knowledge in the field of insurance, the level of use of information technology in the activities of insurance agents and the low capacity of remote services of insurance agents.

Insufficient development of the insurance market of the country, low public confidence in insurance and insurance companies, underdevelopment of modern insurance services, insufficient regulation of electronic sales of insurance services also have a negative impact on the activities of insurance agents.

In order to prevent this, insurance companies need to invent new approaches to the organization of insurance agents and improve the financial mechanisms for the implementation of insurance agents, as well as the implementation of positive features of the implementation of insurance agents in foreign countries.

#### 4. CONCLUSIONS AND SUGGESTIONS

Summarizing the results of the above analysis, the results of research by foreign and domestic scientists, it can be concluded that without the correct and effective organization of insurance agents in the insurance market, without improving the financial mechanisms of remote insurance services, it is impossible to achieve the expected economic efficiency.

Therefore, in order to improve the activities of insurance agents, it is necessary to do the following:

- organization of regular training to increase the knowledge of insurance agents in order to improve the image of insurance companies and improve the quality of insurance services, as well as the issuance of quality certificates to them;
- Development and introduction of financial mechanisms for electronic remote sale of insurance products by insurance agents;
- Development of insurance glossary for insurance agents;
- strengthening the legal framework for the organization of a network of insurance agents in the insurance market;
- wide introduction of market mechanisms for the activities of insurance agents;
- Development and introduction of mechanisms to increase the efficiency of insurance agents and encourage their activities by insurance companies;
- It is necessary to improve the mechanisms of insurance agents and their legal framework in the development of the insurance market.

In general, in order to effectively organize the activities of insurance agents, it is possible to increase the efficiency of insurance companies, strengthen their position in the insurance market and further develop the insurance system of the country only by improving the financial mechanisms and strengthening the legal framework for remote insurance services.

## THE BREATH OF THE PERIOD IN THE EPISODES OF THE NOVEL

**Mekhrison Yadgarova\***

\*Lecturer,

The museum of Literature named after Alisher Navoi,  
 Academy of Science of the Republic of UZBEKISTAN

### ABSTRACT

*A work of art is born out of a writer's desire to communicate. To say a word, the writer distributes all the elements of the work of art on the basis of a certain plan, based on the internal capacity of the work. Even the smallest detail in a work of art should serve the purpose of ideological and artistic purpose. The article deals with the small episodes in the novel "Gold is rustproof" (1965) by the National Writer of Uzbekistan Shukhrat (1918-1993), their role in revealing the artistic intentions of the writer and their life basis. The author also examines the main theme of the novel in small episodes - the repression of the years of the cult of personality and the consequences on the lifestyle and psyche of members of society - by comparing the author's "criminal case" in the State Security Service archives with other works on the subject made.*

### INTRODUCTION

#### **The image of Hajar and her role in the composition of the novel**

In the manuscript of the novel "Gold is rustproof", there is an image named Hajar, who was omitted from the work. Her job is to disguise herself as Musharraf and file a complaint against Sadiq. One of the personages of the novel – Hajar is Mirsalim's trading partner. He hires her for money and admits her to the district committee on behalf of Musharraf. Hajar, in turn, performs her mission face to face without any remorse. Mirsalim thus manages to slander Sadiq by the hands of Hajar. But this character, for some reason, could not get through the censorship claws of the time.

At first glance, the writer does not place such a great task on the image of Hajar. As mentioned in the discussion of "Gold is rustproof", it seems that without it, the novel would not be incomplete, and what the writer wanted to say would appear anyway. Is that really so? What task did the writer "assign" to the image of Hajar? Was the writer able to say what he intended to say, or rather, his pain, without Hajar? We will look for answers to these and other questions below.

Nemat Toshpulatov, who was arrested in 1946 on charges of being an "enemy of the people," testified against Shukhrat during the investigation and accused him of "fanaticism" of Abdullah Qodiri. Shukhrat filed a complaint with the Supreme Court of the Uzbek SSR, alleging: "Witness Toshpulatov's testimony was a personal prejudice - because he suspected me of his wife ... ..He acted this way after he was shown a photo of his wife and me together..."<sup>1</sup>. Shukhrat's statement, frankly, surprised us. Why does Toshpulatov suspect that his wife was in a relationship with Shukhrat? In general, why does Shukhrat take a picture with someone's wife, more precisely, how do they take a picture of them? The questions are tricky. Wouldn't the answer be even more daring?

Considering that someone must have heard this, we sought answers to these questions from Shukhrat's contemporaries who had known him: Poet Shukrullo could not remember the incident, and the literary critics – Umarali Normatov and Naim Karimov had not heard of it. In short, the puzzle was not solved.

We continued to search the archive, trying to find answers to these questions here and ...

Let's listen to the testimony of the convict and witness Mukhiddin Komilov: "... in addition, investigators – Konyukhov and Sukhanov incited me against Alimov. It was said that Alimov was in contact with my wife after my arrest. Sukhanov showed me a photo card with a picture of my wife and Alimov to confirm his statement. This made me against Alimov. As a result, I signed an investigation report with false instructions against Alimov"<sup>2</sup>.

Apparently, the photos were shown to other prisoners as well as to Toshpulatov. This allowed us to find the tip of the iceberg. As we read the criminal case, the document began to reveal its secret to us.

Continuing the testimony, Komilov said that the photo was taken in Eski Jova. He also admitted that the investigators showed him a poem by Shukhrat called " to M ... " and they said that Shukhrat dedicated it to his wife to make him jealous (M. Komilov's wife's name was Mubarak). ) In the end, Komilov also testified against Shukhrat. In general, "Aminjonov Gulom was arrested on February 10, 1951, on the instructions of Mirzaev Yongin, Abdullaev Habibulla, Latipov Khalil, Mirzaev Inom, Komilov Muhiddin, Husankhodjaev Said Ahmad and Toshpulatov Nemat"<sup>3</sup>.

These prisoners were Shukhrat's comrades and colleagues, all of whom were arrested in the second half of the 1940s, that is, before Shukhrat's detention. Later, in a 1955 re-investigation for Shukhrat's official rehabilitation, all but Toshpulatov denied previous accusations with pretexts like "I said it out of compulsion," "I had to say it because I was beaten," "I said it because of mental torture and jealousy, and Shukhrat was in fact innocent." Thus, they refused the testimony they had given.

The above passage is also taken from these 1955 investigative reports. Komilov went on to say that he later found out through his wife that the allegations were fabricated. Shukhrat himself

testified about it: "... my poems were dedicated to my beloved" M.T "- Mukharram Toirova," - not to M.K.– Muborak Komilova"<sup>4</sup>. In general, the women in Shukhrat's life are a separate topic. He informs about this in the 14th volume of the criminal case and counts them by name.

In addition, U.Normatov, a literary critic, wrote about Shukhrat's Azerbaijani mistress in his pamphlet "Shukhrat"<sup>5</sup>. Based on this instruction of the author and the pamphlet of U.Normatov, it can be concluded that Shukhrat had no contact with the wives of his friends. Special agents, who knew Shukhrat's nature, skillfully used it. His friends, in turn, believed this lie. On the one hand, the betrayal of a friend, on the other hand, jealousy ...

Mirzo Kenjabek, poet, in his documentary book "Free heart. Shukhrat's life in detention" wrote that after his release from prison, he reconciled with all the above-mentioned people, except Nemat Toshpulatov. Only Toshpulatov and Shukhrat's relations remained cold.

Muhiddin Komilov was Shukhrat's groupmate at the Transport College, and Nemat Toshpulatov was Shukhrat's groupmate at the Nizami Tashkent State Pedagogical Institute. They all used to live in the Old City of Tashkent. Therefore, it was natural that Shukhrat would meet both Komilov's wife and Toshpulatov's wife in Eski Jova Bazaar.

The Old Jova Bazaar is, firstly, the busiest place in Tashkent, where you can meet anyone (and their houses were close to Old Java), and secondly, if there were a relationship, as the investigators concluded, would it be logical for a woman to date in the bazaar?

We think, Shukhrat met his friend's wife by chance in the market. They did not know they were under surveillance. On the one hand, Ministry of State Security operatives who were watching Shukhrat, on the other hand, Komilov's wife, took pictures of them in the market and handed them over to the investigators. The purpose for which the investigators used the photograph has been seen above.

Ministry of State Security operatives, who carried out the order without batting an eyelid, violated the sacred value of the people. The friendship was sold very cheaply, and, sadly, the "inside" was invaded. Privacy has been compromised. This led society to deviate from its axis. As mentioned above, M. Komilov inquired and found out that the allegations made by investigators about Shukhrat and his wife were false, and restored his previous relationship with both his wife and his friend. N. Toshpulatov and his friend had a conflict, and it is unknown how his family problem was solved. In any case, obviously, it was not easy for him and his family.

Shukhrat takes these events through the prism of his soul and reworks them for the novel. By introducing the image of Hajar into the novel, the writer tries to artistically reflect how slander was organized at that time. If in life the slander was organized by special agents, the writer of the novel entrusts the task to the image of Mirsalim. Mirsalim, in turn, takes advantage of Hajar who accomplishes the task as easy as pie.

In a letter to J.W. Goethe dated September 14, 1797, F. Schiller wrote: "The poet and the artist are required firstly, to rise above reality, secondly, to remain within the emotional world. Where these two requirements meet, aesthetic art emerges. Turning an empirical form into an aesthetic form is a difficult operation, and it usually lacks either body, or spirit, or truth, or freedom"<sup>6</sup>.

Even if we apply the word "writer" instead of the words "poet" and "artist" in Schiller's statement, the essence does not change. The main issue is the rise of reality to the level of art -

the creation of a truly artistic image. It seems as if something is missing in the character of Hajar, as Schiller said. The plot is well thought out, well-based. But the character of Hajar, who has to do the main work, is rather artificial, her behavior is not to the extent that the reader believes. (Maybe that's why A. Qahhor and A. Mukhtor didn't want this character to be included in the novel.)

Neither Toshpulatov's wife nor Komilov's wife was aware that, on the one hand, they were laying the groundwork for the imprisonment of a friend of their husbands, and on the other hand, that they were disgracing themselves. Interestingly, Musharraf is also unaware that her name is being sold and slander is being prepared against her husband. But the writer continues to recreate the reality, portraying Musharraf in retrospect as a woman mired in a swamp of betrayal. Subsequent events continued in a completely different direction, and Musharraf, who had taken the easy way out of life, went to prison to ask her husband for a divorce.

### **A literary image of society and the female psyche**

"To say a few words, he (the writer - M.Y.) has to see a lot, know the events, biographies, facts, feelings, thoughts, psychology. There are areas that an engineer, an academic, does not need to know. The writer has no such field. The life experience of a writer is a golden fund ... A writer must be an experienced person who has seen a lot, tasted bitterness, can distinguish the good and the evil"<sup>7</sup>. Shuhrat, who had such an experience, incorporated the tragedy he witnessed in the next episode into the novel as a logical continuation of the first episode.

Sukhanov called her and advised her to divorce "after explaining the whole matter," otherwise Musharraf would have been driven fifty kilometers out of the city as Sukhanov said. Musharraf agreed to everything and asked: "What if he takes my son?" Sukhanov replied, "No, he has no right." The issue was raised again. "Musharraf admitted she had been trained"<sup>8</sup>.

"In those days of the Soviet regime, it was a daily occurrence for a child to formally renounce his father and for a wife to formally renounce her husband. Because in that period of human society, the treacherous system began to reign: the pioneers, the young elites, the sects were traitorous. Wives used to "divorce" their husbands ... "<sup>9</sup>. Musharraf's case was a typical event for that period; it was especially hard for women working in public affairs.

The episode of the wife's divorce from her husband is also reflected in Abdullah Qahhor's 1959 unfinished story "Zilzila" ("Earthquake.") If Shuhrat brought this episode to the novel to fill the main plot, to intensify the conflict of events, to develop dramatically, A. Qahhor chooses this topic as the main motif of "Earthquake" as the main motif.

During the discussion of the novel "Gold is rustproof" in 1964 at the Writers' Union of Uzbekistan, A. Qahhor spoke about the redundancy of the image of Hajar in the novel and said that it would be better if Musharraf herself performed her role. Following the writer's advice, Shuhrat removed the character and assigns her task to Musharraf. As a result, in all editions of the novel, Musharraf herself goes to complain to the district committee<sup>10</sup>.

In our opinion, based on the logic of his story, which A. Qahhor wrote a while ago and left in his box, he thought that if the image of Hajar was removed, Musharraf's role would increase and the episode of divorce would intensify. But Shuhrat's creative idea was different from the beginning, and he brought in both episodes to develop the main motif. In short, the writers did not understand each other's opinions, and as a result, the novel cracked.

Analyzing the story of "Earthquake", N. Ziyodullaeva noted: "The story of the character Sabir Salim, which began in 1959 but was not completed, may be similar to the life of Abdullah Qahhor in the 1930s."<sup>11</sup>. And she associated the story with Qahhor's imprisonment in 1929. At first glance, the conclusion seems to be not groundless. In the story, the writer skillfully describes the mental state of the prisoner, the conditions of the prison. However, when a writer creates a work of art, he can describe the feelings of both the child and the old man, as well as the woman. This is not a reason to say that the author described himself.

In addition, N. Ziyodullaeva seems to have overlooked the author's notes when visiting the archives of A. Qahhor. According to O. Juraboev, textologist who described the archives of A. Qahhor, the document No. 3785 in the house-museum contains the author's notes under the title "Materials for the story "Earthquake ". In it, the writer made notes about the prototypes of the heroes of the work: "Sabir Salim – Hamid Sulaymon. Abdullaev Sobir. When he sees Mirvahid, his eyes glaze over "<sup>12</sup> Apparently, there is no reason to say that A. Qahhor himself was a prototype for the character of Sabir Salim. Hamid Suleyman and Abdullaev Sabir were prototypes for this image.

After the end of World War II with the victory of the USSR, there was an opinion among the intelligentsia that "the war ended in our favor, we have a share in it, and now Stalin must believe in us." For this reason, the intelligentsia felt a little free. The number of parties and gossips rose. Naturally, in these "speeches" people tell various "anecdotes" and give freedom to their words. Unfortunately, soon the next wave of Stalinist repression emerged.

On November 29, 1950, Hamid Sulayman, Deputy Director for Academic Affairs of the Tashkent Evening Pedagogical Institute, was arrested on charges of being an "enemy of the people." This message spreads around at lightning speed. At that time, the scientist's wife, Fozila Sulaymonova, was teaching World Literature at the Central Asian State University (now the National University of Uzbekistan). In the 50s of the last century, academician Naim Karimov and professor Umarali Normatov were students of this school. Naim Karimov recalled that the dean of the Faculty of Philology G.P. Vladimirov threatened Suleymanova that she must divorce her husband, otherwise the wife of the "enemy of the people" would have no place at the university.

As a result, F. Suleymanova had to do what the dean had insisted. U. Normatov added that Sulaymonova did not get rid of a consequent burden by writing the letter. "I saw her crying a lot after that," he said, recalling the tragedies of that time. "Saida Zunnunova was also studying at our university at that time. Saida was in senior year, we were in junior year. The dean asked her to leave her husband as well. Saida was expelled from the university after she disobeyed the order,"<sup>13</sup> he stated. The poet Shukrullo, after a long pause, noted, "Sister Fozila was a good woman"<sup>14</sup>

Hamid Sulayman's criminal case, which is kept in the archives of the State Security Service (P-21493), contains the following information about his family:

“Family structure:

1. The father: Persecuted in 1938 for anti-Soviet activities. Address unknown.

2. The mother: Sulaymonova Tokhta. 1887. Tashkent Address: Tashkent city, Frunze district, Parovoznaya street № 12. Unable to work.

3. The wife: Sulaymonova Fozila Komilovna. 1919. Fergana region Margilan city Address: Tashkent city, Frunze district, Parovoznaya street № 12. A Lecturer at Central Asian State University.

4. Children: Sulaymonov Rustam. 1939. Tashkent.

Sulaymonov Sultan. 1943. Tashkent Address: Tashkent city, Frunze district, Parovoznaya street № 12.

The brother: Sulaymonov Karim. 1924. Tashkent city, Address: Tashkent city, Frunze district, Parovoznaya street № 12. Unemployed <sup>15</sup>.

Apparently, the family was enormous. The above statement proves that the whole burden of the family fell on the head of F. Suleymanova after the imprisonment of the father of the family. The court also stated that Suleymanov's sister, whose husband had died, was living with them in the house with her three children.<sup>16</sup>

Firstly, the need to save the family, secondly, the concern for the survival of so many people, and thirdly, the fate of the children forced the scholar to do so. On top of that, this was not the first time the family was in trouble. The fate of the father of Hamid Sulayman was unknown after he had been repressed in 1938. Probably, the mother-in-law, who was the wife of an "enemy of the people", knew that it was difficult to take care of orphaned children. She may have advised her daughter-in-law to comply with the dean's request. Otherwise, they would not have lived in the same yard after this incident.

Such incidents were common at the time. After all, both A. Qahhor and Shukhrat used this event creatively in their works. "Every element of a work of art goes through the creative personality and characterizes it. If the author is interested in which side of the reality the author's creative activity is focused on, the reader will understand and master this aspect in the play. That is, the reader understands and assimilates the reality that was previously assimilated by the author in the work of art"<sup>17</sup>.

If in the "Earthquake" Gulandom was persuaded by Mirvahid, in the novel "Gold is rustproof" Musharraf did it after the investigator threatened to expel her 50 kilometers from the city (manuscript, pp. 302-306). However, in the printed versions of the novel, it is written that Musharraf "went to Sadiq to ask for a divorce on the advice of some people"<sup>18</sup>.

These episodes prove that in any case, it was no easier for the wife of a man imprisoned as an "enemy of the people". For them to live in this world was harder than to be in prison. Well, since this is the wife, the second half of an apple, how did this tragedy affect a third person or individuals? For example, the son or brother of the "enemy of the people" ?!

### **Between hope and madness**

In 1937, a report published in the poster newspaper of the Faculty of Literature of the Tashkent Pedagogical Institute turned the whole faculty upside down. It reported: "Hamid Gulomov, a

student studying with us, is the son of one of the activists of the gang." "Gulomov cannot remain in our institute as the son of an enemy of the Soviet state,"<sup>19</sup> the author continued.

At that time, Hamid Gulomov was a first-year student at the Tashkent Pedagogical Institute, studying with Shukhrat, Ilyas Muslim, Nemat Toshpulatov, and Quدرات Hikmat. During the bloody storm of 1937, someone wrote a "round" letter to the rector about the fact that Gulom's father was a basmachi (a rebel against the Russian or Soviet rule in Central Asia). After that, the case of Hamid Gulom was considered and the future poet was expelled from the institute.

Shuhrat continued to testify, "This article was discussed at a meeting of our group of students for two or three days. "As a result of the discussion, we decided to expel Gulomov from the institute." However, Yongin Mirzo, who studied with them at that time, denied the allegations, saying, "Shukhrat has nothing to do with it, we were just participants in the meeting."

The only thing that holds a man to this world is - hope. If there were no hope a person would go insane. When in need, a person clings to the hay so as not to drown. Shukhrat also tries to justify himself by using this incident, which took place during his student days, to help the Soviet state in exposing the enemy in this way, but his lie is quickly discovered and the event disappears on its own. (At that time, it was customary to make a shield for oneself by exposing the "enemy of the people.")

Nothing in this world goes unnoticed. No matter what form a person takes, he feels the need to express his heartache. But there is also the fact that this can sometimes be impossible. It is due, on the one hand, to social conditions and, on the other hand, to the writer's lack of creative ability.

Later, Hamid Gulom covered the Basmachi movement in the novel "Mashal", and Shukhrat created the image of a basmachi in "Gold is rustproof". It should be noted that in both works the image of the basmachi was created following the requirements of the time.

If a person describes what he really sees and knows, the reader will believe it. In our opinion, both writers are well aware of the essence of "the Basmachi movement". However, they tried to evaluate them by looking at the image of the basmachi through a crooked window held by the Soviets, contrary to their views. In the end, H. Gulom's pillow-like novel disappeared, while the image of basmachi in "Gold is rustproof" became one of the most unbelievable characters in the novel.

H. Gulom's expulsion from school as the son of a printer is reminiscent of the episode of Kodir's expulsion from the ranks of students in the novel "Gold is rustproof". "... on the poster, his was harshly disreputed. It was mentioned that he sat in the auditorium in a bad temper; deliberately delayed the delivery of the library book; hid his biography and kept in touch with the brother of "enemy of the people" ... Qodir could not stand in front of the newspaper and went out into the yard. He didn't notice how the big break passed. "I was saved! It's good that the bell rang. " He came in and was crushed worse than at the break. Two of the students sitting next to him took their books and went to the back "(manuscript, pp. 340-341).

At one point in the novel "Gold is rustproof", he says to aunt Adolat's son Sadiq, "... you have a couple of friends who visit at night. I don't know their names. One seems to be in a bigger job and usually appears in a car. But he leaves his car far away "(manuscript, p. 436). Approaching the "enemy of the people" or his relatives was tantamount to risking one's life. That is why

“leaving one’s car far away” or “taking your book and going to the back” expresses the deep-rooted fear of the people of that time. Once the law was broken and the fathers were imprisoned, what if the law was broken for a second time to charge the children? So the unwritten law once again shows its power and Qodir was expelled.

Why should total strangers suffer at a time when the child is responsible for the father and the brother for the brother was being ostracised from society ?!

But it was the case. Everyone became a spectator. No courageous man was found when H. Gulom and Qodir were expelled from the Institute.

### **Fact and fiction**

Every writer prepares for great work as he begins to write it, collects a huge source. Oybek wrote about how he had prepared to write the novel "Navoi", including: "I have long dreamed of writing a work about Alisher Navoi. The image of the great humanist took over my mind like a lighted torch illuminating the darkness of a medieval night. First of all, I wrote the poem "Navoi". "The image of Navoi is embodied in many of my poems ... I started collecting materials about the great poet Navoi in 1928, studied the immortal works of the poet and his period, and wrote many historical and literary works about the life and work of Navoi"<sup>19</sup>.

And Shukhrat admitted that he did not collect special materials for writing the novel: "I know the life in "Gold is rustproof" very well, it is the life of the people who were with me, who met me. I was not around this life, I was inside it"<sup>20</sup>. Obviously, Shukhrat not only apply his own experiences in the novel but also creatively used the fate of his contemporaries and masterfully incorporated their tragedies into the novel. If the writer made good use of his own experience in the first episode, the tragedy of Hamid Sulayman in the second, and the expulsion of Hamid Gulom in the second, the fourth episode reflects the pain of Maqsud Shaykhzoda.

Indeed, life was so cruel. For mirsalims of that time, it was not enough to prison a person and to destroy the families, they intended to possess their property: "Aged and grey-haired by grief aunt Adolat sat on the baggage thrown in the street: "These dark days will pass, and your face will burn, Mirsalim!" What do you say when Sadiq comes? Shame! He said:

"He won't come!" The corpses in lahad (a hollow cavity in which the dead body is kept in a grave tomb) come when they stand up! (Manuscript, p. 252).

On May 25, 1956, the poet Maqsud Shaykhzoda, who had been acquitted during the Khrushchevite heatwave, wrote a letter to the then First Secretary of the Communist Party of the Uzbek SSR, N.A Muhiddinov. The letter reads, in part: "Instruct the relevant authorities to rectify the illegal behavior - that is, to return our apartment on Stalin Street № 3, which was confiscated by Uygun in 1953"<sup>21</sup>.

Shaykhzoda was exiled to Tashkent in 1928. "In the autumn of 1936, Shaykhzoda managed to get a house belonging to the Union on the Shakhrisabz Street. However, in the first days of moving to this house, he went on vacation and went back to his parents with his wife"<sup>22</sup>. Unfortunately, this joy did not last long. The Writers' Union soon took the house from Shaykhzoda and gave it to the writer Shokir Sulayman.

After some wandering, in the summer of 1939, at the behest of Usmon Yusupov, Shaykhzoda moved to a house near Red Square. Later, when Shaykhzoda was imprisoned as an "enemy of

the people", the house was taken over by the poet Uygun. Academician N.Karimov notes: "... then Uygun came to Shaykhzoda's house on Abdulla Tukay Street with a policeman and drove out Shaykhzoda's wife Sakina, saying that the enemy of the people could not live in this house. Sakina answered: "I will not move! My husband is not an enemy of the people. God willing, when good times come, he will definitely come back. My husband is a real communist who has served Uzbek literature ". But with the help of the police, Uygun threw everything in the house into the street and forced Sakina to move. After that, Sakina moved to the house of the then chairman of the Writers' Union, Uygun, on the 4th floor of the House of Experts on Turob Tola Street. According to N.Karimov, Uygun did not return the house to Shaykhzoda later.

This means that the then chairman of the Writers' Union, Uygun, seized Shaykhzoda's house by abusing his official authority. (Uygun, like Mirsalim, did not think about how to look in Shaykhzoda's eyes if he returned.)

Shukhrat brought the episode into the novel and put on a different cloak, giving it a bit of a narrative. "In springtime, ignoring aunt Adolat's tears, Mirsalim emptied the four-room courtyard where Sadiq and his family lived and moved in". (manuscript, p. 252). This, in turn, made it difficult for the reader to understand what action Mirsalim took to seize Sadiq's house. Because it was clear to the reader that Mirsalim was not strong enough to take someone's house. Had the author better covered this aspect of the issue, he would not have allowed ambiguity.

According to prof. U.Normatov, in 1967, a literary critic O.Sharafiddinov and Maqsud Shaykhzoda went to see him a week before his death. Then the poet recalled with regret the dark days he had gone through, and said, "Perhaps, when I recover, I will write something on this subject. If I cannot manage, I have no regret. In any case, Shukhrat in "Gold is rustproof" wrote about my fate and pain"<sup>23</sup>. This serves to substantiate our above considerations.

Above, we have tried to share our thoughts on how the historical reality is fictionalized by comparing the four small episodes in the novel with their vital basis. Needless to say, each of these episodes could have been the basis for different work. In any case, Shukhrat incorporated these events into his novel and used them to shape the plot. At the same time, these episodes reflect the complexities of the period, playing a unique key role in reflecting the psyche of the people of the Stalinist repression era.

## SYSTEM AND INTEGRATED APPROACH TO ECONOMETRIC TRAINING

**Muhaya Makhmanazarovna Ravshanova\***

\*Researcher,  
Karshi Engineering Economics Institute,  
UZBEKISTAN

### ABSTRACT

*In this article, the researcher explains the basic concepts of a systemic approach and comprehensive communication, which are one of the scientific approaches in pedagogy, and their use in the science of econometrics in accordance with the objectives and objectives of the study.*

**KEYWORDS:** *Pedagogy, Systemic Approach, Technology, Integrated Approach, Model, Econometric, System.*

### INTRODUCTION

Today, with the development of science, the concept of a systematic approach and an integrated approach is also used in the pedagogical sphere. In science, the study of objects or events as the system led to the formation of a new approach to science, a systematic approach. As a methodological principle, a systematic approach is used in science and various fields.

The systematic approach is a general scientific method for solving theoretical and practical problems. The development of the theory of functional systems undertaken by PK Zanochein, made it possible to use a systemic approach in pedagogy, and then in psychology.

The essence of the system approach seems to be: a form of integration in scientific and practical activities; type of formalization of real phenomena; The active conversion position of the researcher, involving the design of the result, and the generalized specific scientific expression of the methodological principles, concepts and methods of systemic studies.

**Purpose.** As is well known, the central problem of all scientific knowledge is the objective difficulty in resolving the contradiction, which arises between the complexity and variety of

cognizable phenomena, on the one hand, and the limited forms and methods of thinking-on the other.

"The system (from Greek. Zuzeta is a whole) - the association of some different-forming into a single and clearly disjointed integer, the elements of which in relation to the whole and other parts occupy the corresponding places" it necessarily implies the interaction of the elements.

Any object of pedagogical research can be represented as a system. In this case, the system properties of the pedagogical object are not due to the properties of the components of its elements, since they are a certain result of integrative processes occurring inside it. The definition as an object of scientific cognition of a holistic system is one of the initial stages and at the same time an effective path of resolution of the contradiction, which was mentioned above.

According to T.A. Ilina, the system is an ordered set of interrelated elements, combined with a common goal of functioning and unity of management, and acting in cooperation with the medium as a complete unity.

At the moments of relationships and interaction emphasizes PK Zanolkin. The system, he emphasizes, can be called "only such a complex of selectively involved components in which the interaction and relationship acquire the nature of the interaction of components for obtaining a focused useful result."

In pedagogy, there are numerous options for applying the general theory of systems to the analysis of the pedagogical action by the system, it is customary to understand the complex of interacting elements, connections and relationships between objects. "

The narrower definition of the pedagogical system, but N.V. Kuzmina gives a more important for the analysis of holistic pedagogical objects: "Pedagogical system we define as a functioning structure of interrelated components subordinate to the goals of education, education and learning the younger generations and adults."

**Scientific novelty of the article.** The practice of applying a systemic approach in pedagogy is often suggested about a fairly common error, the essence of which concludes in the non-divergence of a systemic (complex organized) pedagogical object and systemic study of such an object. At various levels of analysis and when solving various tasks, the same object can be explored as systemic and non-system.

**Results and practical applications.** In other words, with the methodological analysis of the pedagogical object, from the very beginning there are two different worldview scientific positions of the author: the declaration of their intention to accept this object for something whole and allocate elements or recognition of the systemity as the qualitative characteristics of this Pedagogy object in it. Depending on the choice of one or another position, the teacher will implement various strategies for knowledge of the object and converting an object:

- Describe the pedagogical system, i.e. consistently consider the elements of the object in several typical embodiments of their interaction (to investigate the states or situations of the pedagogical object) and determine how and to what extent elements (or situations it depends on the choice of structure) are subject to the objectives of the system;
- Describe the qualitative characteristics of the pedagogical system: its integrity, structuralism, interdependence of the system and medium, hierarchy, the plurality of the description of each

system, etc. The choice of the position of the teacher-researcher is the initial step of the implementation of the system approach. In our work, we adhere to the first position, understanding the deep differences between the subject system and the process system.

The systematic approach has a significant number relative to independent directions, each of which solves its own problems: system-genetic, system-historical, system-structural, systemically - meaningful, system-functional, system-methodical, system-information, etc..To comprehensively To know the system, you need to study its essence (quality of integrity), the inner structure (composition, structure, functions, system factors), communications with an external environment, its history. When analyzing the inner structure, system-component, system-structural, system-functional and system-integrative aspects differ.

From the standpoint of the general scientific theory of the systematic approach in the study of the social system of any level, as V. G. Afanasyev notes, it is necessary to consider the main features of the element: an objectively existing system; theoretical scientific system as a reflection in thinking objectively existing system; the movement of this theoretical system in the direction of increasingly adequate reflection of objective reality; Practice as the initial moment of knowledge, the basis and criterion of truth, as the sphere of use of knowledge of the system.

Thus, the use of a systemic approach in pedagogical examination we consider not only necessary, but also inevitable.

A comprehensive approach is expressed in unity, interdisciplinary interaction, the logical synthesis of philosophical, historical, social-economic, technical, technological knowledge about the object and subject matter, as well as general scientific and specific scientific methodological provisions.

Given the sufficient development of an integrated approach in the scientific literature, we define here only the dialectics of systemic and integrated approaches in the knowledge and transformation of the object and its methodological consequences.

The integrated approach "makes" functioning the educational system as a whole as the organic unity of interconnected components. Otherwise, as F. K. Kazaryan notes, the system is the most good in its plan to act "in parts", without ensuring the most educational tasks in the end, for which it was created.

If the systematic approach in pedagogy allows you to determine the set of elements allocated according to the general (system-forming) base for them (that is, complementary by each other), then the integrated approach ensures the relationship of the heterogeneous elements (interconnecting each other) of a particular pedagogical object.

Consequently, the integrated approach in pedagogy provides coordinating targeted, interrelated, but sometimes even multidirectional and contradictory effects on a pedagogical object for its conversion in case it is investigated as a system. If it is not investigated as a system, then the complication of the effects on it is very difficult due to the fuzziness of the allocation and knowledge of its connections, functions, elements, relations, properties, etc. For a holistic study of the pedagogical object, a dialectical application of systemic and complex methodological general scientific approaches.

## CONCLUSIONS AND SUGGESTIONS

In conclusion, we note that the methodological consequences of the use of the integrated approach is wide and diverse in the pedagogy. Research programs in pedagogy are also integrated, and practical pedagogical activities require accounting for all connections and mutual influences of society, the interaction of the social environment and humans. In pedagogical practice, those models that were originally designed as complex were the most effective. When building a model of a methodological system of training econometric students of pedavuses, an integrated approach allows us to take into account various external influences on the study object.

**STATUSES OF SPIRITUAL PERFECTION**

**Murodkhoja Mukhtorov\***

\*Independent Researcher,  
 Alisher Navoi State Museum,  
 UZBEKISTAN

**ABSTRACT**

*This article is about the fact that the art of maqom is an integral part of the wonderful spiritual world and artistic thinking of the work of Hazrat Alisher Navoi. For the gazelle of the sultan of the kingdom of words is an ocean of wisdom, expressed in this poetic style, and makoms are an ocean of wisdom, spread by the sound of a melody. This is probably why the public who reads and enjoys Navoi gazelles usually wants to hear makoms in the same spirit, needs them and enjoys spiritually. And the connection of these two oceans, decorated with wonderful meaning, into one world occurs thanks to great love. This is the teaching of a perfect man who, because of this sublime love, chooses the path of spiritual purity and spiritually ascends to the universe in his position.*

**KEYWORDS:** *Makom Art, Artistic Thinking, Spiritual Development, Melodic Constructions, Main Stages*

**INTRODUCTION**

It is clear from his poetic and scientific works that Hazrat Nizamiddin Mir Alisher Navoi knew the art of maqom both practically and theoretically. This fact also shows that the legacy of the thinker is one of the important and valuable sources in the study of various issues related to status (historical, theoretical, etc.). In fact, the world of status is an integral part of the deep and beautiful spiritual world of Navoi's artistic thinking. For, the ghazal of the sultan of the realm of words is the ocean of wisdom expressed in this poetic style, while the maqoms are the ocean of wisdom spread through the sounds of melody. Probably for this reason, a fan who enjoys reading Navoi's ghazals will usually want to listen to the maqoms as well, and will enjoy them spiritually. And the connection of these two oceans, adorned with beautiful meanings, into one world is due to great love.

Fiery verses such as HazratNavoi's  
*Ochmagayerdingjamoliolamarokoshki,*  
*Solmagayerdingboriolamgag'avg'okoshki.*  
*Chun jamolingjilvasiolamg'asoldirustaxez,*  
*Qilmagayerdiko'zumonitamosho, koshki*  
*Bo'lmagayerdiko'zum, o'tlug'yuzingko'rganzamon,*  
*Ishqingo'tishu'lasiko'nglumdapaydokoshki [1, p. 629]*

I wish you hadn't opened it,  
 I wish the world would be a better place.  
 Your beauty has set the world on fire  
 I wish my eyes were watching my mother  
 My eyes were gone, when I saw your grassy face,  
 I wish the light of the fire of love appeared in my heart.

can be a prelude to every major utterance in the maqoms. Even in the bodies, the warmth of the grassy heart, the torments of peaceful pain, the intense experiences of pure feeling are felt. Indeed, the doctrine of the perfect man, who chooses the path of spiritual purity for the sake of high love and in his status ascends to the universe, and in his provar the real beauty reaches the truth, is the core of both HazratNavoi's poetry and our classical maqams. Consequently, the claims of status, scattered throughout the works of the wise poet, are not merely for the purpose of "lyrical retreat," but the most important point of a particular idea is sometimes expressed in the form of an inward conclusion. At the same time, one should not overlook HazratNavoi's views on music in general.

In particular, we read such verses in the philosophical epic "Lisonut-Tayr", written in response to Fariddin Attar's "Mantiqut-Tayr".

Bo'lsalahnunag'madaogohlig'  
 Behkitoatvaqtidagumrohlig'  
*If so, be aware of the melody*  
*It is a mistake to be obedient*

That means, when one listens to the melody, remembering the Dargah and being aware of the first Address is better than a prayer of obedience performed in error. (Vollohua'lam). In this sense, perceived music can have a direct positive effect on the human heart, can be spiritual nourishment for his soul. So, if "awareness melodies" can be interpreted, then spiritual prayer is sacred. In the meantime, let's look at the following bytes with the names of the positions.

Qaddixajringdatortsangnola,  
 "Rost" ohang, eyNavoiytuz [2].  
*If you pull on your chest, moan,*

*The melody of "Truth", O Navoi salt.*

(Badoeulbidoya)

### THE MAIN FINDINGS AND RESULTS

The term "Truth" and its specific features in music play an important role in understanding the content of this byte. This term, which is the name of one of the famous twelve maqams, also symbolizes the path of the sect (Roxi-rost) in mysticism. Therefore, the content of the verse can be interpreted as follows: Let the lover who suffers from separation (Hijran) enter the path of the sect. Because this path is aimed at this goal. Now, if we consider the "True" in the section of the maqams, the following meaning emerges from this verse: Because the melodies played in this position bring peace and tranquility to the heart of the lover, and maybe he can lift his spirits and achieve the desired state of pleasure.

The reasons for such an extraordinarily strong emotional impact on the human spirit of the status of "Truth" are characterized, first of all, by the association of its perfect curtains and, on this basis, a certain style of development of melodies. The priceless power given in this way to the content of a byte does not negate the former, but shows that deep meanings in a complementary system are embodied in only two poetic verses. In the same byte, it can be understood that the content of this byte reflects the mystical ideas in the music. In this regard, the following verses of Hazrat Navoi are also noteworthy:

*EyNavoiy, sendog'iqilsangtamma'sayri "Xijoz",*

*Qil "Iroq" ohangitarkaylabXuroson men kabi.*

*O Navoi, if you stain, you will go to Khijaz.*

*Let the "Iraqi" tone leave Khorasan like me.*

(Navodirush-Shabob")

*EyNavoiy to muqarrarqildimohangi "Xijoz"*

*Goh "Iroqu", goh "Ajam" sari tarannumaylaram*

*O Navoi, I have inevitably heard the melody "Khijaz"*

*Sometimes I sing "Iraq" and sometimes "Ajam"*

(Xazoyinulmaoniy)

*Eymug'anniy, tut "Iroq" ohangigako'rgiz "Xijoz"*

*Kim, Navoiyxotiribo'lmishXurosondinmalul*

*O singer, show me the melody of "Iraq" "Hijaz"*

*Kim, the memory of Navoi, is known as Khurasan*

(Badoeulbidoya)

The names "Khijaz" and "Iraq", which have several meanings from the verses, have the meaning of "Open". Hijaz is known to refer to the border between the holy cities of Makkah Mukarramah and Madinah Munawwarah, while Iraq is known to refer to the name of the country. Hence, the interrelationship of these names is likened to the great pilgrimage. Hijaz is a symbol of the main

goal of the trip, and Iraq is a symbol of the long road to this goal. In Navoi's time, he crossed the Iraqi desert to reach the Hijaz. Thus, the content of the above verse reflects the aspiration of Hazrat Navoi for the pilgrimage he has dreamed of all his life. At the heart of the "Idea of Hajj" is also the journey of spiritual maturity, which leads to the great truth. As for the meanings in the musical part of the verses, in general, it is clear that the lover has a spiritual need to listen to the maqom melodies "Iraq" and "Khijaz". This is because these positions also have perfect curtain associations, such as Rost, and melody structures that develop in a certain style, which can be a source of nourishment for the lover's soul to rise to surur "vajd" experiences. It should be noted that the status of "Khijaz" (more precisely, its name) does not occur in the structure of the Shashmaqom, Khorezmmaqoms and Fergana-Tashkent maqom roads, which have survived to our time. The status of "Truth" has not changed since the time of Navoi, it is one of the most perfectly organized curtains for the human heart to listen and understand. In the case of "Iraq", the curtain system looks similarly perfect. These curtains are important in revealing the idea of each status, and this situation fully manifests itself only within a certain style.

In fact, this style, which was formed as an artistic reflection of spiritual growth in the stages of development, appeared not only in music, but also in almost all areas of creation with mystical influence, including fiction, which in many respects is close to music. Consequently, the comparisons in this regard are noteworthy. In particular, this artistic principle, which can be described as a method of "gradual ascent" (or status), is widely reflected in Navoi's work (various poems). In particular, we can see that the certain mood expressed in the first verses of the poet's poems develops gradually over the next few verses and eventually reaches its climax.

This style is also used with great talent in large-scale works such as "Khamsa" [3], "Lisonut-Tayr" [4], as a result of which the sources of origin are some of the events and folklore of the ancient world ("SaddiIskandariy") and later ("Sab'aiSaiyyar"). , "Layli and Majnun" and others ...) are the basis of our wonderful, artistic and poetic epics, in which the spiritual maturity of the protagonists is described with great skill.

For example, the literary theme on which the epic Sab'aiSaiyyar is based is based on the legends and myths about BahromGor, who is actually described as a "glorious king, a skilled hunter and a lover." Continuing the tradition of Hamsa on a high level, Hazrat Navoi radically reworked the subject and incorporated into it the views of the ancient Greeks on the seven heavens. As a result, the protagonist of the work, BahromGor, falls in love. The story of the seven planets, which played an important role in the composition of the epic, is interpreted in the section "Man and the unity of the universe", each of which is depicted in a separate color, symbolizing the sect, the ascension. Consequently, the development of the reality of the work in relation to the story is reflected in the fact that the colors change along with the planets (1st black, 2nd yellow, 3rd green, 4th dawn, 5th blue, 6th sandalwood, 7th white). The application of the step-by-step growth method in statuses is also somewhat unique. The content of this method, which is almost consistent in the beginning and main parts, involves the gradual development of small-scale melody structures (contents) on the basis of perfect curtains in a single order (I, II, III, IV and bass ...) from bottom to top.

For example, the gradual growth of the theme of TasnifiRost melody in Shoshmaqom starts from the first scene (stage 1 "Do"). This curtain is the main pillar (stage 1 compared to the sect), and the other pillars are also based on it. In this case, each stage is created at intervals equal to its own amount. In particular, the intervals of the 1st stage "do-do" (prima), the 2nd stage "do-re"

(second), the 3rd stage "do-mi" (thirteenth), the 4th stage "do-fa" (quarter) assimilated by means of. Thus the development of the melody theme is accomplished by the individual key sounds of the seven main curtain sounds in the same order. It should be noted that such a "growth principle" observed in the maqoms was originally used to bring the simple (folk) melodies, inherited from antiquity, to the level of classical requirements. In particular, the melodies of the maqom "NavruzAjam", "NavruzKhor", "Navruz Sabo", which have been classified by experts as "the most ancient example of folk music" ("primary line"), are clearly visible. Of course, this is not in vain. It is known that many peoples of the East have long celebrated Navruz and performed certain melodies and songs. It is probably true that this category of melodies, which played an important role in the traditional life of the people as a kind of seasonal ceremonial music, was later incorporated into maqom structures and gained their highly developed appearance through the application of this style. It seems that the melody structures in the form of "goh" (ie in the form of "Dugoh", "Segoh", "Chorgoh", "Panjgoh") also developed on this basis. Most scholars speculate that this type of melody [5] is based on the tradition of reading ancient books in certain tones, including the Gothic hymns in the Avesto. An analysis of the Goh melodies known to us shows that the roots of these specimens are older than the supposed periods. In particular, from Fergana-Tashkent maqoms on the basis of the melody "Dugohi-Husseini" -1 the structure of two base curtains in the instrumental melody "Segoh", as well as in the parts of Shoshmaqom "Tasnify-Segoh" the existence of which is obvious. It is known from the recent achievements of ethnomusicologists that such basic melodies are the first buds of folk musical thinking. At the same time, it is noteworthy that such simple melodic structures rose to the level of maqoms in the later periods of musical art development. Of course, the "growth" method described must have been used. In our opinion, the study of Navoi's work on the basis of balanced comparisons is very effective in understanding this process. In particular, man's attainment of the peak of spiritual maturity is expressed in a figurative style. In the epic "Lisonut-tayr", thirty birds fly in search of the righteous king Simurg. During the arduous journey, the seven stages of Talab, Ishq, Ma'rifat, Istiqna, Tawhid, Hayrat, and Faqr, the valleys of Fano, are conquered together, but in the end they see themselves not at Simurg, but at the level of Simurg (that is, at perfection).

*Ko'rdilaro'zniqayonkimko'z,  
 Olloh, Olloh, ne ajoyibdurbuso'z,  
 Kim, qilibSimurg'o'ttizqushhavas  
 O'zlarinko'rdilarulsimurg'bas.  
 They saw him with their own eyes,  
 Allah, Allah, how wonderful is this word,  
 Who, so Simurg envied thirty birds  
 They saw that he was dead.  
 ("Lisonut-Tayr")*

It is noteworthy that the idea of "good quality", which is achieved at the end of the road, also appears in the status quo. Examples of this are the Shashmaqom, Khorezmmaqoms and the Dugoh, Segoh, Chorgoh on the Fergana-Tashkent maqom roads. Thus, the gohkuy structures,

which were originally in very simple forms, belonged to a group of branches of the twelve maqom systems, each of which was individually attached to perfect curtain associations in order to develop them at the level of classical requirements.

Accordingly, the Dugoh branch is described as Husayniy, the Segoh branch as Khijaz, and the Chorgoh branch as Zangula. As a result, there was a natural process of penetration into the attached status curtains of the branches. The following example illustrates this. In the way of saying “MaqomiSegoh”, which is one of the Khorezmmaqoms, the melody device “Segoh”, which initially consists of three sounds, “conquers” seven main stages in a row, starting from the “re” curtain. It is true that the flow of melody periodically repeats the conquered stages with wavy motions and repeats them with wavy motions, which is due to the peculiarities of music in general. A comparative study of the twelve positions of the existing association of sounds instead of the basic stages reveals that it corresponds to the expression of the sects identified on the basis of V.M.Belyaev's [6] past treatises on the curtains of "Khijaz". Thus, the simple-looking old melody structures within the two (Dugoh), three (Segoh), and four (Chorgoh) tones of vocal singing are developed along the seven main curtains of certain statuses, irrigated with romantic-sounding moans and healing garlands of new meaning as a result, it can be said that their new levels of quality (i.e., status) had emerged. In fact, now these patterns have "sealed" the beautiful mental states of lovers in their melodies, so in order to "revive" them in the sounds, it is necessary to effectively use such executive methods as "moan", "escape" from the essence of love.

*Qaysiqushbulbulkimingdostonibor,  
Harbiruldostondabirafg'oni bor.  
Lekuldostonlarigulshavqidin  
Nola-u afg'onlarigulshavqidin  
Which nightingale has a thousand stories?  
Each that story has an Afghan.  
But his stories are full of flowers  
Weeping Afghans are interested in flowers  
("Lisonut-Tayr")*

## CONCLUSION

Thus, ancient music samples such as “Dugoh”, “Segoh” and “Chorgoh” discovered new qualities and later formed maqom forms (in ShoshmaqomKhorezmmaqoms - “Dugoh” and “Segoh”, on Fergana-Tashkent maqom roads “Dugoh”, “Segoh ”and“ Chorgoh ”. The logical conclusion is that in this process, the twin names, such as "Segohi-Khijaz", "Dugohi-Husseini", "Chorgohi-Zangula", which used to be used, gradually began to lose their meaning. This is because the subdivisions (melodies) were so naturally absorbed in them during their development in the maqam curtains that the names of these branches became not only the new melodies to be considered within these curtains, but also the concepts of these perfect curtains themselves.

**ABSTRACT**

*This article discusses the historical basis of the creation of symbolic images associated with color in Uzbek literature, the role of the people in oral art, its role. Symbolic images associated with color serve to enhance the art, charm and influence of Uzbek folk proverbs. In folklore, color symbols have been explored using examples as a means of expressing ideas clearly, succinctly, and figuratively.*

**KEYWORDS:** *Folklore, Symbols, Color Symbols, Folk Proverbs.*

**INTRODUCTION**

Art, especially poetry, has evolved from time immemorial in connection with symbolism. Therefore, it is difficult to imagine the poetic image, its essence, the content and idea of the poetic work without symbols. Especially in recent years in the unprecedented development of art in Uzbek poetry "blood of poetry" [Parandovsky Ya. Alchemy Slova.-M., 1972.-208.] One of the means of creating an image is the importance of the place of symbols.

Symbolism, especially color-related symbols, is the most ancient means of artistic thinking. z tarovati serves to reflect with its splendor. Because the use of poetic symbols, their appropriate and skillful use allows each artist to express the spirit of the time, the dreams of the people, human experiences in a concise, meaningful and impressive form. The connection of the symbolic image with color, on the other hand, serves to make the artistic expression deeper and more impressive, to arouse in the fans of poetry the extraordinary wonder and delight that the poet expects. The study of symbols is relevant on the one hand, as it reveals the essence of this magical creature, on the other hand, it reveals the power of its influence on the psyche of our time. Before discussing the symbolic images associated with color, it is necessary to briefly

dwell on what a symbol is in general, its place in human life, and the role it plays in a work of art.

What is a symbol? What is its essence? These questions have been posed to the people since the time of Aristotle, and since then, every scientist has been able to answer this question with great power. rather than expressing, but rather expressing our understanding by generalizing existing views about the symbol.

Symbolism, in the broadest sense, is an image created through live observation of an event. Based on this, it can be said that a symbol is a reflection of an event. By its very nature, a symbol is a specific generalization of an event, referring to the sole object of what it represents. As the well-known Russian philosopher AF Losev noted, a symbol is a symbol of something, but any content and essence cannot be a symbol of something. [Losev AF Logika symbol.-M., 1991.-P.258.] The conclusion to be drawn from this is that the essence of any content of an object cannot be its symbol. In order for the meaning and essence of an object to become a symbol, they must be re-perceived in a specific way, raised to a level that is universally accepted by the majority on a certain conditional basis. In order for the content of an object to become a symbol and for the generalization to rise to such a large scale, it must have many semantic horizons. consists of a view that represents an idea. For this reason, the symbol is not clearly and well defined in any scientific, journalistic, or encyclopedic or dictionary of industry terms. Because the symbol is so complex, so multifaceted, that it is impossible to cover all its features in one arithmetic. This is probably why in almost all dictionaries the term "symbol" is interpreted in two different ways.

1. In a narrow sense, the term refers to special symbols used in the natural, philosophical sciences, as well as in the practical life of man. For example, "x" (x) or "y" (igrek), all the signs in the rules of the road, state emblems and h, k.

2. In a broad sense, the term "symbol" encompasses the concept of image in all forms of art with all its complex aspects. [See: Philosophical Encyclopedic Dictionary, -M., 1983.-P.607-608.] B In order to understand the essence of the artistic symbol and its role in the poem, it is necessary to know the conditionality of the artistic movement in the nature of the symbol, the logical basis of the symbol, as well as the historical and national features. As noted by Ri, if artistic conditionality provides emotional arousal in the symbol, the logical basis allows to find the exaggerated meaning in it. [Sharopov A. Worlds within the worlds.-1978.70-71 pages] In correctly defining the logical basis The past and the beliefs of each nation play an important role. The logical basis of the symbol has a very complex nature, and its definition depends on the artistic symbolic image. It depends on the accuracy and the poet's ability to understand art. Because the artistic symbol moves the image. In the process of movement, the image shows its colorful edges.

There is no nation in the world that has not created masterpieces of wisdom, has not expressed its religious beliefs in them, and has not been nurtured for centuries like the apple of an eye. "Proverbs appear in the upper stages of primitive culture and have the character of living for a long time." Symbols that have become clear and obvious to many in the development of human artistic thought are widely used as a means of expressing thought clearly, succinctly, figuratively. One of such genres is folk proverbs. Color symbols play an important role in folk proverbs, which are an encyclopedia of exemplary ideas that have been confirmed thousands of times in

the centuries-old experience of the people. Of course, there are many symbols associated with different symbols in folk proverbs. It is impossible to dwell on all of them. Therefore, we will comment on some of them below.

G.Vemberi, a well-known European orientalist, visited our country in the second half of the last century and wrote when he returned; „ In Central Asia, which has long been a land of poetic sentiments, young lovers, priests and aristocrats, who fell in love with each other, are equally interested in all poetic works... Proverbs can be found both in written literature and in live speech, both in the palaces of the dead and in the nomadic pastures.

The antiquity of color-related symbols is explained by the fact that they originated in connection with the beliefs of primitive man. Because the human mind still did not have the ability to create complex abstract concepts, it sought to symbolize simple empirical concepts. and distinguished the darkness. During the day he did not have any difficulty in hunting or fighting with others. The reason is that he was able to see his surroundings well, to fully understand the geographical structure of his place. In the darkness of the night, the opposite was true and he suffered a lot. That is why it is dark. He was afraid of death, and this fear led to the formation of black in his mind as a symbol of evil and horror. Light was embodied in white as goodness, comfort, and prosperity. The color of blood in people and animals killed in hunting or war. because it is red, this color was formed as a symbol of war, sacrifice.

In ancient times, the gods lived in heaven, and the idea that people's souls and souls were given to the will of these gods formed the color blue as a divine symbol. Blue is a divine color, as well as a force that unites the souls and souls of all the dead. It is clear from the above considerations that white, black, blue, red , the colors green and yellow were symbolized much earlier than other symbols associated with color as the most ancient religious notions. Even today, these colors have fully retained their religious essence. That is why the symbols associated with these colors are often used in art.

In Uzbek folk proverbs, black is used as a symbol of evil. Because, as mentioned above, this color has always been a symbol of evil and horror in the minds of the people. said But the figurative representation of the image of the bad man in black gave the article expressiveness, impact, conciseness, and conciseness. This is a concept that contradicts the spiritual and moral norms of our black-faced people. This concept is used as a poetic symbol in folklore. Therefore, in the article "The face that is separated from the people will be black", the face serves as a symbol of blackness, humiliation, inferiority. In folk proverbs, not only words that express color, but also other words become symbolic by obtaining color identifiers. For example, the word "earth" refers to the earth that provides food for all and carries the whole being on its shoulders. But before that word, the symbolic meaning of the scientist was created by quoting the color identifier "Black". The black color in the proverb "Be a land, if you are not a land, be a black land" and the symbolic images identified by this color have played an important role in concisely, effectively and figuratively expressing the wise, exemplary ideas of the people. All of them are led by the ancient ideas and views of the people associated with black. The fact that this color and imagination are equally understandable to all allowed the article to turn this color into an artistic image. The symbolic image serves to enhance the artistry, attractiveness and impact of the work.

One such color is white. This color symbolizes goodness, purity, elegance and youth. In Uzbek folk proverbs there are many symbolic images in white. They serve to summarize the content of the proverb. It is very rare in folklore that white is a special symbol. Because in many places this color is a determinant of something or an event. For example: "A white dog is a black dog, anyway a dog". The meaning of the compound symbol in this proverb is that all bad people have bad meanings. In such symbols, the core, that is, the defining meaning, is assigned to the dog. Therefore, the dog symbol in the proverb means a bad person. White and black do not matter in the article. That is why the symbols of the white dog and the black dog are not the black and white of the bad man in the article, because they all conclude that they are bad. In the following article, the color white symbolizes independently: "If you want my face to be white, do the right thing. The white face is the ancient symbol of goodness, peace, righteousness, not to be ashamed." Thus, the fact that the color white is a symbol in a particular case goes back to the ancient notions of the people about this color.

There is one more thing to note here. The ancient use of white as a symbol of goodness is due to the fact that some of the things in white are useful to man. For example, milk has long been known to be beneficial to humans. That is why people did not always say milk, but made a word from the category of adjectives that describe its color. As a result, the word that describes the quality of color has become a word that directly expresses the white thing itself. Because no is understood in the same way for all, the word serves as a symbol associated with color. For example, "Where there is whiteness, there is no pain." White milk is a word based on a white symbol meaning yoghurt. This word symbolizes that the patient should not drink milk and yoghurt in order not to get sick, that is, he should always consume milk and yoghurt. represents bread.

So, in Uzbek folk proverbs there are many symbols associated with the color white, and the meanings of all of them have long been associated with the meaning of this color, such as kindness, serenity, correctness, health, light. goes to mean.

The symbol of red is also common in Uzbek folklore. This symbol of color is also associated with the ancient cosmogonic views of the people. hemorrhage area. Later, redness became a symbol of both negative and positive meanings on the basis of dual (two different) views. As a symbol of negative meaning consists of war, bloodshed, etc., as a positive symbol, folklorist Sh. Turdimov As noted in the settings, it means such things as warmth, girl (woman), love, gold, wealth.

In the following article, the color red symbolizes love: "Girls fly to the red, the merchant - to the money."

In this article, the greed of girls for love is compared to the greed of a merchant for money and wealth. Indeed, grown-up girls fly to guys to express their love and admiration for them. This characteristic of young inexperienced girls is represented figuratively by the likeness of the merchants to the thirst for money. The "red" symbol played an important role in the clear and concise expression of the proverb.

In the following article, the color red is used to mean gold. "The red cup will lead Khidr astray." The proverb clearly and succinctly states that no one, not even a saint, has a human head in the face of a human trap. Therefore, while Khidr is a universal symbol, red is a symbol of money,

wealth and gold. Various variants of the proverb are used, such as “Kizil khizni aynitar”, “Kizil korsa, khizir ozar”, “Kizildan qazi da uyalar”.

In addition, in folklore, the color yellow is also used as a symbol of separation, need for something, illness, longing.

In folklore, the symbol of color is very ancient and very clearly used. In addition, it can be seen that the color symbols in folk proverbs are associated with the ancient religious beliefs of the people.

This means that, as they say, “Shortness is the sister of talent” (APChekhov), symbolic images associated with color can not only provide the leading condition of the small genre - brevity, but also serve to expand its "field of activity" and prolong its life. does.

### ABSTRACT

*In this article are study, Siro-spun yarns were produced from cotton and chemical fibers, and the properties of the yarns were studied. Siro spun yarns from a blend of cotton and polyester (50% / 50%) fiber, cotton and bamboo (50% / 50%) polyester and bamboo (50/50%) fiber, were produced separately and compared on physical and mechanical performance. Parameters such as yarn unevenness (U%, CVm%, CV10m), Siro yarn hairiness and tension were tested and analyzed.*

**KEYWORDS:** *Carded Yarn, Siro Yarn, (Zinser-351), Yarn Quality Parameters, Linear Density, Count.*

### INTRODUCTION

Today in the spinning mills in the creation of a new range of yarn from a mixture of natural and chemical fibers, as well as the development of resource-saving technology, full use of the technological capabilities of the ring spinning machine installed in spinning mills, import substitute, competitive provides extensive use in the production of woven knitted products that can meet the requirements of domestic and foreign markets.

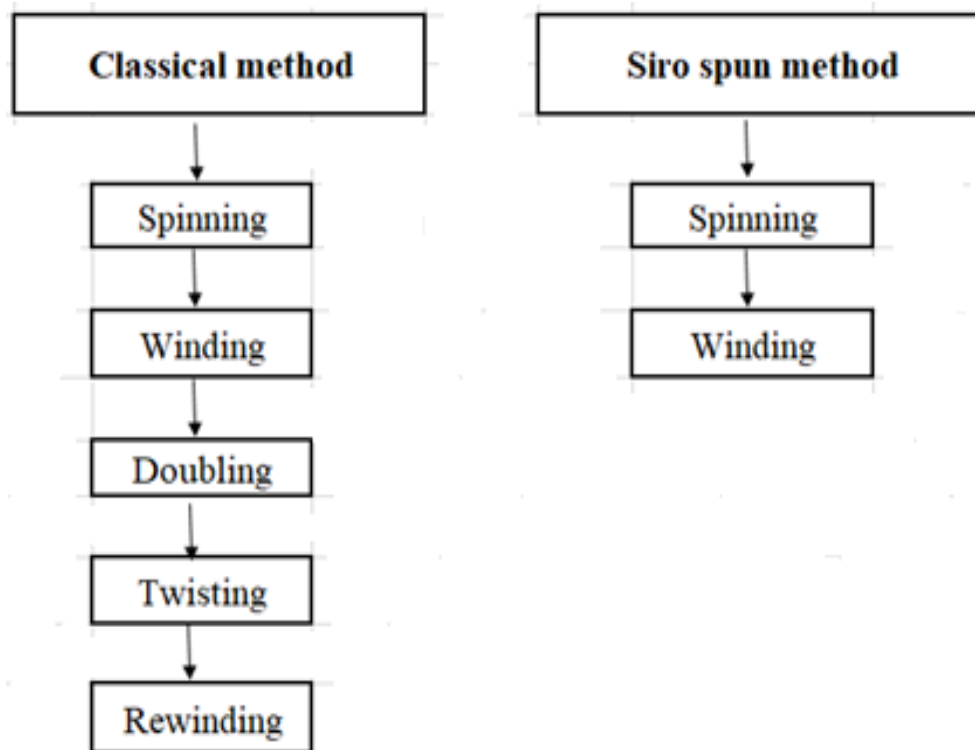

The technological possibilities of ring spinning machines were studied, efficient use of local raw materials. Due to the improvement of the technology of spinning cotton and chemical fibers by the "Siro" method, as well as the production of high-yield yarn, improving yarn quality, reducing technological processes in spinning mills, the introduction of the Siro method will increase labor productivity by 25-30%.

Siro spun yarns from cotton and chemical fibers are characterized by abrasion resistance, high strength, and low hairiness.

The quality of regular yarn produced by the classical method, the unevenness of the yarn and the elongation at break, as well as the abundance of technological advances lead to an increase in the cost of yarn.

The method that bypasses these processes a bit is Siro as a method of spinning, technical technological processes, electricity, number of transition, a reduction in labor costs is achieved.

The sequence of technological processes of the classical and Siro methods is shown in Figure 1 [1,2,3,4].

**Figure 1.** Technological sequence of production of classical yarn and Siro yarn.

The research of domestic and foreign scientists has allowed to create and implement a number of new twisting machines. VTS Volkman (FRG), Yantra (NRB), Savio (Italy), Rieter (Switzerland), Marzulli (Italy) and other companies, is carrying out this work [5,6].

Siro spinning technology was first developed in 1947 by Nesler A.M. was suggested by, however, this method was not widely used due to the lack of a reliable means of controlling the breaks in one of the two sliver of the spun yarn [7,8].

The SIRO spinning method was invented by CSIRO laboratories in 1975-76 and commercialized in 1980.

A brief spinning plan for the production of Siro spun yarn from a blend of cotton and polyester (50% / 50%), Cotton and bamboo (50% / 50%), polyester and bamboo (50/50%) was developed and is presented in Table 1.

The first experimental work was carried out by JV Osborn Textile,

100% polyester, 100% bamboo and 100% cotton in the blowroom department during the test, 1) 70% of Porlok-2 4-type 1-grade fiber, and 2) Sultan variety 4-type 2-grade cotton fiber 30% mixed and carded sliver was obtained.[9,10].

Experimental tests of quality indicators of the carding sliver were carried out in the training and production laboratory of the department "Spinning Technology"[11]. A plan for spinning the experimental test results was developed. According to the plan, the technological parameters of the car were re-adjusted.

**TABLE 1 BRIEF SPINNING PLAN OF COTTON AND CHEMICAL FIBERS (50/50)  
MIXED YARN SPINNING OF JV "OSBORN TEXTILE" JV LLC**

№	Technological equipment item	Linear density of the output, tex	Doubling count $d$	Draft count $E$	Twisting count		Delivery speed		Efficiency, %	Theoretical productivity kg / h
					$\alpha_t$	K bur/m	V m/m in	n $\text{min}^{-1}$		
1	Card C 60	5363	1				165		0.90	60
2	Draw frame I transition SB-D 45	5363	6				500		0.85	150
3	Draw frame II transition RSB-D 35	5100	8	8,36			500		0.85	150
4	Roving frame Zinser-668	900	1	5,65	8,7	29		1100	0.90	0,9
5	Spinning frame Zinser-350	32	2	45,38	32.63	730		15480	0.90	0,022

The linear density of cotton m $\acute{e}$ lange, polyester, bamboo, 0-pass shearing fibers delivered to the test laboratory was determined according to the plan, and experiments were conducted on the equipment available in the laboratory[12,13]In this transition, based on the technical characteristics of the HSR-1000 draw frame machine, the parameters of the machine were changed accordingly. Then, on a RSBD-45 draw frame machine, 500 tex linear density sliver were obtained and the figures are given in Table 1.1, 1.2.

**TABLE 1.1 PROPERTIES OF COTTON FIBER (RESULTS TESTED IN HVI)**

No	Fiber on process	Stapel	Length, inch	Mic	Strength, cH/tex	Rd	+b	Trash count	SFI, %	Uniformity, %	Elongation, %
1	Cotton fiber in bale	36,0	1,12	4,6	28,33	75,90	9,10	3,0	4,30	83,00	6,86

**TABLE 1.2 NUMBERS OF COUNT OF COTTON, POLYESTER, BAMBOO YARNS**

Items	Number of count, ktex
100% , cotton fiber	5.0 ktex
100%, polyester fiber	5.0 ktex
100%, bamboo fiber	5.0 ktex

Before entering the selected and calculated values in the Zinser-668 spinning machine into the machine's computer program, the total elongation constant of the machine was changed and the total elongation variable gears were replaced, and the calculated values were entered into the machine's computer control screen. The machine was started and the expected result was obtained from the experiment, ie Ne 0.65, linear density 500 tex cotton polyester, linear density 900 tex fibers from bamboo fibers.

**TABLE 1.3. NUMBER OF COUNT OF COTTON, POLYESTER, BAMBOO YARNS**

Items	Roving count
100% , cotton fiber	Ne0.65
100%, polyester fiber	Ne0.65

- Zinser-350 ring spinning machine;

In order to obtain the "Siro" spun yarn on the Zinser-350 ring spinning machine, the movement scheme of the machine was analyzed, the machine's elongation and cooking gears were replaced,

the corresponding calculations were performed, entered into the computer program and the results were obtained.

The densifiers installed on the spinning machine's drafting zone were replaced with specially designed densifiers to form the Siro yarn. Siro cotton yarn and chemical fiber yarn were sent to the two-eyed spinner separately, and the flyer coming out of the stretcher was separated and twisted by means of a twisting triangle.

The quality of Ne 18 Siro yarns obtained as a result of the experiment was determined on modern test equipment in the laboratory of Bakan Tex LLC and JV Osborn Textile.

**TABLE 1.4. NUMBER OF SIRO YARNS MIXED FROM COTTON, POLYESTER, BAMBOO FIBERS**

Items	Yarns count
Cotton/polyester50/50	Ne 18
Cotton/bamboo50/50	Ne 18
Polyester/bamboo50/50	Ne 18

Physical and mechanical properties of Siro yarns obtained from a mixture of cotton and chemical fibers (yarn number (Ne), number of twists (T / m), tensile strength (cN / Tex), Uster% (Cv), yarn thinness (-50%), yarn thickness (+ 50%), number of nepses (+ 200%), yarn hairiness (H and yarn thickness) are given in the tables and figures below.

**TABLE 1.5 PHYSICAL AND MECHANICAL PROPERTIES OF SIRO YARNS OBTAINED FROM A MIXTURE OF COTTON AND CHEMICAL FIBERS**

	Item name	Cotton/polyester 50/50	Cotton/bamboo 50/50	Polyester/bamboo 50/50
1	$R_{km}$	20,06	16,29	20,30
2	$CV/(R_{km})$	6,78	5,95	6,57
3	E	7,29	7,06	14,68
4	CV(E)	6,57	9,58	5,48
5	PP	658,0	534,6	666,04
6	CV(PP)	6,78	5,95	6,57

Figure 1.3

In this research work, cotton / polyester (50/50%), cotton / bamboo (50/50%), polyester / bamboo (50/50%) mixed Siro baked yarns were produced on a ring spinning machine made of 100% cotton, 100% polyester, 100% bamboo fibers, Siro yarn strength, were compared in terms of friction resistance, unevenness, hairiness, and tensile strength. The physical and mechanical properties of the obtained Siro spun yarn were studied. The effect of the raw material on the properties of the spun yarns, the number of yarns, the twisting coefficient and the distances between the yarns were studied. The effect of the raw material on the physical properties of the yarn was found to be statistically significant. Cotton-spun yarn from a mixture of cotton / polyester (50/50%) was found to have better quality performance than cotton / bamboo, cotton / viscose mixed fiber Siro-spun yarn.

## TYPES OF DIPLOMATIC TERMS IN THE UZBEK LANGUAGE ACCORDING TO THEIR SEMANTIC RELATIONS

**Sanjar Mavlyanov\***

\*Researcher,

Tashkent State University of Uzbek Language and Literature Named after Alisher Navoi,  
 UZBEKISTAN

Email id: movlanovsanjar@mail.ru

### ABSTRACT

*No matter how important the form and appearance of diplomatic documents, attention should be paid to the main part, its content. The idea must be clear, concise, logically sound, and concise. Diplomatic documents are very comprehensive, they cover not only issues related to the declaration of independence of countries and the establishment of diplomatic relations with other countries, but also political issues such as peace, neutrality, disarmament, etc. and various issues related to cultural cooperation. The author comments on the semantic relationship between diplomatic terms in the article. In addition, the article discusses the lexical-semantic features, relationships and synonyms and antonyms between diplomatic terms.*

**KEYWORDS:** *Diplomacy, Diplomatic Terms, Diplomatic Documents, Synonyms Antonyms, Speech-Thematic Groups, Lexical, Semantic, Speech-Specific Terms, Dictionary.*

### INTRODUCTION

While talking about the lexical-semantic features of diplomatic terms, it should be borne in mind that it is possible to focus on their speech-thematic groups. In addition to a specific formal template, each document uses speech-specific terms.

Diplomatic documents are very comprehensive, they include not only issues related to the declaration of independence of countries and the establishment of diplomatic relations with other countries, but also political issues such as peace, neutrality, disarmament, etc. and various issues related to cultural cooperation.

Therefore, diplomats dealing with diplomatic documents are required to know exactly the traditions and names associated with each state.

The names of the heads of state, ministers and other high-ranking officials should be written in full without any abbreviations. Writing names, surnames, positions in accordance with the original is a sign of respect and attention. [ 1]

In addition, in some official documents, personal appeals, comments are used words that reflect the friendly relationship. Researcher SaodatNosirova in her dissertation "Lexical-semantic and structural analysis of diplomatic terms in modern Chinese" is widely used in diplomatic documents.

### **Main part**

Analyzes the "protocol formulas" and divides them into the following speech-semantic groups.

A) Address words

B) Official remarks

C) Official words used in the final part of diplomatic speeches.

**Reference words.** Words in the sense of respect for the beginning of an official document are used in both the main and middle of diplomatic documents, and official words and phrases are used in the final part of official documents.

It is observed that the words of appeal vary depending on the gender, social and professional status of the person.

For example:

The personal note contains the following forms of appeal:

"Mr. President", "His Majesty the King", "His Majesty the Queen", "His Excellency the Minister", "His Majesty the Queen", "The Pope", "The Grand Minister" and others. When the condolence is indicated, the words of respect are omitted and written as "Mr. President", "Mr. Ambassador", "Mr. Prime Minister". If the note or letter is friendly, the main part also begins with words that express respect. In correspondence through letters from representatives of a foreign country or in letters sent by foreign countries, we can see the following units of reference. We can meet such units as "Mr. President", "Mr. President", "Dear Shavkat Mirziyoyev", "His Excellency the Prime Minister", "His Excellency the Prime Minister" and others.

**Official (kind) words.** In general, when using words and phrases to heads of state, the king, the foreign minister, it is necessary to take into account the role of the two sides in society, their relationship and the political situation.

Each type of reference word used in diplomatic documents has its own meaning and scope. Improper use of certain address words can lead to misunderstandings between interlocutors [ 2 ] .

**Official remarks used in the final part of diplomatic documents.** Diplomatic documents form the basis of the formal style. In addition to the formal word and stereotyped units, they also use units of praise. Researcher SaodatNosirova included such words in the group "Words used at the end of diplomatic documents." In our opinion, it would be more appropriate to call such words of

praise and respect. This is because the words used at the end or beginning of diplomatic documents are written in order to show respect to the sender and praise them.

"I express my deep respect to you"

"With high respect"

"Wishing you good health"

"I express my deep respect"

"I take this opportunity to once again express my respect and esteem to you."

"Trust me once again for my respect and esteem."

Official letters and notes may contain a statement of respect at the end of the document, even before signing:

"Best wishes"

"With all due respect"

"With respect and esteem"

"With deep respect to you"

Like "Wishing you good health."

As discussed, words of praise and respect can be one-component and multi-component, and synonyms can sometimes be used in the same section of diplomatic documents.

The word "respect" with the word "respect", the word "thank you" with the word "thanks", the word "patience" with the word "perseverance", the word "high", can be easily replaced by the word's "infinite". The emotional impact of words a letter to the ambassador or the government, addressed a warm relationship with the person as well as his Master is indicative of a representative of the state [ 3] .

It is well known that any word (lexeme) can be a common word or term according to its nature. As modern sciences are divided into many branches, one of the important tasks is to determine the place and essence of the lexemes used in them. In this regard, the criteria for distinguishing between a term and a non-term word or phrase are clearly defined.

A term is a linguistic unit word or phrase belonging to the language of production, science, and technology, which is a special type of universal language.

The term - a concrete thing - is a specialized name for the original abstract concepts of the subject.

The term requires a specific definition, which can be used to more accurately express the content of the relevant concept, to distinguish one concept from another, while at the same time allowing a particular concept to be placed in a certain classification line.

Terminology is defined as the sum of terms that interact with a system of concepts of a particular science.

Any system of concepts corresponds to a specific system of terms. Terminological systems are evolving along with the development of science. The terms are introduced differently from commonly used words, and their use is somewhat controlled.

"The term does not appear," but is "invented" and "created" with the understanding of their necessity. Also, unlike a simple word, the meaning of a term does not depend on the context. As long as a particular lexeme is used in its terminological sense and in its own terminological and its own terminological space, the same meaning is retained.

However, there is no doubt that context is necessary to distinguish the exact meaning of polysemous terms.

Diplomatic terms, on the other hand, are far from ambiguous. They differ in that they have only one meaning. But only some terms create multiple meanings depending on the context.

For example:

*The* word *absolute* has come to us through British diplomacy and it can have many meanings depending on the context.

1. unconditional absolute

... Italy was soon transformed into a one-party absolute dictatorship.

1. Full. This meaning is also formed by generating valence in context.

Scandia's absolute trust and discretionary trust at glance.

Absolute veto - full veto.

For our Ambassador to propose joint use of the base in Gibraltar would give Spain an absolute veto over every think ...

Diplomat II. A lockable briefcase in the shape of a small suitcase.

Diplomatic 1. Concerning the official relations of the state with foreign countries and diplomacy. Diplomatic act. Diplomatic relations. Diplomatic relations[ 4].

**Lexical-semantic relations in the Uzbek language through diplomatic terms.** No matter how important the form and appearance of diplomatic documents, attention should be paid to the main part, its content.

It is necessary to state the opinion clearly, accurately, logically and taking into account the characteristics of the other party. In these documents, uncertainty should not be a misrepresentation of states. Because it cannot be corrected later or given separate information.

Diplomatic correspondence shall be conducted by the Ministries of Foreign Affairs in the official language of that country and shall be accompanied by a translation into an international language. Embassies and consulates must also conduct their correspondence in their official language or in the official language of the country in which they operate. In diplomatic documents, the focus on the word should be very strong. Its language should be simple and fluent, free from portable meanings, the word should be absolutely consistent with the content, and no other meaning should be expressed. Expressions such as "half a cup under a cup" have no

place in diplomatic documents. if there is any subtlety or abstraction in the meaning of the word, it is better to replace it with another word.

Therefore, it is important for diplomats to know the meaning of diplomatic terms, to have accurate information about their places of application. There are certain differences in the use of diplomatic terminology and literary language. This is especially evident in diplomatic documents.

Thus, the terminology of the language of diplomatic documents has its own lexical-methodological, morphological and syntactic features.

Lexical methodological diplomatic correspondence. It has its own system of terms, molded stable compounds, various means of expression such as synonyms, antonyms. It should be noted that while the formal style of work is free of emotional words, diplomatic correspondence is characterized by a wealth of emotionally colored words, words of praise. Words of praise are one of the essential parts of a note, the most basic type of diplomatic correspondence. Depending on how they are used, these documents can be divided into certain types. For example, in the notes, such words as "Your Excellency", "Dear Sir", "Trust in my high esteem for you" - the use of words of honor is friendly to him, and the use of words of respect is less official. gives color.

The synonymous line of diplomatic correspondence is not more methodologically neutral words, but rather words with a positive emotional color and biblical style. For example, I say the word instead of the word, the opportunity instead of the time, the position once instead of the word, the position instead of the word, thank you instead of the word thank you, instead of the word happy are applied. Phrases in the diplomatic protocol (especially in oral speech), fixed phrases used in a figurative sense, including over the head, my head turned blue, do not despair, head on one side The expressions are widely used, as well as folk proverbs, aphorisms from the sages, as if a body is a soul. Such stable connections serve to increase the sensitivity to give a high spirit to the speech. In ancient times, the phrase was used especially often in diplomatic documents. It is still common in some official personal letters.

In general, our people say in diplomatic documents that they are both friends and enemies. The word spoken or written in its place connects nations to one another brings together, helps to resolve some disagreements [ 5 ] .

This type of formal style also has grammatical features. In diplomatic correspondence, it is often spoken on behalf of the first or third person, so the cut of the sentence is in the form of the first or third person. It should be noted that passive constructions are often used in diplomatic discourse. It is even common to express it in vague forms, such as by a person or “**a decision made by us**”. With the help of more conjunctive conjunctions (**both, and**) of sentences and phrases, and conjunctions with prepositions -ki, therefore due to the following conjunctions, affixes -b, -ibare used to link. In diplomatic correspondence, introductory words and introductory combinations are often used.

Morphologically, personality, identity, pronouns, indefinite verb forms, especially the affix “-moq” form of the noun, passive pronouns, conjunctions (**to collaborate, to hope, to achieve, to cancel**) It is worth noting that diplomatic correspondence is written in an uplifting spirit, so it is worth noting that it is often used in conjunction with conjunctions and pairs of verbs. serving

grammatical - morphological forms are widely used. For example, the use of archaic and biblical forms of the name of the affix - *moq* form, verbs *to express confidence*, *to accept*, and so on.

### **Synonymy between diplomatic terms in Uzbek**

The language of diplomacy is very delicate and requires a great deal of skill on the part of the ambassador.

Synonyms, no matter how close we are to each other in the expression of concepts, differ in the expression of the subtleties of meaning. In the field of diplomacy, synonyms also play an important role in expressing ideas clearly and purposefully. World diplomats say that "diplomacy often finds itself in an awkward position in the negotiation process, indicating that there are still problems in diplomacy." One of them is synonyms," they told diplomacy.

Negotiations between nations ability to act on the basis of mutual consent between nations, as She has had a long and distinguished career in diplomacy.

For example;

Tact, tactfulness- polite, courteous, orderly, He gave a tactful critique of her story.

British diplomats can easily use the word politic instead of diplomacy. They have the same meaning, they are synonyms."

It would not be political to ignore them. Diplomacy and foreign policy are synonymous. Union, union, alliance, confederation coalition, the words union are grouped into a single synonymous line. However, although the words are combined on the basis of a common meaning, there are differences in some aspects of their meaning.

Alliance - a contract-based association;

Confederation - an alliance, a union for a specific purpose;

A coalition is an alliance

The word "union" is derived from the Texas word "Taisha" in Kaddo. Taisha means "friends", "allies". American tribes were friendly to newcomers and used the word "Taisha" in reference to them.

Ambassador, Representative, Delegate, Consul,

Memorandum, delegation,

Agreement, contract, treaty,

Conflict, seriousness, conflict, conflict

Protest, protest, protest

Decree decision;

Consulate, representative office, embassy;

Condolences, sympathy;

Argument - debate

Consolidation, attachment;

Tactless undiplomatic, untactful

Delicacykeenness, acuity, sharpness.

In it, the synonymous series is enriched by foreign words, and most of the words based on translation are mainly used to express narrower meanings.

There is a scientific difference in the classification of diplomatic synonyms. In this regard, synonyms can be divided into 2 groups.

- Synonyms with different meanings (absolute or doublet)

Thank you (rahmat), thank you (tashakkur);

To be happy (mamnun bo'lmoq), to be happy (xursand bo'lmoq);

To express (bildirmoq), to express (izhor qilmoq);

Career, position;

It is used sparingly in diplomacy. This is because even small differences in the meaning of words in a synonymous series can have a significant effect on the field.

For example, the words spy (josus), spy (ayg'oqchi), and spy (shipyon) are grouped together by the term spy, but there are some spiritual differences between them.

A spy is someone who is hired to investigate and kill someone.

A spy is a person hired by certain officials to find out the secrets of a group or country.

The exact translation of the word spy can be a double synonym for spy and spy.

The terms state, government, are actually combined on the basis of organizational semaphore.

But there are some semantic differences between the words in the synonymous series.

The state is the legislature, the executive, and the judiciary.

Residence;

The residence is the permanent residence of the head of state.

The residence is a mobile residence where the head of state works.

Consulate, embassy, representative office;

This synonymous series is also based on the term embassy, and the consulate is a smaller organization that deals with smaller issues. For example: British council, American council, Korean council.

These organizations serve to develop the language, science, culture and arts of a country.

The embassy is a place where more than 17-18 ambassadors work.

An embassy is a place where representatives of a state operate. An embassy is larger than a consulate and deals with important interstate issues.

The terms diplomacy and foreign affairs are also synonymous with British diplomats

### Antonym between diplomatic terms in Uzbek language

The lexical meaning of a lexeme is not a rigid, fixed phenomenon, although it is more stable, it can change over the years under the influence of certain factors. Lexemes learned from other languages become polysemous lexemes over time under the influence of various linguistic and non-linguistic factors. As the meaning of lexemes in a language increases, so do the synonyms, antonyms, homonyms, and other phenomena in the language. An antonym is a relation of lexemes that have opposite meanings [ 7] . An antonym is a relationship between two lexemes, and one of the denotative semaphores of these lexemes is the opposite semaphore. In the pair of diplomatic-rude antonyms, diplomatic-polite means positive, while rude means negative. The phenomenon of antonyms is not unique to all words in a dictionary.

Antonym is a stable semantic relationship based on antonym pairs. Although antonymous pairs have opposite meanings, they represent the two extreme sides of the same event, the two poles.

If there are intermediate events between the meanings of the antonym pairs, we can say that this antonym relationship is formed on the basis of hierarchy. At the same time, the differences between the first and last lexemes of spiritual hierarchy increased, eventually reaching antonyms.

The phenomenon of antonym develops in the same way as the phenomenon of synonymy. For example:

Tact, tactfulness - a synonymous series of polite, courteous

Gauche, untactful, is a rude, rude synonymous series that creates a spiritual antonym. Or:

Tactless- xushmuomala, rude- qo‘pol;

Artless – impolite, sodda go‘l, qo‘pol;

Attentive - awake- hushyor- indifferent, uncorcerned- loqayd;

Adentage disadvantage, ustunlik- noustunlik;

Agree – disagree, rozi bo‘lmoq, rad etmoq;

Alove – forbit, ruxsat bermoq - man etmoq;

Achive failure, maqsadga erishish – maqsadga erishmaslik;

Aknowlage- ignore, qabul qilmoq, rad etmoq;

Belif –distras, ishonch- ishonmaslik;

Cagey- careless, ehtiyotkor – ehtiyotsiz;

Quality-resonable, arzon, qimmat;

Company- individual, jamoaviy, xususiy;

Complate- incomplate, to‘liq, noto‘liq;

Equale- unequale, tenglik - tengsizlik;

Exatly- approximately, aynan- taxminan;

Fake – original, soxta –haqiqiy;

Gain - lose, to‘plamoq yo‘qotmoq;  
General – specific, umumiy – xususiy;  
Gratefull –ungratefull, minnatdor- norozi;  
Legal illegal qonuniy noqonuniy  
Skeillfull- unskeillfull malakali malakasiz;  
Desire - despaire, umidli - noumid;  
Local - national, mahalliy- millatlararo  
Obey disobey bo‘ysunmoq bo‘ysunmaslik  
Loyal disloyal, sodiq, sotqin;  
Protect - unprotect, himoya qilmoq- himoyasiz;  
Prove - disprove, isbotlamoq- isbotlay olmaslik;  
Regular irregular to‘gri noto‘g’ri

## CONCLUSION

In summary, the widespread use of the phenomenon of synonymy and antonym in the field of diplomacy, especially in the naming of diplomatic documents, has been observed in practice to have negative consequences. Therefore, the documents should be carefully analyzed by sinologists before signing.

**INTRODUCTION**

In the history of Uzbek classical literature, artists who grew up in the literary environment of Kokand have a significant place. Among them are those whose lives, works, and scientific and creative heritage have not yet been fully explored. A comprehensive study of the heritage of unexplored manuscripts, identification of sources of their works, comparative analysis, and determination of their place in the classical literature are topical issues.

One of the artists whose creative heritage is almost unexplored is AzimkhojaEshan, a representative of mystical literature, which is an integral part of Uzbek classical literature.

---

## THE MAIN FINDINGS AND RESULTS

AzimkhojaEshan lived and worked in the late 18th and early 19th centuries. He was an excellent poet of Khogand and one of the great sheikhs in mysticism. One of the creators working in the genre of great wisdom. The approximate date of birth is set as 1200 AH (1785-1786 AD). According to the sources, AzimkhojaEshan was born in Sarmozormahalla of Kokand city in the Naqshbandi-Khojagon sect in an educated clergy family. AzimkhojaEshanAzimi shook his pen under his pseudonym. He died in 1263 AH (1847 AD). His grave is in the Sarmazor cemetery in Kokand.

According to the information, Azimi and his loyal friend and esteemed Jalali first learned Sharia and theology from their ancestors Nizamiddin Khoja (Sheikh and poet NizomiddinKhokandi) in Kokand. Then they went to Bukhara together and became disciples of the famous Sheikh KhalifaHusayn ibn Yusuf Bukhari and studied mysticism and madrasah [1, p. 18]. When he returned to his homeland, he served as an imam for 40 years in a large mosque in the village of KalDushan in Hoqand. Towards the end of his life he became blind.

There is only some information about his family and life. According to the poet Zavqi, Azimi had a son named Sadi[2, p. 56].

PulatjonQayumov described AzimkhojaEshon as “a scientist, a pious, pious, alert, loving, eloquent and handsome, full-bodied, white-faced, big-bearded, clean-shaven man”. He also described him as “a very strong, fiery poet, a great sheikh and scholar” [3, p. 321].

Azimi left us a literary legacy of more than 4,000 verses [4, p. 9]. He collected the poems he wrote and composed a dewan. It contains proverbs, ghazals, mustahzod, muhammas, masnavi and musaddas in Uzbek and Persian languages.

AzimkhojaEshan, a follower of Khoja Ahmad Yassavi, has 28 wisdoms in his divan. His wisdom includes didactic issues such as the wisdom of Ahmad Yassavi, i.e. religion and faith, piety and piety, the relationship between murshid and murid, the intercession of the Prophet Muhammad (saas), the world and the hereafter, heaven and hell, and the teachings of love expressed in the form For example, in his wisdom, the poet called on the people to be religious and honest, to make fair decisions in every matter. In Azimi's proverbs, the theme of love and romance is described in a unique way. He considers love for God to be real.

The language of the poet's proverbs is as simple and clear as that of Yassavi. The main theme of his wisdom is the interpretation of true love, the enlightenment of the spiritual experiences of the taxman on the path of monotheism, who seeks the attainment of the vision of Allah.

He is a creator who illuminates religious-mystical, moral-enlightenment ideas through his own artistic paints through his poems in the genre of great wisdom.

In his articles, O. Juraboev covered the life of AzimkhojaEshan and his manuscripts [5, pp. 18-22].

So far, ten manuscripts of this dewan have been known. Below we give a brief account of the manuscripts of this dewan known to us.

1. Manuscript kept in the fund of the State Museum of Literature named after AlisherNavoi of the Academy of Sciences of the Republic of Uzbekistan under the number №189. This copy is

one of the most complete copies of Azimi, and it is called “Murad ul-ashiqin” (Book of love of lovers) [5].

Secretary: not specified (on the cover there is an inscription “In the book of SayyidAkram Khoja”). Date of copying: Hijri 1294 (AD 1877), copied in Kokand city in a fluent Nasta'liq letter Manuscript size: 15.5x26.5 cm, text size: 8.5x16 cm. The manuscript consists of a total of 126 pages.

Beginning: (Bismillah ...)

اسم توبود احمد محمود محمد

وصف توبود رحمت رب بر همه اشيا

Ending:

هر که خاند دعا طمع داريم

زانکه ما بنده گنه کاريم

3. Institute of Oriental Studies named after Abu RayhonBeruni of the Academy of Sciences of the Republic of Uzbekistan is kept in the Department of Manuscripts named after Professor Hamid Suleiman under number 2694. This copy is also one of the most complete and beautiful copies of Azimi's office. Secretary and location not specified. Date of copying: 1311 AH (1893 AD) [6]. The cocoon is transcribed on silk paper in a beautiful Nasta'liq letter. Dimensions of the manuscript: 15x25 cm. Text size: 8.5x20.5 cm. consists of 125 sheets.

Beginning:

يا قادر از وصف تو قاصر زبان ما

باشد بقدر چصله ما بيان ما

Ending:

هر که خاند دعا طمع داريم

زانکه ما بنده گنه کاريم

4. Manuscript No. 6354 kept in the Manuscripts Department named after Professor عظيمديوان Hamid Suleiman. This manuscript is an inaccurate copy. The secretary, where it was copied, and the date are unknown because the last sheets were torn. The text of the manuscript was copied on plain Kokand paper in a fluent Nasta'liq letter. Manuscript size: 16x25 cm. Text size: 9x20.5 cm. The manuscript consists of 121 pages.

Beginning: (Bismillah ...)

يا قادرا از وصف تو قاصر زبان ما

باشد بقدر چوصله ما بيان ما

Ending:

كونكل نرم قىلغان طوطى دىك شىرنى مقالاتى

بو خصلت لار هميشه مرشد كامل علاماتى

5. عظیمدیوان Inventory digital manuscript 5992 / II in the main fund of the Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of the Republic of Uzbekistan. This manuscript is an incomplete copy. Secretary and location not specified. Mirislom Mirkhomudbek is written in pen on the 117b page of the manuscript. The manuscript was copied in 1327 AH (1909 AD) in a large Nasta'liq letter on Russian factory paper [7]. Dimensions of the manuscript: 15x26 cm. This copy consists of 123 pages.

Beginning: (Bismillah ...)

یا قادر از وصف تو قاصر زبان ما

باشد بقدر چصله ما بیان ما

Ending:

ندامنده بولسون اشینگ سوز گداز

قیلسه بولمس یوقسه قللو ق ادابینی

6. عظیمدیوان - Manuscript No. 6806 kept in the fund of the Kokand Literary Museum named after Ghafur Ghulam. Secretary: Koriy [8]. The manuscript was written in 1303 AH (1886 AD) in small letters in a Nasta'liq letter on Kokand paper. This copy was copied in Kokand. The size of the manuscript is 23x14 cm. The size of the text is 17x8 cm. The manuscript consists of a total of 138 pages.

Beginning: (Bismillah ...)

یا قادر از وصف تو قاصر زبان ما

باشد بقدر چصله ما بیان ما

Ending:

ندامنده بولسه اشینگ سوز گداز

قیلسه بولمس یوقسه قللو ق ادابینی

7. Manuscript No. 6750 kept in the fund of the Kokand Literary Museum named after Ghafur Ghulam. This manuscript is written under the title "Nazmisulukuwahasbihol" (meaning, the poetic expression of the hasbi states of those who entered the path of the sect). Secretary: Muhammad Suluk. The date of copying is 1253 AH (1837-1838 AD). The copy was copied in Kokand on a Kokand paper in a Nasta'liq letter. The size of the manuscript is 24x13 cm and the text is 17x9 cm. The manuscript consists of a total of 148 pages (296 pages).

Beginning: (Bismillah ...)

یا قادر از وصف تو قاصر زبان ما

باشد بقدر چصله ما بیان ما

Ending:

ندامنده بولسون اشینگ سوز گداز

قیلسه بولمس یوقسه قللو ق ادابینی

8. دیوان عظیم - Manuscript No. 6209 kept in the fund of the Kokand Literary Museum named after Ghafur Ghulam. Since some of the pages at the beginning and the pages at the end of this manuscript are also missing, it is not possible to determine the secretary, the place and date of copying. The manuscript is kept in a sealed envelope with a museum seal. The cocoon was transcribed on a sheet of paper in a Nasta'liq letter. The paper size of the manuscript is 23x14.5 cm, the text size is 17x8 cm. A total of 69 pages.

Beginning:

ای محتسب گر واقف از خاک کس خونیم ما  
مست می حب کشته ایم یا مست معجونیم ما

Ending:

بیا اید لطمع داری کر از احسان دروشان  
بکن پیوند جان حویش را با جان دروشان

9. دیوان عظیم - Manuscript kept in the personal library of Abdulhafiz Muhammadkhanov [9]. Secretary and date not specified. It is believed that it was moved to Kokand in the 50s and 60s of the XIX century [1, p. 21]. This manuscript was copied on Kokand paper in an average Nasta'liq script. Manuscript size: 15x26 cm, text size 8.5x18 cm. This copy consists of a total of 208 pages.

Beginning: (Bismillah ...)

یا قادر از وصف تو قاصر زبان ما  
باشد بقدر چصله ما بیان ما

Ending:

ندامنده بولسون اشینگ سوز گداز  
قیسه بولمس یوقسه ققوق ادابینی

10. دیوان عظیم - Candidate of Philological Sciences Sayfiddin Rafiddinov [11] is kept in his personal library. This copy is one of the complete copies of the poet's dewan. Information about the secretary is not available. The manuscript was copied in 1319 AH (1902 AD) in a beautiful Nasta'liq script. Manuscript paper size: 14x25 cm. Text size: 10.5x 20 cm. It consists of 160 pages in total.

Beginning: (Bismillah ...)

یا قادر از وصف تو قاصر زبان ما  
باشد بقدر چصله ما بیان ما

Ending:

ندامنده بولسون اشینگ سوز گداز  
قیسه بولمس یوقسه ققوق ادابینی

---

## RESULTS AND DISCUSSIONS

AzimkhojaEshan lived and worked in Kokand in the late 18th and early 19th centuries. He is a mystic sheikh and poet. There are 10 manuscripts of his “Murad-ul-oshiqin” divan, which have reached us. Copies of this manuscript have been fully described and are being brought into scientific practice. An important aspect of these manuscripts is that for the first time in the history of Uzbek literature such a large-scale mystical poet was discovered.

## CONCLUSION

All copies of the Dewanian should be studied comparatively, and the base copy should be identified, taking into account the orderly and literate copying of the manuscript, the completeness of the text, the antiquity of the copied time, the lack of errors affecting the meaning of the work. Ten existing manuscripts were studied, and in the process of comparing the text of each, the main differences, such as byte drop, relocation, confusion of secretaries, errors in words, were identified, and in the process of compiling comparative text such errors were corrected and published. will be appropriate.

## THE ROLE OF MUSIC EDUCATION IN THE DEVELOPMENT OF PERSONAL QUALITIES OF CREATIVE PERSONS

**Sevar Samatovna Malikova\***

\*Associate Professor,  
 Candidate of Pedagogical Sciences,  
 Uzbekistan State Institute of Arts and Culture,  
 UZBEKISTAN  
 Email id: malikova.sevar@mail.ru.

### ABSTRACT

*The article is devoted to the results of research and the creation of guidelines on the pedagogical foundations of education and the development of personal qualities, logical thinking and scientific research of creative individuals by means of music.*

**KEYWORDS:** *Creativity, Scientific Creativity, Logic, Thinking, Personality, Personality Education, Musical Education.*

### INTRODUCTION

The issue of man and his upbringing, the development of a mature person has long been in the focus of attention of Eastern scientists, thinkers and sages. They elevated the human race to the heights they considered the best of all living beings. The valuable ideas of the thinkers who lived in Mazi about man and the purpose of his life, a perfect society, a just and enlightened king, a perfect man, still serve humanity without losing their value.

In the millennial history of the Uzbek people lived and worked the great scientists and thinkers who laid the foundation stone of world science, whose work is based on the education of the individual and the improvement of their logical thinking.

The history of the Middle East shows that the unprecedented rise in culture and education, medicine, literature, art and architecture, the emergence of scientific schools, the emergence and growth of a new wave of talented generations - all this is primarily due to the economy, agriculture and the more rapid growth of the urban economy, the high level of development of handicrafts and trade, the construction of roads, the opening of new caravan routes and, above all, the provision of relative stability.

On the basis of the rich spiritual heritage of our people, oriental and universal values, it is necessary to strengthen the historical roots of the nation, its spiritual foundations and revive its cultural, educational, pedagogical, musical and aesthetic work.

Perfect human education is carried out on the basis of complex means of influence. In this complex, artistic and aesthetic content, knowledge and imagination also play an important role. Therefore, at all times, special attention was paid to the aesthetic education of the younger generation. In particular, the young generation must have formed aesthetic perceptions, knowledge, certain skills and competencies in expressing their understanding of the world, their attitude to events and phenomena in the environment.

Our state has always been a guide to the development of art and culture. In particular, the Resolution of the President of the Republic of Uzbekistan dated July 8, 2008 No PP-910 "On the State Program for Strengthening the Material and Technical Base of Children's Music and Art Schools and Further Improving Their Activities for 2009-2014", July 8, 2008 Resolution of the Government of the Republic of Uzbekistan No. PQ-910 "On the State Program for Strengthening the Material and Technical Base of Art Schools and Further Improving Their Activities for 2009-2014", April 7, 2009 "You are One, Holy Motherland!" Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated March 11, 1997 "On the establishment of the Uzbek State Institute of Arts and Culture", Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated March 11, 1997 "On the establishment of the Republican contest" PQ-1091 Resolution of the President of the Republic of Uzbekistan No. 132 "On holding an international music festival" Proof of our words - "5 important initiatives to raise the morale of young people and meaningful organization of their leisure time" proposed by Mirziyoyev.

After gaining independence, Uzbekistan has paid more attention to the education of the individual and human spirituality, caring for him, caring for his interests, social protection of citizens has become a priority policy of the state, its daily activities. As stated in the Constitution of the Republic of Uzbekistan, "Democracy in the Republic of Uzbekistan is based on universal principles, according to which a person, his life, freedom, honor, dignity and other inalienable rights are the highest value." [1.1]

The current task is to take care of people, to bring up and bring up the younger generation as a mature person, modern, educated, highly spiritual, strong-willed, strong-willed, caring person for the people and the Motherland.

The analysis of the history of music and aesthetic education in our country shows that although the Uzbek music education has been collected, recorded, published, as a result of the lack of national education, these invaluable resources have been left out of the educational system. The performance of vocal, choir, opera, ballet, variety, symphony orchestras, which emerged as a result of the influence of European music, developed in the main direction. Naturally, scientific research on music and aesthetic education has also been largely in this direction. It should be noted that the research on the above-mentioned types of art is carried out in the field of art criticism, including Uzbek folk music, its genre features, melody structure, methods of development, ways of development, some of its types in the field of singing. Consistent research is certainly beneficial. However, it can be acknowledged that new directions in the field of aesthetic education have not been studied in relation to the higher education system.

This article is devoted to the results of research on the development of pedagogical bases for the development of personal qualities of creative people through music and the creation of science-based methodical recommendations, the solution of the following tasks is relevant today:

1. Theoretical and practical study and generalization of the current state of development of personal qualities of creative people through music.
2. Development of the content, methods, forms and means of aesthetic education through the development of personal qualities of creative people through music.
3. Development of methodical recommendations on improving the development of personal qualities of creative people through music.

Pedagogical experiments conducted to observe changes in students' attitudes to the art of folk singing - the results of sociological research, questionnaires, questions and answers:

- the lack of theoretical analysis of the development of personal qualities of creative people on the example of the art of music;
- the practical aspects of the development of personal qualities of creative people have not been studied in the example of music;
- showed that the forms of education through music in the formation of creative individuals are not socio-historically covered in the context of traditional and modern art education.

During the study, the content and methods of music and aesthetic education, improving the involvement of students in spiritual and aesthetic values, improving the existing curriculum, texts of lectures, teaching and methodological manuals, enriching their national foundations. However:

- theoretical analysis of the development of personal qualities of creative people on the example of the art of music;
- to study the practical aspects of the development of personal qualities of creative people on the example of music;
- in the formation of creative personalities, attempts were made to socio-historically cover the forms of education through music in the context of traditional and modern art education.

Improving the content and methods of music and aesthetic education conducted at the institute, ensures the involvement of students in spiritual and aesthetic values, improves the existing program of music education, texts of lectures, teaching and methodological manuals, creates a methodological basis for enriching their national basis.

At present, the widespread use of pedagogical innovations in the educational process is a global trend of global development. Particular attention is paid to the systematic introduction of innovations in the field of education at a time when the scale of pedagogical innovations is growing, the process of modernization in the country is developing rapidly. However, despite the creation of many pedagogical innovations, the level of introduction of pedagogical research on the introduction of new content, forms, methods and tools of teaching in the educational process is not yet sufficient.

Indeed, in the implementation of the updated education system, it is important that every teacher has the ability to constantly study the innovations in their subject and the education of a harmoniously developed generation and apply them consistently in their work. The content, form and methods of developing the personal qualities of creative people through music education is a pedagogical system organized in this direction in the higher school of arts and pedagogy and the implementation of spiritual aesthetic education. The effectiveness of this system is fully reflected in the results of pedagogical research. As music education is an educational tool of the pedagogical system we have chosen and operated, its content has been proved in the samples selected from the treasury of music education.

While pursuing the goals of spiritual and aesthetic education, we have chosen songs on a variety of popular topics that have as much educational impact as possible to achieve that goal.

The development of students' personal qualities is carried out mainly in the classroom. Thinking can only be developed if the learning process is designed to teach students exactly how to think creatively.

During the research, pedagogical methods of developing logical thinking in scientific creativity, practical and methodological recommendations and conclusions on the use of scientific creativity and logical thinking in the formation of creative individuals in music education were developed. Logical thinking and reading give good results only if students understand the diversity of ideas and experiences.

During the study, it was found that the level of use of folk music, especially music education, in the aesthetic education of students in art and pedagogical universities is unsatisfactory. This is due to: a) the lack of purposeful programs and manuals of the leaders of clubs and teachers-educators engaged in aesthetic education in higher education institutions; b) examples of music education that can have a positive effect on aesthetic education and general information about music education (song genre, authors, content, style of performance, performers, which local style of performance it belongs to, in what condition it is performed, music, etc. ) lack of resources; c) lack of popularization of existing practices in the field of aesthetic education in music education; g) the absence of national musical instruments, technical means, visual and musical notes, which would increase the effectiveness of the training and allow to achieve positive results.

[4.76]

In short, Uzbekistan has set key tasks in reforming the education system in order to strengthen its independence and become one of the developed countries. One of them is to form a new generation of young people who have the ability to advance and solve future tasks, a high culture of thinking, the ability to find an independent path in political and socio-economic life.

Effective lifelong learning applied to new situations poses a problem for us to make information and ideas understandable. The highest result can be achieved only when students actively assimilate information and ideas, that is, they become mature professionals in all respects.

In order for young people to become mature professionals in their field, it is necessary to develop their logical thinking. To do this, in the pedagogical process, it is advisable to organize training sessions that allow students to think logically.

The learning process will be more successful only if different strategies for developing the personal qualities of creative individuals are used. Such strategies make the reading process more conscious.

Only when students can apply their knowledge in solving certain problems will they develop knowledge and logical thinking.

Reading based on students' previous knowledge and experience will be solid. All of this allows students to connect new information with what they know.

**ABSTRACT**

*The purpose of this study was to investigate the relationship among job satisfaction, organizational commitment and job performance of non - managerial employees in the commercial banks in Sri Lanka. The sample consisted of 400 non - managerial employees randomly selected from Systemically Important Banks. A questionnaire was administered among the non - managerial employees as the measuring instrument. The collected data were analyzed using correlation coefficient and simple regression. The results of the study indicated that there was a positive relationship between job satisfaction and job performance, job satisfaction and organizational commitment, organizational commitment and job performance. Organizational commitment was found to mediate the relationship between job satisfaction and job performance of non-managerial employees in the commercial banks in Sri Lanka.*

**KEYWORDS:** *Organizational Commitment, Job Satisfaction, Job Performance, Mediating Effect*

**INTRODUCTION**

The importance of human factor has not decreased because the human involvement is yet to be considered as a significant element in the banking sector. The quality of the staff has significant impact on the customer satisfaction and overall performance of the banking sector.

Job Performance (JP), Job Satisfaction (JS) and Organizational Commitment (OC) of the employees are the key factors in deciding the success or failure of any organization. Banking

being a service sector industry, these factors are further significant because the well satisfied, high committed and high performed employees are more crucial for the customer satisfaction and overall performance.

Gabbott and Hogg (1997) argue that employees' JP in particular is considered to be a key individual outcome in the financial and banking services context. In this context, bank employees play an important role in delivering high quality services, promoting the corporate image and improving customer satisfaction (Karatepe and Tekinkus, 2006). Thus, the enhancing the JP of the employees is the high priority of any manager. Lots of researchers and practitioners have focused their researches to find out the antecedents of JP. Among them, personality (Ones & Viswesvaran, 2001), job satisfaction (Iaffaldano & Muchinsky, 1985, Judge *et al.*, 2001), Organizational commitment (Baugh & Roberts, 1994; Meyer *et al.*, 1993), Job involvement (Brown, 1996; Robbins, 2003), work attitudes-organizational commitment and job involvement- (Blau, 1986), motivation (Moorhead and Griffin, 1999), organizational culture (Moorhead and Griffin, 1999), organizational structure (Robbins, 2003), leadership (Mullins, 1996) are the most investigated antecedents of JP. Among them, job satisfaction and organizational commitment are the most significant factors in determining the JP.

JS is a positive emotional response towards the various aspects of job resulting from what the employees want and value from their job (Olsen, 1993). It is closely associated with life satisfaction, job performance, Organizational Commitment, Job Involvement, physical and mental health, absenteeism, turnover, labour problem, labour grievances (Buitendach & De Witte, 2005). Among these different associations, the relationship between JS and job performance has fascinated researchers for decades and several theoretical explanations have been posited to explain this relationship (Schleicher, Watt, & Greguras, 2004). In turn, OC has received substantial attention in past research due to its significant impact on work outcomes. Some researchers point out that organization whose members have higher levels of commitment show higher performance, productivity and lower levels of absenteeism and tardiness. This implies that employees with a high level of commitment tend to take greater effort to perform and invest their resources in the organization.

In reviewing the literature, there exists a substantial amount of research on the relationship between JS and JP whereas a sizable literature has investigated the relationship between JS and OC and OC and JP. Anyway, the mediating effect of OC on the relationship between JS and JP has received little attention in previous researches. In Sri Lanka, there are few researches on the relationship between JS and JP but nothing can be found in the mediating effect of OC on the relationship between JS and JP in the commercial banks. Therefore, it seems that there is a research gap in the commercial banks in Sri Lanka.

### **Problem Statement**

In order to improve the JP of the employees, the managers have to identify the factors affecting to JP and their impact. In reviewing the literature, lots of researchers have identified different factors affecting to JP. Among them, JS and OC of the employees are identified as the most influential factors which shape the employees' JP. In turn, there are relationship between JS and OC and OC and JP. Anyway, there were no researches on the mediating effect of OC in the banking sector in Sri Lanka. Therefore, the problems addressed in this study are to investigate:

1. How and in what ways does JS and OC affect on JP of non - managerial Employees in the commercial banks in Sri Lanka?
2. Does OC mediate the relationship between JS and JP of non-managerial employees in the commercial banks in Sri Lanka?

### **Objectives of the Study**

1. To identify the relationship between JS and JP of non-managerial employees in the commercial banks
2. To investigate the impact of JS on OC of non-managerial employees in the commercial banks
3. To identify the relationship between OC and JP of non-managerial employees in the commercial banks
4. To identify whether the OC can be used as a mediating variable between JS and JP among the non-managerial employees in the commercial banks

### **LITERATURE REVIEW**

#### **Job Performance**

Traditionally, JP was evaluated in terms of the proficiency with which an individual carried out the tasks that were specified in their job description. It has been conceptualized in terms of the execution and completion of well-defined task as a one dimension (Borman & Motowidlo, 1993). According to Moorhead and Griffin (1999), JP is all of the total set of work related behaviors that the organization expects from the individuals to display. Motowidlo, Borman and Schmit (1997) define JP as behaviors or activities that are oriented towards the organization's goals and objectives. However, the changing nature of work and organizations has challenged traditional views of JP. Today, JP is defined as a multidimensional construct.

The Task Performance (TP) and Contextual Performance (CP) have been received the most attention in the recent research (Borman and Motowidlo, 1993). According to Borman and Motowidlo (1993) the TP is the behavior that is directly linked with completion of the job. When employees use technical skills and knowledge to produce goods or services through the organization's core technical processes, or when they accomplished specialized tasks that support these core functions, they are engaging in TP. Task related behaviors contribute to the technical core of the organization. Furthermore, they explain TP including those aspects of a job that contribute directly to the technical object of the organization. These behaviors are predominantly task oriented and are included in formal job descriptions and may represent a key performance indicator. Behaviour in the domain of TP is usually recognized as a formal requirement of an individual's job. Job description often explicitly stipulates that the job holders must perform these activities. According to another conceptualization on TP refers to activities that are formally part of a worker's job. These activities are two types. The first type includes activities that contribute directly to the "technical core" of the organization and the second type includes activities that support the technical core. TP involves all behaviors that are directly relevant to main job functions and in short, is the proficiency of activities that formally are recognized as part of workers "job" (Borman and Motowidlo, 1993).

Borman and Motowidlo (1993) define CP as an individual's performance, which maintain and enhances an organization's social network and the psychological climate that supports technical tasks. CP is comprised of interpersonal behaviors or actions that benefit the organization. Furthermore, they explained that CP includes activities that may not represent formal work tasks although they still make an important contribution to the effectiveness of an organization. This type of performance is often not written in a job description but it is considered to be an important component of JP. CP is behavior that contributes to the culture and climate of the organization. It is the context within which transformation and maintenance activities are carried out. CP consist the behavior of volunteering for extra work, persisting with enthusiasm, helping and cooperating with others, following rules and procedures and supporting or defending the organization (Motowidlo and Schmit, 1999). Borman&Motowidlo (1993), define CP as behaviors that shape the organizational, social and psychological context that serve as catalyst for task activities and processes.

### **Job Satisfaction**

According to the literature, there are various conceptualizations of JS. Most researchers conceptualize it as cognitive, affective and evaluative reactions. Locke (1976) defines JS as a pleasurable or positive emotional states resulting from the appraisal of one's job or job experience. JS is a result of employee's perception of how well their job provides those things that are viewed as important. According to Henne and Locke (1985), JS is an emotional response to a value judgment by an individual worker. If his job values are perceived as being fulfilled, he will experience the pleasurable emotions of satisfaction; if they are perceived as being frustrated, he will experience the unpleasurable emotion of dissatisfaction. The intensity of these emotional reactions will depend on the importance of the values whose fulfillment is being facilitated or frustrated by the work experience.

Some researchers define JS in terms of feeling, attitudes and beliefs. Robbins (2000) defines JS as a subjective measure of worker attitudes, that is, an individual's general attitudes to his or her job. A person with high JS holds positive attitudes towards the job and one who is dissatisfied with, has negative attitudes toward it. George and Jones (1996) define it as "the collection of feeling and beliefs that people have about their current jobs. Ivancevich and Mattson (2005) defines JS as an attitude that individuals have towards their jobs which stems from their perception of their jobs and the degree to which there is a good fit between the individual and the organization.

### **Organizational Commitment**

OC researchers can be divided into two major camps, those who view OC as an attitude and those who view it as behaviors (Meyer and Allen, 1991). They regard attitudinal commitment as the way people feel and think about their organizations. That is the employee attitude that reflects the nature and quality of the linkage between an employee and an organization. Behavioral commitment reflects the way individual have become locked into the organizations.

According to Poter et al., (1984) an attitudinal perspective refers to the psychological attachment or Affective Commitment (AC) formed by an employee in relation to his identification and involvement with the respective organization. They further explain this as "an attachment to the

organization, characterized by intention to remain in it, identification with the values and goals of the organization, and a willingness to exert extra effort on its behalf.” It is considered to be the linkage between the individual employee and the organization because of individuals consider the extent to which their own values and goals related to that of the organization as part of OC.

Behavioral perspectives of OC is explained under the side bet theory (Becker, 1960) Side bets theory refers to the accumulation of investments valued by the individual which would be lost if she or he were to leave the organization (Becker, 1960). According to this theory individuals are committed to the organization as far as they hold their positions, irrespective of the stressful condition they experience. However, if they have been given alternative benefits, they will not to leave the organization. Mowday, Poter and Steers (1982) support the Becker’s view and describe OC as a behavior relating to the process by which individuals become locked in to a certain organization.

Mayer and Allen (1990) viewed OC as multidimensional concept. They proposed a Three-Component Model, including: Affective Commitment (AC), continuance commitment (CC), and normative commitment (NC). AC refers to the employee’s emotional attachment to, identification with, and involvement in the organization. CC refers to commitment based on the costs that the employee associates with leaving the organization due to the high cost of leaving. NC refers to an employee’s feeling of obligation to remain with the organization based on the employee having internalized the values and goals of the organization.

### **Job Satisfaction, Organizational Commitment and Job Performance**

Previous research has devoted a great deal of attention to the relationship between JS and JP. Locke (1970) ,Jaffaldano&Muchinsky (1985), Abedel-Halim (1980), Parasuraman and Futrell (1983) ,Rao (2000), Judge et al., (2001) , Sullivan and Bhaget (1992), Petty, McGee &Cavender (1984). Many studies revealed strong correlations between JS and OC. Poter& Steers (1973),Chen(2007),Clark & Larkin(1992),Mathieu and Zajac, (1990),Mathieu and Hamel (1989),Benkhoff (1997),Price and Mueller (1981),Iverson and Roy (1994),Yousef (2000),Samad (2005),Taunton et al.,(1989),Williams and Hazer (1986).Previous research have studied the relationship between OC and JP and found positive relationship.Riketta (2002), Matheiu&Zajac (1990), Baugh and Roberts(1994),Meyer & Allen ( 1997) ,Randall (1990), Rao (2000), Mowday et al., (1982), Mitchell & Larson (1987), Keller (1997), Brett et al., (1995),Ward and Davis (1995).Based on these empirical evidences, the following hypotheses are formulated.

H1: There is a positive relationship between JS and JP of non-managerial employees in the commercial banks.

H2: There is a positive relationship between JS and OC of non-managerial employees in the commercial banks.

H3:There is a positive relationship between OC and JP of non-managerial employees in the commercial banks.

H4: OC mediates the relationship between JS and JP of non-managerial employees in the commercial banks.

## **RESEARCH METHODOLOGY**

### **The research design**

The current study employed a correlational research design in order to explore the relationship between non-managerial employees' JS (independent variable) and non - managerial employees' JP (dependent variable). OC is the mediating variable. This field study is conducted in natural environment in banking sector under non-contrived settings. The unit of study is individual.

### **Population and Sample**

The population of this study is all the permanent non - managerial employees who work in Systemically Important Banks (highly performed commercial banks) in Sri Lanka. The sample for this study was randomly selected 400 non - managerial employees employed in Systemically Important Banks.

### **The sampling method**

Firstly, The Systemically Important Banks (SIBs) - Bank of Ceylon, Peoples Bank, Commercial Bank, Hatton National Bank, Sampath Bank and Seylan Bank- were selected. The convenient sampling method is used to select the branches of the bank which was situated in Colombo, Kurunegala and Anuradhapura. Then, with the consultation of the branch manager, four permanent non-managerial employees were selected in random basis.

### **Measures**

Non - managerial employees' JP was the dependent variable and JS of the non-managerial employees is the independent variable of this research. OC of non-managerial employees is the mediating variable. These variables were measured using a questionnaire which was originally developed by the researcher. The questionnaire was separated into three sections for demographic data, work related attitudes (JS & OC) and JP. Six questions were included to get the demographic information. The JP was measured including 19 questions under two dimensions (Task performance and Contextual performance). Under the work related attitudes, the level of JS and OC of the non - managerial employees in the banking sector were tested. 16 questions were used to measure the JS under six dimensions (Work itself, pay, promotion, supervision, coworkers and working condition). Nine questions were included to test the OC of the non-managerial employees under two dimensions (Willingness to display effort and Desire to belong to the organization). The total questions were 50.

### **Validity and Reliability**

The questionnaire which was prepared for non-managerial employees consists of 03 instruments (JS, OC and JP). All these instruments have been developed after correctly identifying the relevant dimensions and indicators. Therefore, it can be assured that the instrument has content validity. In developing OC instrument, Affective OC Scale, which was created by Meyer, Allen and Smith (1993), OC questionnaire, created by Meyer, Allen (1997) were considered. When developing JP questionnaire, Motowidlo and Van Scotter's (1994) 15 items scale of OCB and Task and Overall performance scale of Borman, and Ackerman (1994) were considered.

**TABLE 01 - ALPHA VALUE FOR TEST RETESTS RELIABILITY**

Variables	Alpha value
Job Performance	0.87
Job Satisfaction	0.90
Organizational Commitment	0.74

It can be concluded that the instruments possesses high test retest reliability as there is a significant high correlation between the responses of the two administrations.

The table 02 shows the Cronbach coefficient alpha for each instrument. According to the data, each item is correlated with other item across the entire sample and the internal consistency reliability is satisfactory.

**TABLE 02 - CRONBACH COEFFICIENT ALPHA VALUE FOR INTERNAL CONSISTENCY**

Variables	Alpha value –range
Job Performance	0.91
Job Satisfaction	0.90
Organizational Commitment	0.73

### Methods of data analysis

The data analysis included univariate, bivariate and multivariate analyses. Collected data were analyzed using the SPSS data analysis package.

### Results

The results of the univariate data are given in table 03. According to the data, the level of JS is in high level among the non-managerial employees who work in banking sector. The JP and OC are at moderate level.

**TABLE 03- THE RESULTS OF UNIVARIATE ANALYSIS**

	Mean	Std. Deviation
Job Satisfaction	3.50	0.57
Organizational Commitment	3.01	0.52
Job Performance	3.00	0.39

**TABLE 04- CORRELATION COEFFICIENT BETWEEN INDEPENDENT AND DEPENDENT VARIABLES**

Variables	1	2	3
1. Job Satisfaction	-		
2. Organizational Commitment	0.32(**)	-	
3. Job Performance	0.31(**)	0.67(**)	-

\*\* Correlation is significant at the 0.01 level.

**TABLE 05 - RESULTS OF SIMPLE REGRESSION ANALYSIS**

	<b>JS &amp; JP</b>	<b>OC &amp; JP</b>	<b>JS &amp; OC</b>
R Square	0.134	0.381	0.057
Adjusted R Square	0.131	0.379	0.055
F Value	15.913	155.52	24.15
Significance	0.00	0.00	0.00
$\beta$	0.127	0.398	0.220

Table 05 presents the results of the regression analysis. According to the table, JS and OC have significantly and positively correlated to JP whereas JS has also significantly and positively correlated to OC.

**TABLE 06- REGRESSION ANALYSIS OF ORGANIZATIONAL COMMITMENT MEDIATING JOB SATISFACTION-JOB PERFORMANCE RELATIONSHIP**

	<b>Step 01</b>	<b>Step 02</b>
Job Satisfaction $\beta$	0.127(**)	0.042
Organizational Commitment $\beta$	-	0.387(**)
R	0.184	0.533
R <sup>2</sup>	0.034	0.284
F value	13.91	139.05

\*\* Correlation is significant at the 0.01 level.

According to the results of table 06, the introduction of OC in the analysis reduces the impact of JS. The  $\beta$  has dropped from 0.13 ( $P < 0.01$ ) in step 01 to 0.04 in step 02. OC remains a significant predictor in the last analysis. ( $\beta = 0.39, P < 0.01$ )

## DISCUSSION

The objectives of this study were to investigate the mediating effect of OC on the relationship between JS and JP of the non-managerial employees in the commercial banks in Sri Lanka and to identify the relationships of JS and JP, JS and OC, OC and JP of the non-managerial employees in the commercial banks in Sri Lanka. For this purpose, four hypotheses were formulated.

By considering the hypothesis one, the results of correlation coefficient and regression analysis indicated that JS of the non-managerial employees has positively and significantly correlated to their JP. The second hypothesis was that there was a positive relationship between JS and OC. It was confirmed that the relationship between JS and OC of non-managerial employees in the commercial banks has significantly and positively correlated. There is statistical evidence to accept the third hypothesis which was formulated in this study. The OC of the non-managerial employees has significantly and positively correlated to JP. It was the strongest correlation among the variables. It has significantly explained 38.1 % of the variance in job performance. Furthermore, the researcher formulated a hypothesis to investigate the mediating effect of OC on the relationship between JS and JP. For this purpose, the three steps which were recommended by Baron and Kenny in 1986 were used. According to these authors, the first, the mediator

should be predicted by the independent variable. Table 05 already showed that OC can be predicted by the JS. The Second, the dependent variable should be predicted by the mediator and the independent variable. The results in table 05 showed that JP can be predicted by JS and OC. The data suggested that there is an evidence for the first and second steps of Baron and Kenny's procedure. Last, the dependent variable should be regressed on the independent variable, controlling for the mediator. According to the results of table 06, the introduction of OC in the analysis reduces the impact of JS .The  $\beta$  has dropped from 0.13 ( $P < 0.01$ ) in step 01 to 0.04 in step 02. OC remains a significant predictor in the last analysis. ( $\beta = 0.39, P < 0.01$ ). Therefore, according to Baron and Kenny (1986), it can be assumed that there is a full mediation in this case. Thus, the final hypothesis can be accepted.

## CONCLUSION

Based on the results of the study, it can be concluded that there is a full mediating effect of OC of the non-managerial employees on the relationship between JS and JP of the non-managerial employees. In addition to that, the correlation between OC and JP is stronger than the correlations between JS and JP, JS and OC. Therefore, the strategists in the banking sector have to consider this scenario when they are formulating strategies regarding their human capital.

**THE MECHANISM FOR INCREASING THE SOCIAL ENGAGEMENT OF STUDENTS IN THE PROCESS OF TEACHING ENGLISH (ON THE EXAMPLE OF THE PROCESS OF PREPARING FUTURE ECONOMISTS)**

**Pulatova Ziyoda Abdumalikovna\***

\*Senior Teacher of the “English language”,  
Department in Tashkent State University of Economics,  
UZBEKISTAN

**ABSTRACT**

*The increasing importance of English as an international language has resulted in the expansion of one particular aspect of English Language Teaching, namely the teaching of English for Specific Purposes. This relatively new aspect of English Language Teaching has its basis in an investigation of the purposes of the learners and the set of communicative needs arising from those purposes. Consequently, the aim of this study is to offer some immediately accessible guidelines into teaching English to students in Economics.*

**KEYWORDS:** *Learning Styles, Needs Analysis, Teaching English, Student Of Economics, Mechanism, Social Engagement.*

**INTRODUCTION**

English is the most-spoken language in the world. If you're reading this article, you may be one of the 379 million native English speakers, or one of the 753 million people who speak it as a second language and a lot of people know the language.<sup>1</sup> This indicates the amazing success of English as the lingua franca of economics, travel and worldwide relations. The relative ease with which English can be picked up (especially compared with Chinese) and the outstretched soft power of US culture means that English will proceed to dominate the world stage for the expected future.

When teaching English for economics, the connection between content, general vocabulary and specialized terminology is obvious. Therefore, finding interesting texts concerning the latest information in this field, meeting the challenging and changing needs and expectations of the learners, using eclectic teaching methods and techniques adapted to the students' learning strategies can lead to successful English classes.<sup>2</sup>

The best effects of teaching English language for future economists, especially by this book should be reflected in the personal development and professionalism of graduates, who will be competent with a good language command in the world market and science arenas. They will be active at learning news consistently, studying new forms of research, reading professional literature, writing specialized articles, making presentations, and leading research teams. Furthermore, it is important to mention that all measures and actions of organizing ESP (English for Specific Purposes) - courses are performed for developing students comprehension, thinking, dialoguing in English strategies and, of course, to reach the best levels of practicing owned knowledge and skills in their further specialized and research activities as modern specialists with independent English communication. Providing economic students with specific knowledge and skills, especially English for Economists will contribute to their further completion and make them professionally capable to work in possible fields.

Motivation is an important part of learning. Students, contrary to young learners who can study for the sake of a good grade or other indirect rewards, put forth sustained efforts for some other goals than the express enjoyment of the activity itself. Internal and external factors that promote learners' reasons for learning are challenges and promotions at work, claims for English literacy, overseas tasks and trips, workshops and conferences in English, welcoming foreign visitors, professional differentiation and specialization, e-communication. Besides, students have accurate, personality reasons for being in an economics course and learning English.

### **Learning styles**

Students may be grouped according to their preferred learning styles. Using multiple learning methods for learning is a comparatively new approach to teaching. Differences in cognitive styles impact learners' priorities for a separately approach to learning. Discipline styles are 'specific actions taken by the learner to make learning easier, faster, more enjoyable, more self-directed and more transferable to good positions.

The activities referred below are part of the methodology used for designing a lesson scheme based on the concept and term "crypto currency", and aimed at teaching business English. The objectives pursued by the teaching staff could be: teaching specialized vocabulary, developing students' reading, listening, speaking and listening skills through audio-visuals (video, online dictionaries, online learning platforms – if applicable, a variety of teaching resources provided by British Council. Teaching English - <https://www.teachingenglish.org.uk/resources/adult>

Introducing new vocabulary.

The teacher shows the students different kinds of currency (for example, bitcoin/Ripple/Ethereum) and provides their definition alternative to this technique could be the "flipped learning", a learner-centered approach, with topics explained in greater depth, with information conveyed before the English class. The website <https://www.incomeninjas.com> provides valuable information about this kind of digital money. The paragraphs can be used in very different ways, depending on the language skills considered by the teacher. The experience of planning and designing an appropriate course in English that suits students in Economics can be very challenging, as teachers are often faced with various complexities and problems. Traditionally, the first interpretation was widely used and accepted.

Training strategies in teaching English to students in Economics

One of the important goals in learning a foreign language is to develop the skill of listening comprehension. Listening activities often prove to be time-consuming. After listening to some passage, most of the students usually make complaints about all being too fast or different students recall the passage differently. Every individual student has his or her own specific purpose for learning Economics in English.<sup>3</sup> A needs analysis is an essential starting point in teaching students, as teachers cannot really address a student's specific needs unless they are absolutely clear about what they are. A successful English language course for students in Economics is one that is learner-centred and helps to meet the foreign language needs of the learners.

**In the Conclusion**, a method is a way of teaching. The choice of a method is dependent on the teacher's approach, namely what he/she believes about how people learn or how teaching helps people learn. Any teacher then has to make methodological decisions about the course aims, the teaching techniques, the type of activities, the methods of assessment. Despite the various methods that could be approached by language teachers, many of them nowadays do not follow one single method. Over the years, they develop a personal methodology, built from their own selection of what they consider to be the best and most appropriate of what they have learnt about. There are individual preferences regarding how students like to communicate and learn. A complete repertoire of teaching and learning approaches improves learning. Students who approach the learning process with a wide range of strategies have more options available for meeting expectations. It is obvious that well-known methods can be accompanied by new ones, which can get students motivated and interested in the subject, join peers to fulfill tasks, solve problems, contribute with ideas and their creativity, produce portfolios and, most importantly, enjoy learning business English in a comfortable, encouraging, stress-free environment. The mechanism for increasing the social engagement of economist's students in the process of teaching Learning English depends on their movement, interest and motivation. These methods are really useful for learning English economists students.

### ABSTRACT

*The problem of searching for hidden patterns in a sample of objects described by the initial and combined features is considered. The knowledge obtained on the basis of dividing the values of quantitative attributes into intervals is presented in the form of a set of fuzzy inference rules. The methodology of using these rules for decision making is described.*

**KEYWORDS:** *Hidden Patterns, Latent Features, Domination Intervals, Partition Stability, Fuzzy Inference Rules.*

### INTRODUCTION

Regularities are relationships (explicit and hidden) between properties (features) of objects. One of the ways to identify patterns is to divide the values of quantitative features into intervals and search for patterns by them [1, p. 19; 2, pp. 217-225].

In [3, p.310], a method is described for the preliminary analysis of training information, based on finding an informative zone in the training material (such sub-descriptions (or fragments of descriptions) are considered informative if they allow one to distinguish objects from different classes or distinguish a given object from all objects that do not belong to the same class. as considered) and typical for their classes of objects (the most representative).

---

## THE MAIN FINDINGS AND RESULTS

The search for informative zones is based on the use of the apparatus of discrete mathematics, in particular, Boolean algebra, the theory of disjunctive normal forms, the theory of coverings of Boolean and integer matrices. So, in the estimation algorithms developed by Y.I. Juravlev and his students, estimates of ensembles of features are found considered in [4, p. 916; 6, pp. 32-40], which are generalizations of the coefficients of information content.

It is possible to introduce taxonomy into the division of features into intervals - statistical methods for dividing features into equal or unequal intervals. The methods of partitioning into equal intervals include histograms, dicyclic partitioning and so forth. In [7, p. 447], the criterion for partitioning into intervals is based on the analysis of the probability distribution density.

In many procedures of statistical data analysis, the percentage distribution for a certain characteristic is used relative to another indicator. The distribution of the ordered characteristic values into intervals is made on the basis of certain criteria. For example, the Gini coefficient [8, p. 403] was originally defined as a statistical indicator of the degree of stratification of society in a given country or region in relation to any studied attribute. The value of the coefficient changes from 0 to 1. The closer this value is to zero, the more evenly the indicator is distributed.

Most often in modern economic calculations as in [9, pp. 67-70], the Gini index is used as an indicator of the discriminating ability of the classifier in solving the problem of classifying bank customers.

In [7, p. 447], an algorithm for extremal division of attribute values into gradations is presented. The principle that the algorithm implements is as follows: it is necessary to split the parameter values into a finite number of gradations so that the uncertainty (entropy) estimate when classifying using this feature is minimal (or close to minimal). At the beginning, the interval of values of the feature is divided into a sufficiently large number ( $\tau$ ) of gradations, and then by "gluing" adjacent gradations (thereby reducing the number of gradations  $\tau$ ) to achieve the minimization of entropy with respect to  $\tau$ . Then, among the remaining gradations  $\tau - 1$ , two adjacent ones are "glued together" in order to minimize entropy, and so on. The disadvantage of this algorithm is the absence of a criterion for constructing the boundaries of intervals, the initial partitioning is performed in an intuitive way and the final partition is locally optimal.

In [10, p. 33], the main problems of methods of searching for logical patterns in data were identified and analyzed. A common problem for traditional methods is the "first step" problem (feature segmentation). The well-known algorithms for finding *if-then* rules make a mistake at the very beginning of their work, using heuristic assumptions during segmentation to limit further enumeration. In the author's abstract of V. A. Dyuk's doctoral dissertation [10, p. 33], the thesis is substantiated that the first step in the operation of an algorithm claiming a "high result" should be the smallest possible (taking into account the available computing power) partition of the initial features into intervals.

In [11], it is proposed to search for informative regularities through the generation of a family of predicates by an arbitrary feature.

### Formulation of the problem

A sample of objects  $E = \{S_1, \dots, S_m\}$  is given that contains representatives of 2 disjoint classes  $K_1$  and  $K_2$ . The description of objects is made using a set of features of different types  $X(n) = (x_1, \dots, x_n)$ , of  $n$  diverse traits,  $\xi$  of which measured in interval scales,  $n - \xi$  – measured in nominal.

To search for patterns by sets of latent features in the description of sample objects, you need to perform the following action:

- the sequence of values of the initial and combined quantitative characteristics, in the description of classified objects of the sample, split into intervals;
- calculate the stability of the partitioning into intervals;
- Presentation of the revealed patterns by the intervals of partitioning of the initial and combined features in the form of fuzzy inference rules.

Latent (clearly unmeasured) features for describing the objects of the sample can be obtained through the use of linear arithmetic operations on the original quantitative features, or in the form of generalized estimates of objects for subsets of features [12, pp. 1-10].

Consider a variant of constructing latent features using arithmetic operations. The latent feature  $x^*$  is calculated as:

$$x^* = x_i \odot x_j,$$

where  $i \neq j, 1 \leq i, j \leq n, i, j \in I, \odot = \{*, / \}$ .

New knowledge on a latent feature is revealed when comparing its properties with respect to the original features from which it is synthesized.

**Division into intervals according to the criterion of dominance of class representatives.** A method is proposed for calculating disjoint intervals of quantitative features, within the boundaries of which the values of certain classes dominate [13, pp. 35-40; 15, p. 72].

Ordered set of values of a quantitative characteristic  $x_j$ :

$$r_j = r_{j_1}, \dots, r_{j_p}, \dots, r_{j_m} \quad (1)$$

According to the criterion defined below, an ordered sequence of the form (1) is divided into disjoint intervals  $[r_{c_u}, r_{c_v}]^i, 1 \leq u, u \leq v \leq m, i = \overline{1, \tau_c}$ .

$d_t^i(u, v)$  - number of class  $K_t$  representatives, in interval  $[r_{c_u}, r_{c_v}]^i$ . For the recursive procedure for selecting values  $r_{c_u}, r_{c_v}$  the criterion is used:

$$\left| \frac{d_1^i(u, v)}{|K_1|} - \frac{d_2^i(u, v)}{|K_2|} \right| \rightarrow \max. \quad (2)$$

Let's denote by  $\eta_{1i} = \frac{d_1^i(u, v)}{|K_1|}$ ,  $\eta_{2i} = \frac{d_2^i(u, v)}{|K_2|}$  results of optimal partitioning according to (3) for each interval  $[r_{c_u}, r_{c_v}]^i$ ,  $i = \overline{1, \tau_c}$ .

**Pic. 1. Splitting into intervals of dominance of the values of the  $c$  feature**

Dominance is quantitatively expressed through the  $f_{ci} \in (0.5, 1]$  class of  $K_l, l = 1, 2$  membership function. The value of the membership function of the  $c$  attribute to the  $K_1$  interval  $[r_{c_u}, r_{c_v}]^i$  is defined as:

$$f_{ci} = \frac{\eta_{1i}}{\eta_{1i} + \eta_{2i}}. \quad (3)$$

An additional alternative for ranking by  $K_l, l = 1, 2$  with an equal number of intervals is the stability of the feature values by the membership function, which is calculated as:

$$U(c) = \frac{1}{m} \sum_{\{[r_{c_u}, r_{c_v}]^i\}} \begin{cases} f_{ci}(v-u+1), & f_{ci} > 0.5, \\ (1-f_{ci})(v-u+1), & f_{ci} < 0.5, \end{cases} \quad (4)$$

expresses the degree of homogeneity (non-displacement) of the values of the  $c$  attribute of objects within the boundaries of the intervals of dominance determined by (2). If (ideally) the values of the attribute of one class lie within the boundaries of the intervals, then it is  $U(c) = 1$ .

### Computational experiment

For the experiment, a sample of "Echocardiogram" data from [16] was taken, describing the condition of patients who had a heart attack. The sample consists of 108 objects, of which 74 belong to the class (the patient died within 1 year), 34 to  $K_2$  (the patient survived or died after 1 year).

Each object is described by sets  $X(10) = (x_1, \dots, x_{10})$ , containing 8 quantitative features ( $x_1 = \langle \text{survival} \rangle$ ,  $x_2 = \langle \text{wall-motion-score} \rangle$ ,  $x_3 = \langle \text{eps} \rangle$ ,  $x_4 = \langle \text{age-at-heart-attack} \rangle$ ,  $x_5 = \langle \text{lvdd} \rangle$ ,  $x_6 = \langle \text{wall-motion-index} \rangle$ ,  $x_7 = \langle \text{fractional-shortening} \rangle$ ,  $x_8 = \langle \text{mult} \rangle$ ) and 2 nominal ( $x_9 = \langle \text{alive-at-1} \rangle$ ,  $x_{10} = \langle \text{pericardial-effusion} \rangle$ ).

Dividing into intervals of dominance of the values of quantitative features in the description of objects is a way to reveal hidden patterns. Table 1 shows the number of intervals of dominance of quantitative features and their boundaries for the sample.

**TABLE 1. CHARACTERISTICS OF THE INTERVALS OF DOMINANCE OF THE VALUES OF THE INITIAL QUANTITATIVE CHARACTERISTICS**

Attribute	Boundaries of intervals [u, v] by (3)	The value of the membership function (4)	Stability of the trait by intervals (5)
$x_1$	[0.25, 10]	0.05	0.86
	[12, 57]	0.82	
$x_2$	[7.5, 8]	0.13	0.69
	[9, 14.5]	0.68	
	[15, 39]	0.33	
$x_3$	[11, 40]	0.36	0.67
	[0, 10.3]	0.69	
$x_4$	[35, 64]	0.63	0.65
	[65, 86]	0.3	
$x_5$	[2.32, 2.32]	1	0.68
	[3, 3]	0	
	[3.1, 4.55]	0.72	
	[4.56, 6.73]	0.37	
	[6.74, 6.74]	1	
$x_6$	[1, 1.3]	0.71	0.7
	[1.31, 3]	0.31	
$x_7$	[0.01, 0.24]	0.37	0.7
	[0.25, 0.61]	0.81	
$x_8$	[0.28, 0.57]	0.28	0.68
	[0.59, 0.81]	0.6	
	[0.86, 0.93]	0.31	
	[0.93, 1]	0.87	

From Table 1, one can distinguish relatively strongly pronounced patterns in the belonging of objects to classes (in the particular case to  $K_1$ ), for signs  $x_1$  in the interval [12.57] with a

membership function value of 0.82 and  $x_7$  in the interval [0.25, 0.61] with a membership function value of 0.81 s stability of objects in the intervals of 0.86 and 0.7, respectively. If the boundaries of the intervals coincide (for example, as for  $x_2$  - [5.5, 5.5]), then objects with such a value require additional checking for anomalies.

**TABLE 2. INTERVALS OF DOMINANCE OF VALUES OF LATENT QUANTITATIVE FEATURES (FRAGMENT)**

Combination of signs	Boundaries of intervals [u, v] by (3)	The value of the membership function (4)	Stability of the trait by intervals (5)
$x_1 / x_4$	[0, 0.13]	0.02	0.85
	[0.15, 1]	0.83	
$x_4 / x_1$	[1, 6.6]	0.83	0.87
	[7.7, 344]	0	
$x_1 * x_8$	[0.18, 7.14]	0.02	0.87
	[8.12, 52.16]	0.83	
$x_1 * x_5$	[1.21, 42.3]	0.03	0.88
	[52.6, 280.9]	0.83	
$x_1 / x_5$	[0.05, 4]	0.13	0.84
	[4.07, 16.38]	0.93	
$x_5 / x_1$	[0.06, 0.25]	0.94	0.82
	[0.252, 20.8]	0.14	
$x_2 / x_7$	[21.31, 56]	0.77	0.64
	[60.53, 3900]	0.38	
$x_7 * x_8$	[0.01, 0.04]	0.28	0.64
	[0.05, 0.17]	0.68	
	[0.19, 0.35]	0.76	
	[0.38, 0.38]	0	
$x_7 / x_2$	[0, 0.02]	0.38	0.67
	[0.021, 0.05]	0.77	
$x_8 / x_7$	[3.49, 92.8]	0.38	0.56
	[0.94, 3.45]	0.67	

Table 2. A subset of combined (latent) features with high values according to the criterion of the type:

$$\frac{U(i)}{P(i)} \rightarrow \max,$$

where  $U(i)$  is the stability of objects in the intervals of dominance by the  $i$  attribute,  $P(i)$  is the number of intervals when dividing the  $i$  attribute.

In table 2 there are examples of combined features with both “improved” property indicators and “deteriorated” ones. For example,  $x_1$  in 2 intervals, had a stability of 0.86 and  $x_8$  in 3 intervals, had a stability of 0.65 when their combination of the form  $x_1 * x_8$ , the latent feature is divided into 2 intervals of dominance with object stability 0.87. On the other hand, the combination of features  $x_7$  with 2 intervals of dominance with a stability of 0.7 and  $x_8$  with 4 intervals of

dominance, with a stability of 0.68 with their combination of the form  $x7 * x8$  is divided into 4 intervals of dominance with a stability of 0.64.

The patterns revealed during the experiment (see Tables 1-2) can be described using fuzzy inference formalisms [17, pp. 338-353; 18] and linguistic variables. For example, according to the tables 1 and 2, it is possible to compose a set of fuzzy inference rules about the belonging of an object to a class of the form

*If A then B ('coefficient of confidence'),*

where 'coefficient of confidence' is the coefficient of confidence to the conclusion B if condition A.

Fragment of the list of rules for displaying table 1:

$P_{11}$ : *If  $x1 \in [0.25, 10]$  then  $S \in K_1 (0.05)$ ;*

$P_{12}$ : *If  $x1 \in [12, 57]$  then  $S \in K_1 (0.82)$ ;*

$P_{13}$ : *If  $x2 \in [7.5, 8]$  then  $S \in K_1 (0.13)$ ;*

$P_{14}$ : *If  $x2 \in [9, 14.5]$  then  $S \in K_1 (0.68)$ ;*

$P_{15}$ : *If  $x2 \in [15, 39]$  then  $S \in K_1 (0.33)$ ;*

$P_{16}$ : *If  $x3 \in [11, 40]$  then  $S \in K_1 (0.36)$ ;*

$P_{17}$ : *If  $x3 \in [0, 10.3]$  then  $S \in K_1 (0.69)$ ;*

...

Fragment of the list of inference rules according to Table 2:

$P_{21}$ : *If  $x1 / x4 \in [0, 0.13]$  then (0.02);*

$P_{22}$ : *If  $x1 / x4 \in [0.15, 1]$  then (0.83);*

$P_{23}$ : *If  $x1 * x8 \in [0.18, 7.14]$  then  $S \in K_1 (0.02)$ ;*

$P_{24}$ : *If  $x1 * x8 \in [8.12, 52.16]$  then  $S \in K_1 (0.83)$ ;*

$P_{25}$ : *If  $x7 / x2 \in [0, 0.02]$  then  $S \in K_1 (0.38)$ ;*

$P_{26}$ : *If  $x7 / x2 \in [0.021, 0.05]$  then  $S \in K_1 (0.77)$ ;*

You can use a measure of confidence of the form

$$M\mathcal{D}[h : e1, e2] = M\mathcal{D}[h : e1] + M\mathcal{D}[h : e2] (1 - M\mathcal{D}[h : e1]), \quad (6)$$

which is interpreted as “a measure of confidence in an event  $h$  with evidence  $e_1$  and equal to the measure of confidence in an event  $h$  with evidence added to a mixed measure  $e_2$  of confidence in an event  $h$  with evidence  $e_2$ ” [19]. This measure is used to assess the credibility of an event with an increase in the number of evidence. This can be demonstrated with the following example. If, in the process of inference, the sending of the rules  $P_{11}$  and  $P_{17}$  are executed (see the list above), then the measure of confidence in the event takes the form

$$M\mathcal{D}[\langle\langle S \in K_1 \rangle\rangle : x_1 \in [0.25, 10], x_3 \in [0, 10.3]] = M\mathcal{D}[\langle\langle S \in K_1 \rangle\rangle : x_1 \in [0.25, 10]] \\ + M\mathcal{D}[\langle\langle S \in K_1 \rangle\rangle : x_3 \in [0, 10.3]](1 - M\mathcal{D}[\langle\langle S \in K_1 \rangle\rangle : x_1 \in [0.25, 10]]).$$

Substituting the confidence coefficients from the rules, we get

$$M\mathcal{D}[\langle\langle S \in K_1 \rangle\rangle : x_1 \in [0.25, 10], x_3 \in [0, 10.3]] = 0.05 + 0.69 * (1 - 0.05) = 0.706.$$

If there are more than two evidences in favor of an event, the measure of confidence is computed in a cascade manner.

To interpret the results of inference in natural language, it is possible to assign a linguistic variable and a membership function to each feature [12, pp. 1-10; 13, pp. 35-40]. As an example, let us take the sign  $x_1$ , the value of which is the number of months that have passed since the patient has a heart attack. The linguistic variable for attribute  $x_1$  can be defined as follows:

$\beta_1$  – “Number of months after a heart attack”;  $T_1 = \{ \text{“Big enough”, “Very small”} \}$ ;  $X_1 = [0.25, 57]$ ;  $G_1 - \beta_1$  – expanded set of new values of the linguistic variable  $\{ \text{“Very small”, “Small”, “Normal”, “Good”, “Large”, “Large enough”} \}$  (see Table 6).

**TABLE 6. THE SET OF VALUES OF THE LINGUISTIC VARIABLE  $\beta_1$**

Survival interval by $x_1$ (survival)	$T_1 \cup G_1(T_1)$
[0,25..1)	<i>Very small</i>
[1..3)	<i>Small</i>
[3..7,5)	<i>Normal</i>
[7,5..12)	<i>Good</i>
[12..24)	<i>Large</i>
[24..57]	<i>Large enough</i>

The tabular form of setting the values of the linguistic variable and their membership functions  $f_c(i)$  to the  $K_1$  class presented in Table. 7.

**TABLE 7. TABULAR REPRESENTATION OF THE LINGUISTIC VARIABLE**

The value of the membership function $f_c(i)$	Linguistic variable values
[0..0,2)	<i>Practically absent</i>
[0,2..0,35)	<i>Small</i>
[0,35..0,5)	<i>Tangible</i>
[0,5..0,7)	<i>Sensitive</i>
[0,7..0,85)	<i>Strong</i>
[0,85..1]	<i>Very strong</i>

## CONCLUSION

A method is proposed for revealing hidden patterns from databases based on dividing feature values into non-intersecting intervals. The revealed knowledge on making decisions about the belonging of the sampled objects to the classes is presented in the form of a set of fuzzy inference rules. A method for calculating the membership function in fuzzy rules is described. A decision-making mechanism is proposed by calculating the confidence measure of an object's belonging to a class according to fuzzy inference rules.

A methodology for mapping the values of the membership function to the values of a linguistic variable is proposed for the purpose of interpreting knowledge.

Decision-making on the classification of an arbitrary admissible object can be made if it does not have measured values for some of the features.

**ABSTRACT**

*This article examines the content, essence, role of startup projects in the development of an innovative economy. The study also analyzes the conditions for the formation and development of startup on the example of developed and developing countries. As the authors of the report note, the difference between the most innovative companies and the companies lagging behind in this aspect lies in the degree of activity of searching for developments from third parties. In other words, a startup is a business, but not every business can be recognized as a startup. A business, as a rule, uses a ready-made business model, receives loans for the implementation of an entrepreneurial idea with subsequent payment of interest.*

**KEYWORDS:** *Competition, Innovation, Startup, Investment, National Economy, Innovative Development, Ecosystem, Venture, Stages of Financing.*

**INTRODUCTION**

Modern realities of the development of the world economy are characterized by the fact that the country's competitive advantage is closely correlated with its innovativeness: knowledge reflected in innovative products or processes is today the main capital in society that contributes to economic growth and an increase in the country's living standards [1]. Building an innovation ecosystem is unthinkable without the development of innovative entrepreneurship in the form of start-ups - innovative companies with a short history of operating activities.

The term “startup”, which means “the beginning of the process” or “start”. Initially, this concept appeared in 1939 in Silicon Valley and is associated with the names of two graduates of Stanford University, who were the creators of a startup company - Hewlett-Packard, which later became a pioneer in information technology and solutions. Now the word “startup” is familiar to almost

every Internet entrepreneur who has decided to implement his grandiose business project [2, pp. 3946–3950].

In order to increase the competitiveness of the national economy of the Republic of Uzbekistan, the transition to an innovative way of development seems relevant; knowledge applied in innovative products or processes is today the main capital in society, contributing to economic growth, improving the quality of life of the country's population. One of the largest consulting agencies The Boston Consulting Group in 2020 published its 14th annual ranking of the most innovative companies, which is based on a survey of more than 1,500 CEOs from around the world; they are such technology companies as Apple, Google, Amazon, IBM, Microsoft, Samsung and others. As the authors of the report note, the difference between the most innovative companies and the companies lagging behind in this aspect lies in the degree of activity of searching for developments from third parties. Leading companies manage 65% of new ideas through social media and big data analytics, while inactive innovators only 14%. According to researchers, it is the ability to find and obtain technology from outside parties and competitors that plays a fundamental role in the implementation of innovations [3].

### **THE MAIN FINDINGS AND RESULTS**

The practice of the world's leading economies shows that one of the levers providing this process are startups - innovative companies with a short history of operating activities [4]. The term “startup”, which means “the beginning of the process” or “start”, was introduced by the creator of the client development methodology, American entrepreneur S. Blank, who defined them as “temporary structures that exist to search for reproducible [5] and scalable [6] business models” [7]. According to E. Rees, a startup is an organization “creating a new product or service under conditions of high uncertainty” [8].

According to venture capitalist P. Graham, the main characteristic of startups is their rapid growth (5-7% per week in terms of the key indicator) [9]. It should be noted that most of the startups in the world are represented in the field of intelligent IT technologies; in particular, such technology companies as Yahoo, Google, Facebook, Uber, Amazon, etc. have received their conceptual development within the framework of start-up projects. At the same time, the technological nature of the business or the small age does not make the company a startup [10]; frequent use of the concept in the context of technology companies characterizes the role of technology in ensuring sustainable growth, but does not imply technological character as a mandatory characteristic of a startup [11].

Thus, a startup is innovative, often informational projects, created with the expectation of their rapid growth and, as a result, high capitalization;

- The main function is to simplify any actions for users in their daily life; the main goal of creating a startup is to sell it to a large corporation or to list its shares on the stock exchange and continue working as a separate company. The work of Start-up Genome and Grow Advisors to systematize knowledge about startups deserves high praise.

According to Grow Advisors [12], the startup ecosystem consists of the following components: ideas, inventions, and research; startups at different stages of development; entrepreneurs, members of start-up groups; Angel investors; startup trainers; startup consultants; other people with entrepreneurial abilities; other organizations that carry out startup activities. It also lists the

organizations and organizational arrangements associated with startups: universities; consulting and coaching organizations; incubators for startups; startup accelerators; co-working centers; service providers (consulting, accounting, legal, etc.); event organizers; selection at startup; investor relations; venture capital enterprises; reverse portals; other sources of funding (loans, grants, etc.); startup blogs and other business-related media; other elements of the environment.

Startup Genome [13] has been analyzing global startup ecosystems for several years, as evidenced by the fact that 4 reports were released in 2012, 2015, 2017 and 2018, respectively. The organization's research is based on the Startup Ecosystem Index, which is used to sort out startup ecosystems. This index is made up of specific parameters and components. The Startup Ecosystems Index (SEI) in 2015 consisted of 8 components that covered trends in startups, finance, company performance, talent, support infrastructure, entrepreneurial potential, ecosystem trends and differentiation, as well as the 2017 SEI 5 report presented in the form of components - the result, funding, market success, talent, and startup experience. The 2018 report used groups of metrics such as the thinking ability of the founder, local communication, the founder's know-how, and demographics for the assessment.

Each report presents the top 20 startup ecosystems in the world, including Silicon Valley, Berlin, Beijing, Singapore and Bangalore. Of particular importance is Silicon Valley, which is the cradle of the startup phenomenon and the most developed startup ecosystem in the world.

Comparison of approaches to American and European startup ecosystems shows the following:

- In the US, a liberal approach to bankruptcy prevails, which, in turn, impedes the development of motivation for startups. In Europe, on the other hand, bankruptcies or setbacks mean business interruptions and loss of talent, so projects with a potential capitalization of more than \$ 1 billion over the next 5 years could fail;
- The procedure for investing in the US is simple, while in Europe conservative investors need many reasons;
- In the US, students are preparing for business by opening start-ups, while in Europe; young people prefer to work in large corporations;
- In addition, Europeans are more willing to invest in their area of residence, while Americans do not consider it a priority, and instead may invest in other parts of the country, even in Europe.

In Asia, start-up ecosystems are characterized by rapid growth, although high growth is observed a little later. The largest and most promising startup ecosystems are Yekaterinburg, Shanghai, Bangalore and Tokyo, as well as China, Singapore, India and Japan.

Features of Asian startup ecosystems include:

- Active participation of the state in financing start-ups;
- Low operating costs: low wages, low rents, low tax rates;
- An active role of the public and private sectors in the implementation of innovative developments;

The situation is almost the same or has characteristics similar to Latin American startup ecosystems.

However, it is necessary to note the difference between a startup and a small business: as a rule, ordinary firms are based on relative certainty and predictability. The future of the new startup, however, is very uncertain - the new idea must find its application and target audience. As the entrepreneur N. Blumenthal notes, "a startup is a company aimed at solving a problem when the solution is not obvious and success is not guaranteed." In other words, a startup is a business, but not every business can be recognized as a startup. A business, as a rule, uses a ready-made business model, receives loans for the implementation of an entrepreneurial idea with subsequent payment of interest. In this case, the founder / and the firms remain its owners.

In a startup, on the other hand, "investments are attracted through" rounds of funding, "and with each round the owner's share is diluted. Thus, it turns out that the owner pays for future super profits with his share "[14]. Thus, the concept of a startup incorporates the interests of three parties: a business initiator offering an original idea;

a venture investor whose goal is to multiply the profit from investments, as well as a consumer who is interested in extracting maximum utility from the consumption of goods and services.

The concept of a startup proposed by S. Blank was aimed at developing a client development model based on testing a prototype of a future product on potential consumers. It consists of four stages, during which a startup is transformed into a stable company [15]:

1. "Customer identification", during which a startup builds hypotheses about how its product solves the problems of potential customers
2. "Verification of consumers", the stage of hypothesis testing and preparation of a sales plan, marketing strategy, search for early adopters of the company. In case of failure at this stage, the startup returns to identifying its customers.
3. "Attracting consumers", after confirming the usefulness of the company's product, the startup moves on to product sales and marketing investments.
4. "Creation of a company" - the ultimate goal of a startup, the creation of a formal structure of the company and business processes for further development [16].

Exploring the international experience in the formation of sources of funding for startups, it is necessary to note several possible investors, in particular:

1. 3F / FFF (from the English words family, friends, fools - literally "family", "friends", "madmen"), who have no investment experience, but are ready to invest in original ideas; bootstrap startup means raising only your own funds for development
2. Business angels; private investors who invest relatively small funds in projects have competencies and connections [17]
3. Venture funds - risky investment companies focused on working with innovative enterprises and startups; they assess the possible success of the project and finance projects
4. Crowd funding is a method of collective financing; a way to raise funds for a project using special Internet sites. It is based on voluntary contributions, which implies the interaction of a crowd funding platform (an Internet site for announcing crowd funding projects and fundraising) and directly those who finance a project or idea - donors who can receive material or non-material rewards.

It should be noted here that “crowd funding is quite diverse. In addition to gratuitous support or project support for a nominal fee, there is, among other things, crowd-investing, which is focused on micro-investment in startups with further benefits from the future cash flows of this company. Also, crowd funding differs from venture investment in a fundamentally different structure of the transaction itself. In this case, crowd-investing platforms act as intermediaries between micro-investors and startups. Such an intermediary implements all internal venture investment processes - from project verification to closing a deal. For its role in this process, the platform receives a commission (as a rule, no more than 10% of the amount of the completed transaction). In addition, platforms often set a minimum threshold for a transaction. If the required amount is not collected, the money is returned to the investors”.

**TABLE 1 FUNDING MODEL FOR STARTUPS BY P. GRAHAM [18]**

<b>№</b>	<b>Financing stages</b>	<b>Content</b>
1.	Seed Investment (3F)	cover the expenses of the team for accommodation, development of a business plan and a prototype of a future product
2.	Angel investments (private investors)	A business angel who is part of the company's charter capital usually gets a seat on the board of directors and the ability to block decisions of the founders, which he considers unreasonable. At this stage, the startup gets the opportunity to expand its staff, finish work on the first version of the product, attract the first customers - "early adopters"
3	Round “A” / Venture Fund (further rounds can be expanded)	Attracting venture capital funds to a company with a workable product, clients and development plans. The amount of investment significantly exceeds the previous indicators, the startup begins to build a formal structure and expand
4.	Primary public offer, IPO - placement of the company's shares on the stock exchange	IPO is usually the main goal of a startup in the later stages of development.

At the same time, it should be noted that specialized conferences can be used as alternative ways to find investors. Several such conferences are held annually around the world. For example, a conference in StaryOskol - Startup Village, ClickZ Live New York (New York, USA), Pioneers 500 Festival (Vienna, Austria).

The well-known expert Mikhail Babich, having studied the life cycle of startups in foreign countries, claims that 97% of startups “die at the embryonic stage” without attracting investment, and only the remaining 3% find investors. At the same time, about 2% of them also “die”, because in addition to funding, these startups have acute problems with strategies for product formation and development, as well as problems with team work. Babich's analysis showed that the loss of investment when financing startups is 69%, with 30% of investments returning without return and only 1% making a profit. A startup financing system is considered effective if the profit from this 1% investment and the return on investment cover 69% of the lost investment [19, p. 176].

The international practice of start-up development shows that the main platforms for the development of start-up initiatives are universities, business schools, technology parks, grant programs and funds, business incubators and accelerators, etc. For example, the Massachusetts Institute of Technology (USA) has created on its basis the infrastructure of high-tech entrepreneurship. The aggregate gross product of companies created by students, graduates and teachers of the institute for 50 years is comparable to that of major world economies [20]. Silicon Valley, which has formed around Stanford University and the factories of large technology corporations, is a prime example of the world's leading startup ecosystem, where the largest major venture capital funds are concentrated. Israel, when considered in proportion to the total population, has the largest number of start-up companies in the world.

It is Israel, after the United States, that occupies a leading position in the world in terms of the number of companies opening (3,500 companies, most of which are engaged in the development, improvement and implementation of high technologies). However, Israel has the highest concentration of high-tech companies in the world, with the exception of the US Silicon Valley [21]. Under the auspices of the Government of the Republic of Uzbekistan, a resolution “On measures to further support innovative activities” No. 721 dated 09/11/2018 was adopted, the purpose of which is to provide financial and other assistance to startups; “The Fund for Support of Innovative Development and Innovative Ideas will provide grants based on self-sustaining projects for startups that are aimed at creating and commercializing domestic scientific developments. An innovative startup accelerator and a startup incubator have been created in the structure of the Center for Advanced Technologies under the Ministry of Innovative Development. Here, small high-tech companies on preferential terms will be provided with lease of laboratory equipment, production facilities and office space for a period of two years (in agreement with the Ministry of Innovative Development, the period can be extended to five years). In addition, residents of the Center for Advanced Technologies until January 1, 2022 are exempt from land tax, income tax, property tax of legal entities, a single tax payment, customs payments for raw materials and components imported for their own needs (except for customs clearance fees) [ 22].

According to statistics, unfortunately, about 70% of startups wind down their activities in their first year of operation. Among the remaining 30%, about forty do not live until the third year. The main reasons are systematized in the form of table 2.

**TABLE 2 THE MAIN REASONS FOR THE “FAILURE” OF START-UP PROJECTS**

[23, PP. 3946–3950]

Main reason	Failure percentage	Sub-reasons
Incompetence	51	-lack of knowledge on pricing; - tax evasion; - lack of planning; - ignorance of the economy; -lack of experience in accounting
Inconsistent experience or lack of managerial experience	35	-lack of experience in working with loans; -too fast expansion; - the wrong choice of "experience for borrowing"
Lack of experience in the	11	-wrong conduct inventory;

line of products and services		- ignorance of suppliers; -a waste of advertising budget
Fraud, disasters and more	3	-

Thus, summing up, we can say that for the creation of a startup project, the decisive factor is the generation of fundamentally new ideas that meet the needs of society at a given moment in time. Therefore, we believe that creativity and an unconventional look at many everyday things is the key to the success of your future enterprise.

To date, the Republic is implementing several large programs for subsidizing and providing grants to entrepreneurial projects, [24] in particular:

Yoshlar - kelajagimiz Foundation under the Youth Union (“Youth is our future”); is aimed at providing unemployed youth with work, supporting the implementation of youth business initiatives, start-ups, ideas and projects. The fund provides preferential loans and property through banks on lease at a rate of 7% per annum for the implementation of business ideas and startups. The Fund can: a) issue a guarantee for loans in the amount of 50% of the total amount (but not more than 1 billion soums); b) participate in projects by buying out 50% of the company's value with the condition of selling its share within five years. In 2018, the fund allocated 725 billion soums (about \$ 86 million) for the implementation of more than 6 thousand projects throughout the country.

- Fund for Support of Innovative Development and Innovative Ideas under the Ministry of Innovation. The state budget allocated 50 billion soums to the fund to support start-up projects, as well as innovative research and development projects. The fund's supervisory board includes 16 heads of ministries and departments. Any decision, including the allocation of funding, must be approved by each member of the board. In 2018, a competition for innovative, research, development and start-up projects was announced for the first time. Of the 170 start-up projects that applied for the competition, 16 were selected for funding. In 2019, the second cycle was announced; the amount of funding was up to 1.5 billion soums. The main condition is that the project should become self-sufficient in about two years.

- An intensive program to support the development of innovative ideas and start-up projects, designed for students, university staff, including teachers and researchers, the 5th cycle was announced in 2020. The program is divided into several stages. First, the participants study the basics of launching a project, and then move on to its direct implementation - they draw up a development roadmap, create a prototype and conduct test sales, these events are carried out with the appointment of mentors / consultants. In addition, master classes on marketing, taxation, legal aspects of doing business are held for the participants. They are carried out not only by local, but also by foreign experts. The Demo Day ends, where the teams present the results of their work to interested organizations and potential investors. So, starting in 2018, the project has allocated funds for prizes: five winners of the third cycle program won 40 million soums each; in 2019, five winners also received 50 million soums each for the development of their projects; for the winners of the fifth cycle of the program in 2020, a total prize amount of 2 billion soums was announced (40 projects of 50 million soums each). Today the program covers all regions of Uzbekistan.

## CONCLUSION

In summary, it should be noted that, given not only the socio-economic importance of start-up projects in the context of a structural shift in the direction of innovative and technological business, but also the importance of creating a favorable climate for venture capital and direct investments of the future, it is proposed to create:

- A unified strategy for the development of start-up projects in Uzbekistan, taking into account foreign experience;
- Startup accelerator in the Free Economic Zones, in particular, in the field of tourism, in the field of hotel and restaurant business;
- Business incubators at universities for creating startups in such areas as Internet and mobile banking, e-commerce, international logistics, advertising technologies, systems for processing and analyzing large amounts of information.

### ABSTRACT

*This article focuses on the concept of gender, gender studies conducted in various scientific paradigms in linguistics, their goals and objectives. Also, the gender specificity of lexical units, in particular, the Kipchak dialect, which is one of the dialects, based on the Uzbek literary language, the causes and factors of the specificity of male and female speech, the meaning of expressions are analyzed on the example of dialectal expressions.*

**KEYWORDS:** *Linguistics, Gender, Language, Speech, Dialect, Phrase, Pragmatic Situation, Communication Culture, Speech Adaptation.*

### INTRODUCTION

The concept of gender refers to the psychological, social and cultural characteristics of men and women. In the course of the long evolution of mankind, these two opposite sexes have had their own commonalities and differences. As a result, a system of features that distinguishes and generalizes women and men has been formed. Gender refers to the identity of men and women and differences in behavior.

The concept of "gender" was introduced into science to distinguish between the concepts of biological sex, that is, the "sex" that divides people into men and women. Subsequent research suggests that there are more similarities than differences between the sexes in biological terms. Accordingly, biological gender does not serve as a key factor in determining the role of women and men in society [1, 185]. The difference between a man and a woman Since the emergence of humanity, this difference is first seen in the work they do. The men were busy hunting, looking for food for a living, and the women were setting fire to it so that the fire would not go out in the house. Later, with the development of human society, women and men began to differ in their behavior, dress, demeanor, and speech.

Currently, gender research in linguistics is being conducted in various scientific paradigms. Society culture, socio-cultural relations determine the status of men and women in society. The content of these concepts of “man” and “woman” in different languages is not the same, and the concepts of “man” and “woman” of different languages are directly related to the above factors.

### **THE MAIN FINDINGS AND RESULTS**

Gender analysis of language tools is one of the issues that has been and is being done in linguistics in recent years. A number of studies have been done in European linguistics to show the different cases of expressions that occur in the speech of men and women. In particular, sufficient work has been done in Russian linguistics in this regard, and all means of Russian and women's speech have been analyzed. Each nation uses language tools differently in the process of communication due to its mental nature. The means of language used in Uzbek speech are different from the means of language of other peoples, which also reflects the Uzbek culture, way of thinking and thinking. The reflection of the knowledge, culture and views of its users in language units is a key factor in the formation of women's and men's speech in a unique way.

Men and women differ not only biologically and physiologically, but also in terms of communication behavior. The degree of differences between men and women is directly related to the division of labor and gender differences between the sexes. Differences in the communication behavior of Uzbek men and women are observed to some extent at almost all levels of the language system and at many stages of the communication process [2, 31].

Phrases of the Uzbek language and its dialects also have a gender character. This is because the Uzbek language also differs in that it is often used in women's speech or in men's speech. For example, many of these expressions are applied to men and women in speech processes and are distinguished by their expressive and figurative expression of their characteristics.

Millions of years of historical, cultural and bioanthropological development, especially differentiation, division of labor, have shaped the way of life in women and men, thinking, career choice skills, communication methods, the study of these ideas, the essence of which is the main task of gender philosophy . Hence, the study of gender relations is primarily the task of philosophy. But today, fields of science such as “gender sociology”, “gender psychology”, and “gender pedagogy” are emerging. That is why today in the scientific literature, research and debate, the term “gender” is associated with “gender relations”, “gender characteristics”, “gender equality”, “gender culture”, “gender development”, “gender sociology”, terms like “gender psychology” are widely used. In the words of V. Alimasov, the next twenty years can be called the "period of gender research" [3, 5].

Men and women differ not only biologically and physiologically, but also in terms of communication behavior. The degree of differences between men and women is directly related to the division of labor and gender differences between the sexes. Differences in the communication behavior of Uzbek men and women are observed to some extent at almost all levels of the language system and at many stages of the communication process [2, 31].

Phrases of the Uzbek language and its dialects also have a gender character. This is because the Uzbek language also differs in that it is often used in women's speech or in men's speech. For example, many of these expressions are applied to men and women in speech processes and are distinguished by their expressive and figurative expression of their characteristics.

Millions of years of historical, cultural and bioanthropological development, especially differentiation, division of labor, have shaped the way of life in women and men, thinking, career choice skills, communication methods, the study of these ideas, the essence of which is the main task of gender philosophy. Hence, the study of gender relations is primarily the task of philosophy. But today, fields of science such as “gender sociology”, “gender psychology”, and “gender pedagogy” are emerging. That is why today in the scientific literature, research and debate, the term “gender” is associated with “gender relations”, “gender characteristics”, “gender equality”, “gender culture”, “gender development”, “gender sociology”, terms like “gender psychology” are widely used. In the words of V. Alimasov, the next twenty years can be called the “period of gender research” [3, 5].

In fact, gender (gender) is the difference between a man and a woman according to their anatomical gender. These two sexes (male and female), which have belonged to the same species for thousands of years, differ from each other in their characteristics. Linguistically, too, these two sexes differ from each other. In particular, the use of linguistic and non-linguistic units in relation to them, their use of linguistic and non-linguistic units, there are significant differences between the representatives of these two sexes. Many linguistic and non-linguistic units have a gender identity as they belong to one or another gender. For example, the expressions used by men and women are radically different. There are expressions in Uzbek that”, are used only in men's speech. Many phrases, such as “rub your nose on the ground *“take out your dab”*, *“crush your chin”*, *“take out your abjag”* and *“hit the star,”* are also used in men's speech, especially for men. Women's speech, on the other hand, is characterized by words and phrases such as *“aylanay”*, *“orgulay”*, *“qaqindik”*, *“girgittonbolay”*, which are lexical means of expressing the subtleties of positive meaning in different speech situations. Also, according to the nature of its use by women and men, the terms used in relation to women and men also differ in terms of gender attitudes.

Some expressions are applied only to men, in which the gender meaning may prevail over other meanings. For example: *Would this bull talk?!* We know that the phrase blindness in this example applies only to men. But there are also expressions in our language that their use does not differ by gender, that is, they can be used equally for men and women.

Based on the fact that phrases are stabilized in a way that is specific to the speech activity and the pragmatic situation, they can be divided into the following groups according to their gender:

1. Phrases that can be applied to both sexes according to the communicative purpose and speech conditions: *“Cow kidney eats”*, *“Fear the old goat”*, *“It's like sniffing”*, *“Blind”* and others.
2. Phrases used only for men: *“Skinny kid”*, *“Riding a horse”*, *“Your father's bone”*, *“Going dog”*, *“Dog coming”* and others.
3. Phrases used only for women: *“Betibezraygan”*, *“Romolchiyi”*, *“Oqoragan”*, *“Bet achar”*, *“Shobozqogir”*, *“Tilingdantopgir”*, *“Kara basqir”*, *“Dudoringkurugur”* and others.

The expressions involved in the speech of the Kipchak dialect are, in turn, divided into expressions specific to women's speech, expressions specific to men's speech, and expressions specific to the speech of both speakers.

In the Kipchak dialect, we come across the phrase “Walk as long as you can” in a women’s speech. The phrase is actually related to the concept of the weaving industry, which includes the

content of focusing on quality, effective work, performing productive activities, not just finishing quickly, poor quality name when weaving carpets, socks or anything else.

The phrase “pick up your hands and feet” is also actively used in the speech of these dialect women. This phrase is applied to a pregnant woman after she has given birth to a healthy child. In keeping with the high intellect and culture of the speakers, it serves to provide a gentle, soft expression of the process.

The phrase “faceless” is also common in women’s speech. The term is used in women’s speech to refer to women who are rude, who don’t know the culture of treatment, and who hurt others quickly.

“Carrying in the hands” - is used in the sense of respect, esteem. “Not to cut” is used in the sense of not giving good things and blessings to others. “Ayroniochimas” is applied to carefree, carefree women. “Pressed” means to be tired, to be touched. “White wrap” - applies to women in mourning. “Burning one's feet” is used in the sense of lucky, virtuous, and blessed.

There are many expressions in the speech of Kipchak dialect men that have their own peculiarities:

The phrase “cleared the throat” is common in men’s speech, and we can observe that it is used in different meanings depending on the situation, whether the person is objecting to the interlocutor, his or her comments.

The phrase “Skinny boy” is also widely used in men's speech. This phrase is applied to men who ask about the situation when the case comes down and lead them to a stranger at another time.

The phrase “your father’s bone” is used in men’s speech to refer to boys who have done something wrong or made a mistake. At the same time, there is a positive feature in this phrase, which is that the child is disciplined.

In addition to these phrases, the phrase "He rides a horse" is also common in the speech of men of this dialect. This phrase has done evil, i.e. it is understood that when a person sees that his work has come to fruition, he becomes jealous and interferes with his work.

Phrases that occur in the speech of both speech representatives: “Inakbuyrakjigan” is common in the speech of dialect representatives. An “*inak*” is a synonym for a cow, meaning it eats a cow’s kidney. This is said in the Kipchaks to those who are merciless, stony-hearted. Just as the main occupations of each region are reflected in their own language, the profession of the Kipchaks will be demonstrated in their own language.

The phrase “fear the old goat” is also common, and the word goat in it is a portable word used in the human sense. Keep yourself one step lower in front of older people, they are used in the sense that they are more experienced than you. From this phrase it is clear that the basis of Kipchak training is cattle breeding.

In Kipchak, the phrase “*Qariechkidanqo’rq – be afraid of al goat*” serves to ensure the originality of the speech of the dialect representatives. The word is used in the sense of getting rid of any worries, problems, and acts as an active user unit in the lives of dialect representatives. From this it is clear that the unique lifestyle and culture of the population living in each region is also reflected in the words.

The phrase “*Bovurbasdi*” is also actively used, it is understood that a person loves the things and deposits of others. From this it is clear that the peculiar psyche and cultural views of the dialect representatives live in the form of phrases.

The phrase “*Burnipupraygan*” is applied to people who are conceited, arrogant. This phrase is used not only in its original meaning, but also in the sense of a nickname for this person. The phrase nose is used with a different spirit than the adult, which also indicates the cultural characters in the dialect.

The meaning of the phrase “*kurasikurmagan*” corresponds to the meaning of the phrase “he who does not see is cursed” and is related to the character aspects of a person. That is, the inability to control the passion, to be greedy in everything, applies to those who act uncivilized.

“*Uzunquloq – long ear*” refers to people who hear a message, a sentence first, and like to convey it to others first. As a result, others turn to the same category of people to find out a message.

The phrase “*Juliboldi*” is used in the sense of happiness, thankful, meaning that a person is grateful to someone who has done something. This phrase also shows the uniqueness of the speech of the dialect representatives.

This means that phrases in the Uzbek language, as well as in the Kipchak dialect, increase the effectiveness and attractiveness of speech, as well as gender.

## CONCLUSION

The above shows that the expressions of gender in the Uzbek language, as well as in the Kipchak dialect, are not the same for all, some are applied to both sexes by speech requirement, and some are applied only to men or only to women. The social adaptation of expressions in the dialect lexicon, in particular, gender adaptation, is considered to be inextricably linked with non-linguistic factors such as the culture, lifestyle, and profession of the speakers.

**INTRODUCTION**

The method of cottonseed oil refining by these methods is carried out on neutralizers of periodic and continuous action. In this case, the concentration of solutions of aluminate and sodium hydroxide, as well as their excess is selected depending on the initial acid number (mg. KOH / g) and color (red units) of crude cottonseed oil[1,2].

The disadvantages of these methods of refining cottonseed oil are the long duration of the neutralization of raw materials with alkaline solutions, low yield and quality of refined oil.

The closest in technical essence to the present invention is a method for refining cottonseed oil sequentially with solutions of aluminate and sodium hydroxide. This technological method of cottonseed oil refining consists of two stages[3,4].

At the first stage of the refining technology, a certain reduction in the content of free fatty acids (FFA) and substances accompanying the oil is achieved in order to obtain a partially neutralized oil. This is carried out by processing the raw material with an alkaline solution of sodium aluminate of various concentrations and excess.

At the second stage, the final refining technology of partially neutralized raw materials is carried out with an alkaline solution of sodium hydroxide of various concentrations and excess.

As a result of this method, a relative improvement in quality and an increase in the yield of refined oil are achieved.

The disadvantages of this method of cottonseed oil refining are that the total duration of processing of raw materials with alkaline solutions is 120 ... 240 sec; the yield of refined oil, depending on the initial acid number of the raw material ( $K_p = 6.9 \dots 10.8 \text{ mg KOH / g}$ ), is 78 ... 87%. At the same time, the residual content of free fatty acids in the obtained oils ranges from 0.27 ... 0.31 mg KOH / g and their color value is 11 ... 13 CR units at 35 yellow in 13.5 cm layer[5,6].

In addition, high consumption of alkaline solutions for the processes of neutralizing raw materials and sequential refining modes reduce the nutritional value of refined oil.

The objective of the present invention is to intensify the technological process by reducing the duration of processing of raw materials with alkaline solutions, increasing the yield and quality of refined cottonseed oil. At the same time, achieving a reduction in the consumption of alkalis and an increase in the nutritional value of refined oil.

The problem is solved by the fact that in the two-stage cottonseed oil refining technology, the alkaline solutions of aluminate and sodium hydroxide used are pretreated in an electromagnetic field with a strength of 0.4 ... 2.8 A / m. The total duration of processing of raw materials with alkaline solutions is 90 ... 150 sec; the yield of refined oil, depending on the initial acid number of the raw material ( $K_p = 6.9 \dots 10.8 \text{ mg KOH / g}$ ), is 81 ... 90%. At the same time, the residual content of free fatty acids in the obtained oils ranges from 0.07 ... 0.11 mg KOH / g and their color is 4 ... 9 CR units at 35 yellow in 13.5 cm layer[6,7,8,9].

This refining technology makes it possible to reduce the consumption of alkaline solutions for the processes of neutralizing raw materials and improves the process conditions.

In addition, according to the recommended method, an increase in the nutritional value of refined cottonseed oil is achieved.

The essence of the present invention is illustrated by the following examples.

The first stage of alkaline neutralization of crude cottonseed oil is carried out in a standard neutralizer. Partial alkaline neutralization of raw materials is carried out with sodium aluminate solution. In this case, an alkaline solution of sodium aluminate is pretreated in an electromagnetic field, using a typical electromagnetic device AMO-25 UHL4, which is widely used in food enterprises for processing aqueous solutions. The intensity of the electromagnetic

field in the apparatus is regulated by means of a BCA-5K rectifier, which is a necessary part of the apparatus.

Raw cottonseed oil with an initial acid number of 6.9 ... 10.8 mg KOH / g, unobservable color, content (%) of phospholipids 0.8 ... 1.4 is subjected to preliminary alkaline neutralization; free 0.30 ... 0.36 and bound 0.34 ... 0.39 gossypol and tocopherols 75 ... 85 mg 100 g. The process is carried out in order to partially reduce (by about half) the acid number and remove substances accompanying the oil. Taking this into account, the concentration and excess of alkaline solutions are set by calculation, depending on the initial acid number of the raw material.

The process of alkaline neutralization is carried out at 20 ... 22 ° C, with the duration in which the established decrease in the acid number of the raw material is ensured. Research is carried out without and with preliminary treatment of an alkaline solution in an electromagnetic field. At the end of the neutralization process, partially refined raw materials are defatted and filtered from the formed sodium salts (soap stocks). Partially refined raw materials are washed from the remains of an alkaline solution and dried from free moisture, then it is subjected to physicochemical analysis. For the analysis of raw materials and products obtained, modern methods of physical and chemical research are used[7,8,9,10].

The results of the analyzes obtained are shown in Tables 1 and 2.

Analysis and evaluation of the data given in tables 1 and 2 indicate that the treatment of an alkaline solution of sodium aluminate lead to a decrease in the acid number of the partially neutralized oil. An increase in the strength of the electromagnetic field up to 1.6 A / m intensely affects the decrease in the acid number of the raw material, a further increase in this parameter insignificantly affects the studied parameter of the process. As a result of electromagnetic treatment, color is also improved and the yield of partially neutralized oil is relatively increased.

Electromagnetic treatment of an alkaline solution leads to an intensification of the technology of partial neutralization of crude cottonseed oil, that is, the duration of refining is somewhat reduced in comparison with the prototype.

The results of experimental studies confirm the feasibility and effectiveness of using the method of electromagnetic treatment of an alkaline solution of sodium aluminate in a two-stage technology for refining cottonseed oil.

**TABLE 1 EFFECT OF ELECTROMAGNETIC FIELD STRENGTH ON THE RESULTS OF PARTIAL NEUTRALIZATION OF RAW COTTONSEED OIL**

No.	EMF intensity, A / m	Results of partial refining of raw materials			Results of partial refining of raw materials		
		Acid number, mg, KOH / g	Chromaticity, red units at 35 yellow in 1 cm layer	Oil yield,%	Acid number, mg, KOH / g	Chromaticity, red units at 35 yellow in 1 cm layer	Oil yield,%
0		raw materials			raw materials		
		6,9	not looking.	-	10,8	not looking.	90,6
1	Without processing	3,7	37	95,0	6,1	52	90,9
2	0,4	3,6	35	95,2	5,8	41	91,2

3	0,8	3,4	33	95,5	5,4	37	91,6
4	1,2	3,1	30	95,9	4,9	35	92,0
5	1,6	2,7	25	96,6	4,3	31	92,8
6	2,0	2,6	21	96,7	4,1	28	92,9
7	2,4	2,6	19	96,8	4,0	27	93,0
8	2,8	2,6	18	96,8	3,9	25	93,1

The second stage of alkaline refining of partially neutralized cottonseed oil is carried out in a similar manner. The process of final refining of partially neutralized oil is carried out with an alkaline solution of sodium hydroxide. In this case, an alkaline solution of sodium hydroxide is pretreated in an electromagnetic field using an electromagnetic device AMO-25 UHL4. The intensity of the electromagnetic field in the apparatus is regulated using a BCA-5K rectifier[8,9,10]. Partially neutralized cottonseed oil with the following quality and physicochemical parameters is subjected to final refining (Table 2, No. 3):

Acid number - 3.9 ... 4.3 mg KOH / g;

Color - 31 ... 36 crotch units at 35 yellow in 1 cm;

Content,%:

phospholipids - 0.4;

free gossypol - 0.19;

bound gossypol - 0.27.

The process is carried out in order to obtain high quality refined cottonseed oil that meets the requirements of industry standards. Taking this into account, the concentration and excess of an alkaline sodium hydroxide solution are set by calculation, depending on the initial acid number of the raw material of partially neutralized cottonseed oil.

The final refining process is carried out at 20 ... 22<sup>0</sup>C. The duration of stirring the reaction mass is set depending on the quality and yield of refined oil. Upon completion of the final refining technology, the refined oil is defatted and filtered from the formed sodium salts (soap stock). The finally refined oil is washed from the residues of the alkaline solution and dried from free moisture, then it is subjected to physicochemical analysis.

**TABLE 2 RESULTS OF PARTIAL NEUTRALIZATION OF CRUDE COTTONSEED OIL DEPENDING ON FROM THE DURATION OF STIRRING THE REACTION MASS**

No.	Duration of neutralization, sec	Without treatment of alkaline solution in EMF					With the processing of an alkaline solution in an EMF stress. 1.6 A / m				
		Physicochemical indicators of partially neutralized oil				Partially neutralized oil yield,	Physicochemical indicators of partially neutralized oil				Partially neutralized oil yield,
		Acid number, mg, KOH /	Chromaticity, red	Content,%			Acid number, mg, KOH /	Chromaticity, red	Content,%		
				Phospholipids	Free gossypol	Associated				Phospholipids	Free gossypol

		g	units at 35 yellow in 1 cm layer			goss syp ol	%	g	units at 35 yellow in 1 cm layer			goss ypol	%
1	0	6,9	not looki ng.	0,8	0,30	0,3 4	-	6,9	not looki ng.	0,8	0,30	0,34	-
2	30	6,2	51	0,7	0,27	0,3 3	98,6	5,5	42	0,6	0,23	0,30	98,8
3	60	5,7	47	0,5	0,23	0,3 0	97,5	3,9	36	0,4	0,19	0,27	97,7
4	90	4,6	40	0,4	0,20	0,2 6	95,4	3,2	29	0,3	0,17	0,21	95,6
5	120	3,7	33	0,4	0,19	0,2 5	93,4	2,6	18	0,2	0,15	0,19	93,6

For the analysis of refined oil, modern methods of physical and chemical research are used.

The results of the analyzes obtained are shown in tables 3 and 4.

**TABLE 3 INFLUENCE OF THE ELECTROMAGNETIC FIELD STRENGTH ON THE RESULTS OF THE FINAL REFINING OF PARTIALLY NEUTRALIZED COTTONSEED OIL**

NO.	EMF intensity, A / m	Final refining results			Final refining results		
		Acid number, mg, KOH / g	Chromaticity, red units at 35 yellow at 13.5 cm.	Oil yield,%	Acid number, mg, KOH / g	Chromaticity, red units at 35 yellow at 13.5 cm.	Oil yield,%
0		raw materials			raw materials		
		3,9	36	-	4,3		-
1	Without processing	0,27	11	93,4	0,31	13	91,2
2	0,4	0,20	9	93,5	0,29	12	91,3
3	0,8	0,13	7	93,6	0,21	11	91,5
4	1,2	0,10	5	93,7	0,15	10	91,6
5	1,6	0,07	4	93,8	0,11	9	91,8
6	2,0	0,07	4	93,9	0,11	9	91,9
7	2,4	0,07	4	93,9	0,11	9	92,0
8	2,8	0,07	3	93,9	0,11	8	92,0

Analysis and evaluation of the data given in Tables 3 and 4 indicate that the process of the final refining of partially neutralized cottonseed oil proceeds in mild technological modes. This

achieves a significant reduction in the acid number and an improvement in the color of the refined oil. Treatment of an alkaline sodium hydroxide solution accelerates the final refining of the partially neutralized oil to an electromagnetic field strength of 1.6 A / m [6,7,8,11].

Electromagnetic treatment of an alkaline solution leads to an intensification of the technology for the final refining of partially neutralized cottonseed oil, that is, the duration of the refining of raw materials is somewhat reduced.

**TABLE 4 FINAL REFINING RESULTS OF PARTIALLY NEUTRALIZED COTTONSEED OIL ON THE DURATION OF MIXING REACTION MASS**

No.	Duration of neutralization, sec	Without treatment of alkaline solution in EMF			With the processing of an alkaline solution in an EMF, for example. 1.6 A / m		
		Acid number, mg, KOH / g	Chromaticity, red units at 35 yellow at 13.5 cm.	Refined oil yield,%	Acid number, mg, KOH / g	Chromaticity, red units at 35 yellow at 13.5 cm.	Refined oil yield,%
1	0	3,9	36	-	3,9	36	-
2	30	0,37	15	93,6	0,21	11	93,8
3	60	0,31	13	93,4	0,13	9	93,9
4	90	0,29	12	93,2	0,09	6	94,0
5	120	0,27	11	93,2	0,07	4	94,0

Thus, the development of technology for the refining of raw cottonseed oil by pretreating alkaline solutions in an electromagnetic field has achieved an increase in the quality and nutritional value of refined oil and ensured a reduction in the consumption of alkaline solutions used.

### ABSTRACT

*The article is devoted to scientific research of the culture and life of the Karakalpaks of the 19th and 20th century. And also, materials of military expeditions organized in the region in order to study the culture and life of the people. The most valuable information about the Karakalpaks, the nature of the region, history was captured by a member of the Russian expedition N.N. Karazin in his paintings "Chimbai Bazaar", "Amu Darya Barge Haulers" and others.*

**KEYWORDS:** *Material Culture, Spiritual Culture, Tradition, Customs, Arts, Everyday Life, Socio-Economic Life, Expedition.*

### INTRODUCTION

The culture and life of the Karakalpak people of the 19th century, as well as of the earlier period - the period of its formation into a nationality, the stages of its historical development were reflected in the works of Russian researchers such as P.P. Ivanov, S.P. Tolstov, T.A. Zhdanko, N.A. Baskakov [1] and others. Studies of the culture and everyday life of the people require an integrated approach that considers the ethnic development of the Turkic peoples, the relationship between them and each other. In 1936, in the process of working on unregistered manuscripts of the Saltykov-Shedrin Library of Leningrad, P.P. Ivanov discovered the archive of the Khiva khans of the 19th century. And although the archive was seized back in 1873, immediately after the conquest of the Khiva Khanate, it was safely forgotten, they remembered about it in the 1930s. As a result of studying the archival documents discovered by P.P. "Archive of Khiva khans of the XIX century." Thanks to which new information is introduced into the scientific

circulation, land tenure among the Karakalpaks in the XIX century. Having carefully studied 12 documents (notebooks), information about the Karakalpaks and Kazakhs, P. Ivanov summarizes them in the section entitled "Karakalpaks and Kazakhs".

### **Main part**

After the conquest of the Khiva Khanate of Tsarist Russia in 1873, a number of expeditions were organized. As part of the Russian troops, a group of scientists was sent, whose main goal was to study the newly conquered lands. The group of scientists included A.V. Kaulbars, A.L. Kuhn, who collected information of an ethnographic and historical nature, M.N. Bogdanov, who was engaged in the zoological study of the region, I.I. Krause, who focused his research on the study of the flora of the region, etc. [2.112.116].

The materials collected by these authors were especially significant for their time, as they became the primary source for further research in the field of social and natural sciences. Thus, the works of A.V. Kaulbars and A.L. Kuna are valuable for the stored materials on the history and history of the culture of Central Asia.

As part of the Amudarya scientific expedition in 1874 under the leadership of N.G. The Stoletovs were visited by L. Sobolev, N. Karazin, Riza-Kuli Mirza, who collected not only ethnographic materials, but also statistical data [3.37]. Thanks to the work of the expedition, interesting information was collected about the culture and life of the Karakalpaks in the lower reaches of the Amu Darya. One of the members of the expedition, Nikolai Nikolayevich Karazin (1842-1908), summarizing the materials he collected during the expedition, publishes a number of works - essays, stories, novels dedicated to the population of this region, paintings and sketches. Pictures painted by N. Karazin illustrate the life of the Karakalpak fishermen of the 19th century, the Chimbay bazaar and other picturesque sketches, which are a valuable source in the study of the life of the Karakalpak people, their features, and customs. Created during the activities of the scientific expedition N.N. Karazin's picturesque pictures and sketches mainly illuminate the life of ordinary people - farmers, cattle breeders, fishermen on the banks of the Amu Darya [4.212-bet].

The most interesting in terms of ethnographic use under the names "Amudarya barge haulers", "Views of the Aral Sea", "Ustyurt", "Karakalpak dwelling", "AulNukus", "Ruins of the ancient Shylpyk mound", "Around the fire" [5]. These pictures allow you to see with your own eyes the life and ethnographic features of the Karakalpak people of that period.

Special studies devoted to the study of the material culture and life of the Karakalpak people of the 19th century were reflected in a number of works, including the work of the Doctor of Historical Sciences, Corresponding Member of the Academy of Sciences of Uzbekistan Ya.G .Gulamov, dedicated to the history of irrigation in Central Asia [6], M.V. Sazonova, considering the types of land tenure relations in the Khiva Khanate [7],

B.V. Andrianov, who studied the ethnic territory of the Karakalpaks [8], A.S. Morozova, who examined the domestic life and culture of the Karakalpaks until the beginning of the 20th century [9].

These works were performed using a large number of historical sources. The national liberation movements of the Karakalpaks against the Khiva Khan of the 18th-19th centuries, the analysis of

the socio-economic life of the Karakalpaks of that period, with the involvement of a wide range of sources, are covered in the monograph of Academician SK Kamalov [10].

The history of the development of Karakalpak literature up to the XX century was studied by the first doctor of philological sciences N. Daukaraev [11].

His work characterizes the development of Karakalpak literature, from oral folk art to the 20th century, covering all genres of Karakalpak literary criticism.

A study on the development of public education of the Karakalpaks of the 19th century, including the colonial period, was carried out by Zhumek Orynbaev, Doctor of Pedagogy [12].

His work reflected such issues as education in the *mekteb and madrasah*, the distinctive features of regional education from European and other. The research was carried out using a large number of archival materials and written sources. Features of culture, art, traditions and customs of the Karakalpak people are highlighted in the work of Doctor of Philology, Professor K.A. Ayimbetov [13]. His work contains rich information about the origins of the Karakalpak songwriting, the development of the art of *jirau*, the formation of the school of *jirau* and *bahksy*, and creative continuity in them.

The social life of the people until the XX century, documents on the types of land use, the tax policy of the Khiva Khanate, the structure of management of the Karakalpaks, *Beksand Beglerbegi*, data on the ruling elite who ruled the people, geographical names, names of tribal divisions and other historical sources are highlighted in the work of Amanbek Zhalilov [14].

His research is a valuable source for studying the socio-economic life of the Karakalpaks in the 19th - early 20th centuries. Kh. Esbergenov carried out an ethnographic study of the Karakalpak people [15].

The ethnographer's work contains information about family rituals, religious beliefs, and the life of the Karakalpaks. His works are of great importance in the study of the national Karakalpak people. The decorative and applied art of the Karakalpaks, in particular, woodcarving, is devoted to the work of I.V. Savitsky "Folk applied art of the Karakalpaks". T. Adambaeva focused her interest on the study of the Karakalpak zhyraw. She carried out a separate study on the work of Musa baksa. The work of the classic of Karakalpak literature as a historical source was studied by Professor M. Tleumuratov (Berdakh's works as a historical source). These works became a significant contribution to the study of the culture and art of the Karakalpak people. In the second half of the 20th century, Russian researchers published a number of works analyzing a clearly delineated chronological period. Here it is appropriate to point out the work of Doctor of Historical Sciences Rzambet Kosbergenov, which highlights the culture and life of the Karakalpaks of the colonial period - the last quarter of the 19th century. Socio-economic life, relationships with neighboring peoples, construction of dwellings, household utensils and clothes, types of crafts, education, arts and folklore have received extensive coverage in the pages of work [16].

Since the middle of the 19th century, the territories inhabited by the Karakalpaks have become an object of interest for European and Russian travelers and artists. Karakalpak lands were visited by T.G. Shevchenko, A. Alikhanov-Avarsky, N.N. Karazin. As part of a Russian scientific expedition, they visited the Aral Sea, part of the distance (from Kuskhana to Turtkul) traveled by steamer, part of the caravan route. Drawings made during the expedition "Sarykol

fishermen", "Amudarya barge haulers", "Chimbay bazaar", "AulNukus", "Pilot between Nukus and Khojeili", "Shylpyk" and others were published in the pages of magazines.

**Results:** Thus, studies reflecting the history of the Karakalpak people of the 19th century, based on the tasks solved thanks to them, can be divided into the following stages:

First: The emergence of archival memoirs and art paintings as a result of Russian scientific and military expeditions.

Second: The emergence of new sources related to the study of taxation policy and land-water relations

Third: Preparation of scientific papers covering the material and spiritual culture of the Karakalpak people, their customs and traditions.

## CONCLUSION

An analysis of scientific works covering the history of the Karakalpak people of the 19th century allows us to conclude that the influence of Soviet ideology prevails in them. So, for example, when describing the history of the peoples of Central Asia, events are presented in such a way as if they, of their own free will, joined Russia, and were not conquered. The indigenous population is presented as completely illiterate, not taking into account the existence of the local education. The coverage of independence movements is not fully covered. All this gives grounds to say that at the present time, after liberation from the political chains of the imperial system, the history of our people should be assessed from the standpoint of national ideology, from the standpoint of modern history.

**ABSTRACT**

*The article presents the features of the choice of cutting tools in the processing of polymer composite materials. As a result of the analysis, the authors formulated their own recommendations. The solution of these problems is possible with highly qualified training (according to the requirements of the time) of specialists in materials science and technology, programmers, designers, calculators, operation and repair engineers. The choice of tools should not be limited only to carbide drills, which does not allow us to give an objective assessment of the optimization of the choice of the brand and material of the drill.*

**KEYWORDS:** *Polymer Composite Materials, Similar Parts, Tolerance, Carbon, Cutting Fluid, Quality*

---

**INTRODUCTION**

Currently, a whole series of new-generation binders and carbon fiber plastics has been developed, which have begun to be introduced into the design of promising aircraft. The use of composite materials in aircraft structures for various design and technological solutions has been significantly expanding in recent years.

The variety of polymer composite materials (PCM) – carbon fiber plastics, fiberglass, organoplastics, etc., used in the designed structures, requires a special approach when choosing processing technologies, tools, tooling structures and methods for quality control of finished products. The solution of these problems is possible with highly qualified training (according to

the requirements of the time) of specialists in materials science and technology, programmers, designers, calculators, operation and repair engineers. When designing parts and components made of PCM, it is necessary to take into account both the possibilities of existing production and the creation of new specialized production sites for specific technological requirements for the development and implementation of new developments – perhaps with a small reserve for the prospects for the development and implementation of PCM structures.

### **Main part**

One of the priority tasks in expanding the use of PCM should be the task of creating "artificial intelligence", which will ensure the development of processes in the creation of materials, technologies and new promising structures almost without human participation – only according to the task developed by him and under his control.

For the design of structures from composite materials it is necessary to consider (to ensure the manufacturability) volumes, methods and types of machining – milling, drilling, laser cutting and hydraulic etc.

Difficulties in machining PCM are determined by their physical-mechanical characteristics: tendency to phase separation during processing due to their webbing, structural heterogeneity, the high hardness of the filler material and the low ductility of the binder, etc.

Currently, the most widely used tool for mechanical processing of PCM is a diamond-coated tool or a tool made of a hard-alloy material. Examples of such a tool are shown in Fig. 1. The greater the grain size of the diamond-coated tool, the greater the amount of material removed in one pass, but at the same time the cleanliness of the treated surface decreases. To obtain a high-quality cut, it is necessary to choose the tool that provides the required quality and cutting speed with optimal performance.

**Fig.1. Examples of machining tools**

When choosing a tool, it is necessary to take into account the features of the PCM structure. The more viscous the matrix, the stronger the heat during cutting and the binder sticks to the cutting edge with intense heating of the tool and the part, which affects the quality of the surface of the cutting zone. The choice of tools should not be limited only to carbide drills, which does not allow us to give an objective assessment of the optimization of the choice of the brand and material of the drill. Taking into account the requirements for the quality of holes and drilling modes, when conducting an experiment with a drilling speed of 16,000 and 26,000 rpm (when feeding 0.01–0.15 mm per revolution), it was possible to obtain a satisfactory tool life (750 holes before replacing it). When using a manual electric drill mounted on a tripod, the process is inefficient with possibly unstable quality of the results in production. In the manufacture of parts of aircraft structures, one of the mass processes of mechanical processing of PCM is drilling. When making holes, it is necessary to take into account their functional purpose – holes for assembling power elements of structures, functional (for fuel overflow, in noise-absorbing panels, condensate drain, etc.) and technological. In each of these cases, the requirements for the quality of the holes are determined by the requirements of the design documentation. The quality of the resulting holes on the input and output edges, the accuracy and cleanliness of the surface of the cylindrical part of the hole are extremely important in terms of reliability, durability and operability of the structure. The maximum productivity and stable quality of the through holes in the PCM is ensured by properly selected tools and cutting modes during drilling, as well as the structural rigidity of the technological equipment. An important role in ensuring the quality of the hole surface is played by the durability and geometric shape of the cutting edges of the tool. The main defects that occur during mechanical processing are: cracking of the binder, delamination, pulling out of the fibers, non-cutting of the fibers, thermal destruction of the binder.

The cutting edge usually breaks the matrix (binder) brittle and cuts the reinforcing fibers. To eliminate these defects, special tool designs are used, their geometric shape is optimized, and technological drilling modes are used, using special devices. When drilling PCM, defects often occur at the inlet and outlet of the hole, due to the peculiarities of the drill's force action on the work piece (Fig. 2). At the inlet, there are delaminations and material rupture, and at the outlet – delamination and non-cutting of fibers. Since holes are stress concentrators, such defects contribute to reducing the fatigue and static strength of structures. To minimize effects, tool companies offer special drill designs.

a) b)

**Fig. 2. Local delamination of the material layers in case of violations of the axial feed of the tool during drilling (a) and fiber fragments (chips) on the inner surface of the hole due to wear of the cutting edge and violations of the drilling modes (b)**

Typical hole quality requirements:

- roughness  $R_a < 4.8$  microns;
- delamination
- no chips (torn fibers in the hole).

When processing PCM, a decrease in the quality of the resulting holes can occur long before the tool breaks.

**Improving the productivity of the cutting process.** Speeding up the tool feed and cutting speed increases the productivity of the process, but the more important factor is the quality of the hole. The poor quality of the hole leads to the need for two-stage processing with different tools. An example of obtaining a high-quality hole with two-stage drilling processing is shown in Fig. 3.

**Fig. 3. Hole quality in two-stage machining with two tools**

Unlike metals, PCM based on a polymer matrix has low thermal conductivity and heat resistance. At temperatures  $>(300-350)^{\circ}\text{C}$  begins the thermal degradation of the binder. This leads to a sharp deterioration in the quality of the treated surface, the appearance of cauterization and reflow in the defective boundary layer (Fig. 4).

**Fig. 4. Poor-quality (a) and high-quality (b) holes in carbon fiber: 1 – delamination of the material; 2 – non-cutting of the fibers**

To reduce the delamination at the entrance of the hole, double-sharpened drills are used, and to eliminate the non – cutting of the fibers, drills with sharp edges on the periphery are used (Fig. 5). In order to avoid delamination, sometimes it is necessary to use conductors pressed against the surface with a force sufficient to prevent delamination. Drilling is usually carried out with cutting speeds of 100-200 m/min at low feed rates in the range of 0.02–0.1 mm/rev. At the entrance and exit of the drill to avoid delamination, reduce the force and the amount of feed per revolution.

**Fig. 5. Drills for PCM with double sharpening (a) and with undercut edges (b)**

The choice of the process strategy for drilling PCM The upper and lower surfaces of the part differ significantly in the quality of the input and output edges of the holes during drilling. To improve the quality of holes, a number of technological techniques are used: drilling direction, surface protection with technological overlays, etc. Coatings or additional surface layers above the carbon fiber or fiberglass layer can significantly affect drilling performance and quality. Thus, a lightning-proof layer in the form of a fine or large copper mesh (Fig.6, a) allows you to drill carbon fiber with accelerated feed without losing the quality of the hole; fiberglass-increases the risk of delamination, worsening the quality (Fig. 6, b). Both materials can be easily processed with the right choice of tools and processing modes.

**Fig. 6. Lightning protection layer on carbon fiber (a) and carbon fiber with a layer of fiberglass (b)**

## CONCLUSION

When processing PCM, the cutting fluid is usually not used, so the cutting product is a fine fire-hazardous and harmful to human health dust, which must be removed from the cutting area by a special dust removal system. When processing PCM parts, the cutting volume is usually small: the parts are already molded and only requires, as in this case, drilling assembly holes or holes in the form of perforations – for example, in noise-absorbing panels.

## THE MORPHOLEXICON OF THE UZBEK LANGUAGE AS A SOURCE FOR THE CORPUS

**Ural Menglievich Kholiyorov\***

\*Senior Lecturer of the Department of Uzbek Linguistics,  
 Termez State University, UZBEKISTAN  
 Email id: xoliyorov@tersu.uz

### ABSTRACT

*The article analyzes the issue of morpholexicon, which is considered a necessary database for corpora. Morpholexicon is compared with grammatical dictionaries. World experience, theoretical views and research in the Uzbek language have been studied. In addition, the initial works on morpholexicon is described, and in the article the number parts of speech of the Uzbek language is described for the first time. The results are presented on the basis of tables and graphs, and proposals for further work are developed.*

**KEYWORDS:** *Corpus, Grammatical dictionary, Morpholexicon, Automatic Morphological Analysis, Digital Indexes, Morphoclass, Morphological Dictionary.*

### INTRODUCTION

Attention to the state language in our country has increased to the level of one of the priority tendencies. Therefore, preserving our mother tongue, to enrich, along with increasing the effectiveness of practical use of it, further improving the status of the state language, to achieve wide usage of Uzbek language in modern information and communication system, for this to study of our national cultural heritage, increasing electronic resources in education of mother tongue, as well as, to achieve the unrestricted use of these resources by educators, to collect cultural heritage serving national and spiritual education –native language materials on a platform have become an urgent task. In the implementation of this task, exactly the language corpora, especially the Educational corpora takes the main place.

For this the formation of the most necessary morpholexicon for the corpora is an important component.

### Analysis of literature on the topic

A number of monographic studies and articles have been discussed about the principle of creating a morpholexicon in world corpus linguistics, method, theoretical basis and software tools. [8, 13, 12, 10, 9]. In world linguistics there is also the experience of creating grammatical dictionary, in practice it is observed that grammatical dictionary of several languages is created. We discuss about grammatical dictionary of natural language, morpho lexicon, its features as well as the possibilities of using them in the processing of natural language

**Grammatical dictionary**-a dictionary covering the total lexeme of a particular language, all their grammatical forms. A.A. Zaliznyak's grammatical dictionary [12] not only shows the grammatical changes of modern Russian words (noun, adjective, number, declension, conjugation of verbs), but also serves as a reverse dictionary. In addition to there are all the variants of diversification and conjugation about large volume of theoretical and descriptive information except list of words in introduction part of dictionary. [19]. The features of diversification proper nouns are expressed in the next filled edition. Although the dictionary was published in 1977, it has been reprinted several times with additions and corrections. The dictionary is available in paper and electronic versions, the electronic version is used in instruments of processing natural language: orthographic editing, machine translation, automatic referatization. A.A. Zaliznyak's grammatical dictionary is a fundamental study of morphology. Information about group, stress, genus, view of every words, transitive and intransitive (for verbs) are attached [18]. The author himself gives the dictionary the following definition: "The grammatical dictionary shows the grammatical changes of modern Russian words. The dictionary contains 100,000 words arranged in reverse / inversion: the word is in the order of the letters at the end of the word, not the beginning letter. Each word is marked with an index / index referring to the grammatical information: the user diversify and conjugate interesting words through this index based on the rules of diversification and conjugation. The first edition of the dictionary to the present, the changes in the Russian language are taken into account, filled [18].

The information on the word changes of the general morphology of the Russian language given in Wikislovar is based on the dictionary of AA Zaliznyak. The indexes proposed by A. Zaliznyak were taken into account in the formation of the paradigm of word changers: numbers, written letters in the Latin alphabet are based on the classical method of indexing words (Zaliznyak's principles). Even in the automatic morphological analysis of the word assimilation, the same system is preserved [20]. According to A. Zaliznyak's Grammar dictionary and Wikislovar, numerical indices and accents ending in hard vowels, ending in soft vowels, as well as *z, k, x, ж, u, y, u, y* and *y* multi-letter indexes are included. There is a need to enter this data into the index, which provides information about thematic property in the process of compiling the morpholexicon of the Uzbek language.

But since the emphasis in the Uzbek language often does not differ in meaning, it is not necessary to enter an index indicating the word accent. Morpholexicon is a database that covers a specific language lexical, in which information about its category affiliation, grammatical feature is attached to the lexeme, adapted to the natural language processing process. Such a database is available in electronic form and serves as a linguistic support of various means of processing natural language (automatic translation, linguistic corpus, morphological, semantic, graphemic analyzer).

Based on our observations, we can say that the morphological dictionary contains indicators of change of the word belonging to a category, belonging to a grammatical category, variation of the stem and its relation: these characters serve as a search filter; returns the result to the query with the exact, desired, information. A grammatical dictionary serves to describe the grammar of a particular language; its main function is not automatic processing of natural language. And the morph lexicon is distinguished by the fact that it fully covers the language lexical, is available as a database, is a linguistic supply of natural language processing tools. The morphological dictionary of language and morpholexicon are complementary information banks.

A.M.Galieva, A.R.Gatiatullin, studying the importance of the morphological category of the verb in the construction of the model of Turkish word form suffixes [9], describe the possibility of performing morphological analysis through the base.

If a word in one of the specified Turkic languages is entered in the data entry window of the software, the result window shows the sequence of morphemes and morphological categories according to the word morpheme structure. It may seem that the designation of morphemes and morphological categories in a certain word forms is superfluous. There are certain reasons for this: In Turkic languages, the same morpheme (grammatical form) can represent several categories [9].

For example, in Uzbek, *-ган*, *-иб*, *-ди* represent different grammatical categories depending on their position. Therefore, the suffixes morpholexicon such forms require a special description. Depending on its position, it is the task of the morphoanalyzer, not the morpholexicon, to show what the same form represents. There are special studies on the position of additives in the morpho analyzer [17], therefore we will not dwell specifically on this issue. There are several articles on the theoretical foundations and practice of morpholexicon formation [14, 1]. D.Selegey, T.Shavrina, V.Selegey, S.Sharovlar in the article “Автоматическая морфологическая разметка корпусов русской язычных социальных медиа: обучение и оценка качества” [14] problems of categorization of words in the language of media materials, the types of automatic category detectors, their advantages and disadvantages are discussed and develops suggestions and recommendations for their use, categorization of words that occur in the language of these materials. I.A.Bolshakov, E.I.Bolshakova in the article on the creation of an automatic morphoclassifier of Russian proper nouns [6] expressed valuable views on the automatic differentiation of word groups; they can be used in the formation of the morpholexicon of the Uzbek language. I.A.Bolshakov, E.I.Bolshakova writes about giving information about the belonging of compound names to the category: «42 percent of the morpholexicon, known as the Crosslexics of the Russian language, consists of compound names. Compound nouns can consist only of a noun, but also of a noun, adjective, number, pronouns, adverb. For example: *точка зрения, вид на жительство, право быть избранным, свободная экономическая зона, свободно конвертируемая валюта, семь смертных грехов, теория вероятностей, математическая статистика.*

During the gradual development of cross-lexicon, it became clear that this morpholexicon was enriched with 15 percent of the words present in A. Zaliznyak's dictionary. When the user performs a survey of compound names or enter compound names for analysis, in the result window he can see the change in the paradigm of the agreements of this word, even the names that do not exist on the basis of Crosslexics” [6]. The authors also share their experience in

morphosystem separation. The morphosins they suggest are specific to the Russian language: *генус, одушевленность /неодушевленность* and etc.

A. Fadoua, B. Siham's article «Morpho-Lexicon for standard Moroccan Amazigh» also describes the experience of composing the morpholexicon of the Moroccan language [1].

### Research methods

Methods of classification, description, comparison, statistical analysis were used to cover the research topic.

### Analysis and discussion of results

The following is a description of the practice of composing the morpholexicon of the Uzbek language for the educational corpus of the Uzbek language on the basis of the study of the theory and experience of morpholexicon in computer linguistics.

In order to perform a search based on morphological features in the educational corpus of the Uzbek language, the corpus database must contain a table containing information indicating that all words in the Uzbek language belong to a category – the morpholexicon of the Uzbek language. We used the dictionary “Explanatory dictionary of the Uzbek language” [15] (more than 80,000 words and phrases) published in 2000-2006 to form the morpholexicon dictionary. This dictionary lists a total of more than 80,000 words and phrases, but the dictionary - those listed as keywords – makes up 32,500 lexemes; the remaining 47,000 units are compound words, phrases, and commonly used phrases based on the same lexeme. Therefore, the morphology of the Uzbek language is developed in the following four stages.

First stage: 32,500 lexemes from the Uzbek dictionary were included in the morpholexicon database; they were accompanied by information about belonging to the category.

The second stage: 4700 words were allocated from the dictionary of the Uzbek language from The Dictionary pair and repeated words of T. Jumaev in co-authorship with T. Valiev which were published for schoolchildren and contain 8000 units, [4] and included in the morpholexicon. Since the compound words belong to a different category, they were also given information about their belonging to the category. A new 32500 joint, double and repeated words were introduced into the morpholexicon base with 4700 Lexis: as a result, the base of the morpholexicon, prepared in the second stage, amounted to around 37200 lexical quantities.

Statistical analysis of the morpholexicon base has so far shown the following result:

<b>№</b>	<b>Parts of speech</b>	<b>amount</b>	<b>percent</b>
<b>1</b>	<b>noun</b>	22599	60,62
<b>2</b>	<b>adjective</b>	7179	19,26
<b>3</b>	<b>verb</b>	3949	10,59
<b>4</b>	<b>adverb</b>	1856	4,98
<b>5</b>	<b>imitation word</b>	800	2,15
<b>6</b>	<b>Interjection</b>	244	0,65
<b>7</b>	<b>pronoun</b>	182	0,49
<b>8</b>	<b>Modal word</b>	132	0,35
<b>9</b>	<b>polunctional word</b>	108	0,29

<b>10</b>	<b>postposition</b>	106	0,28
<b>11</b>	<b>conjunction</b>	52	0,14
<b>12</b>	<b>Particle</b>	45	0,12
<b>13</b>	<b>number</b>	30	0,08
	<b>total</b>	<b>37282</b>	<b>100</b>

The above statistic is the first morpholexicon to be implemented, which may certainly be free of minor errors and omissions. But these indicators give a preliminary idea of the category of lexemes in the Uzbek language. When you give the words of the existing base in percentages, the following form the view:

The third stage still requires processing, so the amount of content in this lexicon is unknown. At this stage, the Explanatory Dictionary of the Uzbek language and all the phrases given in the explanatory phrase logical Dictionary of the Uzbek language are distinguished and information about their belonging to the category is attached.

In the fourth stage, the compound names given in the explanatory dictionary of the Uzbek language are selected and the information on belonging to the category is attached. The content of this lexicon is also determined when the database is ready. All of these processes require manual labor: if all of these units are included in a database, they can be used in a variety of linguistic operations. In addition to information about the affiliation of words to the morpholexicon of the Uzbek language, it is necessary to attach grammatical symbols (morphos ins) based on the characteristics of the Uzbek language.

The group of morphos ins is different for each parts of speech. Sh.Hamroeva develops a system of morphological, syntactic and semantic tags while studying the problems of grammatic tapping of corpus material[16].The complexity of the system of tags proposed by Sh. Hamroeva makes it difficult to automatically annotate words.The experience of corpus linguistics shows that the simplification of the system of tags simplifies the practice of annotation (tagging).

## CONCLUSIONS AND SUGGESTIONS

During the examination and preliminary testing of morpholexicon, the following problematic cases were identified.

First of all, the word homonym cannot be identified only by information about belonging to the category on the basis of morpho lexicon. The morpholexicon database shows the homonyms present in the language; a tag belonging to the category is assigned, but this information is not sufficient to identify the homonymous unit in context (in the case of a grammatically formed).Grammatical formation is the most important factor that helps to distinguish the homonymous unit; only this requires the activation of a morphological-syntactic analyzer, in particular the development of a homonymous unit filter.This work will be the subject of a separate study.

Second, in the morpholexicon, language units that reflect the feature of polyfunctionality in the Uzbek language were identified, and they were marked as polyfunctional in the database on their belonging to the category.Naturally, this also leads to a lack of clear indication of affiliation to the category. The meaning of such unity is realized only in the text.The issue of automatic determination of the category of polyphonic words also requires special study. The primary and

secondary functions of the word categories in the Uzbek language [7], computer processing of polyphonic words and suffixes [3, 11, 2, 16] were the objects of Special Research. However, in Uzbek computer linguistics there is no development of the algorithm for automatic detection of polyfunctional words. Therefore, we will analyze this issue specifically in subsequent studies.

**ABSTRACT**

*In the article, the directions of preparation of Future Machine-Building bachelors in higher educational institutions for the profession on the basis of technical mechanics are considered. After the author's graduation, the problems of professional training of machine-building bachelors were analyzed..*

**KEYWORDS:** *Technical Mechanics, Professional Training, Engineering Activities, Mechanical Engineering.*

**INTRODUCTION**

The research carried out and the fact of Life shows that in the process of using modern equipment and equipment brought about by heavy and light industrial enterprises with the aim of increasing the work productivity, a number of problems arise. As a reason, it can be seen that in the absence of mutual integration of education and production sectors.

In recent years, several resolutions have been adopted by the president to link the integration between education and production. The work carried out to carry out the issued decisions indicates that for all mechanical specialties it is considered a universal science. The science of technical mechanics is the science of the alphabet of engineering specialists.

**Purpose**

In the science of technical mechanics –theoretical mechanics, resistance of materials, theory of machines mexanizm, theoretical knowledge of machine details, as well as the study of complex issues that determine the external and working forces formed in the materials, the forces generated in the machine and mexanizm structures, the details of machines and mexanizm, the

Basic Rules for the methods of calculating their types and functions. The science of technical mechanics is included in the block of general professional Sciences, as a general scientific science that gives the basis of Special Educational Sciences of general professional education, which provides the basis of knowledge. In science, machines and circuits are studied by linking the calculation of details and structures with scientific and experimental methods. The science of technical mechanics is based on the acquired knowledge. Therefore, its most important task is the formation of practical knowledge in students.

A number of researchers and Methodists-educators concluded that the main goal of teaching the course "technical mechanics" is to study "theoretical mechanics", "construction of buildings and structures with static elements", "theory of machines and circuits", "fundamentals of machine details and design" and similar special disciplines in a cross – examination. It is based on a number of fundamental disciplines to deep master the science of technical mechanics, complete the solution of theoretical and practical issues; chunanchi is believed to be the maximum "link" to higher mathematics, physics, informatics, engineering computer graphics, Materials Science and other sciences [7, 12-14-b.]. It provides a basic understanding of the methods of solving a large number of issues related to the work of various construction structures and their calculation, the Design Calculation of machine details, the study of mechanical movements of material bodies and mechanical interactions.

### **Scientific novelty of the article**

Practical knowledge is considered as a means of opening up the scientific method, thereby providing students with the motivation to acquire knowledge and prepare them for the fulfillment of the purpose and constructive activity in the surrounding world [1].

It was noted that the exact picture of the scientific method of cognition, which determines the tasks of formation of practical knowledge in relation to the course of "technical mechanics", which will be conducted on the basis of Higher Education, will allow students to acquire the necessary knowledge, skills and skills, will appear on the basis of exactly substantive materials [9].

Analyzing the definitions and opinions of various authors on the formation of practical knowledge, taking into account the fact that it is aimed at preparing students of a higher educational institution for professional-practical activities, we have based the following definition: practical knowledge is knowledge that allows applying theory in solving practical problems [9].

When we say practical tasks-we understand the calculation and graphics, laboratory work, various test tasks in a practical description, etc.

The basis of the formation of practical knowledge among students of technical specialties is the rules of an active approach to education.

The science of "technical mechanics" is a "productive" educational environment that allows the formation of practical knowledge among students of technical specialties. For this reason, it is necessary that the teaching of technical mechanics is closely related to special subjects with a focus on practice.

Thus, the formation of practical knowledge in the course of "technical mechanics" in students of technical specialties is an important factor in further ensuring the effectiveness of teaching them special subjects.

In this regard, the students are:

- \* change (deformation) or immutability of machine and construction parts in shape and dimensions under the influence of external forces;
- \* gear, chain and belt transmission;
- new directions in the design of modern machines;
- to determine the dimensions of materials through machine details and knots, compounds, roller bearings, moulds;
- \* calculation of strength of machines and structures and their parts;
- to have an idea of the mechanical properties of stretching and compression materials;
- using modern design tool for machine details and specifications;

must have relevant skills. This is a list of the basic knowledge obtained from the course "technical mechanics", which is necessary for students in the process of obtaining technical specialties.

The results of our research confidently show that the formation of practical knowledge among students of technical specialties is necessary step by step, that is, at the beginning of the process of teaching students-a special course "mechanics", and then – when directly studying the course "technical mechanics", further development of this process is necessary.

The need to introduce a special course "mechanics" depends on the following circumstances::

- \* lack of preparation of students in mechanical and general technical sciences;
- inadequate student's ability to work independently;
- \* high requirements imposed by the state educational standards for the preparation of graduates of technical specialties for the profession [10].

In fact, The conducted experience-test results show that in the performance of tasks with a practical description in technical mechanics, students make mistakes, encounter a number of difficulties associated with the formal assimilation of certain technical terms, physical sizes, formulas, the inability to apply theoretical knowledge in practice, that is, during the study of technical mechanics, practical knowledge among students of technical specialties

Thus, practical issues of technical mechanics are an important factor in the professional orientation of education in the training of future specialists in technical mechanics.

Thus, it was necessary to establish the task of the course "technical mechanics" as the formation of practical knowledge of students. It is important that such a goal is set and constitutes the subject of our research.

Using the solution of the problem of understanding in the proposed education, we distinguish the following stages of the management of the educational process for its basic unit::

- event recording;
- create high quality model;
- to determine the means of quantitative characterization of the phenomenon;
- characteristic of the result of the study of the phenomenon.

**Results and practical applications.** Thus, according to our research conducted, a student with practical knowledge should be able to::

- to identify the different types of structures that are seen in the technical processes, to distinguish the exact dimensions that occur through these structures;
- distinguish the main ones that are important from the insignificant details that are distracting in the object or phenomenon, that is, drawing up a model, it can be not only one of the main models of the type of "material point", but also any model that is suitable for the given task;
- to distinguish objects and phenomena from their descriptive means, to find the descriptive means corresponding to the selected model, to bring a private description, if necessary;
- to predict the course of a particular event with other objects, under the conditions of other events, using the knowledge of the descriptive characteristics of the phenomenon under study.

Must be understood:

- state and meaning of descriptive instruments;
- to logically describe an ongoing event or process and to understand its causes and characteristics.

Must be mastered:

- \* general rules of theories and laws, areas of their application;
- basic physical quantities;
- limits to the validity of concepts.

Thus, an important educational task is the formation of knowledge about modern practical knowledge, modern technology and technical principles of production in students. At the beginning of the study, objects with different characteristics and phenomena with different aspects are selected. The most important function of mechanics is to explain the phenomena of nature, that is, to find the answer to the question "why this phenomenon happened exactly so, and not otherwise (for example, why when the bodies are compressed, an attempt voltage occurs, why the normal voltage is zero, etc.)". But before explaining the phenomenon, it is necessary to discover it, to distinguish it from a number of other different processes occurring in nature, to understand the scientific truth [2,3, 6, 8, 12, 13].

One of the first stages of scientific knowledge is the identification of these facts, in the process of which "what happens when the bodies are compressed or stretched, and how does it happen?the question "quot; is answered. At this critical stage, the student will be able to independently distinguish the phenomenon that is happening and "why...?the answer to the question "quot; will have to give a justification. Specialists are required to have sufficient preparation and

qualifications for the creation of modern machines and equipment, to identify them with theoretical, practical and experimental yuli.

The second stage is modeling. When we say directly about modeling, this logical step can not be overlooked. In order to formulate knowledge in the process of cognition, students must always be able to identify important characteristics in a particular case of the study of the phenomenon and not pay attention to a number of other, insignificant, insignificant, secondary characteristics. The main features and the ability to determine the abstract of the rest are important in the formulation of models and the determination of the forms of the appearance of related phenomena, the establishment of laws.

Modeling is a necessary stage of the process of scientific knowledge as the process of creating the ideal model of objects and phenomena for their study and explanation.

For example, for the logic of introducing a new value corresponding to logical thinking chains, it is necessary to carry out the following steps [11, 32-b.]:

- \* ultimately tracking the interactions of things and events;
- finding a new feature in a single thing or event;
- to determine the same characteristic of a particular group of objects or phenomena in others;
- naming this feature;
- to determine the different degree of manifestation of this feature in different things or phenomena;
- \* conclusion on the need to introduce a new character;
- add new character name.

The fourth stage is a feature of the results of the study of this phenomenon, and the second stage is an inalienable link with the construction of the model. Therefore, we can observe that this logical step is not sufficiently illuminated in the course of mechanics.

## CONCLUSIONS AND SUGGESTIONS

Based on the above considerations, we can conclude that the formation of practical knowledge in technical mechanics and the problem of the universal block of Sciences (technical mechanics) is not sufficiently complete solution. Thus, our research work showed that in order to increase the effectiveness of teaching technical mechanics to students of technical specialties, it is necessary to develop a special course program, a work program on technical mechanics, purposefully formulate practical knowledge of these programs in students, introduce them in.

**ABSTRACT**

*This article covers the analysis of the scientific and theoretical foundations of the development of children's speech with hearing impairments in the process of literary education. In the process of literary education, the essence of the pedagogical factors of the development of children's speech with hearing impairments is revealed.*

**KEYWORDS:** *Literary Education, Hearing-Impaired Students, Speech, Principles, Artwork, Methods, Knowledge, Skills, Literary Education Educational, Pedagogical, Developmental-Correctional Tasks, Speaking Ability*

**INTRODUCTION**

The educational, pedagogical, developmental-correctional, purposeful emotional perception of the world, ideological, aesthetic tasks of literary education are described, and the development of student speech as a tool of communication has a positive effect in the context of application of each of these tasks in interaction. V.K. Skatershikov distinguishes the cognitive, aesthetic, educational and communicative functions of literary education. In addition to these functions recognized by the general public, other functions have also been mentioned by the researchers [2; 37-p.].

If N.K. Gay offers expanded concrete-emotional understanding of the world [8; 463-p.], D.S. Likhachev offers educational-aesthetic [4; 237-p.], and M.E. Markov-compensatory, educational-pedagogical, social-organizing and organizational functions [5; 191-p.]. M.S. Kagan explains the diversity of the multifunctionality of art by linking it to the specificity of human life activity in its completeness and structural integrity. [6; 34-p.]. In the opinion of researchers

engaged in aesthetics, literary studies, philosophy, the value of a literary work is determined not only by its cognitive, educational and communicative functions, but also by its aesthetic effect - the ability to arouse "unselfish" enjoyment in a person. N.K. Gay emphasizes that in art, the process of perceiving oneself as both a creator and a person takes place [9; 456-p.]. In the acts of creativity and perception of the work is an excellent creative person, which means that as an object of aesthetic assimilation, perfect assimilation takes place in the surrounding world. In addition, Yu.M. Lotman's research emphasizes that the aesthetic value of art is the expression of its essence, since the aesthetic function integrates everything else [4; 70-p].

Literary education should be focused on the implementation of educational, pedagogical, developmental-corrective, purposeful emotional understanding of the world, ideological, aesthetic, tasks. The implementation of the tasks of literary education depends on the level of preparation of teachers and students, the correct establishment of partnerships to achieve a deep understanding of the specifics of fiction as the art of speech. The *task of literary education* implies the emotional perception of the work of art, the development of visual, logical thinking, creative imagination, the formation of a feeling of love and respect for educational national values, the upbringing of a spiritually mature person, *the corrective developmental task* of the reader implies the development of dactyl, oral, written speech. Among the educational task of literature education, the formation, lexical, grammatical aspects, residual hearing ability of the student are developed. In the process of literary education, speech development is carried out in three directions, such as the development of speech ability, speech activity and acquaintance with the structural system of speech.

Verbal ability develops in these lessons by mastering the meaning of the whole text by linking the meaning of words with other texts. From the types of speech activities, first of all, in addition to reading, the skills of speaking, hearing, seeing, writing, typing are developed. In reading lessons, students are introduced to the structure of speech, in the expression of their thoughts, on the basis of the presence of examples of words and phrases in the text and passages. In the process of reading the material, which is formed and varied in content, there is a wide opportunity to work on the correction of mental processes such as memory, attention, developing the ability to think in speech and connected speech.

The purpose of literary education is to teach the perception of the beauty of the world through art, the aesthetic task is to create and understand the delicate taste, beauty, the formation of feelings of enjoyment, the ideological task is to cultivate a high worldview and faith. takes

The educational-educational, correctional-developmental, purposeful emotional comprehension, aesthetic, ideological functions of literary education can be effectively realized only if the reader reads and understands what he reads. The level of perception of the work by students with hearing impairments, the level of speech activity on creative thinking based on the read works can be achieved by studying the perceptual features of the literary text, knowing the structure of the text, teaching psycho-semantic space. This approach is also effective in defining the content of education.

Only a purposeful and holistic perception of a work of art leads to the emergence of aesthetic experiences and the need to express it orally. Excessive rationalism in the analysis of the work in the classroom leads to a violation of the integrity of perception and a decline in aesthetic experiences. Therefore, the teacher can perform the tasks of literary education by applying the

interrelationships between the educational, pedagogical, developmental-correctional, purposeful emotional perception of the world, ideological, aesthetic tasks of literary education. A deep understanding of the peculiarities of fiction as the art of speech depends on the level of training of teachers and students, the correct establishment of partnerships.

In the process of literary education, children develop speech. If speech is the back of a medal, the front is a pedagogical, ideological and didactic system. According to VI Tyupa: "The superiority of communication over information, the development of speech means the readiness to teach the native language, the superiority over the formation of formed concepts" [6; 11-b.].

In the process of literary education, the teacher encourages the student to refer to the literary text from an unfamiliar point of view in order to fully understand the opinion of others, to fully understand the opinion of the classmate, allows the student to look at familiar works of art differently. Thus, the comprehension of the text leads to the understanding of the opinion of others, the understanding of the opinion of others, the organization of learning dialogues, the elimination of student egocentrism, the interest of students in each other, respect, the desire to hear the opinion of others.

Dialogue is a method of conversation that is recognized in all learning models as the basis of learning communication. But teachers do not always have a common understanding of the role of dialogue. In traditional education, teachers have always worked in a dialogical manner. In fact, they ask students questions, listen to their different answers, but this form of dialogue does not provide a learning dialogue.

V.A.Domansky distinguishes learning dialogue from traditional conversation: "Dialogic conditions (the difference between lesson dialogue and conversation-lesson, the teacher knows the answers to pre-asked questions) are created from the fact that is taught or learned by the student. It is definitely modeled by the teacher. "Dialogue is a free dialogue between two equal people in the field of culture, in which there are not rigid, but unpredictable examples of creativity" [4; 54-p.].

The factor that hinders the development of speech in children with hearing impairments in the process of literary education is related to the nature of the subjective interaction. The learning dialogue involves not only the teacher interacting with the students, but also the students interacting with each other. Primary school students usually in the early stages of education explain their ideas to the teacher, waiting for his response, evaluation. The teacher, on the other hand, communicates face-to-face with each student.

In the process of literary education, communication between students is established, a barrier called the 'sunflower effect' is overcome (students look at the teacher as if the sunflower were facing the sun, as if it were spinning). The establishment and development of equal rights for teachers and students will lead to a decline in the status of school grades. "Who understood what Alisher said? Do you agree with the princess? Why did Nodirjon think so?" With questions like, the teacher teaches each student to see their classmate as a partner, to work with them collaboratively, to hear the answer, to ask questions, to listen to the opinions of their peers. The learning tasks in the textbook aimed at solving learning problems help students to organize their collaborative work, involving children to pay mutual attention to their ideas. Children's ideas are written on the board, discussed, and artwork created by children is discussed. Such an organization of the learning process allows students to interact, work creatively in groups.

One of the barriers to organizing learning dialogue in the traditional learning process is to look at the child as a fable, explained by the teacher's lack of attention and interest in the students' experience. In this context, the teacher's unique knowledge carrier in the learning community, which is able to assess students, manifests itself in an authoritarian attitude that negatively affects children's access to equal dialogic attitudes. Traditional education does not take into account the many years of intellectual and intellectual skills that a child develops before coming to school and is mastered by school-age adults, books, computers. Many years of hard work (answers to the child's questions, views on problem solving, reading books, discussion of the plays he watched) will not be required to understand the world around the child, supported by the parents. It is this child who will no longer feel the need for personal intellectual and spiritual property and will need to develop. The child worries that his pre-school knowledge, skills, and experience are not needed in the classroom. As a result, the child learns that his personal impressions and opinions are not taken into account in the educational dialogue.

In the non-traditional lesson, the teacher's cooperation with the student prevails, rather than the "individual authority" of the teacher, and a healthy creative environment is created as a result of their joint creative and practical activities. In such an environment, the student acquires the knowledge and skills he or she needs to acquire through hard work, reflection, and thinking. In the process of literary education in this innovative system, the speech experience of students in preschool and school period serves as a basis for the development of speech of hearing-impaired children.

Developing students' speech is one of the main tasks of a modern special school. The development of students' speech is closely related to the process of developing thinking, imagination, learning creativity.

The solution to the problem of organizing educational dialogue in the process of literary education is to overcome the authoritarian approach. In doing so, the teacher must understand the uniqueness of the children and approach each child individually. In the process of literary education, the teacher enters into a natural learning dialogue with the student, at the same time demonstrating the form and methods of teaching the teaching material. Role-reading, acting, and selective reading methods can be used during the learning dialogue.

In the process of literary education, students are introduced to the world of literature through acquaintance with literary genres, folklore, works of art, biographies of writers. At the stages of literary education, the initially acquired theoretical knowledge, skills and abilities are developed. Students' knowledge is monitored on the basis of learning tasks. In the process of performing them, it is necessary to master the literary text, to understand its elements. On the basis of educational dialogue the student develops the ability to aesthetically perceive the literary text, to distinguish the author's individuality through the text.

We describe the following methodological requirements for the development of speech in children with hearing impairments in the process of literary education:

1. Development of student speech through the interrelated application of each of the educational, pedagogical, developmental-correctional, emotional comprehension, ideological, aesthetic functions of literary education.

2. Achieving a deep understanding of the peculiarities of fiction as a verbal art in the implementation of the tasks of literary education through the correct establishment of cooperative relations between teachers and students.
3. Educational dialogue in literary education is formed on the basis of knowledge, skills and abilities available to the student. It is of course modeled by the teacher, the dialogue is a free dialogue of two equal people in the field of culture, not a rigid idea, but a creative dialogue based on vivid, unique, original views and analysis of creative samples.
4. By eliminating authoritarianism and monologism in the development of speech of hearing-impaired students, natural communication is established as a result of lively communication between students, the so-called "sunflower effect" is eliminated (students give up the situation of staring at the teacher forgiven). The teacher should help each student to see his classmate as a partner, to work with them collaboratively, to hear their answers, to ask questions, to analyze the answers of their peers.
5. The student's personal impressions, opinions, personal experience should be taken into account in the formation of the educational dialogue in the process of literary education. One of the barriers to the development of speech in children with hearing impairments is the view of the child as a fable, i.e., the lack of attention and interest on the part of the teacher to the students' intellectual and practical experience. In this context, the teacher's unique knowledge carrier in the learning community, which is able to assess students, manifests itself in an authoritarian attitude that negatively affects children's access to equal dialogic attitudes. Therefore, the student's personal impressions and opinions should be taken into account in the educational dialogue in the process of literary education.
6. In the process of literary education develops naturally through the formation of a natural learning dialogue through the teaching of educational material, the substantiation of students' opinions, their opinions, the attitude to their classmates. Therefore, in order for a teacher to engage in a natural learning dialogue with students, it is necessary to choose the right form and methods of teaching the learning material at the same time.
7. The development of students' speech in the process of literary education should be carried out in conjunction with the development of skills of aesthetic perception of the literary text. During speech development, role-playing, staging, selective, or interpretive reading is performed. In literary education, the educational dialogue involves not only the development of the student's speech, but also the formation of the skills of aesthetic perception of the literary text, the ability to see the author's individuality in the text. Through the learning dialogues organized on the basis of these requirements, it is possible to achieve the development of students' speech.

## TRADITIONS AND HISTORICAL ANALYSIS OF THE FOOD INDUSTRIES OF THE SURKHANDARYA OASIS

**Gayrat Abdulkhakimovich Mamarajabov\***

\*Senior Lecturer,  
 Department of General History,  
 Termez State University, UZBEKISTAN

### ABSTRACT

*In addition to the supra prepared by the craftsmen, there are a number of myths associated with the utensils used for baking such as bullets, sieve, rapid, encha, and kosov. The oasis artisans attached great importance to the cleanliness and purity of the cauldron, because their life could not be imagined without a cauldron. Copper and cast iron pots were used in the daily life of the oasis artisan family.*

**KEYWORDS:** *Cheese, Household Chores, Dishes, Supra, Chopped Soup, Bacon, Butter, Yogurt.*

### INTRODUCTION

In the material culture of the population of the Surkhandarya oasis, it is important to deeply study the features of technology made by artisans, as well as its functions in everyday life. It is only natural that the wonderful supra riddles made by local craftsmen will help the young housewife master the housework, prepare delicious food and earn herself a good reputation, as a result of which the hostess will become an adherent of honesty and cleanliness. All baked goods were prepared by the masters in the supra. According to local tradition, the supra was not left open and without flour, since the flour in the supra was a sign that the family's food would not be interrupted. Supra was popular with families of artisans and it was discovered as "Bismillahir Rahmanir Rahim". Old mothers taught young women that the Bismillah blesses every deed and that the devil does not interfere with what you do. When the work was done in Supra, it was collected by turning to oneself so that his blessings would surely remain with him. This tradition was followed in the Kashkadarya oasis [1.180]. When making dough in a supra prepared by artisans, a woman should have in her hand an "ashalol" (ashkhalol) ring. The handicraft bells in the oasis wore a ring as a symbol of purity. Not only in cooking, but also in other household

chores, women wore a ring with ashalole [2.18.]. There were fears that the bread would "bloom" if someone or a cat jumped over the supra. It has been said that if a woman leaves more flour after kneading during pregnancy, the unborn child will have more hair and less hair [4]. In the village of Koschinor, Denau district, before putting the child in the cradle, two women rolled him from side to side, and then wrapped him in the cradle so that the child would have a portion of food. When a girl was born in the family, her mother sewed her a supra. Because in our people, since ancient times, a house without a supra was considered a blessing. Therefore, there is a supra in every house. While the young brides simply lived on their own, an old and experienced mother stood by them at home and explained the blessings of the supra. Already now we see that in every house the supra is carefully placed in a special clean bag. Hence, the supra and associated rituals taught women to be chaste.

### Methods

In the village of Pandzhob, Baysun district, in the village of Pandzhob, Baysun district, a new bride came to the family in the crafts, dipped her hand into the supra, kneaded the dough with the addition [6]. It was a supra yadi ceremony, during which the bride's readiness for household chores, her ability to read, work hard and dexterity were tested. The idea of transferring to another social group, these rituals associated with preparing the bride for a new activity, were practiced in other regions and are called "supra saldi" [7.41.]. Among the Tajiks of Faizabad, the bride was presented with a supra in her right hand and "thin bread" in her left hand with the intention of becoming a good housewife [8.117.]. It was then that the supra was written, in which the bride was told to knead the dough for the cake. The mother-in-law poured butter on the bride's hand, and the bride kneaded the dough. The mother-in-law spread the dough and baked oshi ugro (chopped soup) thinly. The guests drank chopped soup and praised the young bride as a good hostess. In addition to the supra prepared by artisans, there are a number of myths associated with the utensils used for baking, such as bullets, sita, rapid, enchkha and kosov. For example, in the village of Khazarbog in the Denau district, families of artisans did not pay attention to the rapid, saying: "May the blessings of the house not rise, may our work not go to the left." In the villages of the Altynsay region, if a girl has two locks in her hair, her mother sews a lock on her forehead with the words: "My daughter should not have two marriages." In the village of Khazarbog in the Denau district, during the ceremony of a "boring woman" calling for rain, artisans at night poured rapids into streams or springs, saying: "This is the biggest." Among the inhabitants of the oasis, ammunition made by artisans was not erected, because the ammunition was set when the dead person left the apartment. Since the families of local artisans are the breadwinners of the people, great attention is paid to keeping the utensils used for cooking clean and wrapped in a specially sewn blanket or separate tablecloth. In addition to sheep and goat skins, artisans also used their belly as a container for tail fat, butter and yogurt [12.140]. The abdomen was thoroughly washed, turned out and hung up with a puff. Once the belly is well dry, it is soaked in plenty of salted yogurt. After standing for 10-15 days, not a trace of the demon remained in it, and it turned into a ready-made dish. The amount of oil placed in each belly depended on its size [13]. The oasis artisans attached great importance to the cleanliness and purity of the cauldron, because their life could not be imagined without a cauldron. As soon as the pot is removed from the oven, it is placed on a specially prepared stove and the neck is closed with a lid. The pot is washed immediately after cooking. The washed pot is based on the belief that "there is always desire." The necks of pots and pans are always closed so that the devil

does not lick them. There is a rumor that the bottom of the pot was not broken, and the saying “if the bottom of the pot is broken, the angels will fly away”. In the village of Laylagan, Sherabad region, families of artisans believed that feeding the birds with food or grain in a pot would increase the welfare of the house and make it unattractive [14]. To protect the young bride from all sorts of calamities and disasters, a pot was placed in the corner of the chimpanzee. The craftsmen in the oasis worked on the pot. For example, wounds inflicted on the body of a small child are inoculated with pot black. A child feared by experienced artisan elders drank water from a cauldron. They rubbed his forehead with a cauldron so that he would not fly when carrying a small child at night. The neighbors vaccinated the patient, lit a lamp, adding a pot of blackberries to the side. The artisan families strictly adhered to the Udim and Irin-Sirim, while the breast of the lactating woman was vaccinated with one of the kitchen utensils, such as an elbow, a rapida, or a pen, by first tapping the four ears of the pot and then touching the ground. and then to the woman's chest. If the moon is darkened or the earth shakes, something gets into the cauldron (usually cappuccino) [17]. The masters paid special attention to the funeral rites. Including. Funeral ceremonies also performed rituals associated with the cauldron. On the day of the death of the deceased, the pot of food (gruel) was turned over for three days [18.161.]. To wash the deceased, the water was heated in a new cauldron and after washing it was turned upside down and some ash was sprinkled on it, as the people believed that ash would bring relief [19]. At the Tajik craftsmen Koragin and Darvaz, the water cauldron was thoroughly washed with ash or sand to wash the deceased and turned over overnight. In some villages, a cotton swab was placed over the ears of an inverted pot, claiming that "whiteness" would bring relief. In Kulob, Tajik artisans sprinkled an overturned cauldron with ash or flour with the goal of "so that the dead don't come out again, let the light come on after that." In general, in the house where the victims went out, not only a hot water boiler, but also other boilers were overturned for up to three days.

## RESULTS AND DISCUSSION

Copper and cast iron pots were used in the daily life of the oasis artisan family. Since the cast iron pots created by the craftsmen were cast and heavier than copper, more copper pots were used. That is why copper sandpits, teapots, bowls, basins, handkerchiefs, tuffons and samovars are made of copper. In Sherabad there were special coppersmiths who made various types of pottery. For example, Kurban Misgar is a famous artisan, whose ancestors were also engaged in this profession, and in the 20th century, the descendants of the master continued the profession of a coppersmith [20]. In the principality of Sherabad, experienced craftsmen made beautiful tufdons with the famous oriental cap, which was called dashoy-tufdon [21.66.]. Thanks to the painstaking work of the craftsmen, the place of the knife among the iron kitchen utensils is fragmentary. For example, in the village of Hamkon, Sherabad region, knives made by the master and blacksmith Abiramat Bobo were highly valued for their sharpness and irreversibility. Knives made by the craftsmen of the Boysun Center are also popular, and this tradition continues to this day. Knife myths have survived among the artisans of the oasis. In particular, they believed that if the knife struck, the enemy would multiply, and if the blade was directed upward, it would bleed out. It was customary to hold the knife while moving, trying not to touch the tips of the knives so as not to provoke a quarrel, and nail it to the ground if the tips of the knives touched each other. During prayer at the table, a knife was removed from the table so as not to cut the prayer. He rubbed the kirna with a knife to cut the kirna (kinna). Measures were taken to

prevent this, they say, if the girls cut the knives, they will cut their own happiness. Similar myths still exist today. For example, in wedding ceremonies, people with ill intentions believe that these young people will not be happy if they turn their knives upside down during the wedding ceremony [23.42.]. The knife was a constant companion of the young man. An example of this is the following. After the bread had been broken, the young man approached the girl for a "magic game." That is, the young man came and talked to the girl after dark. As a result of the conversation, if the girl became pregnant and the young man went on a journey without knowing it, the marriage was concluded by placing a knife in the middle of the young man, thereby removing the stigma. Here the knife served the young man symbolically. In other similar customs, we see that a knife is a constant companion of a young man. From the Uzbeks of the Ferghana Valley, the bride's brother demanded "a knife" or "money for a knife" when he brought the bride to the groom's house. For the knife prepared by the groom, they gave "money for the knife" if the knife was not prepared [25.41.].

### CONCLUSIONS

Particular attention was paid to highlighting the traditions associated with artisans, the attitude towards kitchen utensils, that is, our values, such as care and cleanliness in relation to them. The table was created as a source of food for artisans, to prevent waste, to create an image of ethnic traditions and life of the inhabitants of the oasis, focusing on the ethics of education, the criteria of education. The regional disposition of artisans also influenced their farming methods. Thus, an analysis of the kitchen utensils used in the daily life of artisans and the customs associated with them shows that they have both territorial and historical characteristics.

### ABSTRACT

*This article is devoted to the oikonyms of the Takhtakupyr region. Takhtakupyroikonyms are formed from ethnonyms: 1) oikonyms, formed from Karakalpak clans; 2) oikonyms, formed from Kazakh clans; There are also oikonyms formed from numerals and adjectives. Information about the reason for the name of the Takhtakupyr region, Borshitau and the Karaterenlake is given.*

**KEYWORDS:** *Toponym, Oikonym, Genealogy, Village, Anthroponym, Ethnotoponym.*

### INTRODUCTION

The formation of toponyms in the Takhtakupyr region has a separate history. Toponyms of the Takhtakupyr region, with a 90-year history, seem to be an interesting topic for researchers because until today the name of the region, localities, water bodies have not been fully explored. The Oikonyms of the region keep the secret of a century-old history in their names.

The Takhtakupyr region is located in the southeastern part of the Republic of Karakalpakstan along a large road leading to the neighboring Kazakhstan Republic. In the west it borders on the Karauzyak region, in the north-west with the Muynak region, in the north-west and southeast with the Republic of Kazakhstan, in the south-eastern part with Yellikkala, in the south with the Beruni region.

The history of the origin of the toponym of the Takhtakupyr region is associated with the construction of a wooden bridge, in other words, the construction of a bridge made of wood. The bridge was commissioned in 1904. In those years, the location of the Takhtakupyr region was a large road connecting with Khiva, Urgench, Kungrad, Khojeyli, Turtkul and Chimbay for merchants going with a caravan. They went through Takhtakupyr to the cities of Kazaly and Kyzylorda in Kazakhstan. The merchants of these cities passed through this Takhtakupir. The

caravan passed along the shallow lake "Bosayozek" (the current name is "Kuuanyshzharma"), since then there was no bridge. Residents communicated by building a small boat out of black willow on both sides of the coast. During these years, there were many people who came for permanent residence; the eastern and western parts of the lake were led by KhozhametBols (volost). In 1903, under the leadership of KhozhametBols, residents of both banks built a bridge across the lake. Thus, the construction of a wooden bridge over Lake Bosayosek was a great historical event. Since that time, the people called the name of this area TakhtayKopir - Takhtakopir [1].

The Takhtakupyr region was organized in 1928. Although 90 years have passed since then, it has not lost its name and is one of the leading regions of the republic.

### **Main Part**

Knowledge of the history of the origin of localities and reservoirs is interesting to everyone. Especially the study of the history of the origin of the name of one's place of birth, the disclosure of the meaning of each name reinforces the patriotic feeling towards the native land. The name of the localities and reservoirs of the Republic of Karakalpakstan, including the Takhtakupyr district, in other words, toponyms reveals the secrets of the centuries-old history of the people. So, having information about the economy, about the way of existence, according to the toponyms of a certain area, one can talk about the history of the descendants located in this area.

In onomastics, oikonomia is a general set of names for localities (settlements). Oikonyms are considered one of the types of toponyms like the history of people, society. They appear for various reasons, i.e. they have a peculiar history. Each oikonym is a fruit of its time; they were born in connection with historical events. Although the time of the appearance of the oikonyms is not indicated, signs of that time can be seen in their contents. It can be seen by its meaning and structure. Based on the teaching of history, it can be noted that the history of the appearance of toponyms is directly related to historical periods. The study of oikonyms is of particular importance.

In connection with gaining independence, oikonyms and large physical and geographical names of the republic are transformed and many of them acquire new names.

The toponymic system of any region has been created over many centuries. The history of the people is reflected in the language. Each name is history, and place names can be called a mirror of history. If the meaning of each name, a long history, the mystery of birth - if we fully prove everything, then certainly everyone seeks to know this. Similar to this, there is a history of the name of the Karaterenlake, which we want to tell about.

Lake "Karateren" located in the village of Borshitau, Takhtakupyr region of the Republic of Karakalpakstan, for centuries fed the people with its fish: carp, catfish.

They say that earlier there was a padishakhstvo (state) under the lake. This area could not be conquered by any enemy. Since the padishahism was located in the lowland, which was surrounded on four sides by a straight cliff, the enemies could not go down. The padishah of this area was very smart and took care of the people. Because of the love (of the shepherd bakhtashi) of the daughter of the padishah, the city remained under water. When the lovers barely got out of the water and ran away along the shore of Lake Borshitau, a stone falls on them from the mountain, and the lovers remain under the stone. The population was drowned by water and the

padishakhism remained under water. Those who managed to escape from the flood remained alive, and those who did not have time remained under water. In order to achieve the love of one, he destroyed an entire population.

Until now, on the slopes of "Borshitau" there is a tombstone for two lovers.

The name "Karateren" (Black depth) comes from the reason that the sun's rays and the feet of mankind do not reach the bottom of the lake; therefore, so far, what is at the bottom of the lake due to the depth remains a mystery.

Another characteristic feature of the names of localities in the Takhtakupyr region is the wide distribution of oikonyms, named after various clans and tribes, as well as nationalities.

Most of the population of the region are Karakalpaks and Kazakhs. Therefore, there are more oikonyms in the region, formed from the generic names of the two nationalities.

Annaul is a village in the Karateren region. Anna is one of the clans of the Karakalpaks.

Bessaryaul is a settlement of the region on the territory of Atakol and Karaoi.

Kepeaul is a village of the district in the territory of Atakol.

Kanzhigalyaul is a village located at a distance of 10 km from the district.

Kanlyaul is a village in the region inhabited by Karaoi. People of Karakalpak clans live in this village.

Karamoynaul is a village located on the territory of the settlement of the Takhtakupyr and Karateren regions.

Kypshakaul is a village in the settlement of Karaoi district.

Muytenaul is a village located on the territory of the settlements Karaoi and Karateren of the region.

Shalzhuhtaul is a village in the settlement of Karateren. Shalzhyuyt is one of the clans of the Karakalpaks.

Shomishliaul is a village of the Atakol settlement. Shomishli is one of the clans of the Karakalpaks.

Yrgaklyaul is a village located in the territory of the settlement of Karaoi district.

Zhakayimaul is a village located in the village of Mulik. Zhakaim is one of the clans of Kazakhs. It was named because the people of the Jacaim clan lived for a long time.

Kazakaul is a village in the settlement of Takhtakupyr. The village is so named because there were many Kazakhs here.

Karasakalaul is a village located in the village of Mulik. Karasakal is one of the clans of Kazakhs.

Tolengitaul is a village of the fourth village. Tolengit is one of the clans of Kazakhs.

Khojaaul is a village located in the village of Mulik. I go one of the families of Kazakhs.

Shomekeyaul is a village located in the settlement of Mulik district. Shomekey is one of the clans of Kazakhs.

In the study of oikonyms, named by the name of the genus groups, it turned out that the name comes from the names of the representatives of those genera that make up the majority.

With the internal classification of oikonyms on the territory of the Takhtakupyr region, along with ethnonyms, there are oikonyms named in connection with the species, numeral anthroponyms.

Anthroponyms and place names are very closely related. The semantic basis and methods of education are similar [2].

Borshitau is a settlement located in the north of the Takhtakupyr region.

Early times between Khiva and Kyzyl kum were the cities of Kyzyl kala and Dugisken, which were unmatched. There was a road crossing the endless sands of Kyzyl Kum (Red Sand) in the northern part of Karataua, which is the intersection of nine roads and the center of trade. Kyzyl-kala was a resting place for merchants. Having sold salt, loaded onto camels, exchanging goods, returning the caravan, led by Baray, unexpectedly stumbles upon a magnificent place. On one side the lake is like a sea, on the other side there is a hill like a blackish ram. They, dropping camels to their knees, just wanted to rest a little when they suddenly heard a crying child's voice from the side of the mountain (hill). Then, after making a fire in different places, they start looking for a child. At dawn, they find a gray wolf (bori) in a den of a gray wolf (bori), a very tired and dying child of about two months old. A child found in a gray wolf's den is called Borshi. The big hill where the child was found turns out to be a caring one who has a brand (seal) in the history of a noble mountain. They say people named their first-borns Borshi and this area Borshitauy (mountain Borshi). It is also said that to this day one can sometimes hear the cry of a child and the howl of a wolf at the foot of the mountain.

Akishtam - this area is located in the village of Kungradkol and is considered anoikonym named after a person. It was named in connection with the name of the person Akysh.

Atakol - located in the village of Atakol. According to information, an old-timer named Ata lived on the shore of the lake. Therefore, atanynkoli (grandfather's lake) is called Atakol.

Balkiaul - located in the settlement of the Karaoi region. It was named in connection with the name of the girl Balka.

Daukara - on the land of Takhtakupyr there was a settlement called "Daukarazherleri" (the land of Daukar). According to oral folk art, Daukar is the son of Chimbay [1].

Dautsay is an oikonym located in a district in the village of Mulik.

Adilaul is a village located in the territory of the Atakol settlement. Reportedly it was named after an old man, Adil.

Kayypaul is a village located in the village of Takhtakupyr. It was named for the man Kaip.

Pirniyazaul - located in the village of Takhtakupyr. It was named after PirniyazSultanov, the head of the farm.

Rametaul is a village, a settlement of the Takhtakupyr region. It was named after the name of Brigadier Ramet.

Turmanaul is a village in the Takhtakupyr region. It was named for the old man Thurman.

Khozhametaul is located in the village of Atakol district. It was named after KhozhametBolysa, who supervised the construction of the wooden bridge.

Shanghai is a village located in the settlement of Marzhankol district. Previously, the sunflower was grown here by a man nicknamed Shanghai of Korean origin.

Oikonyms derived from numerals:

Birinshiaul is a village located in the village of Takhtakupyr. The name of this village is named for the reason that it was seen first among the villages located one after the other.

Kyryktesik is a village located in the settlement of Karateren district. It was named after the name of the house with a forty hole.

Jeti to communicate is a village located in the village of Takhtakupyr. It was named after the name of the hostel built for the newlyweds.

Tortinshiaul is a village located in the west of the village of Zhanadarya district. The name of this village was named for the reason that it was seen as the fourth among the villages located one after the other.

Oikonyms named in connection with the species:

Akkesekaul is a village located in the village of Takhtakupyr. It was named after the name of the white earth of the soil.

Akkol is a village located at a distance of 10 km from the settlement of Takhtakupyr. There are several information about the name Akkol: 1) Due to the salinity of the lake, which can be seen from afar as white; 2) By the name of a person who moved here from the Aktobe region of Kazakhstan from the Tortkar clan.

Karaagash is a village located in the village of Takhtakupyr. There is a black electric pole at the entrance to the village. The name of the village is associated with this pillar.

Karaoi is a village located in the village of Takhtakupyr. If you look at this place from afar, this place looks like a black lowland. According to one more data, i.e. in the work of Hikmetulla Ayymbetov entitled "Takhtakupyr at a greater crossroads" the name goes back to the trees and forests, which can be seen from afar as a black fog.

Karateren is a settlement named after the name of the Karaterenlake, located on the territory of the Takhtakupyr region.

Kungradkol is a settlement named after the name of the lake, located in the Kungrad region.

Zhanadarya is a village named after the name of the river, located in the Takhtakupyr region.

Oikonyms named in connection with their appearance:

Makpalkol is a settlement named for the beautiful, velvet-like view of the lake. The name of the lake became the name of the village.

Marzhankol - in connection with this name there are several oral folk arts: 1) In connection with the transparency of the lake water as marzhan-coral; 2) The harvest of rice obtained on this land gave a bountiful harvest as marzhan-coral, in this connection the village was named.

Kumaul is a village located in the village of Marzhankol. Since the village is located at the foot of the sand, it is named so.

Oikonyms associated with plant names:

Pishenkol - a lot of reeds grew on the shore of the lake, a person passing through this area had to bend the upper part of the reeds. Currently, this lake does not exist; the area located at the bottom of the dried lake is called Pishenkolauls.

Kendirli is a village located in the village of Kungradkol. The origin of the name is due to the fact that a lot of kendyr (hemp) used to grow here and in connection with this plant the village was named.

Jidelik is a village located at a distance of 8 km from the Takhtakupyr region. There grew a lot of zhiyde and a village named with the name of this plant.

Mulik - the name of this population is associated with the action of Kospanbatyr, who guarded this village saying "this is my people, my property" mulk-property and in this connection the village was named. At the foot of the village is Kospankum (Kospan sands).

## CONCLUSION

It is no accident that they say that "the name of lands and reservoirs is a letter of history." The topic of toponyms in which language was not necessarily indicates its relation to the geographical environment and nature. This means that the history of the names of toponyms provides linguistic and geographical information.

## THE EFFECT OF APPLYING THE ADVANTAGES OF THE INFOGRAPHIC FORMAT IN THE PROCESS OF MEDIA LITERACY EDUCATION

**Hilola Ibragimova\***

\*A second level Independent Researcher,  
 Uzbek University of Journalism and Mass Communications,  
 UZBEKISTAN

### ABSTRACT

*It should also be noted that teaching the new generation in the old way does not justify itself; therefore, the textbook content of this generation should be supplemented with various anthologies, laboratory workshops, a set of assignments, multimedia resources and other innovative technologies, in addition to “teaching just to read”. Infographics are also a fairly effective format in these processes. This article describes in detail the methods and effectiveness of the use of info graphics in the process of media literacy education.*

### INTRODUCTION

The world today cannot be imagined without the media. The media plays a special role in human life. Whereas in the past people used to wake up, wash, sit at a table and read a newspaper or get information on the radio and television, now we dive into the information space through gadgets before we even have time to open our eyes. Every second new piece of information arrives. We have a phone, a tablet, a TV in our house, a radio in our car, a computer in our office, all of which does not allow us to be disconnected from the media world, even if only for a little while. Today we have become the inhabitants of the “media island” and we can’t even imagine that there could be a different life outside of this island; and we can’t imagine living without the media.

## The Main Part

"Media" is derived from the Latin word "media", which means 'middle ground' or 'intermediate', more precisely "common information intermediary".

As it developed, the media has made people's lives easier, and began to satisfy the demand for information in any way; it began to play an important role not only in the form of information but also in the formation of knowledge and skills. At the same time, the proliferation of information channels, in particular the emergence of the Internet and the freedom to disseminate information on it, have brought out the formation of citizen journalism as a factor play an important role in society; this has made it necessary for people, especially young people and children, to develop the ability to select and analyze data, to distinguish reliable and accurate information. It is on the basis of this task that a new concept of media literacy education has emerged.

The main stage in the development of media literacy education dates back to the end of the last century. During this period, a very convenient and fast channel of information transmission, the Internet and mobile phones, developed. Such factors as democracy and the convenience of mass communication, the difficulty of controlling this situation by the state or other organizations, the popularity of technology devices began to affect the social and economic life in communities.

According to the Oxford Encyclopedia, "Media literacy is the study of the media. Media literacy education is linked to the media texts being created and disseminated. It develops the ability of learners to analyze to interpret and evaluate the content of media texts. The study of media is usually done in a practical way, i. e. in connection with the creation of media texts. Media literacy education serves to increase media literacy through the study of the media."<sup>1</sup>

UNESCO defines media literacy education as follows: media literacy education is the study of the theory and practice of knowledge in modern media.<sup>2</sup>

In 1982, UNESCO adopted the Declaration on Media Literacy Education. According to this, "Media literacy education is closely linked with all types of media (print, graphics, audio, screen, etc.) and various media technologies. It educates people on skills such as understanding how to use mass communication in the social consciousness, mastering the ability to use the media while communicating with other people.

The word "media literacy education" first appeared in the territory of the CIS in the 80s of the last century. Although this concept has not been widely used in Uzbekistan, there have been various opinions and researches on media literacy education. In particular, in the dissertation of Sh. T. Khalilova, defended at the Uzbek State University of World Languages in 2001 on "Pedagogical conditions for the use of mass media in the moral and aesthetic education of students" (on the example of Uzbek radio broadcasts), the establishment of a radio studio at school, the organization of trainings "Young Orators", "Young Correspondents", as a result of which students raised the issues of listening to the media, including radio and active participation in it, the formation of knowledge, skills and abilities. Similarly, K. A. Farfiyeva's dissertation on "Peculiarities of the formation of social perceptions in students under the influence of the media" (on the example of television), defended at the National University of Uzbekistan named after MirzoUlugbek, studied the influence of the media on public opinion.

Clearly, the concept of media literacy education is broad; its definition is not limited just to the knowledge that shapes the ability to use the media. A. A. Jurin defined this concept within three categories:<sup>3</sup>

1. A pedagogical subject that studies and teaches the impact of the media on children and adolescents and develops theoretical issues, preparing students for an encounter with the world of the media.
2. A joint practical activity of teachers and students, preparing children and adolescents to use the media, to understand the role of the media in the world.
3. A part of education that provides knowledge about the role of the media in understanding the world and its cultures and develops the ability to work effectively with media information.

The breadth of the concept of media literacy education, which also includes the educational nature of the media, can be seen through its directions. Russian scientist A. Fedorov, who has studied media literacy education in depth, divides media literacy education into the following main areas (perceptions):

1. Media literacy education prepares future professionals for the world of press, radio, television, cinema, video and the Internet - journalists, editors, directors, producers, actors, cameramen and others.
2. Media literacy education prepares future teachers who conduct media culture courses in educational institutions.
3. Media literacy education is a part of general education of pupils and students studying in schools, secondary specials, (vocational) institutions, higher educational institutions or independently functioning centers (special, voluntary, circle, etc.).
4. Media literacy education in other educational establishments and centers that organize meaningful leisure time of students (houses of culture, extracurricular activities, aesthetic and artistic education, clubs in the community).
5. Distance learning for adults, students and pupils using the press, television, video, DVD, Internet.
6. Independent, continuous media education. (This direction is theoretically practiced throughout an individual's life).

From the aforementioned considerations, it can be clearly seen how important the media literacy education is. In a sense, media literacy education helps the public to keep pace with the times, with the news in the media. Because of this, media literacy education itself should be transmitted to students and the audience in new, modern formats. Therefore, through research, we will look at how effective the new format – the infographics can be in media literacy education.

Medialogists studied media and media technologies and conditionally divided them into 5 types.

1. The first media is writing.
2. Print media - printed publications, lithography, and photography.
3. Electrical media - telegraph, telephone, voice recording.

4. Mass media - cinema, television.

5. Digital media - computer, the Internet.<sup>4</sup>

The latest generation media types, such as television and then the Internet, have reached an audience faster than their predecessors. Many researchers point to visualization as the reason for this. Indeed, visuality is one of the most important elements of resource attraction.

Because of their visuality, Infographics have become one of the best formats of communication today, as well as their ability to present information in a concise, brief, meaningful way, that's, in an exact way that an individual wants to express a thought or an idea.

## RESULTS AND DISCUSSIONS

Dividing the use of infographic into media education into two categories can help to shed light on the topic more clearly and comprehensibly. In media literacy education, infographics can be used both in teaching media and in transmitting knowledge through the media.

In teaching media literacy, it is possible to use infographics as a practical task for students in explaining media topics and creating textbooks on media literacy education.

Today's students' attitudes and requirements for the acquisition of knowledge and skills have changed significantly; unlike the previous generations, today's students get bored of "dry" texts quickly and can't just hold their attention by using only these materials. According to research: A large part of the human brain provides the capacity to process visual data – the ability to see. In fact, 50% of the brain depends on the function of receiving information through vision.<sup>5</sup>

Experimental practices also confirm that the brain sees and absorbs the most basic information via visual sources. It is only natural therefore, that the saying: "a picture is worth thousand words" is common.

"An ordinary person can remember seven numbers in a sequence, " said Webster. "But this person can also remember a thousand numbers in a sequence if the figures are presented in the form of a line graph."<sup>6</sup>

Therefore, the use of infographic materials in future media lessons will help to attract the attention of the student. It also enhances the ability to understand infographics in the media.

The article "Infographics in training" on the site synergycorp.ru provides the following claim on the use of infographics in the teaching process: "Training courses created with the help of infographics meet several important requirements simultaneously: they train the student to absorb the maximum amount of information in a short period of time, to demonstrate freedom during the lesson, and to develop memory and visual perception without experiencing boring 'squeezing'."<sup>7</sup>

While the information in the infographics is easy to retrieve, it requires the learner to concentrate well on the visuals provided. Without this, the information given in some types of infographics cannot be easily assimilated. For example, the infographic "Extinct and Fossilized" in the book "History of the World"<sup>8</sup> contains a lot of information. If this information was given in a text form, it would be at least 3 to 4 pages in length, in which a few pictures would have need necessary to accompany the text. This would have made it difficult for the reader to form an imagination. The learner would have to blindly assimilate this information. In the

aforementioned infographic, however, the reader searches for each piece of information on his or her own. He looks at the period, tries to analyze the type of animal, its structure, and how it differs from the animals before and after it. This ensures that the information the reader receives is well stored in memory. At the same time, the student develops the ability to analyze the information provided.

Practice has also confirmed that infographics are effective in the learning process and give a number of positive results. For example, Gary Rob Lamb and his colleagues talked about how to add infographics to science education in high school. First of all, their main goal was to form information literacy in the process of teaching graphical data representation. Infographics have been used in a variety of activities (e.g., “reading aloud and thinking”, “data redrawing”) and in presenting own projects by high school students. In particular, in a “reading aloud and thinking” lessons, teachers will display infographic materials and explain how to read the data, interpret their meaning, and understand the message contained (hidden meaning). In a “data redrawing” class, students will be able to visualize the ideas they see.<sup>9</sup>

Indeed, infographic preparation can also be used in the educational process as a separate pedagogical technique. We know that the "cluster" method is widely used among pedagogical techniques. Creating infographics can be seen as an improved version of the cluster method. In this case, the teacher with students can prepare an infographic in the form of a seminar based on the topic.

Infographics can also be given as a special assignment for students. However, first of all, it is necessary to explain to students the essence of infographics, its difference from ordinary visualization. It is not just an image given as a form of information such as visualization, but it carries additional information. In order to work infographically independently, first of all, it is necessary to study the topic in the textbook in depth. This prevents the student from merely doing a superficial study of the subject. Then the idea of infographics is considered. This helps to enrich the reader’s imagination. Often in hopes that students can master the topics well, the teachers ask students to take notes of the topics.

Teachers often claim that taking notes is equivalent to reading a book three times. In contrast, creating infographics requires students to work on the topic in the same way as they read it 30-40 times. They worry about how to present each piece of information on the topic. This allows one to re-read the information and think about it relentlessly, so that no information is neglected in the preparation of the infographic, which certainly leads to the desired outcome that the reader fully masters the topic.

In the West, even in ordinary schools, teaching using infographics has become commonplace, says the article "Infographics in training" on synergycorp.ru. The article also contains the following sentences. “DELL has conducted research among students and faculty at universities in the United States, China, and Germany. The results showed that 9 out of 10 respondents said that the use of infographics in the course would increase its effectiveness. Eighty-two percent of respondents said it would be better to use these technologies more than they do today.”<sup>10</sup>

The important role that the infographics play in the process of media literacy education is well reflected in and confirmed by the opinions of Canadian scientists. According to them, “Giving assignments on infographics can greatly inspire students to make a good use of all the communicative skills without a direct help of a teacher. It's also a real exercise in digital

communication skills.” According to the researchers, this is content formation and content production. In the preparation of infographics, the ability to critically analyze the content of information (or content analysis), to identify the characteristics and needs of the audience, and to design the message is developed. All of this enhances the level of professional communication skills in any field.”<sup>11</sup>

Another senior class teacher who uses infographics in her classes, Carissa Peck of California, says that she instructs her students to prepare infographics as an alternative to traditional essays. She also asks the students to analyze each other’s infographics at the end of the lesson, sometimes noting that several infographics are combined and generalized.

There are also a number of advantages to using infographics in textbooks.

With infographics, the textbook will have a colorful and unusual look. “The brain is designed to receive what sets it apart from others. We think of the brain as a computer’s hard drive. For it to work actively and efficiently, the memory must not be filled to capacity. To fully maintain optimal speed, the brain filters all the information that enters and as soon as it receives the information, it removes about 99% of the information from the sensory organs. The main criterion in this selection is that the information received is different from the information normally received by the brain before. The brain’s attention is drawn to new and unusual things.”<sup>12</sup>

## CONCLUSION

Infographics is a format that meets the needs of the modern audience. In today's information age, it is considered very difficult for people to obtain textual information, especially when the material contains large amounts of it. Now, despite the level of interest the information appears to generate, most people become bored of it after reading the first few pages, and most of these people do not make the effort to read the information to the end or go to the end without reading the information in the middle. Scientific experiments have proven that it is possible to hold a person's attention for only 10 minutes, regardless of how interesting the material can be.

Infographics help to obtain and absorb pieces of information easily. Also, pictorial information is received faster and easier than text. “Every letter in a word is a symbol. To read a text, the brain must first unravel the shape and sound of the letters stored in memory one by one. Then the sounds in the brain are connected and imagined how the word is formed. It is necessary to draw conclusions by imagining how the sentence is formed after the words, then the paragraphs are formed, and the content of the general text. Although this process takes place within a few seconds, if we compare it with the process of image reception, it is observed that in the textual form, there is more mental strain. Therefore, using infographics, in a sense, can physically simplify the understanding and reception of the information for the audience.”<sup>13</sup>

Because infographics present the information clearly and concisely, the process can prevent possible misunderstandings and misconceptions from arising. To put it simply, for example a word of apple does not describe what it looks like (in most cases, it is a general word without a specific detail or details; In fact, it is not possible to interpret every object. ) Because only the word itself is presented, everyone sees an apple of a different shape and color. In contrast, when the object is presented in the infographic, because the author's image is illustrated rather than stated, the audience gets the same image as the author is imagining.

It also has the advantage of firmly storing the data in the brain and of long-term storage of it there. 70-90% of image information is stored in human memory. This also prevents the books from becoming too extended or bulky.

Infographics can also play an important role in predicting longevity in media literacy education processes. Because it is able to store large amounts of information, it enriches them in school textbooks with information learned in previous classes, allowing the student to constantly revisit even old topics.

For example, in the literature on media literacy education, the presentation of chronological infographics about the stages of media formation, video infographics about media types, or interactive infographics allows the reader to get better acquainted with the world of media.

Just as infographics can be used in all fields, it can also be used in all science textbooks. We also know that today textbooks provide links using QR-codes, in which way readers are given a possible view of the infographic on a topic in the textbook or a video infographic on the infographic itself. This will help the reader to take an interest in the subject and learn more about it.

Textbooks can be used to prepare infographics on each topic or on large general chapters. That is, on the basis of information on each topic separately and combining them into a larger chapter.

The same applies to infographics for electronic textbooks. It is known that an e-book read with the help of gadgets quickly tires the eye. Therefore, they should be designed to be quick and easy to accept. They are also created to avoid large volumes of text. In this regard, infographics are useful in electronic textbooks.

In printed publications, it is possible to use mainly simple types of infographics. If we look at foreign textbooks, most of them are “ted talks” (video lectures of famous and smart people) or various videos in the form of audio and video are put on the book on the disc. In this way, video infographics can be presented in addition to printed publications. This means that simple and video infographics can be used in printed textbooks.

In e-textbooks, it is possible to combine simple, click infographics, if the book is intended for online use, in which case it can be both interactively and through the possibility of transition to video infographics.

Because of this specific feature, infographics are useful in all respects for media literacy education processes; in fact, enriching the media literacy education processes as well as the textbooks with modern materials is the main factor in determining the effectiveness of those processes and text books.

### **ABSTRACT**

*According to the results of the study, 100 ml of winter wheat before sowing with the stimulator "Tumat" navigate Asr. It was observed that the germination rate increased by 10.4-10.6% per 1 ton of seeds during the processing stages of the plant. In the developmental phases, it increased the cold tolerance of crops in the cultivated area, accelerated plant metabolism, and resulted in plant growth and development at 57 quintals of grain per hectare, with an average yield of 2.6 quintals per hectare more than the control option.*

**KEYWORDS:** *Tomato, Winter Wheat, Accumulation Tube, Growth And Development, Harvest*

## INTRODUCTION

In order to increase the yield of grain in the country in recent years, it is recommended to treat it with various organic and biological additives. Great attention is paid to the use of substances that affect the growth and development of plants in the cultivation of abundant and high-quality products from agricultural crops.

These indicators are physiologically active substances, metabolic processes in plant ontogeny, in particular photosynthesis, respiration, enzyme activity, biosynthesis of amino acids, nucleic acids, proteins and phytohormones, metabolism, accumulation and distribution of nutrients, crop growth and development, formation of crop organs, are factors that can have a major positive impact on productivity and product quality. It is known that in order to accelerate the assimilation of phosphorus and potassium mineral fertilizers applied to crops by planting, nutrient suspension through the leaves accelerates the development of the plant root system and assimilation of nutrients due to expansion and thickening of the leaf surface.

**Results of the investigation.** Taking into account the above, the professors of the Andijan Institute of Agriculture and Agrotechnology on a trial basis conducted a new biostimulator "TUMAT", which allows to increase the resistance of winter wheat to diseases and insects, grain quality and high yields. The experiment was conducted in 2019-2020 on the allocated field experimental field of the farm "Sardor mirishkor" Andijan district in the variety of winter soft wheat "Asr".

The experiment was conducted in 4 variants, 4 repetitions.

1- variant control

2- variant 200 ml of Baikal stimulator is applied to 1 ton of seed wheat before sowing. was treated by mixing at the rate of 30 liters of working solution.

3-variant the stimulator "Tumat I" is applied to the plant during the vegetation and accumulation phases of the vegetation period at the rate of 1 l per hectare. processed.

4-variant the Tumat II stimulator is 200 ml per ton of seed grain. 1 l per hectare in the accumulation and tubing phases of the plant, treated in moderation. treated with a rod sprayer at the expense of.

In the comparison (standard) variant with Baikal biostimulator 200 ml per hectare. The seeds were processed into grain as well as during harvesting and threshing.

According to the analysis of the results of the observation of the 2019 experiment, in the control variant of germination and accumulation phases, 75% germination occurred on October 15, 75% accumulation phase on November 20. In the experimental variants, 75% germination occurred on October 20-25, in 3-4 variants, the accumulation phase occurred on November 10-15. The difference in control was 5-6 days.

Thus, when pre-sowing winter wheat was treated with Tumat I stimulator, the germination rate increased by 10.4-10.6%. During the developmental phases, it increased the frost resistance of the crops in the cultivated area, accelerated the metabolism in the plant, and created favorable conditions for the growth and development of the plant. In the experiment, the height of the winter wheat stalk was 22.8-23.6 cm in the control (unprocessed) and standard Baikal variants on

April 3, 2020, and 24.5-27 cm in the experiment with Tumat I. The next variant "Tumat II" is 28.2 cm when applied to the plant during sowing and harvesting before sowing, and in these variants it is 1.7–5.4 cm compared to control. was high.

When analyzing the length of the spike, the control variant was 7.6 cm, and the experimental Tumat I seed was 8.2 cm. The seed and vegetation period of "Tumat II" in the processed variant is 8.6 cm. was observed to be 0.6–1.0 cm longer than the control variant.

According to the results of the experiment, the following data were obtained when studying the effect of the biostimulator "Tumat" on grain yield.

Based on the results of the experiment, the following conclusions can be drawn to the production: In the conditions of light gray soils of Andijan region, before sowing of winter wheat with germinating seeds "Tumat I" at a rate of 1 l / ha, germination of seedlings 10.4-10.6 It was found in the experiment that the number of healthy seedlings from the winter increased by 61.2-67.1, with an increase in the level of resistance of grasses to external environmental conditions and diseases.

**Grain quality indicators on the variants of the experimental variety "Asr".**

## CONCLUSION

When the grain of winter wheat is inoculated with the stimulator "Tumat I" and processed in the phases of harvesting, tubing, the good development of the root system, plant growth and development is accelerated, the height of the stem is 1.7-5.4 cm and the length of the spike is 0.6-1. It was observed that it was higher than 0 cm.

Before sowing of winter wheat with the stimulator «Tumat II» 100 ml. For 1 ton of seeds, 57 quintals of grain per hectare was harvested during the harvesting stages of the plant, and an average of 2.6 quintals of additional grain per hectare was achieved compared to the control option.

Grain quality indicators revealed that grain transparency increased by 3.5%, gluten content by 3%, transparency in Baikal by 0.5%, gluten content by 1.5%, IDK in Baikal by 10% compared to control.

### INTRODUCTION

Uzbekistan is a world leader in agricultural production. The production of this product in accordance with the needs of the population is growing every year. Earthworms make up the bulk of soil biomass. It is well known that earthworms play an important role in soil formation and maintaining its natural fertility.

There are thousands of species of earthworms, which are grouped into three categories according to their natural behavior and living conditions:

1. Anecic
2. Endogeic
3. Epigeic.

Anecic species — almost always build vertical holes to a depth of 1.5–2 m. They feed on organic matter fermented to a certain extent on the soil surface and turn it into humus. If anecic species are deprived of permanent habitat, then they cease to reproduce and grow. They play a very important role in soil formation. Their main species are *Lumbricus terrestris* and *Aporrectodea longa*.

*Aporrectodea* is used as an excellent bait for fish due to the size of the *longa*.

Species such as *Apodeodea caliginosa* feed on soils that are less saturated with organic matter, mineral particles of soil with high mineral content, and decomposed organic matter. As it moves through the soil, they mix it and ventilate it. It is also of great importance in enrichment with nutrients and microflora.

Epigeic species usually live in the organic matter-rich layers of the topsoil, under leaf clumps or rotten tree trunks.

They are exposed to climate change and predators. A typical representative of this class, known as the California red worm, is the *Eisenia foetida*.

Usually used for vermicomposting - mainly *Eisenia foetida* (California red earthworm) or *Eisenia andrei* worms.

This type of worm can be found in old manure or compost piles. Their distinctive feature is the red lines that are variable and clearly visible.

The red worm is suitable for domestic and industrial cultivation and is also used to feed poultry, fish, animals, and fur animals. When worm biomass is added to the feed, the feed value increases by 20-25%. Worms also contain 67% protein and 20% fat.

Of all the earthworms present in the world, only a few are suitable for artificial breeding.

However, according to their characteristics, the most economically viable species are worms belonging to the genus "Red Worms".

The red earthworm in California was created as a result of hybridization of different generations of earthworms in the *Eisenia foetida*. This generation was developed in 1959 at the University of California. It reaches a length of 10 cm, a diameter of 3 to 5 mm, and a body weight of up to 10 grams. 2 worms are capable of breeding up to 1.5 thousand per year. The new generation emerges in 21 days, and puberty occurs in 90-120 days. After 1.5 months, the worm population doubles.

California red worm - dark red, elongated, cylindrical, flattened on the abdomen and divided into pieces, each of which has two feathers. The weight of an adult worm is in the range of 0.2-1.0 g. Body temperature is 19-20 ° C. California worms are 4 times more fertile than "wild" earthworms.

It breeds 18-26 times a year, unlike its wild cousins, which breed only 4-6 times a year. Adults live 10-15 years.

California worms have unique characteristics:

- They live in a substrate saturated with organic compounds, not in the soil;
- Consumes twice as much food per day. Approximately 600 kg of vermicompost is obtained as a result of processing one ton of substrate, the increase in worm biomass is 100 kg;

A population of 1.5-2 thousand worms filled with 2-3 m<sup>3</sup> of compost can provide garden areas (3-4 hectares) with 2 tons of primary fertilizer.

California worms are hermaphroditic but cannot fertilize spontaneously. However, as a result of mutual fertilization of two earthworms, an egg or capsule is formed in each of them. After 14-21 days, depending on the air temperature, 2 to 20 worms emerge from each capsule or jar, and 20-21 worms can emerge when grown in a greenhouse.

California red worms develop over a three-month period and reach sexual maturity. An important factor in their lives is a constant average temperature, humidity and adequate food.

The number of young worms depends on the temperature in the habitat, but the sexual activity of these worms decreases in the cold months, reaches maximum productivity in the mild season, and decreases again in the warm months.

When the temperature is 19 to 20 ° C, the worms increase humus production and sexual activity. Extremely cold (0 ° C) and very hot (above 42 ° C) temperatures are dangerous for the life of California worms.

California earthworms love the heat. It weakens the instinct of self-preservation at low temperatures and therefore does not penetrate deep into the freezing depth when the habitat cools, but accumulates in large quantities and freezes safely. Therefore, this type of worm needs to be moved to a warm room in winter.

California earthworms have the ability to process food faster and more completely than ordinary earthworms. As a result of processing one ton of substrate, the growth of biomass of 600 kg of biohumus and worms reaches 100 kg.

Biogumus - (vermicompost) - obtained by processing of organic matter (manure, straw, leaves, silage waste, hay, food waste, meat, fruit and vegetable industry, utilities, poultry manure) by worms is a high molecular weight organic compound, rich in nutrients - a biological material that is sticky and odorless black and brown in color.

The worms mainly process the manure of farm animals in an environmentally friendly way, turning it into valuable humus.

Biogumus improves soil structure and its water-physical properties. Contains high amounts of water-soluble forms of nitrogen, phosphorus, potassium and other elements. The soil, together with biohumus, has the property of accelerating plant growth. Biohumus retains moisture up to 70%, which significantly reduces the amount of watering and protects against moisture during the dry period. Overdose of this organic fertilizer does not lead to negative consequences for plants.

Biogumus is widely used in fertilizing all types of crops, in floriculture, horticulture, soil regeneration, as well as in insect control.

California red worm is the most optimal solution for waste disposal, which allows you to get a natural organic fertilizer, vermicompost, which is able to regenerate even "dead soil".

Vermicompost is an organic waste processed by worms that passes through the stomach, changes, breaks down into amino acids and is saturated with vitamins, enzymes, macro- and micronutrients and other biologically active substances.

Comparison of the effects of vermicompost with organic fertilizers (humus and peat) showed that vermicompost is more effective than them. The addition of vermicompost increases the yield of beets by 27%, potatoes - by 19.7%, compared with humus.

Studies have shown that biohumus has a multifaceted positive effect on the agrochemical, physicochemical and biological properties of soils. Biohumus is absorbed directly by plants, where it accumulates large amounts of salt and trace elements, growth substances, vitamins, antibiotics, 18 different amino acids and beneficial microflora.

The chemical effect of biohumus is neutral.

Humus can be used for all crops due to the presence of a complex of nutrients. It serves as a new type of fertilizer, especially for those who require a balanced concentrated form of nutrients in terms of chemical composition.

Biohumus is an environmentally friendly organic fertilizer. Biohumus contains all the necessary nutrients, trace elements, enzymes, soil antibiotics, vitamins, growth hormones - in short, everything necessary for plant growth.

It has a biohumus-granular structure, which does not contain pathogenic microflora, helminth eggs, weed seeds. When incorporated into the soil, the development of processes specific to healthy soil is normalized. Biohumus is easily absorbed by plants during development. It also has properties such as moisture and hydrophilicity. This organic fertilizer is several times more than the humus-containing manure.

In short, biohumus: restores the natural fertility of the soil; binds heavy metals and radionuclides in the soil; prevents plants and soils from accumulating nitrates; provides strong immunity in plants; shortens the fertilization time of seeds; increases vitamin content; increases productivity by 1.5 times; improves plant growth and flowering; increases the diversity of tree leaves, flowers, lawn grasses and protects plants from drying out.

**KEYWORDS:** *Fur Production, Modular Design, Innovative Technologies, Resource-Saving Technologies, Karakul Breeding, Fur Haberdashery, Ornamental Composition, Leather Fabric.*

## INTRODUCTION

The problem of processing and rational use of waste from leather and fur production in recent years has become especially urgent all over the world. This is due to the fact that in the production process of natural leather and fur semi-finished products a significant amount of waste is generated, containing up to 50% protein substances and other by-products.

The efforts of manufacturers of fur and leather products are aimed at reducing material losses and rational use of waste. To do this, they plan to produce small leather goods, use patchwork technology, combined cutting according to rational layouts of patterns, use various types of equipment that provide low-waste cutting technology. However, it is not possible to achieve full utilization of waste. A significant part of them have not yet found application and are taken to dumps, which, in addition to material losses, leads to environmental pollution.

The main reason for the incomplete use of waste generated in the process of cutting fur semi-finished products and leather materials is that they have a complex irregular shape and are characterized by a wide variety in size and configuration. This is due to the type of semi-finished product, the configuration and size of the skins, their quality, cutting methods and other factors. Another feature that complicates the process of processing waste of fur semi-finished products (FSFP) and leather materials is their belonging to different topographic areas of skins. Depending on this, the waste has different indicators in terms of the degree of density and height of the hairline, the direction of the hair and the thickness of the skin tissue, which greatly complicates their use for the manufacture of high-quality products. As a result, more than 50% of natural fur waste at fur factories remains unused and is an important resource conservation reserve [1].

The use of FSFP waste in the manufacture of products, a wide variety of the latter and the resulting plates sets the task of determining their properties and conducting appropriate tests to predict quality indicators at the design stage.

The aim of the study is to increase the efficiency of using waste of fur semi-finished products generated in the manufacture of products from natural fur. The object of research is a fur flap and FSFP waste of various sizes.

## RESEARCH METHODOLOGY

Various methods of making fur skins and plates are currently known. The selection of the flap into the plates was made from homogeneous groups of fur, taking into account the requirements for fur clothing.

The traditional way of using FSFP waste for clothing is the manufacture of fur plates collected from the largest fragments of fur skins (mainly peripheral areas and inter-medical waste), the shape and size of which depend on the waste used. The flap of most of the semi-finished fur product is cut into pieces having various geometric shapes, as well as into lobe and transverse strips. In this case, the waste must be of high quality, with a uniform hairline, the direction of which must be taken into account when forming a fur plate.

A flap of the astrakhan-lambskin group is sorted according to the type of curl. Such a flap is cut into pieces of any shape. At the same time, defects of the scalp and skin tissue are removed. In this work, the manufacture of fur plates from the flap was carried out according to the traditional

method: sorting, cutting off and fitting the flap in size, stitching the strips into plates of specified sizes and shapes (rectangular, square, trapezoidal, etc.), moisturizing and straightening, leveling each row and eliminating wrinkles, drying and performing traditional finishing operations [2]. For the processing of fur waste, a flap of high-value parts of skins was taken: mink, muskrat, astrakhan and broadtail.

Strips of the largest possible size were cut from the furrier's flap and parts of the skins. Then the strips were connected to pieces of a skin flap 2,0 cm wide. chalk, measuring ruler, patterns, weight, and other tailor's tools by hand.

For a complete assessment of the quality of fur plates, it is important to reasonably select a set of quality indicators, not missing a single significant indicator, but at the same time not overloading the complex with insignificant ones, which could lead to an increase in the cost of the quality assessment process. When starting the choice of quality indicators, it is necessary to study their nomenclature and classifications in accordance with [3]. These standards provide a wide range of quality indicators (QI). However, the standards do not include the entire range of QIs, but only those that have a certain weight and meaning. When selecting, it is also necessary to take into account the indicators characterizing the purpose of future products and indicators (parameters) that affect the processing of raw materials. The comprehensive assessment methodology [4] provided for:

- Selection of the nomenclature of quality indicators of the evaluated products;
- Determination of the values of these quality indicators;
- Comparison of the values of the selected quality indicators of the evaluated products with the base ones.

The choice of quality indicators consisted of two stages:

- Preliminary selection of indicators;
- the final selection of a set of indicators.

As a result of the analysis of the literature and preliminary selection, the following set of QIs was obtained for a comprehensive assessment of the quality of fur plates from waste ( $X_i$ ):  $X_1$ -thickness,  $X_2$ -breaking load,  $X_3$ -breaking elongation,  $X_4$ -surface density,  $X_5$ -wear resistance,  $X_6$ -heat resistance,  $X_7$ -rigidity,  $X_8$ -air permeability,  $X_9$ -vapor permeability,  $X_{10}$ -drape,  $X_{11}$ -elasticity,  $X_{12}$ -softness,  $X_{13}$ -artistic and coloristic design,  $X_{14}$ -texture,  $X_{15}$ -mass,  $X_{16}$ -abrasion,  $X_{17}$ -deformability. [5] ...

For the selection of the most significant properties, the weight of the above QIs was established using the method of a priori ranking [5]. The expert assessment was carried out with the participation of leading specialists in the leather and fur industry and scientists working at the specialized departments of TITLI. The number of experts ( $n$ ) was 12, indicators of properties ( $m$ ) 17. The results of the questionnaire and their mathematical processing are shown in table 1.

The degree of expert agreement was assessed using the concordance coefficient  $W$  (1). The value of this coefficient can be in the range from 0 to 1. In our case, the calculated value of the coefficient of concordance was  $W = 0,62$ .

$$W = \frac{\sum_{i=1}^n (S_i - \bar{S})^2}{\frac{1}{12} m^2 (n^3 - n) - m \sum_{j=1}^m T_j} \quad (1)$$

The practice of conducting expert assessments of quality established the following ranks of qualification of the concordance coefficient:  $W = 0$  there is no consistency of expert opinions,  $W = 0,4 \dots 0,6$  is a significant connection, with  $W \geq 0,6$  there is a strong connection. Analysis of the results of evaluating the properties of fur plates showed that there is a significant connection between the opinions of the respondents, since  $W = 0,62$ . The experts' opinion is not accidental, since the calculated value of the Pearson- $\chi^2$  criterion at a significance level of 5%  $\chi^2 = 119,04$  is greater than the tabular value  $\chi^2_{\text{tab}} = 26,3$ , which is confirmed by the above figures.

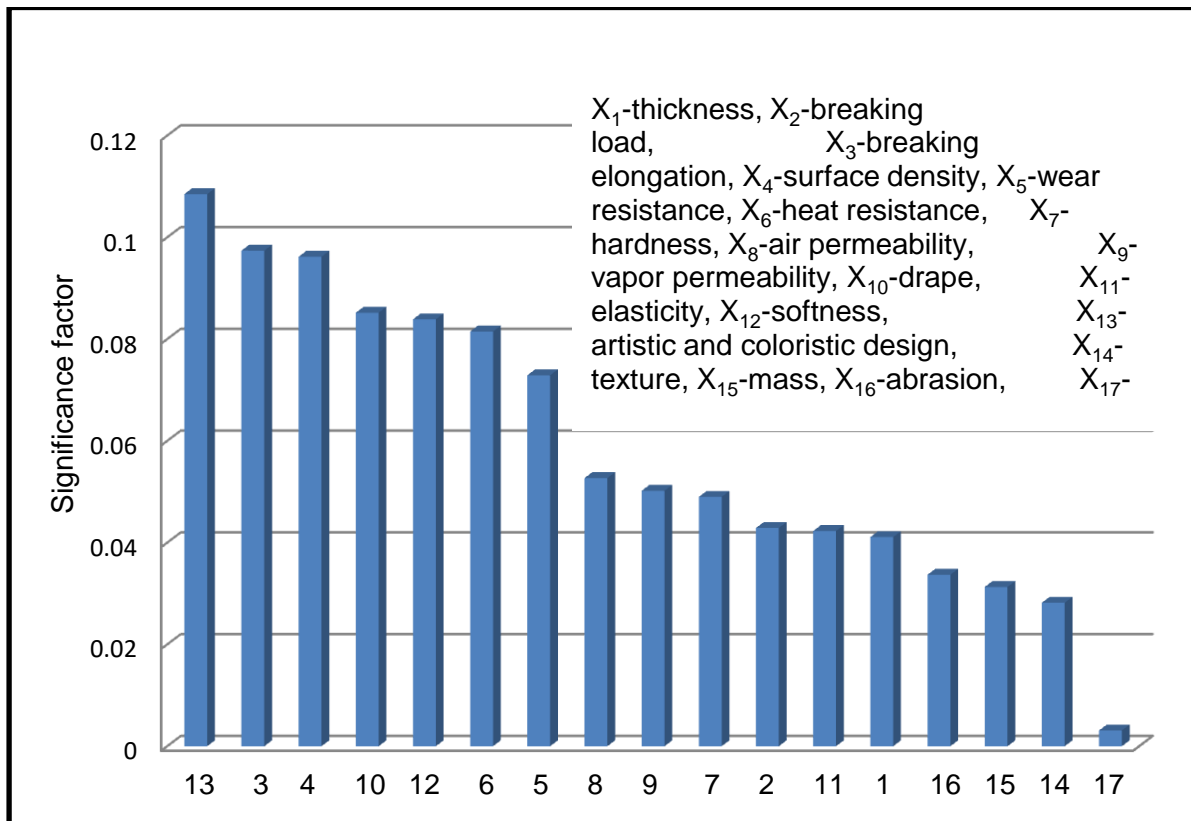

**TABLE 1. MATRIX OF RANKS FOR ASSESSING THE QUALITY INDICATORS OF CANVASES FROM PMP WASTE**

Quality indicator number	Эксперты												$S_i$	Weight factors
	1	2	3	4	5	6	7	8	9	10	11	12

16	16	7	5	16	16	17	17	7	12	8	11	17	149	0,0337
17	17	17	17	17	17	14	16	17	17	17	17	16	199	0,0031
$T_i$														
$\sum_{i=0}^n S_i = 0,6$ * 1)	153	153	153	153	153	153	153	153	153	153	153	153	1836	1

The results obtained allow us to make the following preliminary conclusion about the significance of the selected quality indicators. Seven quality indicators are significant and they are arranged in the following row in decreasing order of importance:

- 1) artistic color scheme -  $X_{13}$ ;
- 2) elongation -  $X_3$ ; [7].
- 3) surface density -  $X_4$ ; [8].
- 4) drape -  $X_{10}$ ; [9].
- 5) softness -  $X_{12}$ ; [10].
- 6) heat-shielding properties -  $X_6$ ; [11].
- 7) wear resistance -  $X_5$ . [12].

Figure 1 shows an a priori diagram of the quality indicators of fur plates, built on the basis of expert assessment data.

In the first place, the experts determined the aesthetic requirements of the materials made from the recruited fur flap, therefore, their artistic and coloristic design should be at a high level, and the products should be light and soft, which is indicated by the surface density and softness. Plates must meet modern fashion trends, provide expressive appearance, beauty and conformity to the consumer's appearance. Along with this, the elongation-plasticity of fur skins, which determine the quality of furrier production processes and the shape of the future product, are important for the considered plastinof FSFP waste.

When carrying out calculations, the relative weightings of significant indicators were also calculated.

In accordance with the selection of the QI nomenclature, to assess the quality of harvested fur plates from fur skins waste, experimental studies were carried out on various semi-finished products of FSFP. The following properties of the plates were experimentally determined: density, thickness, heat retention, mechanical properties and drape [13].

In accordance with the made choice of the nomenclature of QI of fur plates from waste, at the next stage of work, a comprehensive assessment of all working samples of fur plates was calculated. Considering that quality assessment is the first and main stage in the development and operation of the quality management system and clarification of the nomenclature of properties and QI products, an objective comprehensive assessment of the quality of experimental samples are the most important stages in organizing fur production, including in the manufacture of outerwear using fur waste. Since the experimental samples are intended for the top of the coat, they are used as the base QI material for the comparative assessment of waste in accordance with the recommendations of TsNIISHP [15]. selected woolen fabric with the following characteristics: elongation-23%, surface density-450g / m<sup>2</sup>, drape coefficient -65%. To convert the natural indicators of the quality of experimental samples into dimensionless, the following formula was applied:

$$Z_i = \frac{X_i}{X_{i\text{баз}}} \quad (2)$$

The data for calculating the definition of complex quality indicators are given in Table 2.

Таблица 2

Name of experimental samples	Quality indicators				Complex indicator Q
	Artistic color scheme, points Z <sub>1</sub>	Elongation, % Z <sub>2</sub>	Surface density, gr/m <sup>2</sup> Z <sub>3</sub>	Drape * Z <sub>4</sub>	
Astrakhan	5	0,96	2,16	1,41	2,48
Karakul + lining	5	3,13	2,30	1,39	3,07
Broadtail	5	1,26	0,92	1,42	3,06
Swallowtail + lining	5	1,13	1,18	1,41	2,28
Nutria	4	2,22	2,16	-	
Nutria + lining	4	2,19	2,32	-	
Mink	5	2,21	1,08	1,40	2,53
Mink + lining	5	0,30	1,24	1,39	2,09
Relativeweight	1,4875	1,3353	1,3190	1,1672	

\* The drape of the experimental samples was determined by the disk method.

To determine the complex quality indicator Q, the formula was applied:

$$Q = \frac{\sum_{i=1}^n Z_{ji} * \Psi_i}{\sum_{i=1}^n \Psi_i} \quad (3)$$

Thus, the studies carried out have shown that all samples of fur plates have a certain level of quality, which is reflected by the value of the complex quality indicator, in turn, these quality levels are not lower than the base material indicator. At the same time, it is necessary to highlight the astrakhan fur with a lining as the best in terms of a comprehensive indicator of quality, followed by a broadtail, astrakhan, mink, broadtail with a lining and a mink with a lining. conduct their comprehensive quality assessment.

*This paper describes the technology of solving quantitative problems in physics on the laws of electrolysis. Faraday's technology for selecting, constructing, and solving interdisciplinary problems on the laws of electrolysis is described in a consistent, logical manner.*

**KEYWORDS:** *Electrolysis, Electrolyte, Electrode, Anode, Cathode, Substance, Mass, Charge, Time, Solution, Conductor, Contact.*

**INTRODUCTION**

**1-** question. Electrochemical equivalent of chromium  $0,18 \cdot 10^{-6}$  kg / Kl, if 1 Kl of electric charge passes through the electrolyte, how much chromium is released during electrolysis? What if a charge of 20 Kl and 0.2 Kl is passed?

Given:

$$k = 1,8 \cdot 10^{-6} \text{ kg/ Kl}$$

$$q = 1 \text{ Kl}$$

$$q_1 = 20 \text{ Kl}$$

$$q_2 = 0,2 \text{ Kl}$$

$$m = ?$$

$$m_1 = ?$$

$$m_2 = ?$$

Answers:  $m = 1,8 \cdot 10^{-7} \text{ kg}; m_1 = 3,6 \cdot 10^{-6} \text{ kg}; m_2 = 3,6 \cdot 10^{-8} \text{ kg}.$

Formula:

$$m = kq$$

$$m_1 = kq_1$$

$$m_2 = kq_2$$

Solution:

$$m = 1,8 \cdot 10^{-7} \text{ kg/Kl} \cdot 1 \text{ Kl} = 1,8 \cdot 10^{-7} \text{ kg.}$$

$$m_1 = 1,8 \cdot 10^{-7} \text{ kg/Kl} \cdot 20 \text{ Kl} = 3,6 \cdot 10^{-6} \text{ kg}$$

$$m_2 = 1,8 \cdot 10^{-7} \text{ kg/Kl} \cdot 0,2 \text{ Kl} = 3,6 \cdot 10^{-8} \text{ kg}$$

**2-** question. Water is obtained from oxygen and hydrogen in the laboratory (by electrolysis, of course). How much oxygen is released at the anode and how much hydrogen is released at the cathode when a current of 1.2 A passes through the circuit in 30 min?

Given:

$$I = 1,2 \text{ A}$$

$$t = 1,8 \cdot 10^3 \text{ c}$$

$$m_{O_2} = ?$$

$$m_{H_2} = ?$$

Formula:

$$m_{H_2} = k_{H_2} \cdot It$$

$$m_{O_2} = k_{O_2} \cdot It$$

$$k_{O_2} = 8,3 \cdot 10^{-8} \frac{\text{kg}}{\text{Kl}}$$

$$k_{H_2} = 10^{-8} \frac{\text{kg}}{\text{Kl}}$$

Solution:

$$m_{H_2} = 10^{-8} \frac{\text{kg}}{\text{Kl}} \cdot 1,2 \text{ A} \cdot 1,8 \cdot 10^3 \text{ c} = 2,16 \cdot 10^{-5} \text{ kg.}$$

$$m_{O_2} = 8,3 \cdot 10^{-8} \frac{\text{kg}}{\text{Kl}} \cdot 1,2 \text{ A} \cdot 1,8 \cdot 10^3 \text{ c} \approx 1,8 \cdot 10^{-4} \text{ kg.}$$

Question.  $m_{H_2} = 2,16 \cdot 10^{-5} \text{ kg};$

$$m_{O_2} \approx 1,8 \cdot 10^{-4} \text{ kg.}$$

3- question. At what layer thickness of metal parts with a surface area of 120 cm<sup>2</sup> is nickel plated with a current of 0.3 A for 5 hours? The valence of nickel is 2, the molar mass  $58,7 \cdot 10^{-3} \text{ kg/mol}$ , density  $9 \cdot 10^3 \text{ kg/m}^3$  equal.

Given:

$$t = 1,8 \cdot 10^4 \text{ c}$$

$$\rho = 9 \cdot 10^3 \text{ kg/m}^3$$

$$S = 1,2 \cdot 10^{-2} \text{ m}^2$$

$$d = ?$$

$$m = ?$$

Solution:

The mass of nickel that separates on the surface of the product  $m = \frac{Aq}{nF}$  on the other hand,  $m = \rho Sd$ .

So,  $d = \frac{m}{\rho S}$  will be. If we find the mass and layer

thickness:

$$m = \frac{58,7 \cdot 10^{-3} \frac{\text{kg}}{\text{mol}} \cdot 1,8 \cdot 10^4 \text{ c} \cdot 0,3 \text{ A}}{2 \cdot 9,65 \cdot 10^4 \text{ Kl/mol}} = 1,65 \cdot 10^{-3} \text{ kg.}$$

$$d = \frac{1,65 \cdot 10^{-3} \text{ kg}}{9 \cdot 10^3 \text{ kg/m}^3 \cdot 1,2 \cdot 10^{-2} \text{ m}^2} = 1,53 \cdot 10^{-5} \text{ m.}$$

Answers:  $d = 1,53 \cdot 10^{-5} \text{ m}; m = 1,65 \cdot 10^{-3} \text{ kg.}$

4 - question. When oxidized (fermented) water is electrolyzed at a temperature of 270 C and normal atmospheric pressure, what is the minimum amount of electricity that a battery should have in order to release 5 liters of oxygen?

Given:

$$T = 300 \text{ K}$$

$$V = 5 \cdot 10^{-3} \text{ m}^3$$

$$\rho_o = 10^3 \text{ kg/m}^3$$

$$T_o = 273 \text{ K}$$

$$k = 8,29 \cdot 10^{-8} \frac{\text{kg}}{\text{Kl}}$$

$$q = ?$$

Solution:

We find the amount of electricity required for electrolysis

from this relationship:  $m = kq; q = \frac{m}{k}$ .

The mass of oxygen released  $m = \rho_o V_o$  formula,  $V_o$  the

volume is the Gay-Lussac law  $V_o = \frac{VT_o}{T}$

can be found from. This,  $q = \frac{VT_o \rho_o}{Tk}$  (1) will be

we perform the calculation by placing the numerical values of the quantities in formula (1).

$$q = \frac{5 \cdot 10^{-3} \text{ m}^3 \cdot 273 \text{ K} \cdot 1,43 \text{ kg/m}^3}{300 \text{ K} \cdot 8,29 \cdot 10^{-8} \text{ kg/Kl}} \approx 7,8 \cdot 10^4 \text{ Kl.}$$

In fact, the capacity of a battery is measured in Ampere · hours, but we have expressed its unit in Coulomb, considering SI.

Answer: Battery charge  $7,8 \cdot 10^4$  Kl should not be less than.

**5-** question. Gelvano-plate is used in the manufacture of matrices of gramplates. Initially wax form (shape)  $0,8 \text{ A/dm}^2$  coated with copper for 30 min at current density. In this case, the current separation is 90%. The next coating process  $5 \text{ A/dm}^2$  at a current density for 20 hours. In this case, the current separation is 95%. The surface area of a gramophone record  $3 \text{ dm}^2$  if so, how much copper will be consumed on average to obtain a single plate matrix?

Given:

$$I_1 = 80 \text{ A/m}^2$$

$$I_2 = 5 \cdot 10^2 \text{ A/m}^2$$

$$t_1 = 1,8 \cdot 10^3 \text{ c}$$

$$t_2 = 7,2 \cdot 10^4 \text{ c}$$

$$\eta_1 = 90\% = 0,9$$

$$\eta_2 = 95\% = 0,95$$

$$S = 3 \cdot 10^{-2} \text{ m}^2$$

Solution:

Indicates how much of the mass of the substance released during electrolysis is the pre-calculated (by current) mass,  $\eta = \frac{m}{m_{\text{account}}}$

in this  $m_{\text{account}}$  Determined from Faraday's 1st law. The mass of copper separated in the primary coating

$$k = 3,3 \cdot 10^{-7} \text{ kg/Kl} \quad \eta_1 = \frac{m_1}{m_{\text{account}}} \text{ in this}$$

$$m = ?$$

Can be determined from the relationship. Given that  $I = iS$ , we obtain:

$$m = \eta_1 k J_1 S t_1$$

In the same way we create the expression  $m_2$ :

$$m_2 = \eta_2 m_2 \text{ изоб.}, \quad m_2 = \eta_2 k J_2 S t_2$$

The total amount of copper extracted

$$m = m_1 + m_2 = kS (\eta_1 J_1 t_1 + \eta_2 J_2 t_2)$$

will be. We calculate this expression by substituting the numerical values of the quantities.

$$m = 3,3 \cdot 10^{-7} \text{ kg/Kl} \cdot 3 \cdot 10^{-2} \text{ m}^2 \cdot (0,9 \cdot 80 \text{ A/m}^2 \cdot 1,8 \cdot 10^3 \text{ c} + 0,95 \cdot 500 \text{ A/m}^2 \cdot 72 \cdot 10^3 \text{ c}) \approx 0,34 \text{ kg.}$$

Answer: It takes about 0.34 kg of copper to make one matrix.

**6-** question. The surface of metal objects is electrolytically coated with  $20 \mu\text{m}$  thick silver. A current density  $2,5 \cdot 10^{-3} \text{ A/cm}^2$  If so, how long will the electrolysis take?

Given:

$$h = 20 \text{ mkm} = 2 \cdot 10^{-5} \text{ m}$$

$$J = 2,5 \cdot 10^{-3} \text{ A/cm}^2 = 25 \text{ A/m}^2$$

$$\kappa = 1,118 \cdot 10^{-6} \text{ kg/Kl}$$

$$\rho = 10,5 \cdot 10^3 \text{ Kl/m}^3$$

$$\mu = 108 \cdot 10^{-3} \text{ kg/mol}$$

$$F = 9,65 \cdot 10^4 \text{ Kl/mol}$$

$$n = 1$$

$$t = ?$$

Solution:

1-method. We solve the problem using Faraday's

law 1 for electrolysis.  $m = kIt \Rightarrow t = \frac{m}{kI}$  (1).

We find the mass and current using the following formulas:

$$m = \rho S h \quad (2); \quad I = jS \quad (3).$$

(1) to (2) and (3) of take away

$$t = \frac{\rho h}{nJ} \quad (4) \text{ is formed.}$$

Now we calculate by substituting the numerical values instead of the quantities to the right of formula (4).

$$t = \frac{10,5 \cdot 10^3 \text{ Kl/m}^3 \cdot 2 \cdot 10^{-5} \text{ m}}{1,118 \cdot 10^{-6} \text{ Kl/Kl} \cdot \text{A/m}^2} = 7,5 \cdot 10^3 \text{ c.}$$

2-method. If the numerical value of the electrochemical equivalence is not given, then the

problem can be solved on the basis of Faraday's unified law.  $m = \frac{A}{F} \frac{\mu}{n} It$ , from here  $t = \frac{mF \cdot n}{\mu I}$

(1) formula is formed. Mass and current strength using the above formulas, that is 1-method:  $m$

$= \rho V = \rho Sh$ ;  $J = IS$  in that case  $t = \frac{\rho h F n}{AJ}$  (2) derived from the formula.

Now we calculate by substituting the numerical values instead of the quantities to the right of formula (2).

$$t = \frac{10,5 \cdot 10^3 \text{ kg/m}^3 \cdot 2 \cdot 10^{-5} \text{ m} \cdot 9,65 \cdot 10^4 \text{ Kl/mol} \cdot 1}{108 \cdot 10^{-3} \text{ kl/mol} \cdot 25 \text{ A/m}^2} = 7,5 \cdot 10^3 \text{ c.}$$

Answer: For silver  $7,5 \cdot 10^3 \text{ c}$  or about 2.1 hours.

7- question. From fermented water through an electrolytic bath (during electrolysis)  $27^\circ \text{C}$  temperature and  $10^5 \text{ Pa}$  at pressure  $1 \text{ dm}^3$  How to charge to get gas?

Given:

$$p = 10^5 \text{ Pa}$$

$$V = 1 \text{ dm}^3 = 10^{-3} \text{ m}^3$$

$$F = 9,65 \cdot 10^4 \text{ Kl/mol}$$

$$T = 300 \text{ K}$$

$$q = ?$$

Solution:

First, we determine the amount of gas (in molar):

$v = pV/RT$ , by erda  $R = 8,31 \text{ J/(mol}\cdot\text{K)}$  in the electrolysis of water, hydrogen atoms are released twice as much as oxygen

atoms. The amount of hydrogen  $V_1 = 2V/3 = \frac{2\rho V}{3RT}$ .

Given that a gaseous hydrogen molecule is made up of two atoms, we create the charge we are looking for according to Faraday's laws.

$$q = F \cdot 2 V_1 = \frac{4FpV}{3RT}$$

Now we calculate the numerical values instead of the quantities involved in the equation.

$$q = \frac{4 \cdot 9,65 \cdot 10^4 \text{ Кл/мол} \cdot 10^5 \text{ Па} \cdot 10^{-3} \text{ м}^3}{3 \cdot 8,31 \cdot 10^3 \text{ J/(мол К)} \cdot 0,3 \text{ К}} = 5,2 \cdot 10^3 \text{ Кл.}$$

Answer:  $q = 5,2 \cdot 10^3 \text{ Кл.}$

It is advisable to address the above issues in order to determine the extent to which students have mastered the theoretical knowledge, practical skills and competencies acquired in the subjects of physics and chemistry.

### ABSTRACT

*The aggravation of global problems, the deterioration of the ecological situation, the emergence of more and more natural disasters, the wasteful and disrespectful attitude to the nature of individuals require increased attention of society to environmental problems. These problems can be solved only by increasing the general ecological culture, value attitude to nature and the formation of an ecological worldview in all people. The ecological culture of a society is understood as a system of social norms, values, human relations in the field of environmental protection and harmonious development. One of the elements of ecological culture is an ecological attitude towards the natural world - an efficiently practical, strong-willed, environmentally healthy behavior in accordance with the laws of interaction with humans in nature, legal norms, moral norms. Therefore, this article analyzes the features of the formation of ecological culture among students from a scientific and practical point of view. It was also revealed from the pedagogical point of view that the peculiarities of the ecological culture of students are reflected in their understanding of the ecological situation, understanding of the essence of the content, their attitude to public life.*

**KEYWORDS:** *Global Problem, Modern Education, Ecological Situation, Ecological Consciousness, Ecological Knowledge, Ecological Need, Ecological Culture, Ecological Worldview.*

## INTRODUCTION

The 21st century is characterized by a change in the quality from material products to products of traditional activity, an increase in the need for resource-saving technologies and an increase in the problems of environmental balance. In our country, this transition is complicated, first of all, by a sharp change in socio-economic formation, which determines the development of a new attitude to life problems and the potential of the individual. At the same time, science and the potential for it monandly intellektual have been developing for decades. Therefore, it is necessary to start as early as possible to create optimal conditions for the development of the first society and the creative potential of each individual. The established practice of educating young leaders in the field of Science, Technology, Culture and others, the introduction of new requirements in teaching them to creative thinking is one of the pressing issues. This opens up new horizons for the development of the pedagogical science system and teaching practice in our country. In particular, it is important to improve the attitude of schoolchildren to knowledge, to develop cognitive interests, to develop Natural Sciences in harmony with pedagogical knowledge, which have great potential for the formation of the scientific worldview and the modern scientific landscape of the world, Planet, ecocentric consciousness.

In natural science at the beginning of the XXI century at the end of the XXI century, natural social-humanitarian knowledge was acquired on an individual basis. The basis of this trend is characterized primarily by the fact that the individual himself - has become a common and dominant object of their research. In this regard, we must not forget that natural sciences have great opportunities for the formation of a scientific, creative worldview in young people. After all, knowledge of the laws of nature, the direct understanding of the harmony of the laws of inanimate and living nature and social processes motivate them to take into account in all spheres of human activity. Without a new vision of the world and the role of man in it, thinking about the fate of the future generation creates a much more complex landscape. The solution of environmental and social problems of both global and regional character requires only the creation of a new type of culture, the harmonization of education and training with the modern process of providing quality ecological knowledge. To do this, it is required first of all to formulate the environmental consciousness of young people, to update them the appropriate stereotypes of personal behavior, to form an active civil position of the individual in solving various problems.

An important problem of modern education is the expression from the understanding of the principles of consistency, continuity and integrability of knowledge in the study of natural phenomena. The first and most important level in the education system, which creates the foundation of the future education of young people, is formed in the system of preschool and primary education. Therefore, serious changes in the content of primary education began in the 90-ies of the XX century. Even at that time, the primary goal of preschool and primary education was called the development of the personality of the child. In addition, today, special attention is paid to the individualization of education and the creation of an educational environment in which each child feels comfortable and develops at an acceptable level.

One of the important problems faced by educators in preschool institution and primary education system is to ensure continuity in the absorption of natural science knowledge of children of preschool and primary school age. To solve it, it is necessary to seriously update the content of Natural Science Education by integrating modern scientific knowledge into educational

processes. This is greatly facilitated by the effective use of the changing character of modern education, which requires the inclusion in the kindergarten and primary school curriculum of the educational direction "Man and nature", which is composed of Natural Sciences and social sciences, philosophy and other fields. For this, it is important to effectively implement the technology of environmental culture development in young people.

### **LITERATURE ANALYSIS AND METHODOLOGY**

The need for the formation of ecological culture in young people is associated with a number of subjects and sub-factors. At a time when the concept of deepening democratic reforms in society and the development of civil society is being implemented, the role of youth in the solution of environmental problems is increasing. Also, global, regional, local, national environmental problems are among the factors that adversely affect the development of society. Zero, A.V. Asgirosov rightly pointed out, "a country without an ecological culture is dangerous not only for its inhabitants, but also for the inhabitants of other countries. After all, production and economic waste, which pollute nature, do not know the National Border. From our point of view, low levels of ecological culture and environmental consciousness, old views contrary to the existing ecology create problems with the preservation of such a large number of nature. In such conditions, issues of formation and increasing environmental culture of our youth play an important role.

Sh.E. Khamrokulova noted that "as environmental education works are carried out inseparably, the development of environmental competence in students before each educator stands as one of the main issues. Scientists interpret environmental competence differently. From the age of schoolchildren, due to their social characteristics, the interpretation of environmental competence – environmental knowledge, qualifications and skills, in view of which students will be able to correctly apply them throughout life. If the reader is able to approach the side-surrounding events from the point of view of causing harm or not causing harm to nature, correctly analyze the result of observations and try not to cause harm to nature itself in practice, then each educator, or employee, will be performing his duties correctly. In our view, in order to form an ecological culture in the reader-youth, it is necessary, first of all, to study the heritage of the people's historically composed values in relation to nature. Then it is possible to create a system of rules for changes in the life of society, protection of the environment and rational use of all types of Natural Resources. The pollution of the environment is also the reason that educational work on the protection of nature in the education of people is not adequately conducted.

To be kind and fair to the environment, to the nature does not bring much benefit to the self of teaching, teaching, of course. It should be used, applied practically in knowledge and education. Therefore, S.HeAsKistaubaev rightly pointed out, "it is important to develop a holistic pedagogical-didactic technology that ensures the coordination and continuity of the activities of institutions dedicated to environmental education and training and to look for potential opportunities for their introduction into life".

The organization of effective environmental education of Primary School students gives them the opportunity to protect the environment, keep it clean and increase its wealth. This process is meant to lead a healthy life and leave an ecologically clean environment for future generations, environmental education and Environmental Protection are first and foremost the protection of future generations of the nation. M.K. According to Shirinov, " environmental education in the

primary classes is carried out during lessons and extra-curricular times. In extracurricular times, ecological education is formed in the process of conducting Saturdays, conversations, fairy tales, taking students on a trip to nature Bay, Nature museums. In the course of the lesson, students receive environmental education through the story of the teacher and the topics expressed in the textbooks." Therefore, the state policy of the population in the field of environmental education is aimed at providing conditions for the ecological upbringing of the population of competent state bodies and coordinating the activities of state, public organizations on the formation of the general and ecological culture of individuals and society. The main goal of environmental education is to educate the students and young people in the spirit of high environmental education, to properly organize the trends of strengthening their ecological culture and formation of healthy attitude to the environment, and on the basis of this, to effectively organize the system of protection and rational use of the beautiful nature of our country.

Ecological culture is an integral part of a secular and national culture, which includes a set of norms and methods of social relations, moral values, interaction of society with the environment, and which has become an inheritance for the formation of environmental knowledge and consciousness in the social consciousness and morality of people. Therefore, on the basis of raising ecological culture, it is important to educate generations who will contribute to healthy life, the growth of the spirituality of society, sustainable socio-economic development, environmental security of the country and the individual. In this sense, M.S."Man and society are responsible for the preservation and protection of the environment, natural and social riches in general. This can only be achieved by means of educating people's environmental ethics and culture. The upbringing of an ecological moral culture of a person is the most important factor that ensures the development of society, rational use of nature, which constitutes an important direction in solving existing environmental problems. Therefore, the issue of environmental ethics and culture education is one of the important ways of solving problems that threaten the head of humanity, including the lives of the population of Uzbekistan".

The formation of ecological culture in schoolchildren-young people is a rather complex process, requiring Komplex-systemic concomitant use of various methods, means. Therefore, the process of raising the ecological culture of people in the process of education can be conditionally divided into two directions: the first is the formation of an ecological culture with the ability to feel bevoista, rational understanding of the uniqueness and beauty of nature in schoolchildren-youth; the second is the development of ecological culture by knowing the essence, content of spiritual and moral and cultural factors that reflect nature. This, in turn, is the need to develop rational perception of nature, which requires the ecology of all sciences. This task entails the generalization of the theoretical and practical aspects of alternative views on the educational process in the society and the constant implementation of it in all its directions.

## **DISCUSSION AND RESULTS**

At present, it is important theoretical and practical to bring into being the aspects of environmental culture in youth, the forms of its manifestation and, finally, its manifestations in practice. The peculiarity of the ecological culture of young people is manifested in their understanding of the ecological situation, understanding of the essence of the content, expressing their suitability for their appearance in social life. The formation of ecological culture in young people is closely connected with the fact that our country has entered a new stage in its development, with its efforts to take place among the developed democratic countries. At the

same time, the protection of the ecological situation on the borders of our homeland is not only the task of state organizations, but also the work of the general public and youth.

In this regard, it should be noted that in accordance with the strategy of action on five priority areas of development of the Republic of Uzbekistan in 2017-2021, the expansion of production of environmentally friendly products; mitigation of the negative impact of global climate changes and the construction of the Aral Sea; provision of modern facilities for the elimination of waste; prevention of environmental problems that harm the environment, the health and the gene pool of the population, etc., is defined as a priority task.

The maintenance of ecological balance, the cleanliness of the environment, the Prevention of situations that have a negative impact on human health and labor activity are largely dependent on the social activity of the public, youth. In the conditions of modernization of all sectors of the economy, the construction of a democratic and legal state, as well as the development of civil society, the social activity of young people increases, the direct participation of each member of society in the rational use of the natural resources available in our country. In the strategy of further development actions of the Republic of Uzbekistan in 2017-2021, the issue of "prevention of environmental problems that can harm the environment, health and gene pool of the population " is of particular importance.

The environmental situation in the territory of Uzbekistan and constant monitoring for its further improvement are one of the strategic issues in the interests of the youth of our country. This process requires the efficient use of Natural Resources, the transmission of mined minerals to consumers without losses, the wide and productive use of modern technologies in their processing to ensure efficiency. One of the peculiarities and linkages of this issue with the youth ecological culture is the possibility of using the experience of using natural resources in developed countries, taking into account the development of the economy in a globalized environment. Also, the relevance of the formation of the ecological culture of young people is associated with the further improvement of the use of available land, water, biological resources, the features of intensive development of economic sectors. Effective use of natural resources requires the improvement of the legal framework, which is regularly associated with the ecological process. Such a concerted approach to the problem is the globalisation of environmental issues, the close link between the solutions of issues arising in the process of the use of Natural Resources in the regions.

The formation of ecological culture in the reader-youth is largely associated with their environmental consciousness, education, spiritual and Educational Directions. Consequently, this can be done only when the principles of ecology of social, economic, spiritual spheres of development of society are complied with the normative-legal norms of their legality. This conscious activity of man forms an ecological culture only in the destiny that has become an ecological need. Reader-the ecological culture of young people does not form spontaneously in a stichy way. This process is measured by the level of his knowledge, how he can analyze socio-environmental problems, his attitude to the natural environment, his environmental range and the breadth of his outlook. The fact that the ecological culture of the reader-youth interacts with other types of Culture legal, aesthetic, moral, political, economic culture can be explained by the fact that there are no any social phenomena that are not directly or indirectly related to this form of culture.

When it comes to the ecological culture of the reader-youth, their style of thinking in the formation of this process is measured by the fact that its spiritual-moral, socio-historical traditions of nature protection, that is, historicity, succession, science, how they absorb and use systematic prints wisely. This process is also closely connected with the spiritual and educational activity of young people. This activity is associated with the preservation of the external environment with ecology, with modern talabi, with human health. Therefore, the essence and content of environmental culture is manifested in the process of deep understanding of the unity of Man and nature, understanding of the true essence of internal legal, necessary connections between human life, activity and the external environment, adherence to it in practical activities, genuine humanity, observance of the laws, principles of existence.

The ecological culture of the reader-youth is manifested in the connection of scientific and theoretical knowledge about the degree of tamoxification of the ways of educating its ecological quality, qualities, the balance of the biosphere with the goals and objectives of nature protection in practical activities. The true ideological nature of this form of culture, the other side of its enlightenment, is connected with the appropriation of the universal values of this ecological thinking. Therefore, today the importance of developing criteria for assessing the level of environmental awareness and cultural development of young people is enormous. Because, the use of new techniques, technologies and raw materials in production, the need for the development of environmentally competitive products will force entrepreneurs to think more broadly and deeper into the environment. Teaching them to think at the theoretical level of environmental consciousness leads to the penetration into the essence of environmental processes and the creation of various scientific ideas, theories, principles, models, concrete programs and plans on the basis of knowledge of the laws of ecological equilibrium of the biosphere. Transform them into a broad mass of people, that is, to convey them to all layers of the population in a simple and understandable way form a national ecological way of thinking.

A necessary condition for ecological cultural activity is the awareness of the responsibility of each individual for the future of nature and society. Bunda performs two tasks in which cultural values are interrelated; that is, it coordinates the possibilities of the subject of man with the object of necessity, and also harmonizes his personal and social interests. Accordingly, ecological culture, on the one hand, consists in the informal transformation of Man Into Nature, limiting the freedom of Will, on the other hand, is a factor that stimulates the activity of Nature Conservation. That is, it should be regarded as a social phenomenon that ensures the positive activity of the individual. The mutual unity of these is the necessary basis for the management of human ecological cultural activities . These factors also embody the requirements of nature protection and create the opportunity to manage the environmental actions of an individual Komplex. The issue of the impact of environmental culture on the development of society is widely covered in the scientific literature, there is a complex of alternative views.

The main task of ecological culture is to educate young people on the ecological attitude to nature and become a component of general education. Accordingly, on the one hand, the degree of development of socio-economic relations in different societies can be determined, in a certain sense, by the criterion of cultural attitude to nature. On the second hand, environmental education is in the interests of its protection through the culturing of the educational process.

The formation of human spirituality on the basis of ideas of humanism in ensuring environmental stability, the rise of political and legal culture, the embodiment of human consciousness and

consciousness of self-esteem and love for Living Nature gives a positive result. Without an ecological balance, there will be no peace, tranquility, memorabilia, the population will not be able to live comfortably, freedom will be limited, the observance of laws, people's jipsizlik, interest in life will be slowed down, mutual affection between people will eventually disappear, the political, legal structure of the state will be disrupted.

The general purpose of research in the field of ecology is considered to harmonize nature and Human Relations. In this process, the transformation of scientific knowledge, that is, the transition of the scientific knowledge system to a new complex system, creates new prospects. After all, as we observe the transformation in science (changes in the object, subject, interaction and connections, the amount of knowledge, the increase in its species, the transfer, mastering and storage of knowledge), we can see that it develops in harmony with the relations of Man and nature. As a result, this reflection is expressed in the study of the interaction of Man and nature in the study of science. In such scientific research, different approaches to nature and Human Relations appeared. In the vast majority of these collisions, a person is also a part of nature, and his attitude to nature is shown to change and develop. In fact, the evolutionary dialectic character of the interaction of Man and nature is characterized by the fact that again the following types of this interaction are noted separately: to look at nature as a simple object, which can be influenced only by classical methods; the second type, to look at nature as a subject of dialogue. But such interaction can become a bottleneck at any time due to the fact that it does not have a deep character; the third is the degree of coevolution of Man and nature, in which man and nature are interrelated, recognized as one whole, and this is now being developed and interpreted as the main way of preserving man, nature.

In general, the role of environmental education and upbringing is important in preventing environmental problems. The main purpose of environmental education is to form in students a conscious attitude to the problems of nature and the environment. The younger generation should not be limited to studying today's environmental problems. They need to anticipate the consequences of existing environmental problems and organize their activities accordingly. To do this, you need to learn to seek knowledge and follow it. Ecological culture is a part of the world culture, a deep understanding of the importance of environmental problems in human life and its future development is the protection of nature and the environment. Highly spiritual and ecologically cultured people should adhere to the following: to imagine the integrity of nature and society, to treat it consciously, to prevent pollution of the biosphere, to use its resources sparingly and pass it on to future generations, national traditions to know habits, to be intelligent, tasteful, prudent, to have a culture of behavior, to have spiritual, political, legal, ecological knowledge, and so on.

## CONCLUSION

The general trend of the present period shows that all segments of the population, especially the youth, are acquiring a new ecological culture. At the same time, two trends are taking place under the influence of specific factors: first, the current state of the ecological situation, the nature of nature protection practices require people to objectively comply with the requirements of a new ecological culture. This is because inert thinking leads to catastrophe in an increasingly ecological situation on a global scale; second, it is observed that the ecological culture of all segments of the population, especially the youth, is becoming an active subjective factor.

## TYOLOGICAL FEATURES OF STUDENTS' LEARNING ABILITY IN THE STUDY OF MATHEMATICS IN HIGHER EDUCATION

**Otabek Samandarovich Matchonov\***

\*Senior Lecturer,  
Doctor of philosophy (PhD) in physics and Mathematics,  
Tashkent Chemical-Technological Institute,  
Tashkent, UZBEKISTAN

### ABSTRACT

*This article is devoted to the study of the typological features of students' learning ability in the study of mathematics. Proficiency is a comprehensive criterion, which gives us a definitive picture of the availability of the necessary knowledge, skills and abilities of the student, but at the same time, this criterion does not contain information on the cause of deficiencies in LP. And the more variety of content and form of educational material passes through his perception and practice in changing situations of activity, the more this ability will be richer in skills, stronger, more consolidated and more mobile in his activity”.*

**KEYWORDS:** *Proficiency, Level Of Proficiency, Learning Ability, Perception, Objectivity, Integrity, Constancy, Categorical Nature, Meaningfulness.*

### INTRODUCTION

In pedagogy there is no precise interpretation of the concept of “proficiency”. The pedagogical dictionary defines proficiency as “the result of learning, which includes both the present storage of knowledge available to the day, and the established ways and techniques of acquisition thereof”. Thus, proficiency is both a basic component for further learning and result of learning at each stage of learning.

According to S.I. Arkhangelskiy, proficiency is defined as - “one of the essential qualities of the learner, reflecting his ability to operate with knowledge and skills in solving of theoretical and practical problems, which he acquires acting on specific educational material. And the more variety of content and form of educational material passes through his perception and practice in changing situations of activity, the more this ability will be richer in skills, stronger, more consolidated and more mobile in his activity”.

We will distinguish student proficiency as high, medium and low. The level of proficiency (LP) shall be characterized as follows:

High LP - the student deeply and completely possesses the content of the educational material and conceptual framework; is able to link theory with practice, to illustrate by examples. Quickly and rationally solves the assigned tasks, clearly and briefly states the answers to the questions posed; can justify his/her judgments on the issue presented. The answers are independent.

Average LP - the student deeply and completely possesses the content of the educational material and conceptual framework; is able to link theory with practice, illustrate with examples, but the content of the answer has some inaccuracies (minor errors) in the presentation of theoretical and practical material, is less particular and complete; mistakes are corrected by the student after further questions from the teacher.

Low LP - the student shows incomplete knowledge and understanding of the main provisions of the educational material, makes inaccuracies and significant errors in the definition of concepts and basic formulas, is not able to justify his/her judgments, there is a violation of the logic in presentation. The answer is characterized by a low level of independence.

Proficiency is a comprehensive criterion, which gives us a definitive picture of the availability of the necessary knowledge, skills and abilities of the student, but at the same time, this criterion does not contain information on the cause of deficiencies in LP. The criterion that gives us information about the reasons why the student has difficulties in the learning process, and as a consequence, LP shortfalls, is learning ability.

In the psychological dictionary, learning ability is defined as individual measures of the speed and quality of human learning of knowledge, skills and abilities in the process of learning.

Z.I. Kalmykova treats learning ability as one of the main indicators of mental development, understands it as a system of intellectual qualities of mind, which determines the productivity of learning activities under other equal conditions (the initial minimum of knowledge, a positive attitude to learning, etc.).

Learning ability is based on: the level of development of cognitive processes of person - perception, imagination, memory, thinking, attention, speech; the level of development of his spheres - motivational and volitional and emotional; development of learning activity components derived therefrom - clarification of the content of educational material from direct and indirect explanations, mastering of the material to the degree of active application.

We shall consider the typological features that underlie learning ability. First we shall consider such characteristic of the learner cognitive processes development as perception.

Perception (from Latin perceptio) - from the pedagogical point of view, it is a cognitive process that forms a personal world view.

The main properties of image formed in the process and as a result of perception are objectivity, integrity, constancy, categorical nature, meaningfulness.

Thingness - a characteristic feature of perception thingness is that as soon as we focus on a certain object, the entire perceived space is instantly divided into an image of the object itself and an image of the space surrounding the object.

Integrity - unlike sensation, which reflects individual properties of the object, perception gives a holistic image of it.

Constancy is the ability to perceive objects as relatively constant in shape, color and size, and a number of other parameters regardless of changing physical conditions of perception.

The categorical nature of human perception manifests itself in the fact that it has a generalized nature. The perceived object is named, and therefore classified, belongs to a certain category. The subject generalizes with others of the same name.

The meaningfulness of perception. Human perception is closely related to thinking. Apperception of an object means to mentally name it, i.e. to refer it to a certain group, class, to generalize it into a word. Even when we see an unknown object, we try to establish similarities with familiar ones in it.

Any lesson of the teacher with the student, necessarily consists of various techniques to enhance perception. The lesson material is written on the blackboard or in the textbook, the most important formulas are underlined, which is a way to separate the information being studied from the common flow, i.e. thingness. When solving problems, all possible options are necessarily examined. For example, when studying a function for extremum and monotonicity, all extremum points are searched for, and accordingly the information obtained as a result of this study will be complete, i.e. holistic.

Each topic necessarily contains several problems on the studied subject, so the same types of objects, such as points of extremum, are sought for different functions, changing their number and nature, for some functions, they may simply be absent.

Here such properties of perception as constancy and categorical nature are manifested. The result of study of each topic is the ability of each student to independently find not only solutions, but also ways to solve problems, i.e. to independently identify significant characteristics of the studied object, to relate them to the existing hierarchy (for example, with the classification of break points or types of solutions of differential equations), which means meaningful perception of the studied material.

## **CONCLUSION**

After the object under study has been isolated from its environment as a coherent, complete image, correlated with other similar ones, and classified, the information obtained must be stored. The memory stores information. We shall consider memory as a cognitive process.

## Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of iThenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
