Testing, subsequent accounting and calculations of biological effectiveness were carried out in accordance with the "Methodological instructions ..." (2004), approved by the State Chemical Commission of RUz .

Experience scheme:

- 1) Hebenepl 40% SK . - 0.55 l / ha
- 2) Hebenapl 40% drymatter - 0.754 l / ha
- 3) Triskabol 76% dg - 0.3 l / ha (reference)
- 4) Control - noprocessing

Fungicide Hebenepl 40% SK . It was tested against the disease on apple n leaf spot, causing enormous damage to fruit growing in Uzbekistan.

The tests were carried out against the background of infection with n leaf spot of apple trees at the level of 6.9-12.8%.

The final analysis showed that when the fungicide Hebenapl was treated with 40% d.c. at a rate of 0.55 l / ha against leaf blight on apple trees, the biological efficiency was 83.8%.

The biological efficacy of the fungicide Hebenepl 40% s.k.v flow rate 0 75 l / ha against disease n yatnistost leaves on apple was 91.5%.

The biological efficacy of the reference drug Triskabol is 76% SDG. was perceptibly high for all counting periods and amounted to 88.9 % on leaves, respectively (Table 1).

**TABLE 1 THE BIOLOGICAL EFFECTIVENESS OF THE FUNGICIDE HEBENAPL IS 40% DRY MATTER . AGAINST DISEASE SPOTTING OF APPLE TREES (PRODUCTION EXPERIENCE, FERGANA REGION, KUVA DISTRICT, "ROHATOI" FARM**

No.	Variants	Consumption rate of the drug, kg, l / ha	Leaves		
			Damage ,%	Disease development,%	Biological efficiency,%
1	Hebenepl40%sk	0, 55	12.8	6.1	83.8
2	Hebenepl 40% sk .	0, 75	6.9	3.2	91.5
3	Triskabol 76% dg	0.3	11.0	4.2	88.9
4	Control (noprocessing)	-	37.8	17.4	-

Thus, a fungicide Hebenepl 40% SK . is highly effective when applied against diseases n leaf spot in on apple a flow rate 0, 55 0, 75 l / ha, in connection with which the drug must be included in the "List ..." to combat these diseases in gardens.

## THE IMPORTANCE OF TEACHING ENGLISH TO CHILDREN IN PRESCHOOL EDUCATIONAL INSTITUTIONS

**Sayyora Yuldashovna Pulatova\***

\*Senior Teacher,  
Termez State University,  
UZBEKISTAN

### ABSTRACT

*This article deals with the process of teaching of foreign languages, especially English, in preschools on the basis of innovative advanced methods. The views of methodologists about the game is discussed as well. Description of games of an interactive nature that motivate the child to successfully master the English language is considered too.*

**KEYWORDS:** *Foreign Languages, Preschool Education, Modern Educational Programs, English, Speech Exercises, Healthy Development, Orally, Knowledge, Young Learners, Pronunciation.*

### INTRODUCTION

I.A.Karimov's book "High spirituality is an invincible force" states: "Education is inseparable from upbringing, and upbringing is inseparable from education - this is the Eastern outlook, the Eastern philosophy of life." [1].

At present time in the field of preschool education, home-based kindergartens and a network of "kindergarten-school" are developing as well. From this point it is known in Uzbekistan there are many groups that teach children foreign languages, choreography, fine and musical arts, rhythmic and artistic gymnastics, computer literacy.

In particular, in 2014, a program called "We are friends with the English language"[ 5] to teach the first English lessons to children in preschool education was developed and delivered to all institutions. Today, there are more than 4,833 English language clubs in preschools in the country[4].

To create conditions for the comprehensive intellectual, moral, aesthetic and physical development of children, on the initiative of President Shavkat Mirziyoyev, a resolution was

adopted on measures to further improve the system of preschool education in 2017-2021. Implementation of the decision as one of the main priorities of state policy will provide an integral and step-by-step development path for further reform of the system of continuing education of the republic[7].

Therefore in accordance with the decree of September 30 2017 year “On measures to radically improve the management of the preschool education system” and the resolution “On the organization of the Ministry of Preschool Education of the Republic of Uzbekistan” created a new system in this area.

- Further improvement of the preschool education system;
- strengthening the material and technical base;
- expansion of the network of preschool educational institutions;
- provision of qualified teaching staff;
- radically improve the level of preparation of children for school education
- introduction of modern educational programs and technologies in the educational process;

According to Methodists, teachers’ assessments and support are very important for preschools. It is required from English language teachers to have skill, strong knowledge, potential and patience. They must be fluent in English and psychologically able to communicate with children as well. Doubtless, it is the task of the educator to be able to engage young learners through didactic games, to organize the game properly and to develop the skills of collaboration[3].

Today the main purpose of teaching English in preschools is to teach this language orally for children of preparatory age. This ensures that children learn English perfectly and prepare them successfully for school. Therefore, in the process of teaching children English, it is advisable to collect language materials that are familiar to them, in consideration of their psychological aspects, through the active learning we can involve children’s attention.

In order to achieve this process we should to provide environments that appeal to all their senses, including visual, auditory, kinesthetic and tactile. Learning such activities is possible to realize through chants, songs, rhymes, dances, games, videos and others.

For example, following the opinions of instructors when learning a new word in class, children might first: hear the word in songs or chants; repeat the word in singing alone or they can recognize some letters and produce the new words.

It is important to note, that play is a very significant part of what life means to children at the stage of their development. Teachers should promote learning English through play as much as possible. The most exciting ways children learn are the games with flashcards, competitions, races that encourage active learning and help to develop social skills.

Obviously, the language materials taught in this task are carried out through games, songs, poems and drawings that are interesting for children’s parents will have to learn to talk about their professions, about themselves and their families, to do speech exercises, to sing poems and sing. In this way, conducting English lessons has an effective impact on the healthy development and upbringing of children. Wherein, we shouldn’t forget about the creativity and imagination that

are part of their learning process controlled by the teacher. And we should allow them to go further and use their own idea[6].

Mentioned above, a form of effective teaching of preschool children is play. According to T.L. Alekseeva, a well-known Russian English teacher and methodologist considered that in order to participate in games in English classes for children, the teacher must be able to organize various games and arouse children's desire to express themselves in English, or at least how to speak English. During the game, children will need to be polite to each other in pairs or group games, thank each other for their participation in the game, help each other in situations or when necessary, and teach solidarity. These games have a positive effect on the psyche and upbringing of children[2].

These are forms of greeting, farewell, and apology (Good morning, Good afternoon, Good evening, Good night, Good bye, Excuse me): words like thank you, please, sorry, sorry (Thank you, please, I am sorry,). As children memorize these words, they can then use these words in active play in everyday life[4].

It is fair to say that the use of common games between English and American children in English lessons is similar to our own children's play. Thus, they develop a sense of goodwill towards all the children of the planet and the similarities of the children of the world. It means that developing social skills is also very important while learning language. Because children need to learn to socialize with each other, showing some important values as respect and sharing[2].

In this way, children participate in games with great interest and like to pronounce words. For example, to pronounce the words "a cat" and "a map" clearly, the children are encouraged to pronounce them clearly 2 or 3 times after the word, and then the sequence continues in the same way. We can control the movement of the tongue, lips, etc. when they pronounce a word only after showing them the movements of the tongue and lips. We encourage them to imitate and pronounce it later. Only our pronunciation, ways of using the organs of speech, and the formation of the desired sounds can be a shining example.

## CONCLUSION

In conclusion, it should be noted that the appropriate organization of English lessons in preschool education helps to fulfill educational tasks and prepare children for school. Through the playing games, children learn language and it is impossible to develop or expand their vocabulary. We must take into account that all over the world, learning foreign languages, especially English, is one of the great important strategy to our children.

## GENDEROLOGICAL CHARACTERISTICS OF UZBEK NICKNAMES

**Shahnoza Ubaydullaevna Nizamova\***

\*Researcher,  
 Kokand State Pedagogical Institute,  
 UZBEKISTAN

### ABSTRACT

*The article distinguishes the anthroponymic meaning of Uzbek nicknames specific to women (denoting a female person), lexical, nominative-motivational basis, and ethnographic features associated with the naming of the Uzbek people.*

**KEYWORDS:** *Nickname, Anthroponymy, Genealogical Nature, Ethnography, Lexical Basis.*

### INTRODUCTION

Nicknames, like other anthroponymic units, are of a genealogical nature. Nicknames perform differential and genealogical functions by referring to the gender of the owner of the name. In female-specific nicknames, this function is clearly observed. Female nicknames are characterized by their anthroponymic meaning (representing a female person), lexical, nominative-motivational basis, based on ethnographic traditions associated with the naming of the Uzbek people. For example, *Uvaysiy*, *Nodirabegim*, *Anbar atin*, *Dilshod Barno*, *Khoki* (*Uvaysiy's* daughter *Quyoshkhan*), *Tamarakhonim*, *Zulfiya*, *Aydin*, *Olmos*.

### THE MAIN FINDINGS AND RESULTS

Female nicknames in the Uzbek language can be grouped according to the creative direction of the authors as follows:

1. Nicknames of female poets and writers: *Uvaysiy*, *Nodirabegim*, *Anbar otin*, *DilshodBarno*, *Zulfiya*, *Aydin* (*ManzuraSobirova*), *Onagul*(*EnakhonSidikova*), *Olmos*, *Dilbarbonu*(*DilbarHaydarova*), *Khayola*(*RuqiyaGozieva*), *Farida Afroz*(*Butaeva*), *ZulfiyaKuroloykizi* (*ZulfiyaYuldasheva*).
2. Nicknames of female singers, dancers and actors: *Tamarakhonim* (*Tamara ArtyomovnaPetrosyan*, singer and dancer, choreographer, one of the founders of Uzbek professional dance, People's Artist of Uzbekistan), *Rayhona* (*GanievaRayhon*, singer),

*SevaraNazarkhan* (NazarkhanovaSevaraAnvarjanovna, singer), *Dilso'z* (JumaniyozovaGuzal, singer), *Kaniza* (AhmedovaShahrizodaFarhodovna, singer), *Shahzoda* (MusaevaZilolaBahodirovna, singer, winner of the Medal of Fame), *Ojiza* (OnabibiOtajonova) [1,364].

3. Nicknames of female journalists: *Nozimakhanim* (first female journalist) [2,219], like *Nodira Said Ahmad kizi*. Some of the pseudonyms are poetic, writer, translator, journalist and scholar: *Zulfiya* (poet, journalist, translator, public figure), *SalomatVafo* (journalist, translator, writer and poet), *GulbahorSaidGhani* (SaidganievaGulbahor, teacher and poet, scholar), *Lola* (Yuldasheva Lola, singer, composer and actress), *MohinurMuhammadjonkizi* (poet, translator).

In Uzbek anthroponymy, the nickname of ancestors is also used as a sign of respect. For example, *Kaniza* is the nickname of the singer AhmedovaShahrizodaFarhodovna (28.04.1985 - Fergana region, Kokand, singer). Shahrizada took the pseudonym of her grandmother [3].

Most of the nicknames for creative and artistic Uzbek women are derived from their first and last names and are called first names. Nicknames are formed on the basis of abbreviating the original name or surname of the artist and artist: *Zulfiya* (ZulfiyaIsrailova), *Nazira As-Salom* (SalomovaNazira), *Nodira Said Ahmad kizi*, *Malika Mirzokizi* (Mirzaeva Malika), *MatlubaDehqonkizi* (AhmedovaMatlubaDehqonqizi), *MohinurMuhammadjonkizi*, *Muhabbat Ibrahim kizi*, *MahliyoOmon* (RahmonberdievaMahliyoOmonjonqizi).

Nicknames of female artists and artists in the Uzbek language can be grouped according to the nominative-motivational and lexical basis as follows:

1. Nicknames based on words denoting such a sign as great, great: *Muazzam* (MuazzamhonMirsaidkizi (second half of the XIX century, Khojand - 1917, Jizzakh) - poet, *Kutlug* (ShermuhammedovaMuborak).

2. Celestial bodies: planets, stars Nicknames with lexical bases: *Mushtariy* (Saodat (1810/11, Kokand -?) - Poet, *ZuhroYulduzi* (BarakaevaYulduz) - poet. Each of these nicknames has its own lexical and spiritual features. For example, the poet *Mushtari* created written poetic samples of folk oral epics. Her real name was Saodat and she chose the nickname *Mushtari*. *Mushtari* is Arabic and the name of the planet Jupiter:Also means "customer". The poet dreamed of becoming famous from the planet and chose such a nickname. Hilol (KarshievaKamola; 1968, Samarkand) is a poet [5.78].

3. Nicknames based on words denoting the sign of beauty, charm, charm and radiance: *Layli* (Layli - the most beautiful of women), *Barno* (daughter of DilshodRahimqul Sufi), *Bonu* (Samar MawlawiSirojikizi; poet, enlightener), *Anbar* (Anbar otin; poet), *Aydin* (ManzuraSobirova; writer, playwright). Each of these nicknames has a certain anthroponymic meaning. For example, the word *Bonu* was the lexical basis for the nickname of the daughter of *Samar MawlawiSiroji*. The word *Bonu* is Arabic and literally means "ruler, mother, lord, noble, beloved wife, lovable, beloved" [6:73]. The poet chose the nickname *Bonu* because of her positive qualities and her desire to be a sofa.

4. Precious mines, nicknames on which words denoting metal are based: Like *Maadan* (18th-19th centuries). Odina Muhammad sang her own ghazals. He chose the nickname *Maadan* (metal, original stone; mining, treasure) in his dream of being as unique, stately, and as beautiful as pearls. [7.82]

5. Words denoting the sign of grief, anduh are lexically derived nicknames: such as *Mahzuna* (Mehriban Mullah Boshmankizi; approx. 1811, Kokand -?). Historically and etymologically, the Arabic word mahzuna, which is the lexical basis of the nickname, means “treasure, sad, sorrowful, and miserable”. The poet chose this nickname because she lived a sad, miserable life.

6. Nicknames that have a lexical basis for words that express a secret, secret, mysterious character: *Mahfiy* (Zebunnisobegim nickname), *Maknuna* (Mohlar mother Rahmonquli paternal daughter).

In anthroponymy, names are divided into two groups according to their linguistic connotations: male names, such as female names. Typically, the names of men and women in the language differ in nominative-motivational, lexical-semantic, structural features.

There is an interesting situation among the nicknames of women creators and artists in the Uzbek language. Nicknames of some female artists are formed from lexical units based on men's names: *Mavloniy* (MashhuraEgamovna), *Yolkin* (SaodatRakhmonova, poet), *Erkin* (Mahbuba Rahim qizi, poet), *Khaniy* (Rohilahon; XVIII-XIX centuries), and Kokand poet).

We pay attention to the lexical and semantic features of these nicknames: *Mavloniy* (MashhuraEgamovna (1934.4.12, Tashkent) - microbiologist, Academician of the Academy of Sciences of Uzbekistan (1989), Honored Scientist of Uzbekistan (1994), Doctor of Biological Sciences (1971), Industry in Uzbekistan He was the founder of microbiology. He created the first collection of industrial microorganisms in Central Asia.

The word *yolkin* (SaodatRakhmonova), which is the lexical basis of the nickname, means “a flame rising from a burning object; light, ray, radiance, beam” and is observed more as a masculine noun.

In some cases, male poets and writers use female nicknames for specific purposes: *Gulyor*, *Dumbulnisa* (additional nicknames of Abdullah Qahhor) *Mukhtaram*, *Nozik* (Muhammad NematullaqaziSharafiddinogli; poet and tazkiranavis), *Iroda* (SadriddinSaidmurodov (Aini), Sura) Abdulla Avloni), *Maknun* (MullaErnazar, poet), *Mehri* (HojimuinShukrullaev). The lexical bases of these nicknames are widely used as women's names and also spiritually reflect the characteristics of the female gender: The lexical basis of the nickname Dilbar (Ghulam Shadiy, poet) –*Dilbar*. The word is Persian and means “pleasant, endearing, charming, bewitching; beautiful, handsome; beloved” and is often used as a female name in the variants *Dilbar*, *Dilbaroy*, *Dilbarkhan*, *Dilbarbonu*[9,112].

Abdullah Qadiri's humorous nickname *Dumbulnisa* consists of the lexical units' *dumbul* and *niso*. The nickname *dumbul* (f. Immature grain, dukkak) is based on the portable meaning of “foolish, stupid, demented” [10,661], and the anthroponymic meaning of “stupid, abnormal, demented woman or woman; girl” is an abbreviated form of *Mehri's* nickname Mehriniso. Meaning women's sunshine or women's most kind, compassionate. If the author's goal is only to conceal his name, if he wants readers to imagine it as it is not in reality, then he has continued on the path of mystery: a woman takes a man's name or a man takes a man's name [10:8].

## CONCLUSION

The analysis shows that the analysis of linguistic features of onomastic units, including nicknames, including lexical-semantic, nominational-motivational, functional-semantic,

methodological, structural and structural features, reveals the personal life, past, creative concept, dreams and goals of creation and art. is important and essential in learning.

**DYNAMICS OF JOURNALISTIC CONTENT: CHANGES IN FORM AND CONTENT**

**Sohiba Mullaeva\***

\*PhD Student,  
 Uzbekistan University of Journalism and Mass Communications,  
 UZBEKISTAN  
 Email id: smullayeva@mail.ru

**ABSTRACT**

*This article analyzes the stages of development of journalistic content, changes in form and content as a result of the influence of social life and the audience. As a result of the revolutionary events of the seventeenth and eighteenth centuries, monopoly power in a number of countries was abolished and replaced by new and more advanced regimes. Not everything is written in detail here, but the traditions of written journalism are highlighted: that is, “nothing has been said to the government about the facts”. A journalist who creates media content should use the same, understandable methods of expression. It should be borne in mind that the modern audience is busy and needs a lot of speed.*

**KEYWORDS:** *Content, Text, Genre, Format, Journalism, Media Convergence, Convergence Editorial, Audience.*

**INTRODUCTION**

No matter what direction the media operates, a journalist works with content. The core of any content is text. In addition to being a representative of a print or online publication, a TV and radio journalist also displays a certain portion of his or her talent and skills through text.

In the period from the emergence of journalism to the present day, the text, which is an important expression of content, and the demand and approach to it are constantly changing and evolving.

According to Professor Fayzulla Muminov, the first need for information exchange arose due to the coordination of the management of the upper classes in the Roman Empire. Extensive political information exchanges focused more on economic, personal, domestic, and perceptual goals than political movements. Messages about government decisions on gypsum boards are

also briefly written on it. Not everything is written in detail here, but the traditions of written journalism are highlighted: that is, “nothing has been said to the government about the facts”. It was not until the 15th century that gypsum boards began to be replaced by lightweight, convenient, and fast-replicating paper sheets [1, pp. 428-429].

## THE MAIN FINDINGS AND RESULTS

It follows that there is a view that the first appearances of journalistic content informing people first appeared in the form of text before the fifteenth century. The texts in them are also simple and created from the point of view of the authorities. The first appearances of the diary occurred even before antiquity. But they were not recognized as a newspaper.

While the first buds of journalism were written on plaster tablets issued by the Roman Emperor Julius Caesar in the first century BC, the Capital News, which later appeared in China in the eighth century, was recognized as its first stage. The invention of the printing press by Johann Guttenberg of Germany in the mid-16th century was the second stage in the development of world journalism. By this time, the structure and level of the texts had begun to change [2, p. 7]. They were dominated by the informative function of more text.

The development of the press has made newspapers a lucrative business. The press, which was published under the domination of individual journalism in the world, called this period authoritarian. As a result of the revolutionary events of the seventeenth and eighteenth centuries, monopoly power in a number of countries was abolished and replaced by new and more advanced regimes. This fourth stage paved the way for the formation of social opinion, along with the transformation of economic interest into journalism [2, p. 7]. It can be said that the peculiarities of the period in which social opinion was formed were reflected in the textual form of journalistic content in the press.

There are different views on the origin and scientific study of the journalistic text. In particular, some scholars link its emergence to the creation of the alphabet [1, pp. 428-435]. They say that if the alphabet had not been created, people would not have been able to successfully exchange information with each other. It is also emphasized that the invention of paper, paint and technical equipment has a special significance and place in the formation of the journalistic text.

Commenting on the requirements for a journalistic text, American journalist Lauren Kessler writes: “The three rules of the text are clarity, brevity and fluency. First of all, the creator must ensure that the text he creates is understandable to the reader (audience). Each artist achieves a clear, fluent and understandable text through a unique word choice style. The right choice will help to fulfill these three requirements. There can be no ambiguity, unnecessary sentences, and inaccuracies in the written speech in the pamphlet. To achieve a clear goal, the artist must work on himself, practice, be diligent and have a deep knowledge of grammar. It is clear that a journalistic text must first be understandable to the audience with its accuracy and fluency. A journalist creates this content with his skill and literacy.

When it comes to a journalistic text, it is important to focus on form and content. Because the growth dynamics of the text did not go unnoticed in its form and genre characteristics.

“The word “genre” means “type” in French”. Genres are a stable form of journalistic work. They are necessary for the journalist to choose the look that suits his material, to show the events in a certain way, if necessary, to know what information is offered to him, depending on the nature of the genre. If it is news, then the essence of the event is given first, then the details are written. In the report, the journalist, as a witness to the event, also allows the viewer to become a participant in it [2, p. 356].

In Russian journalism, the genre is seen as a sign of identity. According to the Russian scientist G. Lazutina, the genre is a concept of the theory of creativity, expressing the peculiarities of a particular type of creativity. That’s why he always defines this type of creation by his name [3].

According to him, the “National Encyclopedia of Uzbekistan” contains only information about the genres of literature, fine arts and music. There is no mention of publicists or journalism [4, p. 14]. The Annotated Dictionary of the Uzbek Language also describes the genre based on the nature of works of art. For example, “GENRE (fr. Genre - gender, species) is a type of work of art that has its own characteristics in terms of plot and style. *Lyric genre. Humorous genre. Song genre* and etc.” [5, pp. 553-554].

By the end of the twentieth century and the beginning of the twenty-first century, with the rapid penetration of the Internet into our lives, the function and content of the text, which is the basis of journalistic material, has expanded dramatically. Now the term content is being applied to it.

Journalistic content is the structure of information in the media, which expresses certain content in the coverage of events in social life. It provides for the authors to reflect the real reality in a specific way (analysis-based criticism), regardless of what elements (facts and evidence, comments and interpretations), what means (picture, infographic, diagram, sound, image) are used. Also, the concept of “content” means multi-topic on the Internet, and even in specialized publications is divided into sub-topics [6, p. 23].

Traditional marketers have been using content effectively for many years to provide information about products and enhance the reputation of their product. Taking advantage of technological advances in transport and communications, business owners began to use marketing techniques in content creation by the end of the 19th century. From this point on, content acts as a bridge in their communication with their customers. In particular, in 1732, Benjamin Franklin published *The Almanac of Poor Richard* to promote his printing business [7, pp. 71-145].

In 1895, John Deere founded a publication dedicated to animal husbandry, in which he created content that taught farmers how to be more profitable. The publication is still available today, with an estimated 1.5 million copies in 12 languages in 40 countries [8].

During this period, the American company Kellogg began to produce sweet porridge, which has a positive effect on the physical development of children. The marketers of this company publish advertisements tailored to their audiences, thus laying the foundation for the concepts of target audience, target marketing. Also during this time, infographics also emerged as a means of promoting the brand and reminding the audience.

The term *content analysis* was first used in journalism in the late 19th and early 20th centuries by American journalists B. Matthew, A. Tenny, D. Speed, and D. Uipkins [9].

In the 1930s, U.S. sociologists used the method of content analysis in social research. Since that time, the term content has become an object of study in psychology and sociology. The reason is that the text is used as a method of identifying and evaluating the specific features of the media (such as video and radio broadcasts, interviews, answers to open-ended questions) to determine the character and relationships of the media. In psychology, the method of content analysis is used to obtain specific information from the answers given to several categories.

The object of the content analysis method is various printed publications, radio and television broadcasts, films, advertisements, documents, public speeches or questionnaires. This method was first used in journalism and literary criticism. Developed by American sociologists H. Lassuel and B. Berelson, this method was introduced into politics and propaganda in the 1930s. This method was especially useful in propaganda work during the Second World War.

If journalism initially served as an informant and auxiliary in the management of society, over time it can be seen that it has also become the object of marketing. Now journalism has begun to manifest itself through the influence on the minds of the people.

Since 1990, with the advent of computers and the Internet in our lives, a new era has begun for marketers: websites and blogs have flourished, and various companies have begun to communicate with their audiences via email. At the same time, traditional media such as newspapers, magazines, radio and television began to lose their market power. Internet content marketing has become the main form and tool of the information market. This can be seen when companies start advertising and selling their products digitally. The fact that this trend, which began with the advent of the Internet, has become much stronger today is evidenced by the fact that advertising is more effective on online platforms, social networks.

In the above facts and opinions, we have considered that content is the object of study not only in journalism but also in various other fields. Now let's talk about media content that is specific to journalism.

With the transformation of journalistic text into media content, the concept of genre has also begun to shrink. According to some researchers, the processes of media development, convergence and interactivity have not lost the importance of information, analytical and artistic-publicist genres in journalism. Due to the creative activity and mobility of journalists, journalistic creativity has adapted to the modern segment: with the development of convergent editions, newspapers and magazines, the content of the journalistic text and the professional activity of journalists creating it have changed in many ways.

In addition, the intensity of today's information flow and the demand for fast delivery of media products has also softened the concept of the genre. Because journalists, no matter what style and form, try to convey the information at hand quickly. For this reason, the concept of genre has become one of the most controversial topics in journalism. Given the integration of genres, some scholars' predictions that they will disappear over time are also not absent.

Candidate of Philological Sciences, Associate Professor Nazira Toshpulatova argues that with the disappearance of the genre, there should be a form in journalism. "From the outside, the form of the work seems to need no theory or definition. But since form has a certain appearance and meaning, it is a stable concept ..." [11, p. 24]. In his opinion, a journalist should think about what the work he is preparing will be, where to start, what information to bring to the forefront, how

to draw conclusions, how to cover a process or reality. Their arrangement itself emphasizes that it requires a certain form in relation to the text.

The concept of format has also been added to the concept of genre, which is developing on an equal footing with journalism. When it comes to genre, this issue has received little attention from theorists. But as the concepts of genre and format became mutually exclusive in the practice of journalism, controversial topics began to emerge. The format has dramatically expanded its scope of meaning and has begun to squeeze out other concepts, including genre.

They point to the development process of the computer as a simple reason for this process.

It should be noted that even though it has been a long time since the first buds of newspapers and journalistic texts appeared, debates over genre and text have been heated, and even modern views on the need to abandon the genre have prevailed in the national press; there were no striking changes in the form and style of the journalistic text. However, with the development of the media, the demand of the audience has also changed. As a result, the old, traditionally prepared journalistic material did not interest the readers. They want interesting information that can be quickly and easily assimilated. This has highlighted how relevant and important multimedia is.

According to Nazira Toshpulatova, Candidate of Philological Sciences, Associate Professor, digital technologies and audiovisual media are multimedia in the structure of the media. Using its capabilities, media texts are becoming an important trend in the preparation of interesting, vital and lively events (using pictures, videos, audio texts) of life events, in accordance with the level of acceptance of the audience. In such conditions, the development of creative potential of journalists, the improvement of their professional skills, the formation of the ability to prepare journalistic material is one of the most pressing issues in the science of journalism [12, p. 107].

Some research also mentions the emotions that media content evokes. Observers say media content varies by nature. However, in this sense, topics such as individualized violence have a special place in terms of the level of impact.

For example, the constant display of police serials, crime scenes, bloody scenes, and detective material can lead to aggression and, worst of all, a sense of violence in the audience. That's why modern journalists are required to know in advance how media will affect their audience in the process of creating content. Because the problem is manifested in the one-sided interpretation of reality, and in parallel, young people indulge in virtual war games, genocide-based entertainment, blockbusters, commercials, and so on. What we have listed exacerbates the occurrence of violence and aggressive behavior in young people. The reason is that they conclude that violence is the only right way and means to find a solution to conflict situations under the influence of such media texts. Therefore, for example, journalists who make a documentary about a tragic event or a conflict between states will have to choose the middle ground and show both the situation of the victims and the aspirations of those who are trying to resolve the conflict peacefully [13, pp. 24-25].

In fact, people watch TV together, chat with friends in chat, play interactive games with each other, and even go to the movies is a team event. And when there are no others around, we usually turn to the media. Through the media, people's sense of unity is strengthened. And conversely, the overall media experience can also cause problems. Interests, friends, styles and

aspirations bring us closer to people with similar passions; at the same time, media choice differentiates us from people who consume media content of a completely different content and category. The Internet has changed the way we participate in media use. In the world of the Internet and games, young people are actively leading. The virtual, interactive world is more likely to be more efficient than traditional media [14, p. 366].

Therefore, the journalist must take into account that the audience consists of different layers. The audience is made up of people of different ages, groups, strata, genders, and accordingly their interests are different. A journalist who creates media content should use the same, understandable methods of expression. It should be borne in mind that the modern audience is busy and needs a lot of speed. It is also a constant requirement to pay attention to the grammatical correctness of the text.

While the content of media content is one side, another important aspect of it is the issue of conveying this information to the audience through multimedia tools. This is because the convergence processes in the media and the integration of genres remain a topical issue in the era. Although most scientific studies acknowledge the convergence of all aspects of the media in the process of media convergence, some scholars disagree. This has also had an impact on media content creation approaches.

In particular, in the components of the media system, for example, in the press, radio, television, the Internet, in the process of delivering material to the audience in the same editorial office can be a combination of different methods, but not their form. There is no process of merging the forms of means such as text (newspapers and magazines), visual (television), audio (radio) and interactive hypertext (internet), on the contrary, the process of their separation is intensifying. That is why the newspaper's website is based on the principle of "one edition - two editions". Although one person works in the "two editions" [15, p. 15].

The opinion of most researchers also confirms that today's trends, along with the forms of information transmission, have also changed the information-consuming society, i.e. the audience. Now the members of the society not only receive information through the media, but also directly participate in this process. This is changing the nature and functions of modern journalism [16, p. 108].

As mentioned above, today the audience's influence on media content is growing. Through interactivity, they are not only communicated, but groups within the audience interact with each other. Today's audience not only has the opportunity to express their views on journalistic material, but also to independently create content (text, audio, video) and send it to the media site. Proof of this can be seen in the fact that content created by information consumers on sites is given a wide space.

Russian scientist Ekaterina Baranova described the unique values of media content in a cooperative way in her research.

Old content values	New content values
Content is created based on the personal factor of news selection	Content is created according to the wishes of the audience

Content is created by professional journalists	The influence of users on media content is growing, and the medical content prepared by them plays a key role
The latest news will be published in newspapers and audiovisual in the media	The latest news will appear in digital media, appearing on social networking pages. Takes on a more multimedia tone.
Public content aimed at a general audience	Specialized content aimed at certain groups in the audience
Plenty of political news and information in content intended for the public	Leading by regional and local data that serves the interests of a narrow audience
Distribution of media content through newspapers, radio and TV	Transfer of media content through various media platforms (Internet media, various mobile versions, etc.)
A business model based primarily on the number of advertisements and circulation	Cross-media advertising is a business model based on the use of crowdsourcing resources by the number of subscribers [17, p. 29]

## CONCLUSION

On the Internet, too, the content is presented in a concise, concise and interesting style, compared to printed publications, enriched with multimedia and presented quickly. The audience prefers websites and messengers, first of all, because they provide fast information, and secondly, because they are interesting and easy to digest, and because they use the Internet mainly through mobile phones, that is, they receive information over the phone.

These two situations have created a huge gap between print media and the audience. To remove it, every convergent editor must first fully understand what the media convergence process is and its modern requirements. In addition, the media needs to present content in line with changes and new trends in its creation and transmission. That is, they should treat their media content as a product on the counter.

**ABSTRACT**

*Psychological protection is a condition for psychological discomfort of a person and is divided into basic and acquired psychological protection types. Psychological protection is a form of behavior that defines the essence of the subject's psychological culture and life experience. Theoretical psychological protection is divided into two types: basic psychological protection and acquired (secondary) psychological protection. The main objective of psychological protection is to eliminate psychological discomfort expressed in a person. It can be constructively or destructively described.*

**KEYWORDS:** *Maturity, Physical Perfection, Spiritual Maturity, Psychological Maturity, Psychological Protection, Gender Distinction, Cognitive Behavior, Psychological Discomfort, Need, Experience, Situation, Coping Behavior.*

**INTRODUCTION**

There are protections that can be applied by a person in maintaining public order and in a situation of conflict. The inspector of prevention should understand these psychological protections when working with people.

Mechanisms of protection by the person can be constructive (reasonable) or descriptive (unreasonable).

In the process of entering into a relationship, there is a need to protect against stress (tension), conflict (conflict).

On Ontogenesis, each person uses the individual technology to perceive, process, and transmit information by means of the sensory organs, to make it into a cognitive or multidimensional knowledge. This process is automated, becoming individual cognitive. Cognitive style, also

expressed in the dynamics of individual consciousness and unconsciousness, appears in the form of a psychological complex in the form of self-assessment in the form of "I" and "I am-not" in the form of an attitude of the environment, self-awareness. According to the expression, consciousness is divided into social, political, legal, ethical, artistic, religious, ecological types. For example, ethical consciousness is the type of consciousness that is well-known in the community of people, that is, the good and evil, the white and the black. Ethical consciousness regulates relationships in norms, traditions, traditions, procedures, and guiding styles in different activities. Artistic consciousness reveals the social existence and its beauty. An important aspect of artistic consciousness is art, and it is manifested in the cultures of culture, perception, and culture of self-expression, which provides the individual with the ability to cultivate, cultivate and harmonize cultural attributes.

Psychological protection may be the cause of social disarray as a result of a combination of elements in the psychological protection mechanism, with the aim of ensuring the adaptation of the spiritual world to the social environment in terms of its functionality, psychological protection, complicated structure, and manifested in the behavior patterns of a person in a simple and superior order. Theoretical psychological protection is divided into two types: basic psychological protection and acquired (secondary) psychological protection. The main objective of psychological protection is to eliminate psychological discomfort expressed in a person. It can be constructively or destructively described. In our opinion, the constructive expression of psychological protection is based on a person's psychological culture and experience. At the same time, the protection is broken down into simple and high-ranking ones, and their connecting point is to eliminate the psychological discomfort that arose.

Psychological protection is divided into aggressive and positive forms of expression, which includes the protection of emotions, needs and interests from internal and external threats. Psychological protection at individual level means a special regulated system that minimizes the impact of internal and external threats, balancing current psychological state, providing psychological stability. "Tahdid" is derived from Arabic, which means "intimidation", "hurry". In this context there are internal threats, anxiety, fear, negative emotions, personal incompetence, and so on. External threats include various forms of discrimination, neglect of individual values, open aggression, and so on.

In the psychology dictionary, psychological protection has been shown to be a quality that changes the system of interpersonal relationships, in a broader sense, the emergence of a negation, a "lie" created to eliminate discomfort, and the different attitudes that appear in the form of changing behavior. In our view, the main task of psychological protection is to provide the person with the ability to "absorb" the level of consciousness of the person from the negative, ie psychological traumatic information. The right mind is expressed in intellectual activity of a person and, with perception of new impressions, his experiences, emotional assessment of the current situation, reflect the world. Consciousness, the subjective image of the world, the essence of the subject, ie the venue of the subject, is a manifestation of the existence of the "beginning" of man. Task of the consciousness is to eliminate conflicts (dislikes). It is understood that in the consciousness of the person others and his place existence is reflected. The surrounding area is clearly perceived. A person's subjective life is connected with a world of perceiving and consciousness, and he / she can perceive the nature of dangers and threats, the dynamics of social relationships, and distinguish safe and destructive points. It is the mind of the individual that he

seeks ways to get rid of the dangers and threats. In this process, consciousness is a form of self-consciousness, and social consciousness is functional to distinguish risk from the point of view of its functionality.

On Ontogenesis, each person uses the individual technology to perceive, process, and transmit information by means of the sensory organs, to make it into a cognitive or multidimensional knowledge. This process is automated, becoming individual cognitive style. Cognitive style, also expressed in the dynamics of individual consciousness and unconsciousness, appears in the form of a psychological complex in the form of self-assessment in the form of "I" and "I am-not" in the form of an attitude of the environment, self-awareness. According to the expression, consciousness is divided into social, political, legal, ethical, artistic, religious, ecological types. For example, ethical consciousness is the type of consciousness that is well-known in the community of people, that is, the good and evil, the white and the black. Ethical consciousness regulates relationships in norms, traditions, traditions, procedures, and guiding styles in different activities. Artistic consciousness reveals the social existence and its beauty. An important aspect of artistic consciousness is art, and it is manifested in the cultures of culture, perception, and culture of self-expression, which provides the individual with the ability to cultivate, cultivate and harmonize cultural attributes. Consequently, constructive psychological protection defines the essence of events and processes that are of cultural importance. D. Dotsenko knows that "the main aspect of psychological protection isto ensure that the person does not get introduced". The introduction is a testimony given by the views, motives and other ideas created within the person's internal world (in the subject of psychology, the concept of prism is used). Because external reasons are based on the foundations of internal conditions, academician S.Rubinstein states that "external influences give rise as one or another psychic result."

Pedagogical activity is a type of work that has a high social cultural significance. Because any existing profession (sector) is a result of pedagogical activity. Teachers, law enforcement officers, military personnel, economists and lawyers, engineers and programmers, artistic professionals (painters, sculptors, writers, composers, etc.), even professions which are acquired in a short period of time (hairdressers, stylists, etc.) is a successful outcome of pedagogical work. Therefore, in the professionalism (by Klimov) system, the pedagogical activity relates to the working group "Subject"–"Subject". Pedagogical work differs from other types of activities with high stressogenicity. If we choose successful pedagogical activities as educated professions, the pedagogue will not only provide information, but also educate students about the world outlook, the positive "I" and the self-expression. In this process, each subject will have to take account of his individuality. If we study this process in a systematic way, we need to demonstrate a constructive internal and constructive external psychological protection of the teacher to succeed. Considering that Russian physician, Doctor of Medical Sciences V.Delaryu, is used to describe "the concept of psychological protection, psychological discomfort". At the same time, psychological protection is a basic component (component) of pedagogue's component, more precisely psychological component, and is a basic basis for successful professional activity. Therefore, the concept of psychological protection can be regarded as a complex of processes and mechanisms for protecting the subject from negative influences. Although Belorussian scientist A.Krot expressed his attitude, "Psychological protection is a means to eliminate conflicts between mind, ignorance and reality," the author seems to have ignored the existence of a type of internal and external psychological protection. Theoretically, psychological protection

is distinguished for its purpose in terms of its internal and external psychological protection. The purpose of internal psychological protection is to maintain the internal stability of the subject and to ensure a positive state. The goal of external psychological protection is to maintain a social norm and acceptable social distance from the subject of the relationship between the "Subject" and the "Subject" – "I" and the "I" - to ensure the positive position of the subject. In this way, a stable positive psychological state is provided.

As a subject of psychological protection, the subject can be selected as motivational (desire, motivation) and cognitive (outlook, attitudes) and patterns of behavior (manifestation, ability, behavior, or manner of behavior), contrary to psychological protection. On the one hand, it helps the inner person, that is, to adapt the "spiritual I" to the "physical I", and, on the other hand, affects the human being with the outside world. That's why the mechanism of psychological protection is being studied on the basis of various scientific doctrines. Russian scientists R. Granovskaya and I. Nikolskaya, studying the expression of psychological protection in children, have pointed out to the psychological protection mechanism that "understanding the intrapsychical adaptation of the perceived level of personality perception of the information being perceived by the person." In Maturity psychology, It is well-known from "The psychological laws of the younger stages of maternity" that in complex operations, all psychological processes take place with all their functions. That is, emotion, thinking, imagination, attention, memory and perception are the "creator" of psychological protection. Therefore, when detecting psychological traumatic or psychological well-being, the protection mechanism acts as a filter. As a result, disruptive information is denied, negative aspects are reversed or replaced with optimal information type. In this way, the spiritual state is conditioned by the specific type of social adaptation. Analysis of scientific sources shows that there is no single model of psychological protection mechanism and is individually expressed in each subject. In our opinion, this will be conditioned by the specific factors such as ethnomadiality, social maturity, experience of the subject, satisfaction of needs, culture, and type of higher nervous system. Because it is a psychological self-defense behavior. Therefore, someone with a psychological defense is weak, one is strongly exposed. The poor psychological protection does not have the ability to fully protect the subject's mind from the discouraging information. Stronger psychological protection can protect the mind by "cleansing" (filtering) any information that is susceptible to the subconscious. V. Dolgova and O. Kondratieva noted that in this context, "it is necessary to distinguish between normal psychological protection and pathological psychological protection (in assessing the psychological protection model - S.S.)". When normal psychological protection fulfills a prophylactic function, the pathological psychiatric disorder causes disintegration. Therefore, there are various samples of the classification of the psychological protection mechanism. As one of the first in psychology, A. Freud performed his classification and showed psychological protection as a threat to the "I" and the occurrence of ontogenesis. A. According to Freud, the norm of maturation depends on the process and direction of the protection. Theoretical and Comparative Analysis shows that A. Freud's recommended psychological protection mechanism was theoretical basis for modern classifications of psychological protection mechanisms, such as primary and secondary, primitive and advanced, adaptive and non-adaptive, adequate and inexpedient, effective and disadvantaged.

P.Cramer studied the ontogenesis of psychological protection and divided them into types of psychological protection, primitive (normal) and higher. Primitive psychological protection (denier, compression, regression, swap) has been demonstrated by the use of motor and sensor mechanisms to monitor the use of the child in conflict situations to ease the emotional state. Social development norms and behaviors are largely dependent on the expression of higher psychological protection and are expressed in the management of conflict situations.

A.Freud refused to perform the logical classification of the psychological protection mechanism, showing ten types of protection (compression, regression, reactive formation, isolation, projection, injection, self-defeating, transference, and sublimation). In his opinion, except for the sublimation of the psychological protection mechanism, play a negative role for a mentally healthy person. The use of a psychological protection mechanism can not eliminate the conflict, the state of fear remains, and ultimately, the outcome of the disease remains high.

According to L.Grebennikov, "psychological protection mechanisms are, by nature, unreasonable and should not be left to their senses".

A psychologically healthy person defines and protects his / her defenses in the process of perfection. It develops the mechanism of psychological protection and recognizes automatic protection beforehand. The definition defines the essence of psychological protection. Thus, reflexive control of psychological protection is a prerequisite for the transition to constructive protection of the destructive psychological protection mechanism. A. Nalchadjyan treats three types of socio-psychological adaptation as normal, deviant and pathologic, and "psychological protection mechanism ensures the socio-psychological adaptation of individual". This, in turn, suggests that adaptation is normative, if used in the context of a psychological trauma, with a normal psychological protection mechanism. That is, in the context of the requirements of the norms of the society, behavior patterns and attitudes are expressed in definite patterns. M. Mkrtychyan, who learned how to manifest a psychological protection mechanism in the situation of frustration, says that "in this case, not only the individual, but also one of the leading, role-playing, systematizing roles in regulating and responding to the situation as a response to the situation." such as. The author's attitude, in turn, indicates that the expression of the defense complex influences the person's experience, values, attitudes (rules). Effective psychological protection eliminates the conflict without the frustrator's passive protection, and eliminates the conflict.

The psychological protection mechanism is related to the age-related development of a person and the relevance of cognitive processes, R.Plutchic's classification of psychological protection is based on criteria such as primitive maturity. Ontogenetically, the first is the protection that comes from perceptive processes (intuition, attention, perception). R.Plutchik has denied this group, has made projection, regressions, and similarities. The people who use them are distinguished by their emotional and inaccessibility. Subsequently, memory-based protection types such as squeezing and forgetting occur. Practicing these protection mechanisms is based on the memory of information. Relatively complex types of protection is replacement, compensation and rationalization. They are shaped by the development of imagination and thinking and provide information processing and re-evaluation. Based on the analysis of the sources learned, the functional level of analysis can be summarized as a functional description of basic psychological protection mechanisms (Table 1). Denial is an ontogenetically first-described and simple defense mechanism that acts as a cleansing tool for perceptions. At the same time, unacceptable

information is not perceived. The adaptation of these categories is passive, constructive. However, the projection is characterized by some special complexity. It keeps the person in touch with people around him and his / her negative attitudes and observes the existence of negative attitudes in people around him, and then sees the reason for not accepting them.

On the base, on the content of the projection, the projection is divided into attributive, rationalistic, complimentary, symyalable, and the psychological protection mechanism is characteristic of the types of individuals active in social adaptation. In this category of people, low constructivity is observed.

Regressions, in order to avoid fear of self-doubt and failure, return to a feeling of relative perfection and satisfaction. This protection mechanism is characterized by an active adaptive level of clarity and low level of constructiveness.

In order to avoid anger, subjugation goes down from the tension to the relatively weak living or lifeless object, sometimes in the nervous position. There are two types of things, such as changing the subject and changing the need. The swap has active and passive forms, used by those of different types, and their constructiveness is moderately expressed.

Compression is used to preserve the feel of the fear, and is used in unusual cases for positive perception. The real stimulus and all the related objects and factors are collapsed, resulting in fear. The level of adaptability is used by those who are passive, and the degree of constructiveness is typically expressed moderately.

Rationalization relates to the relief from frustrations that emerged from the early years of adulthood and the aggression of peers. In any case, the level of adaptiveness was passive, simplifying the exercise of subjective control

Compensation is an ontogenetically last protection type and has a complex cognitive structure. It is used for the protection of painful feelings and is used by different types of people, with a high level of adactivity.

Hypercompensation is applied at the ideal level of compensation and can be used by all audiences regardless of individuality, and the level of constructiveness is high.

Special mechanisms of psychological protection are the basis of interpersonal psychological protection in the form of basic protection. For the first time E. Dotsenko, later G. Grachev, V.Shtroo and others have studied psychologically, interpreting the psychological protection of interpersonal relationships as follows:

1. Adequate - compliance of the psychological protection with the cause of the threat;
2. Effective - the aim of psychological protection is to eliminate the risks;
3. peculiarity - the content and essence of the psychological protection used in the particular case;
4. Provision of constructive and psychological protection to ensure maturation, positive stability in relations.

#### **Individual Criteria:**

1. flexibility of psychological protection (not to use only one or two psychological mechanisms);

2. Optimal application of the psychological protection mechanism.

**Criteria:**

1. To have a well-grounded understanding of behaviors and actions in applying the psychological protection mechanism;
2. non-protection against adaptive actions;
3. abandoning psychological protection to alleviate the situation.

Thus, the expression of the psychological protection mechanism depends on the availability of resources and the sources of psychological protection are: cognitive block, confidence in diverse areas: professional, intellectual, household problems, relationships with close people, internal locus control;

The emotional block is characterized by the identification of the identity,

The behavioral block is expressed in the use of effective coping strategies.

Based on the analysis of scientific sources on the study of the mechanism of psychological protection and psychological protection, the mechanism of psychological protection can be described as follows:

**first of all**, can be constructive and destructive in terms of expression of the psychological protection mechanism. The essence of the mechanism of psychological protection defines the individual's social maturity, experience and psychological literacy;

**Secondly**, the mechanism of psychological protection has individual meaning and protects the mind from psychological traumatic information and ensures moral and psychological stability;

**Thirdly**, the use of the constructive psychological protection mechanism is used at the level of awareness, is controlled by rhexese and provides psychological and social adaptation of the psychological state to the real environment;

**Fourthly**, it implements the functions of psychological protection, such as enjoying the individual's social and personal life, protection from external psychological discomfort and interpersonal relationships from external psychological influences.

**ABSTRACT**

*It is no exaggeration to say that Abdullah Kadiri is a master of magic words, an incomparable creator of Uzbek literature in the field of artistic mastery. It is natural that this event will be of interest to other representatives of the literature. Therefore, representatives of other languages made a serious effort to translate this work into their own language. The novel was first translated into Russian and then into other languages. It is natural that the translators (L.Bat, V.Smironova and M.Safarov) who translated the work into Russian were able to use the novel's art to some extent.*

**KEYWORDS:** *Novel, Artistry, Translator, Adequate Translation, Original, Retranslation, Classic Literature, Historic Novel, Free Translation.*

## INTRODUCTION

### THE MAIN FINDINGS AND RESEARCH

Frankly, the novel “Days Gone By” is a work that has revolutionized world literature in general. Unlike the French, English, German, Russian and Spanish novel schools, he is one of the founders of the Uzbek school of novels. That's probably why the novel attracted so much attention as it saw the face of the world. But because of the dictatorial regime, the work was repressed like the author. First, the author was physically exterminated on October 4, 1938, and then the book was also banned. Therefore, the work was translated into Russian only in the late fifties of last century. These translations were made by Russian translators Lydia Bat and Vera Smirnova based on literal translation. It should be noted that the book was based on the edition with certain abbreviations. It is true that in 1956, despite the fact that Abdullah Kadiri was justified as a person and a creator, the ideological pressure of the dictatorial regime was still very strong. Sarvar Azimov, a well-known Uzbek writer and secretary of the Writers' Union at the time, deliberately shortened the section on freedom, liberty and nationalism, explaining: “In any case, the work must be published and returned to the people.” As I said above, the dictatorial system strictly controlled the work and could not have been otherwise. Some of our own writers were generally opposed to reprinting the novel. In fact, we grew up reading this abbreviated version of “Days Gone By.” But there seemed to be some flaws in the play. Russian translators, in turn, unknowingly translated the work on the basis of direct word-for-word translation. This process took place in the second half of the twentieth century, and in the new century Muhammadnodir Safarov, a translator who knew the original language, translated the work into Russian. The article compares these translations with the original language and analyzes the advantages and disadvantages. As the author draws the heroes of the work, he shows them before our eyes with special affection. When you read the work, you feel as if you have seen the heroes. Abdullah Kadiri's artistic skills are also embodied in this. Here is a description of Yusufbek Haji, the father of Azizbek, the governor of Tashkent, and his adviser Otabek, in the chapter "A young man worthy of a khan's daughter":

**Original:** “...Azizbekning Turkiston xonlig'ining eng zolim va mustabid sanalg'an beklarining biri va uning o'z qaramog'ida bo'lg'an Toshkand aholisiga qilg'an zulmlari Farg'onaga doston, ammo Akram hojining bu savoli Azizbekning eng yaqini bo'lg'an bir kishining o'g'lini sinab ko'rishlik uchun edi. Bu sinash natijasi Akram hojining taajubini ortdirdi va buning sirrini bilishka qiziqsindi:

- Otangiz Azizbekning mushoviri ekan, - dedi Akram hoji, - nima uchun uni bir oz bo'lsa ham yo'lg'a solmaydir? ”

- Kechiringiz amak, - deb Otabek kulimsiradi, - siz otamning mushovirlig'ini boshkacharak onglag'ang'a o'xshadingiz... Bizning beklarga hukm vaqtida ham mushovir bo'lmoq imkonsiz narsadir. Otam Azizbekning mushoviri va yaqini musohibi sanalsa xam lekin bu juz'iy ishlardagindadir, buning uchun sizga bir misol keltiray, bu ish shu yaqin oralardag'ina bo'ldi: Toshkanddagi jum'alik gap majlislaridan birida bir kishi Azizbekni maxtar va bu maxtovga qarshi ikkinchisi “nega muncha maxtaysan, Azizbekning, asli bir bachcha-da” der. Ularning bu muzokaralarini chetda eshitib turgan huftyalardan biri bu so'zni Azizbekning qulog'iga yetkuzar. Ertasiga Azizbek mazkur ikki kishini o'z huzuriga oldirib maxtovchig'a ulug' mansab ato qilar va ikkinchisini o'limga buyurar... Bu hukm majlisida hozir turgan otam mahkumning

*gunohini so'rag'anida Azizbek jallodga baqirar: "Tezroq olib chiq!" Otam tag'in qullik qilg'anida jallodga bakirar: "qo'lindag'ini bo'shatib, o'rniga hojini olib chiq" – Mana ko'rdingizmi, otamning qadru qiymatini... "[1, p. 15].*

**Original:** *"...Azizbek's cruelty to the people of Tashkent, one of the most tyrannical and tyrannical princes of the Turkestan khanate, and to the people of Tashkent under his control, is epic to Fergana, but Akram Haji's question was to test the son of Azizbek's closest friend. The result of this test increased Akram Haji's surprise and he was curious to know the secret:*

*- "Your father is Azizbek's adviser," – said Haji Akram, "why doesn't he guide him a little?"*

*- "I'm sorry, uncle," – said Atabek with a smile, "but you seem to have misunderstood my father's advice... It is impossible for our princes to be counselors even at the time of judgment. Although my father is considered Azizbek's adviser and close interlocutor, but this is only a minor matter, let me give you an example. This happened just recently: at one of the Friday speeches in Tashkent, one person praised Azizbek and the other one said, "Why are you praising him so much? In fact, Azizbek is just a kid." One of the secret agents, who overhears their talks, tells it to Azizbek. The next day, Azizbek calls the two men, gives one of them a prestigious job, and orders the other to be executed... When my father, who was present at the trial, asked about the convict's guilt, Azizbek shouted at the executioner: "Take him out as soon as possible!" When my father was enslaved again, he shouted at the executioner: "Release your hand and take the pilgrim instead." You can see my father's dignity..."*

**Translation by L. Bat:** *До Ферганы давно уже дошла молва о том, как тиранит Азизбек населения Ташкента. Он снискал себе славу самого жестокого деспота в Туркестанском ханстве. Акрам-хаджи нарочно задал этот вопрос Атабеку: он хотел испытать его. Интерес присутствующих к молодому гостю еще больше возрос.*

*- Ваш отец – советник Азизбека. Почему бы ему не наставить его на правильный путь?*

*Атабек улыбнулся.*

*- Простите, господин мой, вы, видно, не совсем ясно представляете себе положение моего отца. . . Наши беки, принимая важное решение, не слушают своих советников. Хотя Азизбек часто беседует с моим отцом и даже совещается с ним, но только по мелким незначительным поводам. Расскажу один случай, чтобы вам стало понятно. Недавно на какой-то пирушке один человек начал хвалить Азизбека, собеседник заспорил с ним: "Что ты его превозносишь ведь он просто бача". Тут же оказался доносчик, который поспешил довести эти слова до ушей Азизбека. На следующий день Азизбек вызвал к себе спорщиков. Тому, кто хвалил его, он дал высокую должность, другого же приказал казнить. Мой отец присутствовал при этом и попросил смягчить столь жестокое наказание. Тогда Азизбек крикнул палачу: "Веди быстрее" Отец снова начал просить, но Азизбек сказал еще решительнее: "Ах, так! Брось этого! И веди самого хаджи!" Вот как он считается с отцом! ... "[2, p. 35]*

**Translation by L. Bat:** *The rumor has long reached Fergana that Azizbek is tyrannizing the population of Tashkent. He earned himself the fame of the cruelest despot in the Turkestan Khanate. Akram-haji deliberately posed this question to Atabek: he wanted to test him. The interest in young man of those present grew even more*

- *“Your father is Azizbek’s advisor. Why doesn’t he guide him on the right path?”*

*Atabek smiled.*

- *“Forgive me, my lord, you do not seem to have a very clear idea of my father’s position... Our princes, making an important decision, do not listen to their advisers. Although Azizbek often talks with my father and even confers with him, but only on minor insignificant occasions. I will tell you one case to make it clear to you. Recently, at some revelry, one person began to praise Azizbek, the interlocutor argued with him: “Why do you extol him, because he’s just kid”. There appeared an informer who hastened to bring these words to Azizbek’s ears. The next day, Azizbek summoned the debaters. To the one who praised him, he gave a high position, while the other he ordered to be executed. My father was present at this and asked to mitigate such a cruel punishment. Then Azizbek shouted to the executioner: “Take him away faster!” Father again began asking, but Azizbek said even more resolutely: “Ah, so! Let him free! And take the Haji himself!” That’s show here reckons with his father!...”*

**Translation by M. Safarov:** *“...Азизбек снискал себе славу одного из самых злобных угнетателей – тиранов в туркестанских ханствах, о его жестокости к населению Ташкента в Фергане давно ходили легенды, однако же Акрам-хаджи, адресованный сыну наиболее приближённого к Азизбеку человека, был дан неспроста, а для проверки Атабека. Услышанное ещё более изумило Акрам-хаджи, и он не преминул проявить интерес к причине такого отношения:*

- *Раз ваш отец является советником Азизбека, - развивал мысль Акрам-хаджи, - отчего бы ему хоть изредка не наставлять бека на правильный путь?*

- *Прошу прощения уважаемый, - улыбнулся Атабек, - видимо, у вас нет достаточно ясного представления о должности моего отца... Исполнять роль советника при вынесении нашими беками какого-либо решения – есть задача невозможная. Хотя мой отец является советником Азизбека, да к тому же ещё ближайшим собеседником, однако прислушивается он к советам моего отца лишь по вопросам не имеющим особого значения. Позвольте, приведу вам один пример, имевший место совсем недавно: на одной из частных пятничных пирушек один человек начал восхвалять Азизбека, на что другой возразил: “И чего это ты расхваливаешь его? Азизбек всего лишь бача”. Эти слова были немедленно донесены до ушей Азизбека находившемся неподалёку тайным доносчиком. На следующий день Азизбек вызвал к себе этих двоих, восхвалявшему была дарована высокая должность, второй же приговорён к казни... Мой отец, присутствовавший при вынесении приговора, обратился к Азизбеку с просьбой разъяснить ему вину приговорённого, на что ответом был лишь окрик Азизбека, обращённый к палачу: “Выводи скорее!” А когда мой отец повторил свою просьбу, Азизбек “пошутил”: “Может быть заменить преступника на самого хаджи?” [3, p.16]*

**Translation by M. Safarov:** *“...Azizbek earned himself the fame of one of the most vicious oppressors - tyrants in the Turkestan khanates, there were legends about his cruelty to the population of Tashkent in Fergana, but Akram-haji, addressed to the son of the person closest to Azizbek, was given for a reason – to test Atabek. What he heard amazed Akram-haji even more, and he did not fail to show interest in the reason for this attitude:*

*“Since your father is Azizbek’s advisor,” Akram-hajji developed the thought, “why would he, at least from time to time, instruct the prince on the right path?”*

*- “I beg your pardon, dear,” - Atabek smiled, - “apparently, you do not have a clear enough idea of the position of my father...” To play the role of an adviser when our princes make any decision is an impossible task. Although my father is Azizbek’s advisor, and besides, he is also the closest interlocutor, but he listens to the advice of my father only on issues of little importance. Let me give you one example that took place quite recently: at one of the private Friday parties, one person began to praise Azizbek, to which another objected: “And why are you praising him? Azizbek is just a kid.” These words were immediately conveyed to Azizbek’s ears by a secret informant who was nearby. The next day, Azizbek summoned these two to him, the one who praised was given a high position, the second was sentenced to death ... My father, who was present at the sentencing, turned to Azizbek with a request to explain to him the guilt of the condemned man, to which Azizbek’s shout, addressed to the executioner, was only answered: “Get out soon! And when my father repeated his request, Azizbek “joked”: “Maybe replace the criminal with the hajji himself?”*

Analyzing this passage, we found that translators have chosen different paths in translating the passage. **Original:** *“... Azizbekning Turkiston xonlig’ining eng zolim va mustabid sanalg’an beklarining biri va uning o’z qaramog’ida bo’lg’an Toshkand aholisiga qilg’an zulmlari Farg’onaga doston, ammo Akram hojining bu savoli Azizbekning eng yaqini bo’lg’an bir kishining o’g’lini sinab ko’rishlik uchun edi. Bu sinash natijasi Akram hojining taajubini ortdirdi va buning sirrini bilishka qiziqsindi:...”* – *“... Azizbek’s cruelty to the people of Tashkent, one of the most tyrannical and tyrannical princes of the Turkestan khanate, and to the people of Tashkent under his control, is epic to Fergana, but Akram Haji’s question was to test the son of Azizbek’s closest friend. The result of this test increased Akram Haji’s astonishment and he was curious to know the secret: ...”* The first paragraph of the passage consists of 49 words, so how did the translators translate it into Russian. **Translation by L. Bat:** *“...До Ферганы давно уже дошла молва о том, как тиранит Азизбек населения Ташкента. Он снискал себе славу самого жестокого деспота в Туркестанском ханстве. Акрам-хаджи нарочно задал этот вопрос Атабеку: он хотел испытать его. Интерес присутствующих к молодому гостю еще больше возрос”...* - *“... The rumor has long reached Fergana that Azizbek is tyrannizing the population of Tashkent. He earned himself the fame of the cruelest despot in the Turkestan Khanate. Akram-haji deliberately asked this question to Atabek: he wanted to test him. The interest of those present in the young guest increased even more”...*

The Russian translator translated the paragraph using fewer words than the original language, only 42 words.

**Translation by M. Safarov:** *“...Азизбек снискал себе славу одного из самых злых угнетателей – тиранов в туркестанских ханствах, о его жестокости к населению Ташкента в Фергане давно ходили легенды, однако же вопрос Акрам-хаджи, адресованный сыну наиболее приближённого к Азизбеку человека, был дан неспроста, а для проверки Атабека. Услышанное ещё более изумило Акрам-хаджи, и он не преминул проявить интерес к причине такого отношения:”...*

**Translation by M. Safarov:** *“... Azizbek earned himself the fame of one of the most vicious oppressors - tyrants in the Turkestan khanates, legends have long circulated about his cruelty to*

*the population of Tashkent in Fergana, however, the question of Akram-haji, addressed to the son of the person closest to Azizbek, was given for a reason, and to check Atabek. Akram-haji was even more amazed by what he heard, and he did not fail to show interest in the reason for such an attitude: "...*

A translator who knows the original language translated this paragraph with 56 words. I think the translator who translated on the basis of the tag has had some success. However, Akrom replaced Haji's interest with the interest of the members of the assembly: "...*Интерес присутствующих к молодому гостю еще больше возрос*"... - "... *The interest of those present to the young guest has increased even more*" ...This is not the case in reality. The translator, who knew the original language, performed the translation while preserving the content of the paragraphs as much as possible, but the content remained under the pile of words. We must not forget that, as the Russian thinker F. M. Dostoevsky said: "In literary translation, one word should be superfluous and one word should not be less." [4, p. 75] Continuing my point, there are some shortcomings in Atabek's address to Haji Akram in the passage as well. For example, if the sentence is "*Kechiringiz amak...*" – "*Excuse me, uncle ...*" L. Bat translates as: "...*Простите, господин мой...*" - "... *Excuse me, my lord ...*", M. Safarov translates it as: "...*Прошу прощения уважаемый...*" - "... *I beg your pardon, dear ...*" Atabek is the son of a man of his own position in society; he never addresses his interlocutor as "*mening janobim*" – "*my lord.*" At this point, I think the second translation is more appropriate. The sentence at the end of this passage was mistranslated by both translators. Atabek says that his father has no dignity for Azizbek, but we do not see it in the translation: Original: "... *Mana ko'rdingizmi, otamning qadru qiymatini...*" - "... *See my father's dignity...*" **L. Bat translates it as:** "...*Вот как он считается с отцом! ...*" - "... *See how he reckons with my father!*" In Safarov's translation, this sentence does not exist at all. Such inconsistencies in the translation undermine the artistry of the work being translated. Circumstances that give aesthetic pleasure in the language of the original remain abstract to the Russian reader. The simple word "*mushovir*" – "*consultant*" has some meaning, and Abdullah Kadiri could easily be called a "*maslahatchi*" – "*advisor.*" But in Russian they gave it with the word "*советник*" (advisor). At the same time, translators must understand that the author uses the word in an archaic sense, giving it a national color and the spirit of the period. Speaking in Atabek's language, Abdullah Kadiri masterfully painted portraits of the heroes on small plates. We will see how cruel Azizbek is and how noble Yusufbek Haji is.

The place and role the development of the plot in the work, and the course of events is incomparable. At the end of our article we quote from a letter written by Kumush's mother to Oftoboyim:

**Original:** "...*O'tkan xatlarimda kundashim bilan mirosamiz kelishmay turganini kulguluk tarzida yozgan edim. Nafsilarimizda ersa, oramiz juda buzilg'an, men oshal vaqtlarda chin kundashlik to'nini kiygan edim. Zaynabning bitmas xusumati esa g'olibo manim ikki qatlig'im oshkor bo'lg'an kundan boshlandi. Sizning boshingizdan kundashlik savdosi o'tmagan bo'lsa ham tushunsangiz kerak: Biz ikav agar qo'yib bersalar guyo bir-birimizni yeb-ichmakchi edik... U kunlardagi holimdan o'zimga endi xisob berishka ham uyalaman... Yaxshiki, bizning mojarolardan qayin otam juda siyrak xabardor bo'ldi. Shundog' xam bo'lsa bu janjallar goxo uning qulog'ig'a yetib qolar va biz ikki yov uning oldig'a chaqirilib nasihatini eshitar va lekin yana yomonlig'imizdan qolmas edik. Siz ranjisangiz xam aytay: qayin otamni o'z dadamdan xam yaxshi ko'raman. Bu yaxshi ko'rishim kuyavingizning dadasi bo'lg'ani uchun emas, balki*

*uning nur ichiga cho‘milg‘andek bo‘lib ko‘ringan siymosini, “oyim” deb xitob qilg‘andagi muloyim, beozor va muassir so‘zini yaxshi ko‘raman. Ul nasixat uchun og‘iz ochsa vujudim erib ketkadek va bir turluk uxlab huzurlang‘andek, Qisqasi, Zaynab bilan janjallashishning o‘zi bir huzur... Siz manim telba so‘zlarimdan achchig‘lanmang. Agar bu gapimning to‘g‘rilig‘ini bilmakchi bo‘lsangiz, Toshkand kelingiz-da, qayin otamning nasixatini o‘z qulog‘ingiz bilan eshiting-da, unday keyin so‘zimga qiymat bering...” [5, p. 293]*

**Original:** “... *In my previous letters, I jokingly wrote that my legacy and my diary do not match. As for our souls, we are very corrupt, I used to wear a real robe in those days. Zaynab's endless animosity began on the day the winner was revealed. Even if you haven't had a daily sale, you probably understand: We were going to eat and drink each other if they let us go ... I'm not ashamed to give an account of myself in those days ... Fortunately, my father-in-law was rarely aware of our conflicts. Even so, these quarrels would sometimes reach his ears, and we, the two enemies, would be summoned to him and hear his advice, but we would not be spared again. If you are upset, I will say that I love my father-in-law more than my own father. This is not because I love your son-in-law, but because I love his image, which seems to be bathed in light, and his gentle, gentle, and gentle words when he calls her “mother” In short, arguing with Zaynab is a pleasure, as if my body melts and I fall asleep for a while ... Do not be offended by my mad words. If you want to know the truth of this statement, come to Tashkent, listen to my father-in-law's advice with your own ears, and then value my word ...*”

**Translation by V. Smirnova:** “... *Я подшучивала в предыдущих письмах над моими распрями с соперницей. Но говорить по правде, наши отношения совсем испортились, я очень невзлюбила ее. А она особенно возненавидела меня с тех пор, как узнала о моей беременности. У вас-то не было никогда соперницы, но вы, наверное, поймете, что мы готовы были съесть друг друга. Теперь мне даже стыдно бывает вспомнить, как мы ссорились иногда больше ничего. Хорошо, еще, что свекор не всегда узнавал о наших ссорах. Но бывали случаи, когда до него доходили сведения об этом. Тогда он вызывал нас обеих, мы выслушивали его наставления, но не переставали быть врагами. Может, я обижу вас, но все же скажу, что люблю свекра больше родного отца, и не за то, что он отец вашего зятя, а за доброе сердце, за ласковое ко мне отношение - он зовет меня «красавица», - за необходимые убедительные назидания. Когда он говорит со мной, я испытываю истинное удовольствие. Ссориться с Зайнаб - иногда тоже удовольствие, а слушать после этого наставления свекра - удовольствие вдвойне. Пусть вас не смущают эти безумные слова. Вы все поймете, когда приедете в Ташкент и своими ушами услышите речи моего свекра...” [6, p. 359]*

**Translation by V. Smirnova:** “... *I used to make fun of my quarrels with my rival in previous letters. But to tell the truth, our relationship has completely deteriorated, I really disliked her. And she especially hated me since she found out about my pregnancy. You have never had a rival, but you will probably understand that we were ready to eat each other. Now I am even ashamed to remember how we quarreled sometimes nothing else. It's good, also, that the father-in-law did not always find out about our quarrels. But there were times when information about this reached him. Then he called us both, we listened to his instructions, but did not cease to be enemies. Maybe I will offend you, but nevertheless I will say that I love my father-in-law more than my own father, and not because he is the father of your son-in-law, but for his kind heart, for his affectionate attitude towards me - he calls me “beauty” - for inoffensive convincing*

*edifications. When he speaks to me, I feel real pleasure. Quarreling with Zainab is sometimes also a pleasure, and listening to the father-in-law's instructions after this is a double pleasure. Don't be confused by these crazy words. You will understand everything when you arrive in Tashkent and hear with your own ears the speech of my father-in-law ...”*

**Translation M. Safarov:** “...Я подшучивала в предыдущих письмах над моими распрями с соперницей. Но говоря по правде, наши отношения совсем испортились, я очень невзлюбила ее. А она особенно возненавидела меня с тех пор, как узнала о моей беременности. У вас-то не было никогда соперницы, но вы, наверное, поймете, что мы готовы были съесть друг друга. Теперь мне даже стыдно бывает вспомнить, как мы сильно ссорились иногда. Хорошо еще, что свекор не всегда узнавал о наших ссорах. Но бывали случаи, когда до него доходили слухи об этом. Тогда он вызывал нас обеих, мы выслушивали его наставления, но непереставали быть врагами. Может, я обижу вас, но все же скажу, что люблю свекра больше родного отца, и не за то, что он отец вашего зятя, а за доброе сердце, за ласковое ко мне отношение - он зовет меня «айм», «милая», за необходимые убедительные назидания. Когда он говорит со мной, я испытываю истинное наслаждение, словно просыпаюсь после благотворного сна. Одним словом, сама ссора с Зайнаб – одно удовольствие, а после этого сесть напротив свекра и слушать его наставления - удовольствие вдвойне. Пусть вас не смущают эти безумные слова. Вы сами все поймете, когда приедете в Ташкент, своими ушами услышите речи моего свекра и оцените мои впечатления...” [7, p.402]

**Translation M. Safarov:** “... I used to make fun of my quarrels with my rival in previous letters. But to tell the truth, our relationship has completely deteriorated, I really disliked her. And she especially hated me since she found out about my pregnancy. You have never had a rival, but you will probably understand that we were ready to eat each other. Now I am even ashamed to remember how much we quarreled sometimes. It's good that the father-in-law did not always find out about our quarrels. But there were times when he heard rumors about it. Then he called us both, we listened to his instructions, but did not cease to be enemies. Maybe I will offend you, but still I will say that I love my father-in-law more than my own father, and not because he is the father of your son-in-law, but for his kind heart, for his affectionate attitude towards me - he calls me “aim”, “dear”, for offensive persuasive edification. When he speaks to me, I experience true pleasure, as if waking up after a wholesome sleep. In a word, the very quarrel with Zainab is a pleasure, and after that it is doubly pleasure to sit down in front of the father-in-law and listen to his instructions. Don't be confused by these crazy words. You yourself will understand everything when you arrive in Tashkent, hear my father-in-law's speeches with your own ears and appreciate my impressions ...”

As you read the letter, you discover the inner world of Kumush, its unique world. There is no artistic mastery in the original, no beauty in the translations. Writing about his father-in-law Yusufbek Haji, Kumush describes his image as follows: Original: “... Siz ranjisangiz xam aytay: qayin otamni o'z dadamdan xam yaxshi ko'raman. Bu yaxshi ko'rishim kuyavingizning dadasi bo'lg'ani uchun emas, balki uning nur ichiga cho'milg'andek bo'lib ko'ringan siymosini, “oyim” deb xitob qilg'andagi muloyim, beozor va muassir so'zini yaxshi ko'raman. Ul nasixat uchun og'iz ochsa vujudim erib ketkadek va bir turluk uxlab huzurlang'andek, Qisqasi, Zaynab bilan janjallashishning o'zi bir huzur...” – “If you are upset, let me tell you: I love my father-in-law more than my own father. This is not because I love your son-in-law, but because I love his

*image, which seems to be bathed in light, and his gentle, gentle, and gentle words when he calls her “mother.” In short, it is a pleasure to quarrel with Zaynab, as if my body melted when I opened my mouth for advice and I fell asleep.”*

**Translation V. Smirnova:** “...*Может, я обижу вас, но все же скажу, что люблю свекра больше родного отца, и не за то, что он отец вашего зятя, а за доброе сердце, за ласковое ко мне отношение - он зовет меня «красавица», - за необходимые убедительные назидания. Когда он говорит со мной, я испытываю истинное удовольствие. Ссориться с Зайнаб - иногда тоже удовольствие, а слушать после этого наставления свекра - удовольствие вдвойне...*”

**Translation V. Smirnova:** “... *Maybe I will offend you, but still I will say that I love my father-in-law more than my own father, and not because he is the father of your son-in-law, but for his kind heart, for his affectionate attitude towards me - he calls me “beauty”, - for offensive persuasive edification. When he speaks to me, I feel real pleasure. Quarreling with Zainab is sometimes also a pleasure, and listening to the father-in-law’s instructions after this is a double pleasure ...*”

**Translation M. Safarov:** “... *Может, я обижу вас, но все же скажу, что люблю свекра больше родного отца, и не за то, что он отец вашего зятя, а за доброе сердце, за ласковое ко мне отношение - он зовет меня «аим», «милая», за необходимые убедительные назидания. Когда он говорит со мной, я испытываю истинное наслаждение, словно просыпаюсь после благотворного сна. Одним словом, сама ссора с Зайнаб - одно удовольствие, а после этого сесть напротив свекра и слушать его наставления - удовольствие вдвойне...*”

**Translation M. Safarov:** “... *Maybe I will offend you, but still I will say that I love my father-in-law more than my own father, and not because he is the father of your son-in-law, but for his kind heart, for his affectionate attitude towards me - he calls me “aim”, “dear”, for inoffensive persuasive edification. When he speaks to me, I experience true delight, as if waking up after a wholesome sleep. In a word, the very quarrel with Zainab is a pleasure, and after that it is doubly pleasure to sit opposite the father-in-law and listen to his instructions ...*”

There are also a number of shortcomings in the translation of these passages. Most importantly, the translators either did not understand the author’s assessment of Yusufbek Haji from the Silver language, or it was overlooked: Original: “...*balki uning nur ichiga cho ‘milg’andek bo ‘lib ko ‘ringan siymosini, “oyim” deb xitob qilg ‘andagi muloyim, beozor va muassir so ‘zini yaxshi ko ‘raman...*” – “... *maybe I like her image, which looks like she’s bathed in light, and her gentle words when she calls me “aim”...*”, translation by V. Smirnova: “...*, азадоброе сердце, заласковое отношение - он зовет меня «красавица», - за необходимые убедительные назидания...*” – “... *but for a kind heart, for an affectionate attitude towards me – he calls me “beauty”, – for inoffensive convincing edifications ...*”, translation by M. Safarov: “...*азадоброе сердце, заласковое отношение - он зовет меня «аим», «милая», за необходимые убедительные назидания...*” – “... *but for a kind heart, for a gentle attitude towards me – he calls me “aim”, “dear”, for inoffensive convincing edification ...*” In general, the main content of the letter, “... *uning nur ichiga cho ‘milg’andek bo ‘lib ko ‘ringan siymosini...*” – “... *his image, which seemed to be bathed in light ...*” was not reflected in both translations. The emotional and culmination point of the letter was this sentence. It would be

appropriate to translate this sentence as follows: “... за его омытый лучами образ...” – “...for his image washed by rays ...” Unfortunately, neither the translators nor the translator of the original language have been able to come up with this beautiful and beautiful description.

## CONCLUSION

Studies show that when translating the text of a classic work, it is necessary to pay attention to even the smallest details of the original, because those small details are important in revealing the character of the protagonist. Also, it should be noted that prose translations are no exception, as there have been changes and losses in poetic translation [8, p. 73].

### ABSTRACT

*The article deals with the issue of ambiguity in the Turkish words that express things and events in the text of the epic “Malika Ayyor”, and almost 52% of such words in the text of the epic belong to the category of nouns. It has been established that these nouns have different appearances from the historical and etymological point of view.*

**KEYWORDS:** *Epic, Text, Turkish Layer, Bakhshi Poet, Epic Hero, Ancient Turkic Language, Historical Work, Turkish Words, Lexeme.*

### INTRODUCTION

Polysemy plays a significant role in any language. Linguistic richness is measured not only by words and phrases, but also by the lexical meanings of words. The ambiguity of words - the phenomenon of polysemy has its place in the richness of language [1, p. 3]. No matter how diverse the individual semantics of a polysemous word may be, they are always grouped around a single semantic basis. Secondary meanings are recognized as a further development of the primary meaning [2, pp. 39-50]. Polysemy is one of the linguistic phenomena related to the semantic structure of a word. Polysemy occurs in almost all word groups [3, p. 209]. Based on the same principles, we have tried to study semantically, lexically-grammatically and genealogically from the polysemous words in the words that express things and events used in the text of the epic “Malika Ayyor”. Our research in this regard has shown that ambiguity is most active within the noun phrase.

## THE MAIN FINDINGS AND RESULTS

The astronomer “*er*”, which signifies the chief semaphore of “the third planet after the sun” (Explanatory Dictionary of Uzbek language, 2, 14), was used in four senses in ancient written monuments (OTD, 257). In the language of Navoi's works, this name lexeme is used in six senses (Explanatory dictionary of the language of Alisher Navoi's works, I, 524-525). In the lexicon of the poet's historical works, it is acknowledged that this term served to express four meanings in one hundred and eighteen places [4, p, 153]. In the modern Uzbek literary language, the lexeme “*er*” is found to occur in eleven senses (Explanatory Dictionary of Uzbek language, 2, 14). In the epic we have studied, the activity of the use of this lexeme is much higher and has the following meanings:

1. In the meaning of “the surface on which things stand, the surface on which living organisms live (in relation to a person or other thing)”: *Izlasang, topmaysanerningustidan* (8) - If you search, you will not find on the earth; *Borareringaytginnenga, sendushman* (22) - Go tell your husband, you are the enemy;

2. In the meaning “A certain part of the earth's surface; place, territory”: *...ostigamingandirG'irotni, harergaborsatopadiMurodni* (16) - ... rides under Girat, wherever he goes he finds Murad; *Enditavakkal, ovloqerdabungama'lumqilayinbir, — deb Avazxonozinimalumqilib, birso'zqilibturibdi* (23) - Now, let me tell you about it in the wilderness, in the wilderness”, said Avazkhan, introducing himself;

3. In the meaning of “A place occupied by something; space”: *G'irotniSoqigaberib, qirqeshiklichillaxonasigakirib, ko'krugininamergaberibxafabo'libyotdi* (10) - Giving his giraffe to Soki, he entered his forty-door children's house, lay his chest in the damp ground, and lay down in sorrow; *Qaradi: ikkiyog'ichimerniomochdaytilgan, soqolmurtio'sibketgan* (21) - He looked: his two legs were plowing the grass like a plow, and his beard was growing;

4. In the sense of “a short time before the start of a particular task (saddle)”: *Soqiotniyalang'ochlab, qashlab, egarlabberayin deb turganeri* (13) - Her husband, who was about to strip the horse naked, snort, and saddle it;

5. In the meaning of “territory, place belonging to a particular country or state”: “*Bu erdaqulaygatushirolmadik, birorerdaqulaygatushirsak, o'zibilanbirgabo'lsak deb: — Avazxon, boradiganeringyaqinmi, uzoqmi? Biz ham birgaboribkelsak, — dedi* (19) - “We couldn't get comfortable here, we wanted to get comfortable somewhere, to be with him: - Avazkhan, is your husband near or far?” If we go together, he said;

6. In the meaning of “a part, place, and point, place of an object or member”: *Avazxonko'nqlinixushlab, dimog'ichoqbo'lib, u eridan, bueridanushlab, Gulqizoyimningko'nqlinixushlab, o'tiraberdi*(54) - Avazkhan was happy, he was happy, he was happy, he was happy, he was happy, he was happy, he was happy, he was happy, he was happy, he was happy, he was happy;

7. To underestimate - in the sense of “humiliation, insult”: *Xoldar mahram o'nyigitmanquvonib. Ergauribqo'shadiharbirso'ziga* (207) - Holder rejoiced at the ten young men. Every word that hits the ground;

8. *Underground* - in the meaning of “wherever”: *Erostitadushmantanichirisin* (110) - Let the enemy rot under the ground; *Erostitagushibketsakkerak-da* (46) - Although we must go underground;

9. *Earth* - in the meaning of “the whole world, the universe”: *Qizil dev aytdi: — O'jiyanim! Bizlarkunbotishbilan kun chiqarni, eryuziniqolmayuchamiz* (58) - The red giant said, “Oh, nephew!” We fly with the rising of the sun at sunset, without leaving the earth; *Eryuzindajumlao'tganvalilar* (72) - Governors who passed sentence on earth;

10. *To put on the ground* - in the sense of “everyone's words and advice are the same”: *Avazxonuchchovichinorningoldidako'pso'zlnarnigaplashib, maslahatnibirergaqo'yib: - Eybolam, gapdannimachiqadi, yo'lyurmoqa'loroqdedi* (66) - The Avazkhan trio spoke many words in front of the plane tree and put the advice together: - My son, it is better to walk than to talk;

11. *Staying on the ground* - in the sense of “not leaving his head on the ground or alienating”: *Pastkiko'shkigaetib, “Mardningboshierdaqolmasin”, Avazjonningboshinitizzasigaolib “qaysimamlakatdankelding?”— debso'rab, birso'zdedi* (51) - Reaching the lower mansion, he said, “Let not the head of the man remain on the ground”. He brought Avazjon's head to his knees and asked, “What country are you from?” - he asked and said a word;

12. The lexeme of “er” in the text of the epic expresses such relations as time, place, cause, when it serves as an auxiliary in the form of direction, place-time, exit, future tense: *Devlarbuerdayo'qedi* (54) - The giants were not here; *Manzilishuerdanetmishyillikyo'lkeladi* (58) - The address comes seventy years from here; *ShundaXadichaTillaqizdanbuso'znieshitib, erdanTemirtaktopganquldaybo'lib, chopiborqasigaqaytaberdi* (108) - When Khadijah heard this from Tillaqiz, she ran back like a slave who has found iron on the ground.

Another polysemous lexeme, the blood lexeme, which means “the fluid tissue of the body that moves continuously within a closed system of heart and blood vessels,” is also actively used in the text of the epic. In the language of Navoi's works, it is recognized in linguistics that the term is used in two senses (Explanatory dictionary of the language of AlisherNavoi's works, IV, 63), as well as in the lexicon of the poet's historical works in the sense of “blood”, “revenge, blood revenge” [4, p. 153]. In the epic we studied, it was found that this lexeme was used in the following senses:

1. In the meaning of “faded”: *Bu devlarniko'rib, merganlarningrangi-tusiuchib, qoniqochib, mazasiketibqoldi* (41) - Seeing these giants, the snipers flew in color, bled, and lost their taste;

2. In the meaning of “to weep bitterly”: *Qonyig'latibbumanzilda. Sen ketarsanbiznitashlab. Ayroliqo'tigadog'lab. Biz qolamizqonlaryig'lab* (120) - Blood crying at this address. You leave us. Spotted on the grass. We remain weeping blood;

3. In the meaning of “Sacrificing war, fighting; to sacrifice a person in this way”: *G'ayratbilanqonto'kishmoqlozimdi(r)* (131) - Blood must be shed with zeal; *Otqo'yibdushmanustiga. Qaramaybaland-pastiga. Qonto'kilibshuzamonda* (141) - Put the horse on the enemy. Despite the ups and downs. Bloodshed at this time;

4. In the meaning of “To be in great distress; to be bloodthirsty”: *Yodimizgasizniolsak. Biz yig'larmizqonyutib* (120) - If we remember you. We weep and swallow blood;

5. In the meaning of “fading color, loss of redness”: “*Qonisuyuq, rangidaqoniyo'q, ko'ziolayganyomonyigitekan*”, *deb devlarqo'rqibturibdi* (42) - The giants are afraid, “He is a bad guy with thin blood, no blood in his complexion, and his eyes are wide open”.

**Polysemy in words in the Turkish layer**

10.	To put on the ground– “the word, the advice is the same”		
11.	<i>To stay on the ground</i> – “not to		

	alienate”			
12.	“In terms of agreements, it means relations such as time, place, reason”.			

**Table 3. Polysemous representation of earth and blood lexemes**

The lexeme of speech, which has its own sound shell, an independent lexical meaning (Explanatory dictionary of Uzbek language, 3, 608), is also actively used in the epic and expresses the following meanings:

1. In the meaning of “sentence, word, speech”: *Ota, eshitmeningaytganso'zimni* (12) - Father, hear what I say; *Aytganso'zimolendiBo'zo'g'lon* (12) - Take what I say now, bully;
2. In the meaning of “narrating certain information”: *Ana shunda Parizod Go'ro'g'lidanbuso'zni eshitib, o'sganelini, sog'u-so'lini, sha'n-shavkatini, manzil-joyini Go'ro'g'ligabayonberib, birso'z deb turibdi...*(8) - When Parizod heard this word from Gorogly, he told Gorogly about his upbringing, health, honor, and address, and said a word ...;
3. In the meaning of “dialogue or consultation, communication”: *Shunda Go'ro'g'libek Avazxondanbuso'zni eshitib: — Avazo'g'lim, buso'znibejoyaytding. Bu aytganso'zingko'pyomonbo'ldi, endiharnimabo'lsa, bormasangbo'lmaydi* (12) - Then Goroglybek heard this word from Avazkhan: - My son Avaz, you said this word in vain. What you said was so bad, now that whatever it is, you have to go;
4. Topromise - in the sense of “to allow or not to speak”: *So'zbergandirmerganlargajodugar. So'zbermasa, merganlardanimabor* (202) - The sorcerer promised the snipers. What does the sniper have if he does not promise?;
5. To stutter –in the meaning of “To say or not to say something; to speak or not to speak”: *Diqqatbo'libyotgan Avazjon Gulzamonga So'y lamadi ham, qaramadi ham, so'zqotmadi ham* (49) - The attentive Avazjon did not speak, look, or speak to Gulzamon; *Shunda Qosimshohqalandarlarga qarab: - qaysi shahardankeldinglar? - debso'rab, so'zqotib, birso'z dedi:* (91) - Then Kasimshah looked at the potters and said: - What city are you from?, - he asked, stiffening his words and saying a word;
6. Proverb, a word of wisdom; as an example of the phrase: “*Piyodaqo'noq - yaxshiqo'noq*”, *deganso'zbor* (84) - There is a saying, “A guest on foot is a good guest”; “*Ertilaganerdaaziz*”, *deganso'zbor* (184) - There is a saying, “Saint wherever he wants”.

## CONCLUSION

It is noted that the *word* lexeme had one meaning in the ancient Turkic language (OTD, 511), and in Navoi's works it served to express four meanings (Explanatory dictionary of the language of Alisher Navoi's works, III, 137). It has been established that in the modern Uzbek literary language the word lexeme is used to express eight semantics (Explanatory dictionary of Uzbek language, 3, 608). It is clear from the above analysis that in the text of the epic studied, this term served to express the six semas.

**ABSTRACT**

*The article examines the similarity of an adverb and a verb in their functional and semantic planes, characterized by the fact that the semantics of both the verb and the adverb is homogeneous, both denote signs and properties of the grammatical plan; the meaning of the verb depends on the meaning of the noun; meaning of an adverb from the meaning of a verb. This means that the difference between the grammatical meanings of an adverb and a verb is determined by the fact that the meaning of the verb is procedural, and the meaning of the adverb is not procedural, but a sign of quality. In addition, the meaning of the verb in relation to the object, the phenomenon is immediate, i.e. through the meanings of the verb.*

**KEYWORDS:** *Functionality, Semantics, Grammatical Plan, Processuality, Verb, Sign, Meaning, System Of Parts Of Speech, Signs Of Property.*

## INTRODUCTION

During the functioning of grammatical meanings, oriented towards sequential logical subordination, the grammatical meaning of a noun is characterized as a hegemonic, basic, leading meaning in relation to the grammatical meanings of other other significant parts of speech in the general system of parts of speech. The functioning of the grammatical meanings of the adjective, verb and adverb is carried out under the influence of the grammatical meaning of the noun.

It was said above that the presence and implementation of the grammatical meaning of an adverb is determined in relation to the grammatical meanings of the verb (mainly) and the adjective (in some cases). If there is no verb and adjective and their grammatical meanings, then there is no adverb and its grammatical meaning, this is typical for adverbs and their grammatical meanings of all languages of the world, not only Tajik and Uzbek.

### Main body

The meaning of a feature, quality and properties is equated to the meaning of objectivity, processuality in the semantic system of the grammatical plan of parts of speech. The meaning of a trait, quality, and property is understood in a narrow and broad sense. In the broad sense, the meaning of a trait, quality, and property covers almost all the tiers of a language, except for its phonetic and phonological tier. So, for example, words like *yakhshi* (хороший // ое // ая), *юмшоқ* (мягкое // ая // бй), *ўртача* (средний // яя // ее), *иссиқ* (жаркий // ая // ое), *совуқ* (холодный // ая // ое) refer to the lexical tiers of the language and denote the signs, properties or qualities of a certain object or phenomenon. The derivatives *ейишли* (съедобный // ая // ое), *болалик* (детство), *хийлакор* (хитрец), *эзма* (болтун), *учирма* (слеток) are derived words, the morphemic-word-forming meaning of which is characterized by the meaning of the attribute, quality and properties of certain concepts that are associated with the word-forming function of the affixes -ли, -лик, -чор, -ма.

The syntactic values of the predicate, the definition, and the circumstance also belong to the general system of values of the attribute, quality, and property, which are considered in syntax as the grammatical values of its separate categories – the categories of the definition, the circumstance, and the predicate, which are semantically in the same general group with respect to their common, invariant meaning – the meaning of the attribute, quality, and property.

So, the grammatical meaning of a trait, quality, and property in a broad sense has the character of isolation, universality, and it is not limited in terms of a particular specific level (tier) of the language.

The grammatical meaning of a trait, quality, and property in a narrow sense is specific, not universal. It refers only to the semantic plan of a certain level of the language, usually it is characteristic of the content plan of lexical units of one or two lexical-grammatical categories of the general system of parts of speech. The meanings of the trait, properties and qualities characteristic of adjectives and adverbs belong to the group of their narrow understanding. It should be noted that, in turn, the meaning of the attribute, qualities and properties peculiar to individual lexical and grammatical categories (categories) of words is an abstract complex ideal semantic unit. The abstractness and complexity of this ideal semantic unit is determined in relation to their relation to what phenomena of the language and why it is related to them. It is natural that certain concepts of the meanings of a trait, quality, and property have a direct

connection with objects and phenomena of the objective world, and the relation of some does not have a direct connection with them, their relation is mediated, non-objective.

The relationship of these concepts with objects and phenomena is carried out through the processes of real action and the state of the objects and phenomena of the world around us. The meaning of a trait, quality, and property that is directly related to objects and phenomena is the grammatical meaning of an adjective. The second group of meanings-the meaning of a feature, quality, and property that are not directly related to objects and phenomena-is the grammatical meaning of an adverb. From the point of view of the commonality of the grammatical meanings of the adjective and adverb, these two lexico-grammatical categories, that is, parts of speech, are close in relation to each other. Despite this, there are significant differences between these lexicon-grammatical categories (parts of speech), which are determined by the fact that the adjective is a lexical-semantic group of predicative lexical units with the meanings of a non-procedural attribute of an object (E.M.Wolf); an adverb is a set of lexical units, in the functioning of which the attributive qualities of predicative meanings are realized (I.I.Meshchaninov), as well as lexical and grammatical groups of words (N.M.Vasilyeva). All lexical units that make up the lexico-grammatical category of adverbs are characterized by the same grammatical features and grammatical meanings, in which the procedural features of a particular character are displayed. The meaning of this symbol is sometimes expressed using lexical units and other parts of speech, for example, nouns and verbs, but they are not categorical, not isosemic to their meanings and differ from their own categorical meanings.

The property of lexico-grammatical meanings of an adverb is characterized by the fact that these meanings are farthest from the reality of lexico-grammatical meanings, for example, of an adjective and a verb, although they, together with the lexico-grammatical meaning of an adverb, are at the same stage of the semantic plan of significant parts of speech [5,6,7].

Avrorin, regarding the meaning of adverbs, emphasizes that adverbs are combined into one part of speech, primarily on the basis of the unity of their most general categorical meaning: they are all specially designed to denote certain signs of actions and qualities. But this is not enough. The same signs of actions can be indicated by some forms of names and verb words. A distinctive feature of the semantics of adverbs is that they, in comparison with other parts of speech that can denote similar concepts, have a more abstract, generalized meaning devoid of real concreteness.[1]

Differences between scientists are also observed in the linguistic description of parts of speech. Some linguists call them lexical categories of words (because parts of speech are formed as lexical groups of words), other linguists call them grammatical classes of words (because parts of speech are formed based on the grammatical features of words, because in fact they are grammatical phenomena). In some sources, parts of speech are considered as lexical and grammatical groups of words (since the lexical and grammatical meanings of words exist in words simultaneously, synchronously and syncretically). [2,8] Parts of speech are large groups of words in which each lexico-grammatical category is formed on the basis of the unity of grammatical meanings and their formal means, which gives rise to the definition of parts of speech as the largest morphological category. In particular, a noun is a morphological category that combines lexical units with a common meaning of objectivity; an adjective is a morphological category whose lexical units are combined with a common meaning of a feature, quality, and property of an object or phenomenon. In turn, the verb is characterized by the largest

grammatical category, the system of which consists of lexical units with a general meaning of processality, etc. [2,3,4].

Thus, it is clear how important parts of speech are in the morphological system of language, because the term morphology primarily refers to the system of parts of speech. When choosing each part of speech, the grammatical meaning of the word and their formal meanings are taken as a basis. When highlighting certain parts of speech, one cannot rely only on the formal means of lexical units. Or one-way is the method of classifying a dictionary to parts of speech, based on the real lexical characteristics of lexical units.

Elements of the structure of one part of speech are interconnected with elements of another part of speech, a set of structural elements and their interconnection constitutes the entire system of language, because language is a system of systems.

## CONCLUSIONS

From this point of view, if we approach the question of an adverb, we should say that the values of the signs of a trait contain a system of grammatical meanings of the adverb. The grammatical meaning of an adverb is outside the system of formalization. However, the units of this lexicogrammatical category have a peculiar grammatical form. The proper morphological features of an adverb are the absence of inflection affixes in it and the presence of proper affixes of adverb formation (affixes of word formation).

### ABSTRACT

*The article is devoted to the phenomena of the formation and distribution of color in nature, its role in the creation of works of art by ancient scientists and artists, the use of color science in the creation of works of art by great artist theorists. The future artist is also focused on teaching teachers how colors change under the influence of the environment, how to prepare and use paints.*

**KEYWORDS:** *Color, Painting, Fine Arts, Color, Gamma, Color Range.*

### INTRODUCTION

It is known that the course of painting fundamentals is aimed at the best development of knowledge, skills and abilities of future professionals in the field of painting. The basis of painting is the science of color. The future artist will teach teachers examples of the formation and distribution of colors in nature, how they change under the influence of the environment, and how to prepare and use paints.

In ancient Central Asia, the doctrine of color has developed since ancient times in connection with book miniatures, painting, painting paintings and panels on the walls. Because the art of painting required the ability to choose colors and prepare them. Therefore, each student first learned the secrets of color preparation and the chemical processes involved in this work.

### **The main findings and results**

The phenomena of how colors form and spread in nature have long attracted the attention of scientists and artists. The great Renaissance painters and theorists Leon Batista Alberti, Leonardo da Vinci, and others wrote about the properties of color in their paintings. Well-known scientists Newton, Lomonosov, Helmholtz studied the essence of colors on a scientific basis.

If Newton studied colors from the point of view of physics, German poet and art historian IV Goethe was more interested in the effect of colors on the human body in his book *The Doctrine of Colors*, Goethe wrote about the use of warm (yellow-red) colors to evoke a sense of well-being.

In the XX century, the German naturalist G.L. Helmholtz, one of the European scientists, made an important innovation in the theory of color science. Based on many years of experience, it has been shown that chromatic colors should be categorized based on three main characteristics - color tone (name), color saturation, and saturation.

Japanese scientists have always taken the study of color problems seriously. At the Tokyo Institute of Color, which is still the only one in the world, color is studied in detail - a natural phenomenon that affects the human heart.

The symbol that represents the name of a color, that is, one of which is called red, the other blue, the third purple, and so on, is called a color tone.

When we add a little gray to a chromatic color, its brilliance decreases and it becomes dimmer. This indicates a low saturation of the color, i.e. a decrease in the content of pure dye. So, when we say color saturation, we need to understand its level of color, its purity, compared to gray.

From the above, it is clear that chromatic colors differ from each other in three main properties — color tone (color itself), color saturation, and saturation. If we look closely at the spectrum, we notice signs of similarity between the red and purple colors at its very edges. When two colors are combined, red is formed between them, and when the spectrum is connected by placing the resulting color between red and purple, it is called a range of colors.

Colors range from red, reddish-orange, yellow-yellow-green, green-quality blue, air-color, blue-air color, blue, blue-purple, various shades of red.

There can be a lot of color tones in the color range. But our eyes are able to distinguish about 150 of them. The order in which the colors are arranged around the circle is kept certain.

If the color range is divided into two equal parts, in the first half there are red, orange, yellow-green (pistachio) colors, and in the second half there are green air colors, turquoise, blue, purple. The first half of the circle is warm colors and the second half is cool colors. The reason for this name is that the reds are reminiscent of fire, hot iron, coal, the color of air is blue, and the blues are reminiscent of ice and water. This difference is relative, and any warm color may appear cooler next to a warmer color than itself, and conversely, a cold color may appear warmer next to a cooler color than itself.

In 1676, Isaac Newton used a three-dimensional prism to absorb white sunlight into the color spectrum. There were all colors in this spectrum except red. Newton conducted his experiment as follows; when sunlight falls on the prism through a narrow beam, the white light in the prism is

associated with separate spectral colors. The continuous colored ribbon started with red and ended with ink through orange, yellow, green, and blue. If this image was then passed through a condenser lens, the sum of all the colors would again give a white color. There are other physical ways of creating colors, such as fluorescence, polarization, diffraction, and interference.

If we divide the spectrum into 2 parts, for example red, orange, yellow and green-blue-ink, and we collect each of these groups with a special lens. As a result we get 2 mixed colors, this color mixture also gives the result a white color. This is the sum of the two colors, called the complementary color. If we remove 1 color from the spectrum, for example, green and the remaining colors using the lens, i.e. red, orange, blue and ink, then the color mixture we get will be red, i.e. an additional color will be created relative to the removed green.

If we remove the color yellow, the remaining colors in it - red, orange, green, blue, and ink - give us an ink color, which is an additional color to yellow. Each color is called an additional color relative to the remaining color mixture of the spectrum. In this color mix we can see the remaining ranges in its composition. In this case, the eye is different from the musical ear in that it can distinguish sound from any chord. Different colors are created by light waves. These waves consist of specific electromagnetic forces.

Each color spectrum is characterized by its own wavelength. There is no color in the light waves. Color appears only with the perception of these waves by the human eye and consciousness. It is not yet fully known how man can distinguish these waves. The main issue here is to determine the body (general) or (solid) color of the object.

If we put a filter that transmits red and a filter that transmits green in front of an arc lamp, then both filters together give black or dark.

In addition to its specific colors, red absorbs spectral rays in that range. The green filter captures all colors except green.

Thus no light is transmitted. And we get the darkness. According to physical experience, the absorption of colors is called separating colors.

The colors of objects appear mainly in the process of wave absorption. The red vessel appears to be red because it absorbs all the light rays and reflects the physical color. When we say "this container is red", the molecular composition on the surface of the container absorbs all types of light from red.

The container itself has no color, but the color appears as a result of light. If the red paper is illuminated with a green light, the paper will appear black to us. Because there is no light in green that responds to red all dyes in a color image can be spotted or pigmented. In the process of mixing these self-absorbing dyes, it is recommended to follow the rule of separation.

The harmony of different colors in works of fine art, the interdependence between beautiful color combinations, the leading color in a work of art is called *calorie*.

Color mixtures play an important role in painting. Colors are close in color blend together.

When colors are mixed through mutual hues, they show a distinct resonance and quality changes are noticeable. The color that deviates from the overall color looks inappropriately alien, and the fine art undermines the integrity of the work. A work of fine art is created by mixing all the

colors together. It is not possible to change, reduce or enlarge any piece of color in terms of brightness or brightness without damaging the integrity of the work.

Color reveals to us the rich, colorful beauty of the universe. It helps artists express the mood of the image.

The coloring can be calm, enjoyable, anxious, frustrating, as well as marrow and cold, bright and muffled. The paintings of great artists and masters in the past allow us to observe the development of color in some of the following periods. The concept of color was formed and developed in the late fifteenth century. The first changes from it began to appear at the end of the century. Artists of this period divided the colors into semi-streams, smoothing the colors without adding them separately. This is exacerbated by the Constable, especially the Impressionists. The scientific works of the Russian art critic B. Vipper are dedicated to the history of painting.

In the XV century in the paintings of Italian, French, German artists, paints existed independently of each other. As you watch Bernard Dürer's "Portrait of Oswald Krel," notice that the background of the work remains bright red or light red in both light and shadow. The artist depicts it as if he is filling things and objects the bodies of the heroes are not immersed in the surrounding space, but are embodied on an indistinct brown, red background.

Color and shape blend into one whole, leaving the paint indistinguishable from the light and space. The period from bell to titsen and tinturettu is the period when the original color is transformed into hues.

In the sixteenth century, while color represented life in general in works of fine art, their coverage increased exponentially. New reflections began to appear; The dry valley is very bright-red, warm-green, brown-yellow, light blue, blue, on bicycles - unobtrusive swells around black, gray, white-pink and so on.

Rembrandt limits its palette to dark colors, but in it the color has a new liveliness and mysterious properties.

Renaissance painters, such as Titian, use color as a reflection of real life. In the Baroque period, color is involved in many aspects as an element that performs aesthetic functions in painting fantasy.

Master artists of the past have used beautiful, colorful combinations, color combinations, and intricate techniques to express their work. They used strong color and color contrasts.

Therefore, they used the underestimation method to achieve the desired color tones.

By the XVIII century, color-related aesthetic games began to take on a more antique and intricate tone. The artists applied subtle shades of a single color to the human figure, hair, and clothing white, light yellow, light brown came to the fore.

The struggle of different ideas, the contradictions between color and shape, dates back to the nineteenth century. During this period, color became the main source of optical research. Nineteenth-century painters, especially the Impressionist groups, mastered the art of distinguishing bright from free color and expressing the scattering of sunlight. They paid more attention to color contrast by using impressions of color optical combinations and began to use pure dyes.

Henri Matisse, Paul Gauguin, Van Gogh will have large contours with clear contours and resonance. Matisse had its own palette - a set of colors - in the realm of original paints. He discovered that the cut-out pieces from a painting were placed in certain planes, without any auxiliary images, in the grease method of the paintings. Matisse's paper stickers are a whole in terms of color, making it very easy to turn them (tapestry) into a carpet image, fabric color print, and book decorations.

In Gauguin's works, color does not perform pictorial functions, but is in an ornamental, symbolic direction, where red sand, pink grass, and blue trees can be seen.

Van Gogh's works featured beautiful contrasting color complexes. But here the dyes are not decorative, but psychological factors and moods.

Sensing and perceiving color is a very important skill. I.Repin, V.Surikov, K.Korovin, M.Vrubel, F.Maliavin, U.Tansiqbayev, Sh.Abdurashidov and others are among the colorful artists.

Repin ages serve as a free expression of color, with the first colors — gold, yellow, and red.

V. Surikov's favorite color was blue, with cool blue colors. Many of his works are depicted in silver color.

M. Vrubel is illuminated in gray-blue, and most of F. Maliavi's works are bright red.

Often, color serves as a primary vehicle in reflecting nationalism, naturalness, human qualities, and household items.

In this regard, we are talking about the concept of "national color". The works of Ch. Akhmarov, R. Kent, M. Saryan are examples of this. Each artist has his own color, as evidenced by the general palette of works of fine art he worked on.

## CONCLUSION

In conclusion, the art of painting is the art of combining color and light. When working on works of art, it is important to consider the effects of colors on each other and describe them on the basis of color harmony.

It is important that the right combination of colors found in the image, along with the understanding of beauty, also creates the basis for the development of knowledge of the beauty of fine art.

Artists focus on applied art and color combinations, while at the same time being able to focus the original colors of things and objects in symbolic directions. The color harmony in the pattern is achieved using all the elements, color contrasts and tone polishes.

The color chosen, its pictorial parts, rhythmic arrangements, what it is intended for and what it is made of are always taken into account when performing decorative-decorative works.

In the design direction, the relationship of color and shape, the purpose for which it is, the brightness, the attractiveness are of great importance.

## **THE USE OF MODULAR LEARNING TECHNOLOGY IN TEACHING PRIMARY SCHOOL STUDENTS TO THINK INDEPENDENTLY**

**Marguba Mirqobilovna Mirqosimova\***

\*Professor of the Islamic Academy,  
UZBEKISTAN

### **ABSTRACT**

*In fact, modern pedagogical technologies increase the productivity of the educational process, shape the independent thinking process of students, increase the enthusiasm and interest in knowledge in students, and strengthen the acquisition of knowledge, the formation of skills and skills of free use of them in practice. Teaching students to think independently is a process that is not carried out in one day or one hour of classes, but is carried out gradually over the years under the influence of various factors. This article discusses the use of modular learning technology in teaching primary school students to think independently.*

**KEYWORDS:** *Modular Learning Technology, Independent Thinking, Teaching, Primary School Students, Formation Of Skills.*

### **INTRODUCTION**

The use of modular educational technology in teaching primary school students to think independently, preparing them for the implementation of modern pedagogical technologies is one of the important requirements of today's primary education. Modern pedagogical technologies, firstly, allow students to learn knowledge, skills and abilities easily and with interest, and secondly, help the teacher to grow both professionally and spiritually. When does a student begin to think independently? The question naturally arises. First, it is necessary to know the stages of formation of the human thought process. The process of human thinking is formed in the process of observing life, people, relationships between them, nature through the senses. From the moment a child is born, he begins to see, observe and absorb life, adult activities, events and phenomena in nature, and as a result, he develops imagination and speech. At the same time, the child acquires a lot of imagination based on the information collected through the senses, and tries to understand it. So they have a lot of questions. For example, *what is in the*

*sky? Why is a day and a night? Why do birds fly? Why am I small? Why are the colors different? Why is it raining and snowing? What about clouds? and so on.*

A mother told of her three-and-a-half-year-old son: "One day my son asked me this question:

*- Mother, why are our noses different? Mine is flat, yours is upright, my sister's is different? Not knowing what to say,*

*"That's the way it is, son," I said.*

*"Who made it, the doctors?" Do they cut and paste?*

*"No, boy, God made it."*

*"How does God do it?"*

*So my son beat me in question and answer. I didn't know what to explain. I tried to distract my child. My son kept asking questions.*

Indeed, children constantly ask their parents questions in their preschool years. Answering the child's questions patiently helps him/her to think, to understand events, and to develop his/her speech. In preparation for school, a child's speech is formed at the level of reading and understanding people's interactions with adults. He can understand what he has heard and seen. He can express information in a certain order, use mental operations appropriately. (Compares, clarifies, groups them, tries to draw valid conclusions).

The level of thinking of a preschool child improves in the educational process at school. The role of the teacher in the development of students' thinking is invaluable. The teacher needs to make students active participants in the learning process. It is especially important to teach students to think about what they are learning and to express themselves freely. The use of pedagogical technologies in the educational process is very effective. The student actively participates in the lesson, which is based on pedagogical technologies, and interacts freely with the teacher and peers. In particular, person-centered technology makes students the subject of the learning process and allows students to think freely about the material. The role of modular learning technology in this area is invaluable. The use of didactic games in the educational process is also very effective. Didactic games help children develop reading skills. There can be no real mental development without games. The game sparks students' interest and curiosity. Students facilitate the acquisition of knowledge, learn to interact with a variety of subjects, and develop a culture of communication through games. It is important that in the process of didactic games the child develops self-confidence, learns to move freely, to express themselves freely, to express independent thoughts. For example, in the game "Find the mistake in the picture" the child observes the picture independently. If a picture of a winter landscape shows a tree in bloom, the child will find it independently. The games such as "can't be", "find the error in the text" games, rebuses, and puzzles stimulate students' thinking and teach them to think independently. Exercises to work on the picture in the textbook also teach students to think independently. The child expresses his / her attitude to the picture, actively participates in questions and answers, and when given a task to write a story based on a picture, he / she writes a story based on his / her imagination. There are many opportunities to teach a child to think independently in elementary school, and it makes good use of it wisely. Guiding students to work on a text is one of the most effective ways to teach them to think independently.

Textbooks for primary school should also encourage students to think independently through exercises, questions, and assignments at the end of the text. For example, "Who is reciting the poem?", "How can you add to the poem?", "Do you want to be friends with the protagonist of the story (or fairy tale)?", "What advice would you give to the protagonist of the story?" , "Do you want to be in a fairy tale?", "Who do you want to be in it?". Questions such as "Divide the text into parts and put a title to each part", "Make a text plan with the help of the teacher", "Re-narrate the text according to the plan", "Re-narrate by changing the characters in the text" and so on assignments serve to develop students' thinking and independent thinking.

## **MATERIALS AND METHODS**

### *Current status of the use of modular learning technologies in primary education*

To increase the activity of teachers in the use of modular learning technology and, conversely, to identify the reasons that hinder it, to look for more effective ways to work on the basis of the use of modular learning technology. The information gathered on these issues will help the school teacher to enrich the pedagogical activity with elements of the use of modular educational technology and to identify a number of measures that will help it to be effective. An in-depth study of the specifics, differences in structure, and character traits of experienced teachers based on the use of modular learning technology. When evaluating the performance of teachers with the skills to use modular learning technologies, a positive description will undoubtedly prevail. Young teachers consider the specific features of the use of modular educational technology in the methodological support of pedagogical activity, the correct application of psychological and pedagogical knowledge. Experienced teachers emphasize the importance of using modular teaching technology in their work, which can be understood through in-depth analysis of the pedagogical situation, along with methodological support.

Working on the use of modular learning technology, methodological support is paramount, and the importance of knowing, explaining, communicating, and engaging students in modular learning technology is highly valued. Skilled teachers have a slightly different situation. They consider the reasons for success to be: the ability to use modular learning technology, regular self-study, problem-solving based on modular learning technology, and research on professional development. They prioritize the use of modular learning technology, which is one of the foundations of pedagogical skills and need to work on themselves on a regular basis.

The study of the peculiarities of the organization of pedagogical activity of skilled teachers on the basis of the use of modular educational technology has yielded the following results:

- a) compare the methodological skills of experienced teachers;
- b) be able to intelligently analyze the pedagogical situation;
- c) specificity in the use of modular technology.

In this context, we have identified differences in understanding the nature of the use of modular learning technology, its sources of development, its causes, and the factors that contribute to or hinder the use of modular learning technology. In order to make the comparison more effective, we had to conduct an initial selection in a group of experienced teachers. For comparison, we selected only those that were rated "based on the use of modular learning technology" and "generally based on the use of modular learning technology."

Comparing teachers who have a lot of experience with experienced teachers and who have achieved high results in this area, by identifying the differences between them, which of them has the highest pedagogical skills, the work of educators who have earned the title of a skilled teacher an in-depth analysis of its specific features was made possible. In addition, the specificity of the scope of attitudes of skilled teachers stems from a clear perception (lat. perception) of their inner state of mind and actions, a clear knowledge of their own personality and the personality of the student. The results show that the teacher's organization of the educational process on the basis of the use of modular learning technology depends in many respects on his self-reliance, knowledge, good knowledge of pedagogical features and the teacher's modular learning technology.

*The essence and description of the concept of modular training.*

The term "modular teaching" is related to the international concept - module ("module", from the Latin word "modulus" - means a norm, a measure.) The module divides the subject studied in the educational process into specific parts and creates a clear system of its study. A single meaning of a module is a node consisting of closely related elements that can function. In this sense, it is understood as the main tool of modular learning, as a complete block of information.

A module is a fundamental concept of a science: a specific process or law, a section, a specific major topic, a group of interrelated concepts.

A module is a logically complete learning material based on developed principles that are designed to help students master one or more concepts.

A module is a purposeful functional network that combines learning content and learning technology in a highly integrated system [Kaldibekova, 2006].

A module is a logically complete piece of learning material that compulsorily monitors students' knowledge and skills [Stolerenko, 2003].

A module is a logically defined piece of learning information that has some kind of logical integrity and completeness, synchronized with knowledge control.

By module we mean a didactic unit of learning material that logically completes and perfectly illustrates important aspects of the objects, with a clear goal in mind for a particular subject [Nuriddinov, 2002].

Modular learning is a logically defined part of educational information that has some kind of logical integrity and completeness, coordinated with knowledge control [Stolerenko, 2003].

An educational module is a meaningful part of a course of study, along with relevant teaching materials.

Curriculum module - instructions for studying the timing of each assignment, methods of control and accounting, study of teaching materials (paragraph, topic, section, subject, integrated course). In a more simple and unique way, the training module reflects the topics (sections) of the usual curriculum, along with more reasonable forms and methods of learning it [Podlasiy, 2002]. Modular learning is one of the most promising systems of learning because it is best adapted to the assimilation system of the human brain. The modular system of education was first officially discussed in 1972 at the UNESCO World Conference in Tokyo. Modular learning

technology is based on the general theory of functional systems, neurophysiology of thinking, pedagogy and psychology.

Modular teaching provides a comprehensive solution to the following modern problems of pedagogical education:

- module - optimization and systematization of activity-based learning content to ensure the flexibility and flexibility of programs;
- individualization of teaching;
- Monitoring the effectiveness of training at the level of practical training and assessment of observable actions.

There are two approaches to modern theory and practice of modular teaching: the science approach and the system approach.

The effectiveness of teaching is enhanced when the module program is provided to the student as a textbook for independent reading for continuous use during the reading of the block of learning material included in the curriculum.

The structure of the module manual reflects the following design requirements and rules:

- An integrated goal included in the quality classifications (personal and cognitive) as a result of modular reading.
- Clarification of the purpose in the "learning elements" of the subject given in the educational standard.
- study of the module, programs and recommendations on technological methods.
- Clarification of goals in the final control tasks on the standards and criteria of mastery levels.
- Standards for the organization of self-control and mutual control.

Features of the implementation and design of modular technology in the classroom.

## **RESULTS AND DISCUSSIONS**

The organization of educational activities on the basis of separate modules in the educational process creates great opportunities for the student to acquire independent, planned knowledge and self-development as a subject of educational activities. Applying modular technology to practice requires the teacher to be familiar with the principles of modular learning:

### **Principles of modular education**

Modular learning technology is developed and implemented in accordance with the accepted principles of teaching. The following principles form the basis of modular learning technology:

**1. Principle of activity:** This principle means that the modules are formed in accordance with the content of the activity of the specialist.

According to this principle, modules can be based on a science-based approach or a systematic approach. Modular learning technology requires a science-based approach to building modules as a result of curriculum and program analysis. In the systemic activity approach, a block of modules is formed based on the analysis of the professional activity of the specialist.

**2. Equality, the principle of equality.** This principle determines the nature of the subject-subject relationship between teacher and student.

This suggests that modular learning technology belongs to the category of person-centered technologies. The modular learning technology is adapted to the individual psychological characteristics of the individual.

**3. The principle of system quantization.** This principle is based on the requirements of the theory of information compression, the concept of pedagogical knowledge, theories of enlargement of didactic units. In addition, this principle requires consideration of the following psychological and pedagogical laws:

- A large amount of learning material is remembered with difficulty and reluctance;
- Abbreviated learning material in a particular system is easier to master;
- Highlighting key elements in the learning material has a positive effect on memory.
- The basis of the teaching material should be scientific and fundamental.
- The principle of system quantization is achieved by building the appropriate structure of educational information in a module.
- The module can generally consist of the following elements:
  - historical - is a brief description of the history of the problem, theorem, problem, concept;
  - problematic - the formation of this problem;
  - systematic - this is a systematic representation of the content of the module;
  - Activation is the identification of key phrases and actions needed to master a new learning material;
  - Theoretical - this is the main educational material, which - didactic goals, problem statement, hypothesis (hypothesis), ways to solve the problem;
  - experimental - is the description of experimental material (learning experience, work, etc.);
  - Generalization - is the generalization of the image and module content of the problem solution;
  - Application - the development of new methods of action and a system of issues for the practical application of the studied material;
  - Errors - to identify, identify the causes of mistakes of the student in the study of the content of the module, and to show ways to correct them;
  - Connection - to show that the passed module is connected with other modules, including related disciplines;
  - Deepening - providing highly complex learning materials for gifted students;
  - Testing - monitoring and evaluation of students' mastery of the content of the module by means of tests.

It is important to understand the practical significance of the module during the lessons, the relevance of the content of the module to other modules, the analysis of the same mistakes of students in the study of this module.

4. **The principle of motivation.** The essence of this principle is to stimulate the learning process of the student. This is the basic rule.

The tasks of the historical and problematic elements of the module are to arouse interest in the learning material of the module, to stimulate learning, to encourage active creative thinking during the lessons.

5. **The principle of modularity.** This principle is the basis for the individualization of teaching.

First, the dynamic structure of the module allows the content of science to be presented in three ways:

- full;
- abbreviated;
- Deepened.

The choice of this or that type of teaching is left to the student.

Second, modularity is reflected in the mastery of the content of the module, as well as in the variety of methods and forms. These can be active forms and methods of teaching (dialogue, independent reading, reading and simulation games, etc.), as well as problem-based lectures, seminars, consultations.

Third, modularity is provided in the step-by-step acquisition of new material, meaning that teaching in each subject and in each module is oriented from simple to complex.

Fourth, due to the flexibility of the learning elements included in the module, it is possible to regularly update the learning material.

6. **The problem principle.** This principle allows you to increase the effectiveness of the learning material, as it focuses on problem situations and practice. During the lesson, a hypothesis is made, its validity is demonstrated, and the problem is solved. First of all, this is what interests the reader, it stimulates creative thinking and activity.

7. **The principle of cognitive visualization.** This principle stems from the psychological and pedagogical laws, according to which educational exhibitions increase the productivity of learning only if they perform the function of painting, as well as cognitive function.

That is why cognitive graphics is a new problem area in the theory of artificial intelligence, where complex objects are represented in the form of computer images. The structure of the module consists of colorful, cognitive-graphic learning elements (picture block). Images are therefore a key element of the module. This is:

First, it develops the student's ability to see and think in space, which means that the learning process is enriched by the rich possibilities of the brain's right hemisphere.

Second, a picture that clearly illustrates the content of the learning material helps the student to form systematic knowledge.

Thirdly, color pictures increase the effectiveness of the reception and recall of educational information material, as well as serve as a means of aesthetic education of students.

Learning is like using two mechanisms of thinking: one is symbolic and the other is geometric (algebraic). Visual information is more important and effective than verbal information. The ability of the visual cortex to receive information is much higher than that of the auditory cortex. This, in turn, allows the visual system to transmit about 90 percent of the information a person receives. In addition, visual information is provided at the same time. Therefore, it takes less time to receive and remember information than verbal information. When visual information is used, the formation of imagination is on average 5-6 times faster than verbal. Human exposure to visual information is much higher than to verbal information. In most cases, he misses the last one. Repetition of visual information is easier and more accurate. People have more confidence in visual information than in verbal information. That is why it is said, "It is better to see once than to hear a hundred times."

## CONCLUSION

We conclude that the following results can be achieved when using modular learning technology to teach elementary students to think independently:

1. The possibility of modular learning - "dosing" of the material, combining it with the individual characteristics and abilities of students, special selection of material, the combination of information-cognitive and educational tasks, the principle of compulsory assessment, a great contribution to it. The provision of flexibility, flexibility, diversity allows for a high level of organization of professional practice and the approximate introduction of bachelor students to the cultural and socio-pedagogical reality.

2. Modular teaching provides an opportunity to comprehensively address the following modern issues of pedagogical education:

- module - optimization and systematization of activity-based learning content to ensure the flexibility and flexibility of programs;
- individualization of teaching.

### ABSTRACT

*This article discusses the proverbs as paremic units, their features, differences from related phenomena, the study of Uzbek folk proverbs and morphological system. The environment is a complex object of perception for human beings. A nation's way of life cannot understand the diversity of the surrounding reality throughout its life, adapt to it, and develop acceptable ways of living. So at this time wisdom was used in its own sense, it was considered a parable. Over time, as a result of idiomization, it became a proverb. Therefore, "some parables will be changed into a proverb when time goes"(B.Saatov) [15: 7]. Although both mosquitoes and ants are insects, we can see that there is a positive evaluation of ants and a negative evaluation of mosquitoes.*

**KEYWORDS:** *Paremic Units, Proverb, Parable (Saying), Phrase, Lexical System, Conversion, Valence*

### INTRODUCTION

Proverbs that have been attracting the attention of scholars for many years have been studied as the object of study of folklore and ethnography, in linguistics by scientists such as Sh.Rahmatullaev [1], Ya.Pinkhasov [2], G.Salomov [3], Q.Samadov [4], Sh.Shorahmedov [5], H.Abdurahmonov [6], M.Sadriddinova [7]. H. Abdurahmanov's doctoral dissertation is aimed at covering the syntactic structure, morphological and some spiritual and methodological features of proverbs and sayings in the Uzbek language [8:20]. The lexical features of folk proverbs and sayings have been studied comparatively by M. Sadriddinova in the lexical scope of literary languages and dialects.

## MATERIALS AND METHODS

Recently, folk proverbs have been widely covered in many works on the language and style of the works of writers and poets in Uzbek linguistics. In this regard, the scholars such as A.Rustamov, H.Sulaymon, Sh.Shomaksudov, Sh.Shorahmedov H.Berdiyev, R.Rasulov, M.Abdurahimov, R.Jumaniyozov, A.Kholmukhamedov [9], V.Abdullaev, H.Doniyorov, S. Mirzaev [10: 122], S.Askarov [11: 19-22], A.Jurahanov [12: 52-55], M.Tuychiev [13: 84-87], M.Hakimov [14: 176] can be mentioned.

A synonymous dictionary of folk proverbs in Uzbek linguistics was compiled by B. Juraeva [15]. This dictionary was compiled on the basis of synonyms of ordered paremic units, can be considered as a prelude to lexicographic works to be created in this direction.

The environment is a complex object of perception for human beings. A nation's way of life cannot understand the diversity of the surrounding reality throughout its life, adapt to it, and develop acceptable ways of living. Proverbs, which convey all the achievements of man and nature, the relationship between man and society, as well as a unique means of self-understanding, culturally define, summarize, and record all the information necessary for human life.

In the Uzbek language, wise sayings are generally called proverbs [16: 5], however, more than a dozen terms are used to express this concept such as: "*maqol, matal, masal, naql, hikmat, tanbeh, Zarbulmasal, hikmatli maqol, xalq iborasi, xalq so'zi, donishmandlar so'zi, donolar so'zi, yaxshilar so'zi, burungilar so'zi, ulusning so'zi, avomunnos masali, hikmatli so'z*" which convey the meaning of proverb, parable or sayings [17: 6]. Folk wisdom is part of a system that is completely dependent on man, his choices and his values, what man considers being the norm for himself [18: 180].

The terms proverb and parable are almost indistinguishable in the scientific literature. Even though in some sources they are distinguished as types of paremas, it is possible to find places where the interpretation of proverbial and parable terms is confused [17:12]. In classical literature, the term "*maqol*" (proverb) refers to the concepts of word, speech, [19: 234], and the term "*masal*" (parable) is used to express the concept of proverb [19: 237]. For example, in a text that uses proverbs in classical poetry, combinations such as *masaldurkim, masalkim, masal budur* mean proverb. In his famous work *Zarbulmasal* of Gulkhani used the term "*masal*" (parable) in the sense of a proverb, so historically the term parable can be understood as the equivalent of a proverb.

In linguistics, it is expedient to limit proverbs and sayings by meaning, as they differ from each other in the nature of the expression of the message conveyed.

If the medium of communication in speech is a proverb, then the parable is used as a means of conveying this information in vivid symbols, proving it. The different situations are described figuratively and their didactic nature goes unnoticed in proverbs. Proverbs, on the other hand, have an educational aspect, and most such units differ from proverbs in that they express the content of advice, commands, and insights. For example:

Maqol (proverb): "*yirtiq uyni el topar, yolg'on so'zni chin topar*" yoki "*maddohning va'ziga ishonma, g'olibning – so'ziga*".

Matal (parable): *"uyida chaksa uni yo'q, tom boshida qo'sh tandir"*.

Proverbs are short, concise folk sayings that are used in a sharp, figurative sense, expressing a grammatically complete idea. Parables, on the other hand, are short, concise folk sayings that express a grammatically complete idea, used only in its own sense - in the true sense. The main difference between proverbs and parables is that proverbs have an idiomatic figurative meaning, and parables do not have this feature, but are used only in the correct sense [15].

## RESULTS AND DISCUSSIONS

As in society, when several units are used side by side, as in language, they can be in interaction with each other, and as a result of this attitude, one can observe silks towards each other. In the Explanatory Dictionary of Uzbek folk proverbs define the proverb *"qarg'a qarg'aning ko'zini cho'qimaydi"*, which was presented in the F.Makrobiy's "Grammar": *"qarg'a-quzg'unlar odamning yo biror hayvonning ochiq erda qolib ketgan murdasini qo'rib qolsa, avval uning ko'zini cho'qib erkan-da, keyin go'shtini eya boshlar ekan. Ammo tirik qarg'a va quzg'un o'lik qarg'a va quzg'unning ko'zini cho'qimas ekan"* (meaning: If the crow or raven sees a died body of a man, or an animal, which has remained in the open ground, they first drown his eyes, and then begin to eat his meat. But, when the crow or the raven is dead, and the eyes of the crow or the raven's is not be crowned" [20:321]. So at this time wisdom was used in its own sense, it was considered a parable. Over time, as a result of idiomization, it became a proverb. Therefore, "some parables will be changed into a proverb when time goes"(B.Saatov) [15: 7]. Another situation is that some proverbs have changed lexical composition and new variants have appeared. For instance, the proverb *"mushk isi yashursa bo'lmas"* used in the works of Navoi, has used now as *"kasalni yashirsang, isitmasi oshkor qiladi" shaklida qo'llanadi"* [21:20].

The language units called proverbial-type paremas also exist separately, reflecting the characteristics of proverbs and parables. The features of such expressions are that some of them are used in their own sense, while the other part has a figurative meaning: *"Oltinning yaxshisi – yantoq, xotinning yaxshisi – qalmoq"*.

In proverbs, *oq, qora, ola, qizil, sariq, ko'k*, (white, black, purple, red, yellow, blue) which represent the color; *keng, tor, uzoq, yaqin, olis, engil, og'ir* (broad, narrow, long, close, distant, light, heavy) to represent size and character; *aqli, dono, ahmoq, nodon, epchil, chaqqon, chiroyli, xunuk, do'st, dushman, xom, semiz, oriq, baxil, saxiy, bemor, kasal, sog'* (smart, wise, foolish, ignorant, agile, agile, beautiful, ugly, friend, foe, raw, fat, thin, stingy, generous, sick, sick, healthy) to represent size and character; lexical units such as *"kar, ko'r, kal, soqov"* (deaf, blind, deaf, dumb) were used to represent physical defect of the category of quality. For example: *"Kal o'zini ovutar, qo'ltig'ini sovutar"*.

Qualitative lexemes as a person, animal, plant, status sign specify the meaning of the noun lexeme: *zo'r, qimmat, bilimli, bilimsiz, yaxshi, yomon, to'g'ri, olim, zolim, mehnatsiz, ilmsiz, ilmli, bedov, kuchli, tekin, bop, tikansiz, mashaqqatsiz, ulug', olchi, yalangoyoq, quruq, jafoli, vafoli, xor, hunarli, do'st, dushman*. (excellent, expensive, knowledgeable, ignorant, good, bad, right, scientist, tyrant, hardworking, ignorant, knowledgeable, strong, free, bop, thornless, effortless, great, cherry, barefoot, dry, cruel, faithful, crafty, friend, enemy).

In proverbs composed with the adjectives, character-traits and signs of physical defect appear as basic lexemes. This feature occurs in exchange for most conversions. For example: *Kalning nimasi bor – temir tarog'i, ko'rning nimasi bor – eski tayog'i*.

The following words can be used as the most commonly used verbs in proverbs: *yemoq, kelmoq, qaramoq, yo'rg'alamoq, yurmoq, o'tirmoq, bermoq, olmoq, tortmoq, ko'rinmoq, ko'rmoq(harakat fe'llari); o'ylamoq, bilmoq, bilmoq, o'rganmoq (tafakkur fe'llari); yig'lamoq, sasimoq, yog'moq, o'lmoq(holat fe'llari); so'ylamoq, so'ramoq, maqtamoq, demoq, o'qimoq(nutq fe'llari); bosmoq, ekmoq, sug'ormoq, o'rmoq, tutmoq, eshitmoq, ayamoq,saqlamoq, siylamoq, yuvmoq, cho'zmoq, o'lchamoq, yashamoq (mashg'ullik fe'llari. Masalan: nomard yovga yalinar,mard kuchiga suyanar.*

The grammatical basis of a sentence is a set of verbs in folk proverbs. In this case, the verbs serve to syntactically form the sentence. In proverbs, verbs are mainly devoted to the cut function. Adjective and action noun forms adapt the verb to the syntactic function of other word groups. The relative forms of the verb, on the other hand, are very few.

The use of numbers, rhymes, and pronouns in proverbs is quite limited. A number leads in proverbs. This remains due to the polysemantic nature of a number. One and two lexemes serve to form proverbs in the context of comparison. In proverbs where one number is used, the numbers such as “*uch, etti, qirq, yuz, ming, tuman*” (three, seven, forty, one hundred, thousand, much) are also used. There are also examples where some proverb components are selected only from a number of word groups. In this case, the phenomenon of conversion can be observed: *Birniki – mingga, mingniki – tumanga*.

The proverb “*bir pashshag'a olamda etkurma zarar hargiz*” (meaning: *Never harm a fly in the universe*) from Navoi's byte has been transformed in Mashrab's work. Let's compare... “*Bas kishiga tekmasun xavfu xatar, mo'rg'a ozor bermas yaxshilar*”.(Meaning: *So it's better not to hurt anyone, not to hurt*)

If we semantically compare the proverbs used by both poets, both variants of folk wisdom differ according to the shades of meaning. Although both mosquitoes and ants are insects, we can see that there is a positive evaluation of ants and a negative evaluation of mosquitoes. If we analyze it from the point of view of this relationship, it is not difficult to see that the byte, which is the product of Navoi's, has a significant role, as it should not offend not only the harmless, but also the mosquito. This shows that we can achieve the disclosure of the semantic aspects of a literary text through the most delicate linguistic analysis.

The proverb “*Qizni kim sevmas, qimizni kim ichmas; kelin ketag'on bo'ldi, ovul kezag'on bo'ldi*” has long been considered the beauty of language, as an example of folk wisdom, such as the bride was gone, the village was gone.

## CONCLUSION

The compact size and meaning is a product of the people's spirituality and intelligence. The use of proverbs in speech, first of all, leads to the enrichment of content, increasing the impact, and on the other hand, ensures the popularity of speech.

### ABSTRACT

*Ideology of Secularism was framed by India's freedom fighters and legislators based on the location, structure and types of India's culture and religion for protect multi –people interests. Basically, India is a country where diversified people are living with diversified interest and happiness .The government and its policy should be guardian of all religion without creating stumbling blocks to interest and welfare any religion habits, customs and convention .Because, once this formula was broken by an any anti-social elements or wrong government policy it would be highly and deadly dangerous to secularism and India's integrity. To avoid these kinds of forth coming dangerous of anti-secularism activities from the any community and political parties, the government needs to adhere strictly a common wheel polices and approaches irrespective of the caste, class and religion .The vision of India's ancestor on secularism is to make a pivotal parts of India's government that should be looked frequently by the ruler and administrator to ensure the integrity of India and protect secular identity of various people. This type of oversee attitudes of ruler and administrator makes people to feel that they are part and parcel of multi religious country of India without socio ,economic and political draw backs . In India there are lot of anti –secularism and minority violence are increasing from the government side instead of arising from the people side .In old days policies were legislated for integrate people interest for maintain ideology of secularism. The present government is treating and enacting policy against the secularism and minority communities on account of minority people could not do any think against majority community. Therefore this study has been focusing on importance of secularism for the integration of India's in future as well as at present and suggests to accommodate minorities' interests and stop killing them in India.*

## INTRODUCTION

The core principle of the secularism in India is to accommodate the multicultural, ritual, interest, caste and religion along with elaborated policy for enable all people to grow on equilibrium platform irrespective of socio, economic and political differences and status. There are happening so many atrocities and gruesome events in India against secularism ideology with aim to split multicultural integrity .In which the innocent and minority people have been suffering much more as unanswerably by anti-people attacks of the government and polices since 2014 to 2015.This is very ruthless activities of ruling government over the minority development and life in India. In ancient days politics were run by the ruler toward defeat the enemy and exploit other country resources ,this barbarian ruling culture was vanished and changed after people and world community woke up to know their rights for get freedom and run independent life in the civil society of the world .

People awareness let to disappear the inter country war and exploitations of other country resources. Now India's ruling party and upper community people forcing entire multicultural people to go to above said ancient social status by iron control , armed attacks and political pressure over the minority to keep salve to dominant community and submissive to their arrogant political activities. In fact ,the minority People were cheated by the political party bearers and leaders to attain the political power by the duplicate political manifesto .Due to this ruling party pressures and atrocity minority people liked an alternative ruling party in India but they don't know that elected alternative party known as upper caste people will enslave them under the majority community to their political ambitions or crush down them to follow upper people food habits by beating ,killing and humiliating .

These inhuman activities and polices have been practiced by the ruling government along with inclination to enslave minorities like ancient civil setup for keep them at upper caste control and arms .Since beginning of the new government to rule over the India from 2014-2015 ,its ant-secularism and anti-minority policy have been affecting the minority people from basic life to politics .The policy of today government absolutely seeming to be inciting communal violence through the their caste party bearers .Their attitudes are focused at preventing the life growth of minority people ,motivating inter community caste feelings and fights in each villages of India. All these ruthless politics and policy of the majority community have been destroying the minority life that they got after 69 years through the hard labors from the slavery setup society of India's .All this causes made them to understand so much about the ruling government activities of community breaking, disturbing people peace and escalating communal violence as minority people could not develop and progress.

The gruesome policies and caste based activities of the majority over the minority are being as a serious threat and panic to be daily life of minority people in India as well as India development .the majority community activities have been resulting at serious destruction way minority people like rapping girls ,making nude minority girls ,giving corporal punishment unless they obey to their local politics ,chopping minority people regarding to lower people love over upper people to show their mighty and showing of bravery affecting attitudes over on the minority community in nuke and corner of the India's villages .For all these their frivolous and fearless

activities have been tolerated by the minority community and Islamic people since they are as powerless, propriety less and socially feeble community .

Still from the central to state the minority people have been attacked by the ruling party on account of caste and food habits differences .No political leader from the central and state have never raised their voice to protect them in India .Because, all major political party leaders of India's are belongs to upper caste people who have no sympathy or courtesy on this issues. Majority people like to rule the minority people through their violence. Their political agenda is not to let other for live or use political benefits and economic advantages than keeping slave other caste people and preaching their caste principles to rest of people in India.

### **Improper policy impinging on minority community life**

Now days India's policies are toward disturb, disintegrate and destroy the minority community people life and development all these policies were disrespected by the like Muslim, Dalit,Sikh, Tribal and fisherman community. Through their arrogant policy they would like to reinstate ancient slavery system omitting all the modernly emerged developments .Except all other community in India the minority people alone have been creeping toward socio-economic and political development after 69 years while rest of community and caste in India have attained socio-economic and political status before 1947.

Indeed ,the inapt policy of the present government shows its intolerance over the minority community developments in terms of social ,economic and political institutions .Generally, the ratio of the minority community people in India constitutes more than 65 percentage unless their cooperation India could not have become as a shining country and protected secularism ideology .So ,the minority people hard work at agriculture land alone have made India as shinning country and kept majority people at sophisticated life since the minority people do not have a respectable social status and money power to rule the people .None of policy of the so many government in India do not keep survive the minority people as happily as stress free .In fact the ruling community have been living at the sweat of the minority hard labor and they tasted their daily enjoyment of socio-economic and political benefits through the minority community traditional bondage works to India's developments .

So, based on this horrible and heart renting minority socio-economic and political position ,the present government needless to do service to them but it may be calm not disturbing ,infuriating ,inciting communal violence and inter caste fight at the India's villages .Because ,the minority people have felt now only that their untouchable fight was over with majority community in India after long decades, reversely to this, the present government perpetuating the same fight has to come to be soil of the India for break the multicultural unity and integrity .Indeed ,past two years the minority people are facing so many consequence of the intercaste, fight ,love issues ,honor killing and power sharing at government places .

All these incident took place duet to present government policy motivation and the higher caste people dominating policy counseling's to India's officers (the times of India 5 Oct, 2015). This kinds of unsecular policy of India's upper community people and government highly attempts to break the secularism and makes the minority to feel as an unattached with secularism ideology. In fact, the government irrational polices has paved way to divide India as two parts in future, one minority and other majority .This two elements will be fighting as an endless to share social benefits and show their superior power.The secularism would be broken in future .So ,this is a

blatant prediction of the present government policy and attitude .All these incidents have been as a continuous phenomenon against minority people since India's independence. So, government controversial anti-minority polices and arrogant activities are needs to be stop by good policy makers based on the view to protect secularism for protect the multicultural identity of India's society.

### **Partial religious policy affects Islamic people**

In the world ,the same community does not have relation with same community because lack of continuity , In India Islamic religion is only one community which is having universal relations in all countries of the world .The reactions of anywhere Islamic attacks will be creating worldwide Islamic conflict with apposite religion and ruler .In this perspective the present government have legislated a new law (prevention of cow eating )in India .It affects largely Islamic livelihood and habits of personal , and individual life style. Some of religious fanatics and ant-minority groups have attacked a Muslim family in Bisad village near Dadri, Uttar Pradesh an account of they had cow meat at their home .Same attack was done on another Muslim family in which family head Akhlaq was killed by the ruling party mob in New Delhi on September 2015 an account of that family have had beef. Succeeding other attacks was orchestrated by the religious fanatic mobs in Anrapradessh ,a boy was brought to the public street by the group of mob and tipped him at drainage channels asking to say (harijairam ,harijairam), its meaning is to convert Muslims to Hindu religion forcibly by the Hindu higher caste people Indeed .All these brutal and anti-minority attacks have been splitting the unity of secularism, psychologically makes people distress ,makes resentments among the minority people toward revolution and shows ruling party majority and mighty.

### **Attacks on Indian Islamic community affects India –Afghanistan relations**

After 1955,India –Afghanistan relations met large gab in terms of socio ,economic and politics due to several reasons of geopolitics ,religious politics ,allied politics and power politics .Since 1947 on wards two partners are being mismatch to the all the aspects of smooth relation for maintain a friendly relations in south Asia .How did come gab ?and how do they feel about India relations over the Islamic community is known very clearly to be all the academicians and rulers ?.In fact, the reason for Pakistan separation ,often terrorismattacks,severalHindu partial and brutal attacks over the Islamic people in India have created Islamic angry and aversion on India .All these notorious activities of the India's political power holder have let to segregate Islamic people themselves from the India's Hindu politics. They perceived that Hindu religion is an incompatible to Islamic and minority community. The sporadic Hindu domination attacks on minority socioeconomic and political platform and Demolition of babri masjid On December 6, 1992 created a strong scornful aversion among the Islamic people over Hindu culture setup. Still the Islamic angry on India's arrogant Hindu political ruler and follower have been continuous process through the terrorism. (The Hindu, 2009). It is true that this kinds of majority attacks over the minority has affected not only Islamic community but also affected all the minority people sentiments and dignity on terms of human rights aspects.

Indeed ,all these bitterness and inconsolable situation of the minority community came to be an end slightly in 2001 through the international community support for establish a friendly relations with Afghanistan after so many years .Unfortunately Taliban attacks on (WTC)world trade Centre in USA have offered good opportunities to India for project its long fostered

relations with Afghanistan through its reconstruction activities in Afghanistan .When two partners relation do not come to be a well-established relations ,the Hindu domination over the Islamic people like attacking ,speaking sarcastically, killing beef eater and prohibition of beef eating habits have created a serious and dreadful Islamic provocation and gap between the two nation .This attitudes of majority Hindu people probably will push two country to go back to old days severe conflict situation(The Hindu,2015).Therefore, it is better to enact a new law to protect minorities in India unless secularism would be meaningless than being as a namesake ideology of India's constitution.

### **India needs to accommodate minority dignity**

Obviously it is not only would be enough incorporation of secularism principle at the preamble of India's constitution and it has to make an effective law for protection and accommodate of minority welfare and social security .Because ,India's constitution makers selected secularism to accommodate and facilitate different religion irrespective of caste ,color ,race and religion bias .Actually the main aim of secularism is to make people share ,participate ,practice and perform their interest in the Indian soil system despite every person attached with some religion and caste .So ,this kinds of India's policy was known widely as just an eyewash ideology .Truly, itsaim is to protect multicultural entity of India ,being as fence to prevent religious ,caste and community oriented conflict and fights in India. In fact ,the Indian government alone says that secularism is for protect inter community people and multicultural people interests in India but the same government and ruler are ruining, provoking ,inciting and instructing to their party cadres to create anti-secularism activities against the minority people in India for the vote bank purpose ,power sustaining purpose and nurture Hinduism ideology .The chief purpose of this contemporary caste oriented violence of the majority people over the minority is to make slave them under the umbrella of Hinduism principles .Therefore ,government or policy makers are obviously needs to focus on this issue to protect the thirsty of secularism and minority life.

### **India needs to transplantations its anti-social elements**

As never before in the Indian history or in the world history the minority people have been killing by the majority people of India for their political power and social status .The majority community defined as power holder ,prosperity holder ,being dominant in each village affairs ,caste differentiations and attacking minority in a sympathy less way for demonstrate their altogether mighty in the Indian social setup toward keep salve others and rule over-all these activities of majority ruler affects India's economic growth ,splits secularism ,disintegrate people fondness and create communal violence .

Thereby, India's appearance in abroad has been humiliated by the international community when India's leaders travel to foreign visits for make an agreement's and MOU in the fields of education ,security ,and economical. Indeed, no foreign policy or domestic policy of an any country would not be effective , it would be collapsed by its unethical appearance in the international scenario and in domestic scenario ( The Guardian ,2015) .As reflection of this study , Pakistan launching continuous cross border terrorism and bomb attacks on an important monuments and entity of India's due to majority people wrong role toward ban of beef eating and attacks Muslim people in the different state of India's.

### Needs minority support for India's developments

It would not be fruitful unless Indian government seek minority support despite it embraces aboard country economic cooperation .The unhappy conditions of minoritylike ,crying, women's raping ,preventing minority people love by killing ,discriminating Dalit's ,Muslims , tribal and spoiling minority community people life ineducation institutions have been asgreat stumbling blocks to India's foreign policy as well as India's integrations. Because ,minority community in India's Hindu systems have been facing so many torture and inhuman practices by the majority community in terms of socio-economic and political patterns .Thereby ,the minority people are segregated ,isolated and discriminated from the Hindu social setup despite they are found as an archipelago of India's social setup by working restless ,facing endless poverty and suffering from homeless .For the smart development of India's future as well as at present ,the today government have to accommodate the minority in the gamut of socio,-economic and political development as equilibrium as equity.

### CONCLUSION

If there is a garbage inside of home it will not be clean, as it a country could not develop or shine internally and externally toward soft development and hard development having huge internal problems. So, since the minority is having continuous relation over all the world, the majority attacks and discrimination over the minority are provoking common people and tarnishing India's image externally. Frequent caste based discrimination and attacks on the minority people in India have made an irreparable stumbling blocks to its country integration, secularism and foreign policy. Among the minority community, the Islamic community in India having relation internationally as flora as fawna ,the ratio of Islamic population in India is in second place next o Indonesia and its neighborly countries like Afghanistan , Pakistan and Bangladesh .It has been main source of India's security and prosperity .Any disturbances and discrimination on Islamic people will hurt the India's relations with Afghanistan ,Pakistan and Bangladesh in terms of security ,economic ,culture and politics . Therefore, India sincerely needs to stop its political oriented communal violence, it hast to punish the anti-social elements of ruling community over the minority attacks, it should not intervene at secular and multicultural affairs of diversity people of India's community. Therefore ,India needs to regulate its arrogant caste splitting politics than showing much more interest toward foster majority community in all the vital fields for rule successively constricting the minority people .Therefore, India needs to enforce a special law for protect minority community from the torture ,attacks ,violence and socio economic discrimination of the majority community in India.

## CHALLENGES AND IMPORTANCE OF CENTRALIZATION AND DECENTRALIZATION OF LOCAL PUBLIC AUTHORITIES

**Mardonov Aziz Botirovich\***

\*Master of Public Administration Law of Tashkent State Law University,  
 Republic of UZBEKISTAN

### ABSTRACT

*Local public authorities (in the Republic of Uzbekistan) are local government bodies. They resolve all issues of local significance within their competence, reconcile the national interests with the interests of the citizens living in the area, and ensure the implementation of decisions of higher state bodies as an integral part of a single state authority. After gaining independence, Uzbekistan, based on long historical experience and national traditions, studied the positive aspects of the experience of advanced countries and radically reformed its public institutions created the system. A number of laws and official documents have been adopted in the field of forming the system of local government. Among them are the Constitution of the Republic of Uzbekistan (December 8, 1992), the Law "On local government" (September 2, 1993), the Law "On elections to regional, district and city councils of people's deputies" (May 5, 1994.) play an important role.*

**KEYWORDS:** *Local Public Authorities, Decentralization, Cautious Decentralization, Reform, Public Administration, Laws.*

### INTRODUCTION

Chapter 20 of the Constitution of the Republic of Uzbekistan stipulates that local public authorities o. The constitutional and legal basis of its activity is reflected (Articles 99-104). In these articles local public authorities. The system, the position, the functions, the order of the structure are enshrined in the constitution. The Constitution strengthened the two-tier system of local representative bodies (ie, district and city councils of people's deputies - the lower level; regional and Tashkent city councils of people's deputies - the upper level), and this was reflected in the law on local government. Local public authorities ensuring law and order and security of citizens, economic, social and cultural development of the regions; formation and execution of the local budget, establishment of local taxes, fees, creation of extra-budgetary funds;

management of local utilities; environmental protection; ensuring the registration of civil status acts; adopts normative acts and exercises other powers that do not contradict the Constitution and laws of the Republic of Uzbekistan.

Implements the laws of the Republic of Uzbekistan, presidential decrees, decisions of the highest bodies of state power, directs the activities of lower councils of people's deputies, participates in the discussion of issues of republican and local authority. It is divided into 2: local representative bodies and local executive bodies. Local representative bodies operate on a collegiate basis. The main organizational and legal form of work of the local council is a session. All branches of local representative bodies are formed through elections. The law provides for the election of representative bodies with comprehensive knowledge, experience, broad, independent thinking, and the functioning of these bodies. On December 25, 1994 and December 5, 1999, local elections were held in Uzbekistan. Local executive bodies - khokimiyats are headed by khokims of regions, districts and cities, and they act on the principle of monopoly. Authorities consist of departments, divisions and subdivisions, the structure, organization and activity of which are determined by the relevant regulations approved by the Cabinet of Ministers of the Republic of Uzbekistan.

The structure and staff of the executive bodies of the regions and the city of Tashkent shall be determined and changed by the governor in coordination with the Cabinet of Ministers of the Republic of Uzbekistan within the budget approved by the relevant Council of People's Deputies. Structure and staffing of district, city executive authorities and executive bodies of the Republic of Karakalpakstan Local state authorities regulated by the law on in accordance with the legal documents regulating the relations of the Councils of People's Deputies and the governor, an advisory council under the governors was established to consult on important issues and problems in the region. However, the formation of such advisory councils does not undermine the principle of monopoly in the activities of the governor. The heads of the branches of the executive branch shall be appointed and dismissed at the sessions of the relevant councils of people's deputies in agreement with the higher bodies of state administration and on the recommendation of the governor. Documents adopted by local representative bodies and governors must not contradict the constitution and laws. Citizens, public associations, enterprises, institutions and organizations can appeal to the court against the documents adopted by the governor.

Since 2016, Uzbekistan has been actively taking steps to gradually decentralize public administration, however, there are a number of systemic problems along the way. Since the first days of independence, Uzbekistan has paid attention to the issue of gradual decentralization of the public administration system. Especially after 2016, this direction was identified as one of the priorities in the strategy of actions for the development of the republic approved in 2017. The importance of the phased decentralization of public administration was identified among the approved main directions and tasks of the administrative reform of public administration. [1] Cautious decentralization

The reforms carried out in the period from 2016 to 2020 in this direction demonstrate that Uzbekistan is still trying to carefully implement administrative and fiscal decentralization, while maintaining the status quo on the issue of political decentralization. The following decisions should be noted, which were aimed at strengthening local government agencies: Strengthening the financial independence of the regions, supporting the growth of the revenue base of local

budgets, and increasing the powers of local authorities to formulate priority expenditures at the level of oblasts, cities, and regions. At the first stage, the country's leadership decided to conduct an experiment with the local budgets of the city of Tashkent and its districts. Thus, on June 7, 2017, Presidential Decree No. UP-5075 "On measures to expand the powers of local government bodies in the formation of local budgets" and Resolution No. PP-3042 "On expanding the powers of local government bodies and increasing their responsibility for the formation of revenues of local budgets".[2]

According to the above legal acts, a number of receipts as a flat tax on certain types of entrepreneurial activity, property tax and land tax from individuals and legal entities, a single tax payment for micro firms and small enterprises to the revenues of regional budgets. As well as tax for the use of water resources, tax on the consumption of gasoline, diesel fuel and gas, as well as other fees were redistributed in full or in part in favor of the city budget of Tashkent and local budgets of its districts.[3]

Already at the end of 2018, it was decided to extend this practice to other regions of the republic. It was decided, in addition to the above types of taxes and fees, to the regional budgets to transfer part of the most important receipts in the form of taxes on personal income and value added tax, as well as fully receipts from the excise tax on alcoholic beverages, beer, retail sales of gasoline, diesel fuel and gas.[4]

However, unfortunately, the increase in the volume of revenues of local budgets is not always associated with a parallel increase in the level of accountability of local authorities and the introduction of a transparent system for their spending. In many cases, additional revenues are used only to strengthen the material and technical base of local khokimiyats [ local administration – ed.], and not to develop social infrastructure. Transfer of decision-making powers from central government bodies to local authorities and increasing their responsibility for the socio-economic development of regions, cities, and districts.

At the end of 2018, local authorities were also transferred from the republican budget to local funding for a number of state-funded organizations. For example, financial departments / sectors of khokimiyats, departments of justice, territorial plant quarantine inspectorates, information and library centers, territorial departments of state financial control and treasury, museums and theaters of regional significance, as well as departments / sectors of the off-budget Pension Fund.[5] Along with this, in order to activate the independent activity of local kengashs of people's deputies, it was decided to form separate secretariats that will provide organizational, technical and other services for the activities of local deputies.[6] Strengthening the financial independence of the regions, supporting the growth of the revenue base of local budgets, and increasing the powers of local authorities to formulate priority expenditures at the level of oblasts, cities, and regions.

#### Challenges in implementing decentralization measures

Despite the measures taken to increase the responsibility and importance of local authorities, there are a number of systemic problems on the path of the decentralization policy in Uzbekistan: While there have been some changes in the legislation, the fundamental legal act regulating the activities of local authorities, the Law on State Power in Localities, is still being implemented in the outdated version, approved in 1993. [7]

Back in May 2019, it was reported about the development of this legislative act in a new edition, but so far it has not been adopted. According to this project, it was proposed to expand the powers of khokims on the ground, including in their list the coordination of the activities of territorial law enforcement agencies in matters of ensuring the observance of public order, the safety of citizens, the protection of their rights, freedoms and health, the prevention of offenses, compliance with the passport and visa regime, the social rehabilitation of persons who committed offenses of law. [9]

Obviously, it is necessary to adopt this normative legal act in a new edition in accordance with modern realities and within the framework of a cardinal transformation of the public administration system in accordance with the launched administrative reform. Along with this, the approval of the Strategy for the consistent decentralization of public administration with the indication of specific terms for each stage of the transfer of powers from central bodies to local authorities, increasing the independence of local authorities, their financial support, high responsibility, and transparent accountability.

In recent years, the powers of local authorities, especially khokims and khokimiyats, have significantly expanded. Currently, according to the legislation, they perform about 300 tasks and functions, while 175 of them are not included in the main competence of khokims and duplicate the functions of other departments. [10]

Decentralization in the country is developing according to the type of deconcentration, when the powers transferred from the center are consolidated in the hands of the local khokim. Effective decentralization requires greater involvement of non-governmental organizations in the work of local authorities. The transfer of certain functions and the involvement of NGOs to address pressing socio-economic issues in the field of protecting the rights of persons with disabilities, youth, supporting vulnerable groups of the population, as well as education could relieve local executive structures. It would also help to improve the targeting of government support and the role of civil society in resolving significant local issues.

The concept of decentralization implies a gradual decrease in the role of the central government. However, in recent years, there has been a tendency towards an increase in the number of central administrative structures and their staff headcount. Compared to 2016, the number of ministries was increased from 14 to 22 units, state committees from 8 to 10, agencies from 6 to 7, committees from 2 to 4, inspections from 7 to 8. In this vein, currently, khokims of the regions, cities and districts can have up to eight assistants on various issues compared to three to six assistants at the beginning of 2016.

To sum up, it should be noted that the decentralization of public administration is often perceived only as a simple strengthening of the powers of local authorities. In fact, effective decentralization is possible with thoughtful allocation, rather than division of overall responsibility between central and local governments. Effective decentralization implies the creation of a new model of relationship between the central government and local authorities, based on closer cooperation and a strategic role of central government. At the same time, many cases in Uzbekistan demonstrate that the expanded financial independence of local authorities at the current stage of development and, considering the existing gaps in the legislation, is detrimental to ensuring financial discipline and financial stability of the regions.

### ABSTRACT

*Present Day linguistics is rich in tendencies and schools. Formation and development of the anthropological paradigm and its leading position promised much to explain the problems related to how languages change, why do the languages change, what are the main causes of language changes, what is the role of internal and extralinguistic factors in language change? Convergence and Divergence are two main mutually related terms denoting the process of language development from two different angles. The author states, that there are two aspects of convergence: a) glottogonic, dealing with the formation and development of the language; b) structural-diachronic aspect, dealing with diachronical aspect of linguistic structures. Glottogonic convergence is the formation and development of the common structural features in the genetically related or non-related languages as a result of the long-termed and intensive contacts. The author points out, that the linguists distinguish two types of convergence: a) contact-based convergence; b) substratum-based convergence. The closing part of the article deals with the lexical, morphological and phonological types of divergence and convergence as illustrated with the materials from the ancient Germanic languages and the corresponding forms in Gothic, Scandinavian, Latin and common Indo-European.*

**KEYWORD:** *Convergence, Divergence, Convergent Features, Divergent Features, Integration, Differentiation, Linguo-Genetic Investigations, Structural Aspect, Diachronic Aspect, Substratum, Diphthongization, Assimilation, Glottochronology, Language Change, Language Development.*

## INTRODUCTION

Linguistics of the latest decades is marked by the expansion of the new terms to linguistics which earlier belonged to different branches of science, like philosophy, physics, biology, psychology, etc.

Webster's Dictionary gave the following definitions to the terms under discussion:

**“Divergence** – 1. A receding from each other in moving from a common center, the opposite of *convergence*. 2. Disagreement, deviation, from a standard.” [WNED, p. 295]

**“Convergence** – 1. Act or state of converging; also, a degree or point of convergence. 2. Tendency to grow alike; development of similarities in form, habits.” [WNED, p. 222]

A. Ushakov's Dictionary of Modern Russian gives the following definition to the word “divergence”:

**“Divergence** [fr. divergence] – Deviation in features, becoming different. Differences observed in features or qualities are called divergence.” [Ushakov, Vol. I, p. 707]

**“Convergent** – becoming alike as a result of convergence.” [Ushakov, Vol. I, p. 1432]

**“Convergence** – [from Latin “convergeus” - corresponding] scientific term.

– Correspondence of the features of the objects which are not related to each other; becoming alike;

- similarity of some features of the objects not on the basis of their genetical relationship but as a result of some other factors (in biology)”;

- The process when the ace of eyelids comes near when a man looks at a very close object. [Ushakov, Vol. I, p. 1432]

In one of the encyclopaedic dictionaries we find the following definition to the word “convergence”.

1. Formation and development of similar features in genetically different organisms on the basis of the similarity of the place of living and mode of life. Convergence can explain similarity between the body of the shark (fish) and dolphin (mammal), as well as between American cactuses and Afrikan molochais.

2. The direction of the ace of eyelids to the object. [Encyclopaedic dictionary, p. 276]

And now let's analyse the definitions given in the latest editions of that dictionary.

**“Convergent zones** – the zones in the world oceans when the upper currents get together and the water descends. Usually convergent zones are formed when the warm and cold currents meet. The waters going down are enriched by the oxygen of the lower layers of the ocean. According to their size Southern Sub Polar zone is distinguished from others and it forms a belt around the planet between the 50°-60° of the southern latitude.” [Encyclopaedic dictionary, p. 616]

The theory of Convergence is one of the concepts in European and American politology.

In the Penguin dictionary of Science [1978] we find the following definition to the term convergence.

“**Convergence** – Coming to a point...” [p. 89]

To the word “**divergent**” we find the definition – “Going away in different directions from a common path or point.” [p. 115]

**Convergence** – (from Latin Convergo – coming near to, becoming alike). This term is used in biology to denote the process of appearing and development of the similar features as a result of the common location and conditions of life. It is explained by common trends of natural-selection. [p. 616]

In Ethnography this term is used to denote the phenomena which earlier were not found in definite cultures but later appeared in them as a result of different causes. [ED, p. 616]

In linguistics **convergence** is used to denote the formation and development of different structural elements of languages and the languages proper in the process of their historical development. [ED, p. 616]

In geography we use the term “**divergence zones**”. In geography there is a term “**divergence**” which is used to denote the scalar field indicating the density of the Vector field  $a(P)$ . It is marked by the abbreviation  $\text{div } a$ . [ED, p. 616]

The term “divergence” was introduced to the science by Ch. Darwin to explain the differences in the features of the primary organisms which came from one origin as a result of evolution.

In linguistics the term divergence is used to indicate the following phenomena:

- 1) The variants of a linguistic unit (generally the variants of a phoneme) become independent units as a result of the loss of the conditions determining the variation of the units.
- 2) A language unit, for example, a phoneme becomes different in its phonetic representation.
- 3) Variants or dialects of a language develop in the direction forming a new variety or a separate language. [LED, p. 136]

Convergence is an integration or correspondence of two or more essences. There are two aspects of convergence:

- **glottogonic** – dealing with the formation and development of the language;
- **structural-diachronic aspect** – dealing with the diachronical aspect of linguistic structures.

Glottogonic convergence is the formation and development of the common structural changes in the genetically related or non-related languages as a result of the long-termed and intensive contacts. This can happen with the languages which developed from common substratum. In this case scholars differ two types of convergence:

- 1) contact-based convergence
- 2) substratum-based convergence.

These two types of convergence may correspond or coincide. Convergence may include different levels of the language (for example lexical level, morphological level) as well as the entire language. The area where convergence is observed is called convergent zone.

The terms convergence and divergence may sometimes be replaced by other terms having close or similar meanings. For example, some linguists use the terms “Integration” for convergence and the term “differentiation” for the term divergence.<sup>1</sup>

There are two tendencies in the process of a **language development**:

- 1) **Integration** (convergence). In integration dialects or develop towards obtaining common features in phonetic, grammatical structures and vocabulary.
- 2) **Differentiation** (or divergence). In differentiation dialects or languages develop towards obtaining different features in phonetic, grammatical structures and vocabulary to form new languages.

There are two types of factors of language change:

- 1) **Extra linguistic factors**. Extra linguistic factors of language change include a) Geographical factors, b) Social factors, c) Temporal factors.

- 2) **Intra linguistic factors**:

Intra linguistic factors of language change include:

- **Phonetic changes**. Phonetic changes include all kinds of changes taking place in the phonetic structure of a language like consonant and vowel changes.
- **Spelling changes**. Spelling changes include all changes taking place in the writing of words in different varieties of the language, like *honour – honor, colour – color*, etc.
- **Grammatical changes**. Grammatical changes include all changes taking place in the grammatical structure of the language; like using one form instead of another: *have got – have, in the street – on the street*, etc.
- **Lexical changes**. Lexical changes include all changes taking place in the vocabulary of the language. They are: *widening, narrowing, metaphorical use, connotative use, occasionalisms*, etc.
- **Stylistic changes**. Stylistic changes include all changes within the frames of stylistics that is the use of the word of one style can be used in the other style, thus becoming a stylistically marked form.

Convergence and Divergence are closely related to the process of language change. We can frankly say that they make the language change to be systematic. For example:

Any lexical change, can it be the word formation or borrowing may correspond to the general trend of the developments of the word-stock. Then, we observe Integration. If the borrowed word wouldn't correspond to the general trend of the development of the vocabulary it'll be a divergence. For example, the word “*paynet*” was borrowed from English into Uzbek and it has become an Uzbek word which Uzbek speakers pronounce as [pai'net]. In Uzbekistan even the people who know English, and can use English for their general and specific purposes pronounce the word as [pai'net] not as [pei'net]. And if a person pronounces the word correctly, that is as

[ˈpeiˈnet] the people look at him in queer way and correct him as if he is correcting an illiterate person. This kind of “modified”, “spelling based” pronunciation coincides with the Uzbek way of pronouncing words. In linguistics this process is called “**hypercorrection**” or correcting on the basis of a wrong variant.

Integration and Differentiation are also observed in the diachronic processes of inflectional Change, like leveling and the loss of inflections. For example: OIcel and ONorw “*steinn*” (stone) corresponds to Old Swed., Old Dan. “*stēn*”, OIcel., ONorw “*-auga*” (eye) corresponds to OSwed. “*ogha*”; ODan. “*oghe*”, OIcel, ONorw “*lauss*” (untied) corresponds to OSwed, ODan “*lōs*”; OIcel “*eyrir*” (a name of a monet) ONorw “*øyrir*” – OSwed, ODan “*øre*”; OIcel. “*heyra*”, ONorw “*hoyra*” (to hear), OSwed “*hōra*”, ODan “*høre*”, etc.

In diphthongization of “*ě*” we observe divergence of phonemes in North Germanic languages.

OIcel, ONorw “*ek*” (I) – OSwed, O Dan “*iak*”; OIcel, ONorw “*stela*” (to steal) – OSwed “*stia’la*”, ODan “*stia’le*”.

In west Scandinavian languages a special type of breaking can be named as a source for divergence, where diphthongization of “*y*” to “*iu*” (y>iu) before **ngw**, **nkw**, **ggw** become different in neighbouring languages.

For example: OIcel “*syngva*” (to sing) – OSwed “*siunga*”; ODan “*siunge*”; OIcel “*syug*”, OSwed, ODan “*siung*”; OIcel “*søkkva*” (to lower) OSwed: “*siunka*”; ODan: “*sinke*”; OIcel “*tyggva*” (to chew), OSwed: “*tiugga*”; ODan: “*tiugge*”, etc.

A case of divergence we observe when East Scandinavian languages preserved the phoneme “*v*” before “*re*” which was lost in West Scandinavian languages. For example, OIcel “*reiðr*” (angry) – OSwed: “*vredner*”, OIcel “*reka*” (drive) – OSwed “*vræka*”, OIcel “*riða*” (turn) – OSwed. “*vriða*”.

As we see languages are rich in such processes. Let’s analyse some other phonemes of IE origin and see how they developed in Germanic languages:

**IE e > Germ i:** Lat. *fēro* > Goth *bairau*, *baira*, *bairip*; OE: *bēran*; OHG: *bīru*, *birit* (to bear).

**IE o > Germ. a:** Lat. *octo* > Goth. *ahtau*; OScan: *ātta*; OE: *eahta*; OFriz: *achto*; OHG: *ahto* (eight).

**IE ə > Germ. a:** Lat.: *pater* > Goth.: *fadar*; OScan: *faper*; OE *fæder*; OHG: *fater*.

**a > e:** Goth. “*harj*” is “army” – OFris.: *here*.

**ā > ē:** OE *dǣd* (dead) – OFris.: *dēd*.

**ō > ē:** Goth. *dōmjan* (to judge) – OFris. *dēma*.

**u > y > e:** OHG: *kuri* (choice) – OFris. – *kere*.

**au > e:** Goth. *hausjau* (to hear) – OFris.: *hēra*.

**ē > a:** Goth. *tēkan* (to take) – OScand: *taka*.

Goth. *lētān* (to let) – OE *lǣtan*.

**ā > ə:** Lat. *scabō* (to make) > Goth. *skapiau*.

The exact determination of the time of these and other changes depends on many factors, such as, for example, differences in the judgements of contacts, differences in the material selected from within a family, etc.

Thus the divergence times revealed by the glottochronological method are not at all accepted, since the use of this method has not been generally recognized. Beyond this, we may consider comparable those divergence times in which we have a good deal of confidence, and our degree of confidence must depend upon the circumstances. We can be more confident in divergence times that are confirmed by evidence from other sources.

As we see linguists of the present time, as well as the linguists of the XIX-XX centuries could not explain the causes of the first and second Consonant Shift in Germanic languages, also the Change of the Stress system, Assimilation in the sphere of vowels, Rhotacism, Ablaut, etc. using traditional methods and procedures of the Historical-Comparative method, founded by B. Delbrucke, H. Paul, K. Brugmann, K. Osthoff, F. Kluge, A. Meillet, H. Hirt, R. Prokosh, H. Krahe, W. Streitberg, A. Noreen, E. Benveniste, Y. Kurilovica and many others as well as we can mention the theories put forward and developed by the great Russian comparativists, like V.M. Jirmunsky, E.A. Makayev, M.M. Guchman, G.S. Schur, V.M. Serebrennikov, S.D. Katznelson, G.S. Klychkov and others who lived in the XX th century.

We think that those problems, related to divergence and convergence mentioned above can be solved successfully if we apply the principles, theory and procedures of analysis of the linguistic data, as well as the cause and the results of convergence and divergence in Germanic languages.

**ABSTRACT**

*The article examines the existing problems in the preschool education system, ongoing reforms aimed at solving these problems, and the importance of the state program "First Step". The advantages of organizing classes based on interactive methods in PEO are shown.*

**KEYWORDS:** *Preschool Education, Preschool Age, Reforms, Education, Continuous Education, Pedagogical Process, Science, Interactive.*

**INTRODUCTION**

It cannot be exaggerated to say that the system of preschool education is the most important period of the most important link in the formation of personality. Because, although this age of upbringing coincides with a short opportunity of a person's life, during this period the child will understand and learn many percent of what he has learned all his life. This period serves as the foundation for future life.

So, what are the problems in this system, which deals with the education and training of the child in an important period of his life, and how are they solved? What news is being watched in the industry? What to expect from the reforms?

At this educational stage, which is considered important in the life of the child, there are several issues that need to be solved and found a solution. Including:

- \* Full coverage of preschool children in preschool institutions;
- \* To organize the educational process in preschool institutions in a way that can meet the modern requirements;
- to ensure the passage of training in an interactive way, interesting.

The field of preschool education is the primary component of the system of continuous education, which in all respects plays an important role in the preparation of a healthy and harmonious person for school. Therefore, systematic work is being carried out in our country to further develop this sphere, to create all conditions for our children. At the same time, the contribution of not only the state, but also non-state educational institutions to the coverage of children in preschool institutions is significantly increasing.

In general, it is noteworthy that since the establishment of this ministry, preschool education institutions have increased from 5 211 to 8 104 units, the level of coverage of children from 27.7% to 61.8%.

The pedagogical process aimed at ensuring the comprehensive development of preschool children should be simple, suitable for age groups and colorful. The successful implementation of educational and educational work will depend on the correct Organization of the pedagogical process in pre-school educational institutions, each type of activity. Defining the worldview of children in all aspects, both physical and spiritual, as well as spiritual formation and development issues as the main goal in the lessons is considered one of the main tasks facing the current educators.

Sufficient material, technical and methodological and methodological assistance is provided by state organizations to educators in the implementation of these tasks. For example, the program "first step" for the new pre-school education sector, which is being implemented since 2018, is based on state requirements and all preschool institutions in the Republic are introduced to this program. The package of documents, which includes the state and program requirements, has been delivered to Mus in all regions. In addition, for the first time in Uzbekistan, thematic planning programs were distributed to everyone.

The basic principle of this program, which is called the "first step", is the first steps of young children who are already involved in the educational process.

The main tasks of the program " first step" :

- To determine the requirements for the development, content and quality of education and training of preschool children;
- To provide education to children on the basis of national, universal and spiritual values, to introduce effective forms and methods of development;
- Implementation of pedagogical and modern information and communication technologies in the educational process;
- to ensure effective integration of Education, Science and production for the purpose of targeted and quality training of personnel.

In general, it has been shown that state students should develop small and school-age children in five directions.

---

The main area of development of children	Areas of small scale development
1. Physical development and formation of a healthy lifestyle	<ul style="list-style-type: none"> <li>➤ the major motorist interest</li> <li>➤ fine motor oil</li> <li>➤ sensamatarika application</li> <li>➤ healthy lifestyle and safety</li> </ul>
2. Socio-emotional development	<ul style="list-style-type: none"> <li>➤ The concept of "I"</li> <li>➤ Emotions and their management</li> <li>➤ socialization,</li> <li>➤ Communication with adults and peers</li> </ul>
3 Speech, communication, reading and writing skills	<ul style="list-style-type: none"> <li>➤ speaking and speaking</li> <li>➤ reading skills</li> <li>➤ tiny fingers motorikasi of fingers</li> </ul>
4. Development of cognition process	<ul style="list-style-type: none"> <li>➤ intellectual-cognitive skills</li> <li>➤ elementary mathematical skills</li> <li>➤ research-cognitive and effective reflexive activity</li> </ul>
5. Creative development	<ul style="list-style-type: none"> <li>➤ the artistic challenge of imagining the world</li> <li>➤ creative abilities-artistic artistic talent</li> </ul>

Tirib it develops five directions, the child 4 to compensation:

- \* The sphere of "physical development and formation of a healthy lifestyle" competences;
- \* To the sphere of" socio-emotional development " competences;
- \* Competences in the field of" speech, communication, reading and writing skills";
- \* To the sphere of" development of the cognitive process " compensation;
- The sphere of "creative development" will have compensations, that is, they are motivated to go to the 1st grade and are ready for school education.

The process of acquiring knowledge on the basis of the program lies in the development of games through. In children, such concepts as knowledge acquisition, creativity, social orientation develop, a healthy lifestyle is brought up, and they begin to understand how to behave in a social environment. Educating preschool children as inquisitive, active, initiative, free-thinking, observant, healthy is an important task facing parents and educators. The organization of classes based on advanced pedagogical technologies, specific to the modern requirements, using all-round methods of activity of children-interactive methods, is considered to be a very effective factor.

Interest, attention and demand for increasing the effectiveness of education using interactive methods, innovative pedagogical and information technologies in the educational process are increasing day by day.

The significant aspect of the use of pedagogical technologies in the process of education is the breadth of the possibility of carrying out the education that develops the individual.

When modern technologies are used, educators should pay attention to the fact that they seek the knowledge they possess, independently study and analyze it, and even draw conclusions

themselves. The pedagogue creates conditions for the development, formation, acquisition and training of knowledge of the individual and team in this process.

- ✓ At the present stage of development of the educational system, intensive changes are taking place in preschool education, which is considered its first tier, and they are manifested in the following:
- ✓ the basis of pre-school education institutions ' activities is being improved;
- ✓ up to now, educational institutions are moving to new types of financial and economic activity schools; a network of non-public pre-school educational institutions is being introduced; advanced technologies of education are being introduced; improving the system of professional development of employees; alternative forms of preschool education institutions on the basis of term groups are being introduced (on the basis of the "Ilm Road" short-term program) ; investment projects with the participation of financial institutions are being implemented; innovation and experience-testing works in preschool education institutions are being significantly improved.

Today, the rational use of new pedagogical technologies in pre-school education creates favorable conditions for linking education to education, integrating both in terms of structure and content, embodying educational activities, sending them to independent thinking. The lessons conducted on the basis of pedagogical technology become spiritually mature, harmonious personalities, thinking independently of the younger generation. Therefore, in the educational process in educational institutions, the importance and role of modern teaching methods-interactive methods, innovative technologies - can not be overemphasized.

Innovation (English innovation - introduction of innovation) - means changing the internal structure of the system. Innovation is of urgent importance and new approaches formed in one system.

Pedagogical technology is implemented on the basis of a systematic approach to education, and attention is paid to the age, spirit, outlook, knowledge, level of activity, purpose, direction, content, forms, methods of education and training of the educator. The organizer of this process of the educator, the basis of his activity as a creative person, is his knowledge and skills, the ability to influence the interest and aspiration of the child using technical means, the support of methods that serve the child Faux, the ability to achieve guaranteed results.

In conclusion, a number of reforms are being carried out in the pre-school education system, which is aimed at serving the interests of children and teachers, as well as improving the quality of preschool education.

The basis of all things in the state educational program" first step "and the varativ programs" the way of knowledge " is a social approach, that is, in the center of attention - the child and his interests stand. Pedagogical parents, pedagogical content, the child himself and, of course, social partners, such as society and the state, should organize a social environment.

The fact that the interactive techniques used by the educator in the course of the lessons are not only to increase the interest of the children, but also to the extent that they meet their needs, constitute an important basis for improving the quality of preschool education.

### ABSTRACT

*At present, the sources of reactive power are widely used in telecommunication facilities that have windings (electric motors, transformers, etc.) in the design. To manage these sources, necessary to introduce new technical means and elements, including microprocessor blocks. Combined control of reactive power sources and voltage regulation with the help of a microprocessor-based unit of electric receivers of telecommunication objects turns out to be technical and economical not only for reactive power sources, but also for lowering transformers of the power supply system.*

**KEYWORDS:** *Compensation, Electric Motors, Transformers, Reactive Power, Microprocessor Control Units, Active Power, Connection, Voltages.*

### INTRODUCTION

Receivers and converters of electrical energy, which have windings in their construction (power converters, transformers, electric motors, etc.), consume not only active power, but also reactive power. When electricity is transmitted through the electrical networks of the power supply system (PSS) of reactive power (RP), they generate losses of active power, for which the consumer pays. An alternative to an additional payment for electricity is the installation of reactive power sources (RPS) in the electrical network [1-2].

At most facilities with high-voltage electrical equipment, reactive loads are compensated by overexcitation of existing synchronous compensators (SC) with high voltage (6-10 kV) or by placing in the power grid of PSS capacitor installations - high-voltage (WCD) and low (NCB) voltage [3-11].

As shown by the analysis, the loss of electricity in the UK, due to the generation of PM by them, is minimal in the operation of electric receivers with a small consumption of PM. The growth of PM output is accompanied by a sharp increase in electricity losses, which primarily heat SK units. Studies have also shown that the use of any power, as well as high-voltage CS with a power below 1,600 kW, is uneconomical in low-voltage systems [3, 6,7].

It should be noted that even with excess PM of high-power high-voltage CCs and generators that allows to observe contractual parameters with the electricity supplier, the consumer is not immune from unjustified losses of the latter. The remark is typical especially for electrical loads with extended high voltage electrical networks and a large number of reducing power transformers (T) 10 (6) / 0.4 kV of PSS objects.

### MAIN PART

As experience of operation of electric networks and electric receivers of objects of PSS has shown, cosine capacitor installations for them are more widespread RPS. The power of a reactive power source is proportional to the square of the voltage, frequency and its capacitance [2-14]:

$$Q_k = U^2 \cdot \omega \cdot C, \quad (1)$$

where:  $Q_k$  - reactive power of the condenser unit;

$U$  - voltage of the electrical network TK;

$\omega$  - angular frequency;

C-capacity of the condenser unit.

The use of embedded microcomputers in the block of microprocessor combined automatic control of reactive power sources makes it possible to reduce damage from damage to electrical and electrical equipment and to improve the quality of generated electricity.

Connection of capacitor installations for compensation of reactive power at different voltages of PSS objects is shown in Fig.1.

Fig.1. Scheme of capacitor installations for compensation of reactive power at different voltage levels of electrical networks.

For an example we will determine the additional losses of active power  $\Delta P$  in T and cable lines of PSS with a length of 400 m with a cross section of 50 mm<sup>2</sup>.

Suppose, before the installation of the NSC at the PSS site, there were loads: load factor, time of maximum power losses:  $\tau = 5000$  h.

After the installation of the NSC, the load of the PSS facility will have the following values:

The current flowing through the electrical networks of the PSS facility is determined as follows:

$$I_1 = \frac{S_1}{U\sqrt{3}} = \frac{860}{(10,5 \cdot 1,73)} = 47 \text{ A}; \quad (2)$$

$$I_2 = \frac{S_2}{U\sqrt{3}} = \frac{707}{(10,5 \cdot 1,73)} = 39 \text{ A}. \quad (3)$$

Additional power losses in the HV cable:

$$\Delta P_K = 3R_K(I_1^2 - I_2^2) = 3 \cdot 0,248(47^2 - 39^2) = 0,52 \text{ кВт}. \quad (4)$$

Additional power losses in T of the PSS object depend on its load losses:

$$\Delta P_T = \Delta P_{K3}(K_{31}^2 - K_{32}^2) = 10,6(0,862 - 0,7072) = 2,54 \text{ кВт}. \quad (5)$$

Total power loss:

$$\Delta P = \Delta P_K + \Delta P_T = 0,52 \text{ кВт} + 2,54 \text{ кВт} = 3,06 \text{ кВт}. \quad (6)$$

The energy savings for PSS facilities for the year will be:

$$\Delta \mathcal{E} = \Delta P \cdot \tau = 3,06 \cdot 5000 = 15300 \text{ кВт} \cdot \text{ч}. \quad (7)$$

The increase in the capacity of T and the cable lines of PSS objects can be taken into account with corresponding shares of their cost.

For power transformer TC:

$$\Delta K_T = K_T(S_1 - S_2)/S_1 = 500000 \cdot (860 - 707)/860 = 88953 \text{ руб}. \quad (8)$$

For cables with a long-lasting current

$$I_D = 130 \text{ A};$$

$$\Delta K_K = K_K(I_1 - I_2)/I_1 = 62000 \cdot (47 - 39)/130 = 3815 \text{ руб}. \quad (9)$$

Payback period of the NCB:

$$T_{OK} = (K_{KV} - \Delta K_T)/(C_{cp} \cdot \Delta \mathcal{E}) = (160000 - 88953 - 3815)/(0,77 \cdot 15300) = 5,7 \text{ года}. \quad (10)$$

The indicator of the effectiveness of this measure is determined as follows:

$$ПЭФФ = \left( \frac{T_{OK \text{ НОПМ}} - T_{OK}}{T_{OK \text{ НОПМ}}} \right) \cdot 100\% = \left( \frac{8 - 5,7}{8} \right) \cdot 100\% = 28,75\%. \quad (11)$$

## CONCLUSION

1. The specific value of the WKB is half that of the NCB. However, the constant component of costs for WKB is higher due to the greater cost of connecting them to the electrical networks of PSS objects.
2. Parameters of the regulated NCU - the number and power of the control stages, the power of the unregulated part - are determined by the daily schedule of consumption of PM by electric receivers.
3. Combined control of reactive power sources and voltage regulation with the help of IRM proves to be effective only for NKR, included behind the large inductive resistance of step-down transformers of PSS objects.
4. To change the voltage by one percent of the nominal value, it is necessary to change the PM after transformer, behind the transformer, behind the cable line length, behind the cable line length.

As shown by the conducted studies, the proposed method of selection and application of reactive power sources and microprocessor combined control allows them to reduce by 28.7% the payback period of the implemented technology and the elements of electricity consumption management and to increase the efficiency of energy saving measures implemented in the PSS objects.

### ABSTRACT

*Robert Burns and Berdach are widely renowned in literature due to their unrepeatable poetry of English and Karakalpak languages .Both of them are great poets who are loved by their nation for their remarkable works. The study proposes to compare the views of these two poets in the theme of "Freedom". Despite the fact that they belong to different religions, cultures, centuries and countries, there are striking similarities in their conspicuous works.*

**KEYWORDS:** *Robert Burns, Berdach, Freedom, Liberty, Honesty, Justice, Poetry*

### INTRODUCTION

Robert Burns is a National Bard, the Ploughman Scottish poet and lyricist. He was born on January 25, 1759 in Ayrshire, Scotland. He is the best known of the poets who have written in the Scots language, although much of his writing is in English and a light Scots dialect, accessible to an audience beyond Scotland. He wrote his first poem when he was 15 years old. It was "Handsome Nell". Its subject is Nell Klipatrick who is the daughter of the village Blacksmith. He describes circumstances in his first poem in an autobiographical letter to Dr. John Moore, a doctor and writer with whom he corresponded. He also wrote in standard English. His notable works are: "Tam O'Shanter", "Auld LaungSyne", "To a mouse".

Berdach is a Karakalpak classic poet of the 19<sup>th</sup> century. He was born in 1827, Muynak, Karakalpakstan. His father was a fisherman. When Berdach was 10 years old, his parents died and he was brought up by his relatives. He wrote his first poems "O'gizim" and "Shig'irim" when he was 10. These poems were about agriculture. He is famous for his epic

poem ‘Shejire’. He studied in Karakumlyshan madrasah but he couldn’t continue his study because of poverty. He lived in poverty and described it in his poem “Jaz keler me? (when will summer come)?”:

“Tamag’imjoqisherge,  
 Ko’ligimjoqko’sherge,  
 To’segimjoqto’serge  
 Biz sorli’gajazkelerme ?  
 Ko’silipjataru’yimjoq,  
 Iyinge tartar kiyimjoq  
 Toqlardanbizgebuyimjoq  
 Men sorlig’ajazkelerme ?[1,166 p]

In this poem he describes that he doesn’t have any home to live, food to eat and clothes to wear. He compares “summer” to “happy days” for him and his nation.

### **The main themes of the poetry of poets and how they are described through stylistic devices**

We can see a lot of revolutionary-democratic motives in Berdach’s works. Of course, it is due to the social, financial and political conditions of Karakalpaks at those times. In the XVII-XVIII centuries, Karakalpaks lived in the downstreams of Syr Darya river. As a result of different historical processes, they settled in Khorezm in the middle of the XVIII century. Khiva Khanate completely conquered them in the XIX century, the century Berdach lived. The later life of Karakalpaks was dependent on Khiva Khanate. Khiva Khanate oppressed them, demanded high amounts of taxes. Berdach described it in his poem “Saliq”:

Biltirg’idanbiyiljaman,  
 Qalayqalayboldi zaman,  
 G’aripqaserqalmayaman,  
 On tilladankeldisaliq.  
 O’ndiredi ash xaliqtan  
 Jetimjilaydisonliqtan  
 Bay amanqaldisaliqtan  
 Dohmetboldiusisaliq,-[1,48 p]

In this poem he describes that only poor people payed the taxes, not the rich. By this, the poet tries to emphasize the inequality between the rich and poor. Also the amount of tax was higher than the past years and it was very difficult for the people to pay it. In the poem “Bolg’anemes” the poet uses metaphoric lines to emphasize his difficulties in life that he didn’t have any freedom to write his right thoughts due to the khans:

Gu’lboldinguljaynamadim,

Oyshilboldimoylamadim,  
 Bu'lbilboldimsayramadim,  
 Hadiyseazbolg'anemes[1,162 p]

At those times ,the khans made poets write poems about khans with respect.Otherwise ,it would be even worse for poets .This is illustrated in this poem with the idiom “tastaytunekkejoliqtim”(left in the darkness).He compares the poor to the rich by using metaphor:”lashing'aqurg'an tor boldi ,tordiheshkimu'zgenemes”.

The same meaning is illustrated in Robert Burns’ “Is there for honest poverty?” poem which describes the social inequality in the XVIII century:

Is there for honest poverty,  
 That hangs his head and all that,  
 The cowards slave ,we pass him by,  
 We dare be poor for all that,  
 For all that and all that,  
 The rank is but the guinea’s stamp,  
 The man’s the gold for all that[3,259 p]

The poet tries to describe that the value of human’s life is not measured with wealth or money by using metaphors in the last two lines.

Then let us pray that come it may,  
 That sense and worth over all the earth,  
 Shall take the prize and all that,  
 For all that and all that,  
 That man to man the world over,  
 Shall brothers be for all that.[3,259 p]

In these verse,the poet hopes that one day all people will be equal and they will be as brothers for each other.He hopes for bright future.

Despite the fact that the main theme of Robert Burns’poems is love,we can find some poems about justice and liberty in the poem “The slave’s lament”,he tries to show the inequality ,especially slavery.He compares slavery to liberty :

The burden I must bear while the cruel scourge I fear,  
 In the lands of Virginia-ginia,O  
 And I think on friends most dear  
 With bitter,bitter tear,  
 And Alas I’m weary,weary,O.[3,732 p]

In this poem the narrator is the slave himself. He shows his emotions. One important thing, it is revealed to the slave's past: he had a lot of friends when he was free, and now he is a slave and his friends make him afraid. It is described with the epithet "bitter tears" in the fourth line of the poem.

All things considered, the world-renowned poets from different countries and cultures, Robert Burns and Berdach have left conspicuous works including similar emotions of freedom. Even though they wrote in different languages, they both illustrated the idea of freedom and justice in their masterpieces.

## PHONETIC INTERFERENCE OF VOWEL PHONEMES IN UZBEK- RUSSIAN AND UZBEK-GERMAN BILINGUALISM

**Askarova Shakhnoza Ismailovna\***

\*Basic Doctoral Student,  
 Fergana State University, UZBEKISTAN

### ABSTRACT

*The article examines the issues of phonetic interference in Uzbek-Russian and Uzbek-German bilingualism, as well as identifying the features of phonetic interference in the speech of Uzbek speaking students in the process of acquiring Russian and German. **The purpose** of this work is to identify the features of bilingualism, phonetic interference of the vowel sounds of Uzbek, Russian and German languages. It is established that the Uzbek language has a greater impact on the German language system in the learning process than the Russian language. The Uzbek language, as a system mastered in a natural environment, affects the process of mastering all subsequent language systems. The phonetic interference of the Russian and German languages is most clearly expressed in the pronunciation of phonemes and intonation, and this is primarily due to the methods of mastering these languages. **Materials and methods.** The material for this study was linguistic scientific articles, abstracts and monographs. The study of Russian and German languages usually occurs at a conscious age, so the simple imitation that begins the development of the native language is replaced by the identification of language systems. In the course of studying the problem of phonetic interference, a descriptive method of vowel phonemes in the Uzbek, Russian and German languages was used, which makes it possible to understand and generalize the corresponding theoretical material. **Results.** The results of the study are as follows: to explore the manifestations of phonetic interference in Uzbek-German and Uzbek-Russian bilingualism, which are most displayed in phonetics, grammar and vocabulary. At the same time, the first foreign language begins to have a great influence on the second. The degree of interference of languages largely depends on the contact of languages and the level of linguistic competence of individuals. Improving the language competence of a bilingual is an effective way to prevent interference. To reduce the degree of influence of languages on each*

other, the ability of individuals to switch language codes should also be developed. Universal errors arising at the point of the largest approximation of languages are adjusted by the targeted fixing of the foreign language material. **Conclusion.** The manifestations of sound (phonetic and phonological), spelling, grammatical (morphological, syntactic and punctuation), lexical-semantic, stylistic and, finally, intra-linguistic interference must be distinguished from the phenomena of language switching, in which a language change occurs. Interference is a characteristic process of a bilingual situation. Features of these stages can be influenced by both internal and external factors. It is necessary to observe the influence of extra-linguistic situations on bilingual speech.

**KEYWORDS:** *Language Contacts, Bilingualism, Multilingualism, Interference, Vowel Sound, Language System, Phonetic Interference.*

## INTRODUCTION

Bilingualism as a result of language contacts, which are inevitable in the world of globalization, is of absolute interest along with other linguistic results, such as language borrowing, language change, language mixing and interference phenomena that naturally follow it. The characteristics of the communicative scopes and forms of language existence, within which language contacts take place, their intensity and regularity, turn out to be the most important aspects in the analysis of cases of deviation from the norms of each of the languages involved in the contact situation, and are manifested in the speech of bilinguals as a result of their acquaintance with in more than one language. In connection with the contacting of languages, one can observe changes in the system of phonemes L1, L2 or L1, L2, L3, manifested in the form of changes in the implementation of certain phonemes or the phonological system as a whole, as well as violations of the differentiation of significant features in contacting languages, leading to confusion, non-discrimination or rethinking linguistic facts. The linguacultural situation is often characterized by an active non-equilibrium Uzbek-Russian and Uzbek-German bilingualism, the main feature of which is its diglossic-bilingual nature.

Bilingualism or multilingualism and linguistic contact are prerequisites for the manifestation of linguistic interference, which can become the beginning of borrowing, transfer, from one language to another, or fusion (convergence) of certain elements of the contacting languages. The problems of bilingualism, multilingualism and the influence of languages on each other have attracted the attention of researchers for a long time. In the multilingual regions of the Republic of Uzbekistan, there is a diffuse nature of linguistic processes in combination of the spoken language with the literary language, which creates problems for the bilingualism as a linguistic personality in linguacultural identification.

With regular language contact and bilingualism, the phenomenon of *interference* occurs. In linguistics, the problem of interference is considered within the framework of linguistic contacts and interference is understood as a violation by a bilingual (a person who speaks two languages) of the norms and rules of the ratio of two contacting languages. [1]

Interference problems have worried many linguists. For the first time, the idea of the mutual influence of languages on each other was put forward by the Russian-Polish linguist I.A. Baudouin de Courtenay. By interference, the scientist understood the convergent restructuring of

languages in the course of contacts. It should be remembered that at that time the term "interference" was not yet widespread. The main idea of I.A. Baudouin de Courtenay was that as a result of the mutual influence of languages on each other, not only the borrowing of individual linguistic units occurs, but also the convergence of languages as a whole [6,317].

The term "interference" comes from the Latin words "inter" (between) and "ferens" / "ferentis" (carrier, carrying). It first appeared in the fields of physics, chemistry and biology, and then was borrowed into the field of linguistics. This phenomenon is studied in linguistics, sociolinguistics, psychology and psycholinguistics and can manifest itself in both oral and written speech. [2]

According to the theory of such linguists as W. Weinreich, I.A. Zimnyaya, A.A. Leont'ev interference is the replacement of the system of rules of the target language with another, built under the influence of the system of rules of the native or previously studied language [3,4,5]. Moreover, the interference arising from the negative impact of the native language and the first foreign language on the studied third language in bilingualism covers all linguistic levels of the language.

There are three main forms of interference. We are talking about phonetic, grammatical and lexical-semantic interference. The problem of phonetic phenomena, respectively, the interference becomes especially relevant in connection with the question of acceptance or non-acceptance of specific phonetic phenomena. Determining phonetic hindrances, their causes and impact on communication are important tasks for phonetics researchers, teachers and students working in the field of German as a foreign language. This applies in particular to phonetic phenomena in the comparative analysis of the German and the native language. The article discusses phonetic interference from the native language (in our case, Uzbek) to the target languages (Russian and German).

In the sound systems of the Uzbek, German and Russian languages, there is a significant range of articulatory and acoustic phenomena that do not coincide with each other. This leads to an emphasis in bilingual pronunciation. To eliminate the emphasis, it is necessary to refer to the data of the acoustical-articulatory features of phonemes, which deals with the phonological system of a non-native language, to master syntagmatic and paradigmatic patterns in order to understand the similarities and differences of the Uzbek, Russian and German language systems.

The system of German vocalism has 18 vowel phonemes, three times more units than Uzbek and Russian. This is due to the presence in it, firstly, of long and short vowel phonemes and, secondly, labialized front vowels. These two features of the sound system of the German language, as well as the hard onset of vowels at the beginning of words and morphemes, which has a delimiting meaning in the flow of German speech, have a constant interfering effect on the pronunciation of the Uzbek and the Russian speaker in German. The timbre of vowel sounds depends more on the position of the tongue, soft palate and lips.

In the conditions of Uzbek-German and Uzbek-Russian bilingualism, there are many obstacles, that is, the phenomenon of interference in the phonetic system of these languages. To overcome obstacles in mastering a non-native language, Uzbek students need to study phonetics by comparing the sounds of vowel and consonant phonemes. The characteristic of vowels is related to the type of syllable. German vowels: [i:], [ɪ], [y:], [ʏ:], [u:], [ʊ], [ɛ:], [ɛ̃:], [z], [ø] [œ], [o:], [ɔ], [a:], [a], [ə], [R], [ao]. The sounds of the Russian language are divided into vowels and consonants. The vowel sound consists only of the voice. The consonant sound consists of voice

and noise or only noise. In Russian there are 6 vowel sounds: [a], [o], [e], [y], [and], [s]. Uzbek vowels: [i], [e], [a], [u], [u], [o].

According to the movement of the tongue along the vertical, or according to the degree of rise of the tongue, according to the degree of approach to the palate during the formation of sound, all vowels are divided into sounds of the upper, middle and lower ascents. According to the movement of the tongue horizontally, or at the place where the tongue rises during the formation of sound, the vowels are divided into vowels of the front, middle and back rows. If the vowel sounds of German are I - [i:], [ɪ], E - [e:], [ɛ:], [e], U- [u], [Y], O - [o:], A - [a] of the upper ascent, then in the Uzbek language the vowel sounds of the upper row include [and], [a], [e], in Russian the upper one is [and], [s], [y], the middle one is [e], [o], lower - [a]. Thus, the lower ascent of vowels in German includes [o:], [o], [a:], [i:], [i], and in Uzbek, the vowels [u], [a], [about].

The phoneme [and] of the Russian language is the sound of the front row, high rise, non-diphthong, non-labialized. In the Uzbek language, the vowel phoneme [and], possessing the same specific features, differs significantly from the analogous Russian phoneme. There are two variants of the phoneme in the Uzbek language: anterior [i] and posterior [s]. In terms of its articulation characteristics, Uzbek [and] occupies an intermediate position between the front and rear sounds, that is, it is the sound in between the Russian [and] and [s]. A great difficulty in mastering Russian pronunciation is the vowel sound [s], which is absent in Uzbek and German vocalism. Even if students begin to distinguish by ear the sounds [and] - [s] articulation of the vowel [s], that is, the upper rise of the middle part of the back of the tongue, not accompanied by labialization, is not given to them for a long time. Compared to the vowel [and], the main articulatory movement of the vowel [s] is the backward movement of the tongue. But Uzbek students tend to replace the desired articulation with the familiar one. The vowel sound [s] is found in the Uzbek language mainly in borrowed words from the Russian language, for example: cheese, exhibition. In articulation, this vowel differs from the vowel [s] existing in the Uzbek lexicon, by raising the tongue, by a narrow back row, by touching the sides of the tongue to the hard palate. In the spoken process, this sound is almost distorted and faces assimilative conversion, since Uzbeks do not have an articulatory skill for the vowel [s] [9,65].

According to the theory of academician V.V. Reshetova: "If the more posterior shade of the phoneme [u] = [b] is characterized by us as acoustically close to [s] but Russian [s] is not identical [7,138].

If mistakes in bilingual speech are associated with the use of German labialized vowels of the front row, then a methodical technique should be deliberate stretching of the lips, although in Russian when pronouncing [s] the lips are neutral, In the position of the end of a word under stress, for example, in the words: mountains, you, walls, tables, carpets, writing, etc. - sometimes there is a diphthong pronunciation [s] with s-shaped or u-shaped shades at the end of the sound. This discontinuity in sound is the result of an inability to fix the vowel line or rise [s].

Unlike Uzbek and Russian vowels, German vowels are divided into short (with a minimum duration), long and semi-long. Longitude and brevity of sounds perform a meaningful function. For example, the difference in the sense of sentences is determined only by the duration of the vowel in the words: Städte (long sound - "cities") and Stätte (short sound - "place.")

Wirbesuchtergern die Städte. - We enjoyed visiting cities. WirbesuchtergerndieseStätte . - We visited these places with pleasure. ") [8, 6].

The vowel sounds of the German language form pairs "long vowel" - "short vowel". The difference leads in most cases to the emergence of differences, called qualitative. The difference in their articulation depends on how wide the mouth is when pronouncing the vowels. At the beginning of a word or root of a word, German vowels should be pronounced with a so-called hard attack. A hard seizure is the result of the rapid opening of tightly closed vocal cords and is perceived in the stream of speech as a light clicking sound. Thanks to a firm fit, words beginning with a vowel do not merge with the previous word into one sound group when pronounced. Thus, we see some differences in the phenomenon characteristic only of the phonetic system of the German language, which shows a significant difference from the systems of the Uzbek and Russian languages, compare: bu \_ uskun. This \_ setting (continuous pronunciation). diese Anlage (non-fusion due to hard attack).

When pronouncing German vowels, tension of the entire vocal apparatus is necessary, ensuring the preservation of the homogeneity of the sound throughout its sound. In the Uzbek and Russian languages, when pronouncing vowels, the vocal apparatus is not tense, which leads to non-uniformity of the sound of vowels (sliding). Compare: [to: t] tot - dead [that] - that. In German, primarily [o:] and [e:], they retain their sound in unstressed syllables, while in Uzbek and Russian they often change completely, for example: [fo · ne · tik] Phonetik - [fanetics] - phonetics [me · te · o: r] Meteor - [mitior] - meteor. In German, unlike Uzbek and Russian, all vowels are pronounced in unstressed syllables cleanly, clearly and clearly. In Russian, vowel sounds, especially [o], in unstressed syllables are pronounced very vaguely, like a cross between [a] and [o]; Wed the Russian word "professor" and the German word Professor [pro · ' feso: r]. Often, not only beginners but also advanced Uzbek learners of Russian are unable to pronounce some Russian sounds correctly. For beginners to study the Russian language of foreigners, the difficulty in studying the Russian alphabet and Russian phonetics lies in the fact that almost all letters of the Russian alphabet can denote several different sounds, for example: the letter E can denote the sounds [e], [ye], [and], and sometimes even the letter - E - can denote the sound [s] (after the consonants w, w, c without stress: price, wife). As shown above, the Russian language is written in Cyrillic. The Russian alphabet has 33 letters and, therefore, more than the Uzbek and German alphabets. Some Russian letters resemble Latin letters used to write Uzbek and German languages, for example A / a, O / o, K / k, but Sh / w, Y / s are not displayed from the Latin font. On the other hand, Russian language does not know some Latin letters, as well as the rewriting of the German language (W / w, Ä / ä, Ö / ö, Ü / ü, Z / z, etc.). This poses a challenge for Uzbek German learners as well as German teachers to cope with sounds they are unfamiliar with. It is especially difficult to formulate front round vowels such as Ö or Ü. With interference, not only phonology is important, but also the implementation of sounds in the speech process.

Summing up, it should be noted that a comparative analysis of the phonological units of the Uzbek, Russian and German languages gives grounds for the assertion that the interference in Russian and German speech of Uzbeks at the phonetic level is caused by: a) the presence of the law of vowel harmony in the Uzbek language; b) the presence in the Uzbek language of sounds that are close, but different in their articulation from the sounds of the Russian and German languages; d) the presence in the Uzbek language of sounds that have no analogy in the sound composition of the Russian and German languages. A characteristic feature of the interference in

Russian and German speech of Uzbek students can be considered that phonetic interference is observed in the forms of external and internal, direct and indirect interference. In some cases, interference manifests itself in a combined way as indirect and intra-lingual and can cover several linguistic levels.

In the similarities and differences in the phonetic structure of the Uzbek, Russian and German languages, we see the basis for determining the specifics of the interference in the Uzbek-German and Uzbek-Russian bilingualism in the Russian and German speech of Uzbek students.

In the course of the study, it was established that it was necessary to create textbooks and teaching aids for the phonetic - practical course of the Uzbek-Russian and Uzbek-German languages, including special exercises to overcome the interfering influence of the native language on non-native languages in the context of bilingualism.

### ABSTRACT

*This article presents the results of a study of the lifestyle of aquatic mollusks and the ecological group of Central Asia. In the considered ecological groupings, the composition of species is very often relative, since some of the representatives of these groups can inhabit adjacent biotopes. A striking example of this is the views of the Galbas.str section. Among the small reservoirs there are both flowing (springs, streams, rivers, canals) and standing (ponds, haus, saz, swamps, reservoirs, medium-sized lakes). These bodies of water differ in origin, position above sea level, content of organic matter in them, salinity, turbidity, temperature, etc.*

**KEYWORDS:** *Central Asia, Molluscs Ecological Group, Stagnophiles, Rheophiles, Telmatophiles,*

### INTRODUCTION

Central Asia, despite the aridity of this region, has a complex hydrographic network, including numerous and varied water bodies. It is based on rivers, mainly of glacial feeding - Syr Darya, Amu Darya and others. Among the small reservoirs there are both flowing (springs, streams, rivers, canals) and standing (ponds, haus, saz, swamps, reservoirs, medium-sized lakes). These bodies of water differ in origin, position above sea level, content of organic matter in them, salinity, turbidity, temperature, etc. For each of the listed types of water bodies, certain ecological groups of mollusks are characteristic (Zhadin, 1933, 1940, 1950a, b, 1952; Izzatullaev 1981, 1982, a, b, 1983).

Molluscs that live in rivers, streams, springs, warm springs, and the surf zone of lakes are classified as rheophiles. The ecological group of inhabitants of stagnant reservoirs is made up of stagnophiles.

Molluscs - rheophiles (inhabitants of moving waters) in the reservoirs of Central Asia with respect to the biotopes inhabited by them are divided into the following groups; lithoreophiles (inhabitants of a solid substrate) - *Dreissenapolyomorpha aralensis*, *D.p.obtusicarinata*; phytophils (inhabitants of thickets) - *Lymnaea auricularia*, *L.psilia*, *Hippeutis diaphanella* and *H.euphaea*; peloreophiles (inhabitants of the silted bottom) - *Theodoxus pallasi*, *Cinnapiscinalis*, *Pisidum amnicum*, *Corbicula cor*, *C.fluminalis*, *C.purpurea*, *Corbicula ferghanensis*, *C.tibetensis*, *Colletopterumbactadrianum*, *C.cyreumsogdianibba*, *S. puerorum*; crenophiles (inhabitants of springs) - representatives of the genera *Bucharamnicola*, *Turkmenamnicola*, *Valvatamnicola*, *Martensamnicola*, as well as species *Alloocinmacaspica*, *Karinarella minima*, *K.likharevi*; thermocrenophiles (inhabitants of warm springs) - *Melanoides kairanensis*, *M.pamiricus*, *M.shahdaraensis*; thermocrenophile-phytophile-*Lymnaea alticola*.

In addition to these clearly demarcated groups, there are ecological groups that form on silty-sandy soils - *Pelopsammophiles* (Neizvenova-Zhadina, 1937; Zhadin 1940). These include 6 species of *Melanopsis* and some other groups.

Stagnophiles, in turn, are subdivided into lake dwellers (limnophiles), puddles (telmatophiles), and swamp dwellers (eleophiles). Limnophils, depending on the substrate, are subdivided into ecological groups: phytophils, lithophiles, pelophiles, pelo-psammophiles. The most typical representatives of the latter in the water bodies of Central Asia are inhabitants of fresh waters (*Euglesa conica*, *E. feroense*, *E. fedderseni*, *E. zugmayeri*, *E. borealis*, some representatives of the genus *Odhneripisidium*) and brackish waters of 6 species of the genus *Caspihydrobia* *Peudocaspia issykulensis*; : *Cinnagafurovi*, *C.depressa*, *C.klinensis*, *Anisus centralis*, *Musculium hungaricum*, *Colletopterum ponderosum*, some species of the genera *Euglesa* and *Odhneripisidium*, phytophilam: *Cinnastolickiana*, *Boreolonacaerulans*, *Digonistomakashmirensis*, *crematorium* a *Dreissenacaspiapallasi* belongs to the brackish water pelolimnophiles. In the reservoirs of Central Asia there is an acclimatizer of brackish waters - pelo-psammolimnophil - *Adacnacolorata*. Telmatophiles, inhabitants of puddles, are unequal, and therefore they are divided into inhabitants of periodic water bodies (*Cinnina umbilicata*, *Lymnaea aberlani*, *L.iliensis*, *L.saridalensis*, *L.terebrabolotensis*, *Aplexahypnorum*) and drying up water bodies. Of the Central Asian mollusks, only *Lymnaea kazakensis* and *Planorbis stenostoma* belong to this group. These groups of reservoirs differ in that in the former the bottom is covered with moisture-loving vegetation and they dry out for a period of 1 to 3 months, in the latter the bottom is bare clay and dry up for a period of more than 4 months.

It should be noted separately phytophils - inhabitants of thickets of rivers and stagnant water bodies - *Lymnaea stagnalis*, *L.fragilis*, *Costatella acuta*, *C.integra*, *Planorbis planorbis* and 5 species of the genus *Anisus*.

In the considered ecological groupings, the composition of species is very often relative, since some of the representatives of these groups can inhabit adjacent biotopes. A striking example of this is the views of the *Galbas.str* section. (subgenus *Galba*) which include: *Lymnaea truncatula*, *L.gaupili*, *L.oblonga*, *L.subangulata*, *L.thiesseae*, *L.shirazensis*, forming a special group of madicol mollusks that inhabit wet surfaces (i.e. wet walls and slopes) ... These species can also be found in drying up water bodies and in springs (in the latter, wet surfaces are very common), as well as at the water edge of large water bodies. The species of the section *Montigalba* (*L.tengriana*, *L.almaatina*, *L.bowelli*) live in springs and are thus limnocrenophilous.

*L. lagotis* is an inhabitant of semi-permanent water bodies (i.e., drying up for a period of 20 days-1 month - according to Klimovich's classification). *Planorbisplanorbis*, *Pl.sieversi*, *Pl.tangitarenensis* and usually live there (they are all found in permanent water bodies). Semi-permanent water bodies, in contrast to periodic ones, are characterized by overgrowth with coastal aquatic vegetation.

From small bivalve molluscs - *Pisidumammicum* can live on sandy and silty soils of rivers and lakes. Typical eurybionts are phytophils - *Lymneasubdisjuncta*, *L. bactriana*, *L.fontinalis* and telmatophiles - *L. lagotis*, *Anisusladacensis*, *Planorbisplanorbis*, etc.

Thus, in the water bodies of the studied territories, aquatic mollusks of Central Asia are represented by various (6) ecological groups, the leading place among which is occupied by phytophils-9 (30.00%) species, crenophiles-5 (16.67%), pelolimnophiles-3 (10 %), pelosammolimnophiles (6-66%), telmatophiles-1 (3.33%) and madicol-3 species (3.33%).

Distribution of ecological groups of aquatic molluscs in the river basins of Central Asia.

### ABSTRACT

*Today, the development of tourism in the Republic of Uzbekistan is growing from year to year, due to the fact that in our article the tourism industry is one of the fastest growing. The use of terms entering this field from the point of view of this field forces them to be studied carefully. We will consider them on the example of Uzbek and French, as well as on the example of words with the word "tour" in the field of tourism.*

**KEYWORDS:** *Tour, Tourism, Tornado, Tourist Turpolisiya, Turfirma, Turpaket, Turmarket, Turmarshurt, Tur-Farm.*

### INTRODUCTION

Tourism is one of the fastest growing industries. The use of terms entering this field from the point of view of this field forces them to be studied carefully. We can see this in the example of the Uzbek and French languages, as well as in the field of tourism with the word "tour".

As a field develops in the world, new words begin to enter that field. It follows that the introduction of a new word means the addition of terms related to the same field. This means that the field of tourism, which we have chosen as the basis of our research, is also one of the areas that is developing from year to year, and new terms are entering the field. From this point of view, the accidental entry of terms in any field of human professional activity is not a mere process. Any set of terms, even if not structured without additions, is structurally related and has

a unique structure. The terms are not randomly grouped, but grouped based on the systematic nature of the science, the knowledge they serve.

This article is about words made with the word "tour". The word "tour" comes from the Latin word "turno" which means to wrap, to turn, and in French the word "tour" means to turn, turn, turn, and again it is The type is a strong tower. It is a special high place built to watch the cities, castles and shahristans from the enemy's attack. It is noteworthy that the lexical meaning of the word is reflected in the fact that the towers are usually circular. It is also used in dance as a term for rotational movement; If we understand a tour as a journey to a specific destination and return to one's destination, in French the word also means: for example; grand tour - a journey of rich people with their families all over Europe; tour de concert (tour de concert) concert tour is a type of travel in which artists and composers travel in different countries within the same music. In addition, the word "tour" reflects the stages of selection in sports competitions. For example, the Tour de France is a bicycle race that has been held in France for many years.

Any word sign (including and a term of a particular language has a national-cultural identity, which does not mean that there is any special cultural component in its semantics: any element of the content plan in oral speech (denotative, emotional, linguistic and empirical) may have cultural specificity. However, the national specificity of a terminological (primarily non-equivalent) dictionary may be explicit or minimal because only ma There is a peculiar systemic connection of the verbal sign in a certain national language. This phenomenon is undoubtedly peculiar to tourism terminology.

The Uzbek language also has new words (neologisms) formed by the word "tur". The word tour actually means organizing excursions for tourists in a specific direction, with a set of services and a definite duration. It is noteworthy that the words formed by the word "tour" are not translated into Uzbek, but are directly assimilated. For example, the word tourism is a mastered word formed by adding a suffix -izm to the word "tour". This means that a person leaves his / her place of permanent residence for a period of one year without engaging in paid activities at the place (country) where he / she is going for professional, health or other purposes.

A tourist is a person who has a pre-planned purpose and desire to travel to certain places, or a person who crosses the border for a period of not less than 24 hours and not more than 6 months in order to satisfy his interests. Tourist police is a word formed by adding the word "police" to the word "tour" and is responsible for the safety of tourists in special clothing. There is no exact alternative to this word in Uzbek; travel agency - a manufacturing company that organizes and offers travel in cooperation with different countries; tour operator - a person who organizes a trip for tourists and is directly responsible for this trip; tour package (travel product) - a travel bag provided to tourists, which includes the cost of transportation to hotels, restaurant and kitchen services, a list of travel destinations, health insurance and other services; travel agent - a person who establishes contacts with other foreign travel agencies, sells them travel packages (travel products) and advertises and offers travel products; Tour route - a place where tourists can travel, historical monuments and modern buildings and other tourist attractions.

The word tour can be followed by other words. For example, the word business tour can be a type of trip or fam-tour, fam-travel related to the professional activity of the tourist, and it is a privileged tourism, organized to introduce a tourist destination or center of a particular country,

and This tourism industry can be called advertising tourism, and there are many similar examples.

In general, the terms of tourism, which are included in the Uzbek language dictionary, are important because they are not translated into Uzbek, as such terms are important because they lose their translation properties when translated.

**ABSTRACT**

*The aim of the study was to study the validity of spirometry and bodyplethysmography methods for assessing the functional state of the bronchopulmonary system in children with bronchial asthma. Materials and methods. 62 children were examined, among them 27 children with a diagnosis of moderate bronchial asthma and 35 children are conditionally healthy children. All patients underwent a comprehensive study of respiratory function indicators in compliance with research standards. Results. When analyzing the FEV1 / FVC index, which characterizes the presence of bronchial obstruction, it was found that in the group of children with BA it was 69.6%, while in the control group it was 97.53%. The analysis of the results of bodyplethysmography showed an increase in ROL up to 117.2% (p < 0.005) in children with bronchial asthma, relative to children in the control group (96.9%). Conclusions. Revealed a significant increase in ROL relative to the control group. Based on this, to clarify the presence of disturbances in external respiration and pathology of small bronchi in children with bronchial asthma, a more in-depth examination, in particular, bodyplethysmography, is required.*

## INTRODUCTION

Bronchial asthma (BA) is one of the most common diseases in all age groups, including children [1]. According to the WHO, the prevalence of asthma has reached the level of 5% among adults and 10% among the child population of the planet [3,5,6]. Bronchial asthma develops more often among preschool children (80%), often the first attacks occur already in the first year of life [4]. Recently, practical doctors have been paying great attention to assessing the functional state of the lungs. Respiratory function (RPF) indicators are important both for diagnosing, determining the severity of the disease, and for choosing treatment programs. Dynamic monitoring of patients with recurrent respiratory function studies allow you to make changes to the treatment, to predict the course and even the outcome of respiratory diseases in children. The main task of the study of the function of external respiration in most patients is to establish disorders of the ventilation capacity of the lungs, among which obstructive ones predominate, i.e. caused by changes in the passage of air through the tracheobronchial tree [6,10]. Less commonly, restrictive or restrictive disorders are diagnosed due to changes in the elasticity of the lung tissue. Unlike adults, the growth and development of bronchopulmonary structures continues in childhood [8,10]. This explains the fact that even in the presence of chronic diseases of the respiratory system, due to the high compensatory capabilities, pulmonary dysfunctions are often absent.

Children suffering from bronchial asthma often have normal functional parameters, not only during remission, but even in the stage of exacerbation of the disease [2,4]. The most complete characterization of the ventilation capacity of the lungs is possible when examining the structure of the total lung capacity. The method of body plethysmography, simultaneously with the study of the total lung capacity (TLC), makes it possible to assess bronchial resistance, which is sufficient to diagnose the nature and degree of disorders.

In recent years, the understanding of the processes occurring in the airways of a patient with asthma has been supplemented by information about the role of small airways in the development of bronchial inflammation. Inflammation in the small bronchi in bronchial asthma leads to an increase in peripheral resistance, the appearance of nocturnal symptoms of asthma, repeated exacerbations, the formation of "air traps", despite ICS therapy [7]. In patients with mild BA compared with healthy children, the resistance in the small bronchi is 7 times higher, although the indicators of pulmonary function are within the normal range. [8].

**The aim of study** of the validity of spirometry and bodyplethysmography methods for assessing the functional state of the bronchopulmonary system in children with bronchial asthma.

## MATERIALS AND METHODS

In total, a comprehensive assessment of the state of the bronchopulmonary system was carried out in 62 children aged 12 to 18 years. Among them there are 27 children diagnosed with moderate bronchial asthma. The comparison group included "conditionally healthy" children of the same age and sex (n = 35). The diagnosis of BA was established in accordance with the International Consensus on Diagnosis and Treatment of BA (GINA, 2014, 2018). Among the surveyed children, 40.3% (n = 25) were girls, 59.6% (n = 37) were boys (Table 1). The average age of the surveyed was  $15.27 \pm 7.69$  years. The length of the illness averaged  $3 \pm 1.1$ .

**TABLE NO1 INDICATORS OF BA PATIENTS INCLUDED IN THE STUDY**

No	Number of patients, n = 62	
1	Average age in years	
		14,21±1,9
2	Sex	boys
		girls
		37 (59,6%)
		25(40,3% )
3	Diagnosed with BA	
	"Conditionally healthy"	
		27 (43,5%)
		35 (56,4%)

Of the functional tests, spirometry was performed using a Microlab apparatus (England). The parameters of the forced expiratory volume in 1 second (FEV1), forced vital capacity (FVC) and the FEV1 / FVC ratio were assessed after the test with a bronchodilator (MDI Salbutamol, 200 µg). For the purpose of a more in-depth examination, bodyplethysmography was performed using the "Master Screen Body" apparatus (Jaeger, Germany). Statistical analysis was performed using the STATISTICA 10 software.

## RESULTS AND DISCUSSION

The FEV1 value in children with asthma was 92.4%, in children in the control group - 100.2%. When analyzing the FEV1 / FVC index, which characterizes the presence of bronchial obstruction, it was found that in the group of children with BA it was 69.6%, while in the control group it was 97.53%. When spirometry was performed in children with BA after inhalation of 200 µg of salbutamol, the FEV1 level was 101.2% and was comparable to the values of children in the control group. The FEV2 / FVC indicator was within the normal range and amounted to 70.3% in the group of children with BA and 95.2% in the group of "conditionally healthy" children.

To monitor the effectiveness of the treatment in order to prevent exacerbations and prevent the progression of the disease, it is very important to timely identify changes in bronchial patency using modern diagnostic methods. The variety of available equipment for studying the parameters of external respiration raises the question of choosing high-quality devices that meet modern standards and are reliable in operation. For doctors working with children, these requirements are supplemented by taking into account the age characteristics of their patients. To date, a research method that meets all these requirements is a bodyplethysmograph.

We carried out an additional examination to identify pathological abnormalities in volumetric parameters in children with BA using the bodyplethysmography method. The indices of intrathoracic pressure and residual lung capacity corresponded to normal values and did not differ statistically significantly in the study groups. A significant difference was obtained in the indicator of residual lung volume (ROL), which allows assessing the presence of pathology in the small airways (PSA) [4]. As you know, bronchial asthma of any severity is characterized by an inflammatory process in the respiratory tract, which develops as a result of a complex interaction of genetic factors and environmental factors [6]. In our study, we obtained a statistically significant increase in ROL up to 117.2% ( $p < 0.005$ ) in children with bronchial asthma, relative to children in the control group (96.9%). Despite the fact that similar indicators were obtained by the spirometry method, in children of the main group, after taking salbutamol, ROL was within the reference values, the revealed significant difference in the direction of

increasing this criterion in patients with BA indicates the presence of a pathological process in the small bronchi.

## CONCLUSIONS

Considering the above data, it can be concluded that in children with controlled bronchial asthma, when determining the lung function by spirometry, obstructive disorders are not detected, although the FEV1 and FEV1 / FVC indicators are statistically lower than in the group of healthy children. Revealed a significant increase in ROL relative to the control group. Based on this, to clarify the presence of disturbances in external respiration and pathology of small bronchi in children with bronchial asthma, a more in-depth examination, in particular, bodyplethysmography, is required.

### ABSTRACT

*The presence of parasitic invasion (PI) affects not only the prevalence of allergic diseases in the population, but also the severity of the clinical manifestations of the disease. The maximum detect ability of parasitic invasions is observed in children under 6–11 years of age, nematodes prevail in boys, and giardiasis occurs with the same frequency in boys and girls [7]. In patients with allergic rhinitis, giardiasis was also significantly more often detected - 24 children (80.0%), 5 children suffered from ascariasis (16.7%), one child had a combined parasitic invasion (3.3%). Thus, the studied samples of children were comparable in gender, age and living conditions. The main group consisted of 100 patients with bronchial asthma (37%), 100 (37%) - with allergic rhinitis, 70 (25.9%) - with atopic dermatitis.*

**KEYWORDS:** Prevalence, Nematodes, Prevail

### INTRODUCTION

The growing prevalence of allergic diseases (AD) is a serious medical and social problem in all countries the world [5,9,10]. In the world, according to epidemiological studies, the prevalence of AD is from 15 to 35%, while children most often suffer [4]. At its core, ADs not only have a

hereditary predisposition, but belong to multifactorial diseases [1,8], while the modifying role is played by the invasion of helminths and lamblia [2,6].

The prevalence of helminth-protozoal infections is also quite high: at present, about 500 species of helminths parasitizing humans have been registered in the world [1, 10]. The presence of parasitic invasion (PI) affects not only the prevalence of allergic diseases in the population, but also the severity of the clinical manifestations of the disease. The pathological effect of all parasites (P) is due to the modulating effect on the human immune system [6,9]. According to many researchers, the processes characteristic of allergic reactions: blood eosinophilia, overproduction of immunoglobulin E (IgE), release of mediators by mast cells, mucus hyper secretion, interleukin synthesis are a protective reaction and a manifestation of the body's mobilization in the fight against parasites [3,4]. On the one hand, the data of numerous experimental studies demonstrate an inverse relationship between the presence of parasitic invasion and the activity of the inflammatory process in allergic diseases [2]. On the other hand, parasites and their metabolic products are allergens, cause inflammatory changes, have a sensitizing effect, which initiates the development of chronic allergic diseases such as urticaria (C), atopic dermatitis (AD), bronchial asthma (BA) [3,5]. According to some authors, the evolutionary phenomenon of an allergic reaction was formed exclusively due to the molecular similarity of antigens of parasites and antigens entering the body from the outside (dust, pollen, food), which determines the development of nonspecific sensitization in the infected [4]. In this regard, it is extremely important to determine the role of parasitosis in the formation of allergic diseases, to assess objective allergy diagnostics in the combined course of allergic diseases and parasitic invasions in children, to optimize their treatment, and to increase the effectiveness of controlling risk factors.

**Purpose of work.** Determine the frequency of occurrence of parasitosis among the observed children with allergic diseases.

**Research results.** At the initial stage of the study, we conducted a comparative study of the frequency of occurrence of parasitosis in samples of children with allergic diseases, as well as children without allergic diseases. The study involved 300 children aged 2 to 16 years, inclusive:

- The main group: children with allergic diseases (n = 270, average age  $6.14 \pm 0.13$  years);
- Control group: children without allergic diseases (n = 30, average age  $6.41 \pm 0.21$  years).

According to a few studies, there is a relationship between the risk of parasitic diseases and the sex and age of the child, as well as dependence on living conditions. It has been shown that the prevalence of parasitosis is observed among urban residents than among the rural population [1].

The maximum detect ability of parasitic invasions is observed in children under 6–11 years of age, nematodes prevail in boys, and giardiasis occurs with the same frequency in boys and girls [7]. In this regard, we compared the children of the studied samples by gender, age and living conditions. Among the patients of the main group, there were more urban residents (151 children, 55.9%) than the rural population (119 patients, 44.1%). The same tendency was observed in children of the control group - 20 (67%) and 10 (33%), respectively ( $p = 0.52$ ).

So, among the children we studied, the largest proportion were boys: 149 (55.1%) in the main group and 18 (60.0%) in the control group ( $p = 0.121$ ). When comparing patients in the study samples by age the sign also did not reveal statistically significant differences. In the main group

of the studied children prevailed 4–7 years old (36.0%), in the control group: 4–7 (34.2%) and 8–12 (35.1%) years old. The smallest number of patients was at the age from 13 to 16 years, both in the main (15.0%) and in the control group (11.0%), ( $p = 0.124$ ). Thus, the studied samples of children were comparable in gender, age and living conditions. The main group consisted of 100 patients with bronchial asthma (37%), 100 (37%) - with allergic rhinitis, 70 (25.9%) - with atopic dermatitis. All children with bronchial asthma were diagnosed with an atopic form of the disease; by severity, 45 children had mild intermittent (45.0%), 32 (32.0%) - mild persistent, 21 (21.0%) moderate persistent and 2 children (2.0%) - severe persistent asthma. Intermittent AR occurred in 25 patients (25.0%), persistent - in 75 patients (75.0%). BP of mild, moderate, and severe severity was detected in 32.0–63.5–4.5% of patients, respectively. The presence of concomitant allergic diseases was detected in 181 patients, which amounted to 67.0%. Among comorbid pathologies, allergic rhinitis was most often recorded - 53 patients (19.6%), less often atopic dermatitis - 31 (11.4%). The control group consisted of 30 children without allergic diseases. According to the results of parasitological examination, among the studied children with allergic diseases, parasitic invasion was detected in 98 people, which amounted to 36.2%. Among the patients of the control group, helminthiasis and giardiasis were diagnosed only in 4 children (13.3%), ( $p = 0.000001$ ). Thus, the results of the study showed that the frequency of occurrence of parasitosis in the samples of children comparable in gender, age and living conditions is 2.7 times higher among patients with allergic diseases, compared with children without allergic pathology.

The most frequent clinical signs of parasitosis were: allergic syndrome (75.6%); dyspeptic (44.7%) and abdominal pain syndrome (35.6%); asthenoneurotic syndrome (21.4%); syndromes of damage to the gastrointestinal tract and hepatobiliary system: reactive changes in the liver and pancreas (38.9%), biliary dyskinesia (30.7%), cholecystocholangitis (8.1%), hepatosplenomegaly (10.4%), increased aspartate aminotransferase (18.1%), dysproteinemia (6.2%), hypersalivation (5.8%); anemic syndrome (18.0%); polylymphadenopathy syndrome (4.3%), body weight deficiency syndrome (18.5%), blood eosinophilia (59.9%).

In the structure of parasitic invasions in children with AD ( $n = 98$ ), giardiasis was most often recorded - 54% (53 patients), less often ascariasis - 38% (38 people), opisthorchiasis - 6.1% (6 children) and toxocariasis 1.0% (1 child). Moreover, 7 patients (7.1%) were found to have combined parasitic invasion. Among the combined invasions were identified: ascariasis + giardiasis (2 children), ascariasis + toxocariasis (1 patient), ascariasis + opisthorchiasis (2 children), giardiasis + opisthorchiasis (2 patients). The results of the study for enterobiasis, trichinosis, toxoplasmosis and echinococcosis in all children were negative. The lack of positive results of parasitological examination for enterobiasis, according to our data, was due to the timely detection and treatment of patients with this helminthiasis. According to the results of our study, the highest incidence of parasitoses was recorded in children of early, primary, and senior school age (45.3, 46.3 and 52.4%, respectively). The smallest number of parasitic infestations was found in children aged 4–7 years (33.7%). In the structure of parasitosis, the share of giardiasis among young children was 92.6% (25 patients), among preschoolers - 56.7% (17 people), among children of primary school age - 76.5% (26 people), which corresponds to the world data. Statistics [7]. Among parasitic invasions in patients aged 13–18 years, helminthiasis (ascariasis, opisthorchiasis, toxocariasis) prevailed - 77.3% (17 people), the proportion of giardiasis was only 22.7% (5 children). Parasitosis was more common among children with

atopic dermatitis(42.9%) and bronchial asthma (40.0%), somewhat less frequently in patients with allergic rhinitis - 35.3%. The highest percentage of positive results of parasitological examination was noted among patients with acute allergic urticaria - 22 people, which amounted to 68.8%. Among children with bronchial asthma, giardiasis - 73.4% (22 patients), less often ascariasis (6 children, 20.0%), opisthorchiasis(1 patient, 3.3%) and combined invasion (1 child, 3.3%).

In patients with allergic rhinitis, giardiasis was also significantly more often detected - 24 children(80.0%), 5 children suffered from ascariasis (16.7%), one child had a combined parasitic invasion (3.3%). In children with atopic dermatitis, the most common cases were giardiasis (66.7%), less often ascariasis (5 people, 16.7%), opisthorchiasis (4 children, 13.3%) and concomitant invasion (1 patient, 3.3%). Among children with acute allergic urticaria, giardiasis was equally common (8 people, 33.4%), ascariasis and opisthorchiasis - 6 patients each (25.0%), respectively. Two children were diagnosed with toxocariasis (8.3%) and two (8.3%) - combined invasion.

## FINDINGS

Thus, it can be assumed that in the pathogenesis of chronic allergic diseases, such as atopic dermatitis, allergic rhinitis and bronchial asthma, invasion by lamblia plays a key role, and both giardiasis and helminthiasis are alikely cause of acute allergic urticaria.

### ABSTRACT

*In this paper, the angle of a triangle can be divided into 3 equal parts, and it is given to find 2 tresektrissa of different lengths coming out of one angle.*

**KEYWORDS:** Triangle, Angle, Triangle Surface, Bisector Ratio, Sin a Cos 2 a, Sin2 a, Triangle Ratio And Sides Ratio.

### INTRODUCTION

If we are given two sides of an arbitrary triangle ABC and one angle between them. Find two tresektrissa  $l_1$  and  $l_2$  that divide one of the angles of the triangle into three equal parts.

The sides of a triangle  $BC=a$ ,  $AC= b$ ,  $AB=c$  sides and  $\angle BCA=3\alpha$  let's say. Here are two bicycles  $AB$  side  $x$ ,  $y$  and  $z$  to lengths.  $AB=c= x+y+z$  get. Triangle  $BCE$  Let us give this formula when the angle of a triangle is equal to two.

$$\frac{a}{x} = \frac{l_2}{y}$$

Triangle  $DAC$  and for these formulas,  $l_1$  va  $l_2$  Let's simplify them.

$$\frac{l_1}{y} = \frac{b}{z}$$

$$l_1 = \frac{b^y}{z} l_2 = a \frac{y}{x}$$

Now we find that  $x$ ,  $y$ , and  $z$  are the sides of  $a$  and  $b$  and the  $3\alpha$  between them. To do this, we need this formula. The side of a triangle has the same proportion as the opposite side of the straight line from the end of the triangle..

$\frac{S_1}{S_2} = \frac{m}{n}$  So based on this formula we get the ratio of the triangles  $BCD$  and  $CAD$ .

$$\frac{S_{BDC}}{S_{CDA}} = \frac{x}{c-x}$$

Now we write this on the surfaces of a triangle, come to the following formula, and simplify it by finding the  $x$  by shortening the denominator.

$$\frac{\frac{1}{2} a l_1 \sin \alpha}{\frac{1}{2} l_1 b \sin 2\alpha} = \frac{x}{c-x} \frac{a \sin \alpha}{2 b \sin \alpha \cos \alpha} = \frac{x}{c-x} \frac{a}{2 b \cos \alpha} = \frac{x}{c-x}$$

$$a (c-x) = 2b x \cos \alpha \qquad ac - ax = 2bxcos \alpha$$

$$ac = ax + 2bx \cos a \quad x(a + 2b \cos a) = ac$$

$$x = \frac{ac}{a + 2b \cos a}$$

So we found x and now we can find z in the same way.

$$\frac{S_{CEA}}{S_{BCE}} = \frac{z}{c-z} \frac{\frac{1}{2}bl_2 \sin a}{\frac{1}{2}al_2 \sin 2a} = \frac{z}{c-z} \frac{b}{2a \cos a} = \frac{z}{c-z}$$

$$b(c-z) = 2a z \cos a \quad bc - bz = 2az \cos a$$

$$z = \frac{bc}{b + 2a \cos a}$$

So we found z, now we just have to find y. For this  $y = c - (x + z)$  we use.

$$y = c - x - z$$

$$y = c - \frac{ac}{a + 2b \cos a} - \frac{bc}{b + 2a \cos a} \quad y = c \left( 1 - \frac{a}{a + 2b \cos a} - \frac{b}{b + 2a \cos a} \right)$$

$$y = c \left( \frac{(a + 2b \cos a)(b + 2a \cos a) - a(b + 2a \cos a) - b(a + 2b \cos a)}{(a + 2b \cos a)(b + 2a \cos a)} \right)$$

Now we can just simplify the image by opening the parentheses and narrowing down the similar terms.

$$y = c \left( \frac{ab + 2a^2 \cos a + 2b^2 \cos a + 4ab \cos^2 a - ab - 2a^2 \cos a - ab - 2b^2 \cos a}{(a + 2b \cos a)(b + 2a \cos a)} \right)$$

$$y = c \left( \frac{4ab \cos^2 a - ab}{(a + 2b \cos a)(b + 2a \cos a)} \right) \quad y = \frac{abc(4 \cos^2 a - 1)}{(a + 2b \cos a)(b + 2a \cos a)}$$

So we found x, y, and z by the sides a, b, and the angle  $\cos a$

$l_1$  and  $l_2$  by shortening similar terms by placing them in place to find them

$l_1$  and  $l_2$  we can find.

$$l_1 = b \frac{y}{z} l_2 = a \frac{y}{x}$$

$$l_1 = b \frac{\frac{abc(4 \cos^2 a - 1)}{(a + 2b \cos a)(b + 2a \cos a)}}{\frac{bc}{b + 2a \cos a}} l_2 = \frac{ab(4 \cos^2 a - 1)}{a + 2b \cos a}$$

$$l_2 = a \frac{\frac{abc(4 \cos^2 a - 1)}{(a+2bc \cos a)(b+2a \cos a)}}{\frac{ac}{a+2bc \cos a}} \quad l_2 = \frac{ab(4 \cos^2 a - 1)}{b+2a \cos a}$$

So we have found  $l_1$  and  $l_2$ , now that we are working on examples of these formulas and checking that the faces of the three triangles separated by these tressektrissa must be equal to the faces of the common triangles.

Example 1: If the sides of a triangle are 5cm, 6cm and the angle between them is given by  $10^\circ$ , and find the angular tressektrissa that divide this angle into three equal parts.

$$a=5 \quad b=6 \quad 3\alpha = 10 \text{ equal .}$$

The face of a triangle

$$S = \frac{1}{2} \cdot 5 \cdot 6 \sin 10^\circ = \\ = 15 \sin 10^\circ$$

$$l_1 = \frac{ab(4 \cos^2 a - 1)}{a+2bc \cos a} = \frac{5 \cdot 6(4 \cos^2 \frac{10}{3} - 1)}{5+12 \cos \frac{10}{3}} = \frac{30(4 \cos^2 \frac{10}{3} - 1)}{5+12 \cos \frac{10}{3}}$$

$$l_2 = \frac{ab(4 \cos^2 a - 1)}{b+2a \cos a} = \frac{30(4 \cos^2 \frac{10}{3} - 1)}{6+10 \cos \frac{10}{3}}$$

Now let's use these tressektrissa to check that the sum of the three triangles is equal to the total area of the triangle.

$$15 \sin 10^\circ = S_1 + S_2 + S_3 \quad S_1 = \frac{1}{2} a l_1 \sin \frac{10}{3} \quad S_2 = \frac{1}{2} l_1 l_2 \sin \frac{10}{3} \quad S_3 = \frac{1}{2} b l_2 \sin \frac{10}{3}$$

$$S = \frac{1}{2} \cdot 5 \cdot \frac{30(4 \cos^2 \frac{10}{3} - 1)}{5+12 \cos \frac{10}{3}} \sin \frac{10}{3} + \frac{1}{2} \cdot \frac{30(4 \cos^2 \frac{10}{3} - 1)}{5+12 \cos \frac{10}{3}} \cdot \frac{30(4 \cos^2 \frac{10}{3} - 1)}{6+10 \cos \frac{10}{3}} \sin \frac{10}{3} +$$

$$+ \frac{1}{2} \cdot 6 \cdot \frac{30(4 \cos^2 \frac{10}{3} - 1)}{6+10 \cos \frac{10}{3}} \sin \frac{10}{3}$$

Andy  $\frac{1}{2} \cdot 30 \cdot \sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1)$  out of parentheses.

$$S = 15 \cdot \sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1) \left( \frac{5}{5+12 \cos \frac{10}{3}} + \frac{30(4 \cos^2 \frac{10}{3} - 1)}{(5+12 \cos \frac{10}{3})(6+10 \cos \frac{10}{3})} + \frac{6}{6+10 \cos \frac{10}{3}} \right)$$

$$S = 15 \cdot \sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1) \left( \frac{5(6+10 \cos \frac{10}{3}) + 30(4 \cos^2 \frac{10}{3} - 1) + 6(5+12 \cos \frac{10}{3})}{(5+12 \cos \frac{10}{3})(6+10 \cos \frac{10}{3})} \right)$$

$$S = 15 \cdot \sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1) \left( \frac{30+50 \cos \frac{10}{3} + 120 \cos^2 \frac{10}{3} - 30 + 30 + 72 \cos \frac{10}{3}}{30+50 \cos \frac{10}{3} + 72 \cos^2 \frac{10}{3} + 120 \cos^2 \frac{10}{3}} \right)$$

$$S=15 \cdot \sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1) \left( \frac{120 \cos^2 \frac{10}{3} + 122 \cos \frac{10}{3} + 30}{120 \cos^2 \frac{10}{3} + 122 \cos \frac{10}{3} + 30} \right) = 15 \cdot \sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1) \cdot 1$$

Now let's add an extra formula here.

$$\begin{aligned} \sin 3a &= \sin (2a + a) = \sin 2a \cdot \cos a + \sin a \cdot \cos 2a = 2 \sin a \cdot \cos a \cdot \cos a + \sin a \cdot (2 \cos^2 a - 1) = \\ &= 2 \sin a \cdot \cos^2 a + 2 \sin a \cdot \cos^2 a - \sin a = 4 \sin a \cdot \cos^2 a - \sin a = \\ &= \sin a (4 \cos^2 a - 1) \end{aligned}$$

$$\sin \frac{10}{3} \cdot (4 \cos^2 \frac{10}{3} - 1) = \sin 3 \cdot \frac{10}{3} = \sin 10^\circ$$

$S = 15 \sin 10^\circ$  proved to be equal.

For example -2 :If the catheter of a right triangle  $AC=5$  smandhypotenuse

$AB=10$  smis equal to,  $C$  find the tresektrissa that divide the angle into three equal angles?

$$\text{Ergo } BC = \sqrt{10^2 - 5^2} = \sqrt{75} = 5\sqrt{3}$$

$$\begin{aligned} \sin B &= \frac{5}{10} \sin B = \frac{1}{2} \angle B = 30^\circ, \\ \angle A &= 60^\circ \text{ equally} \end{aligned}$$

Ergo  $\angle A = \angle E$  from equality  $AC = CE = l_2 = 5$  it turns out that,

$\sin B = \frac{l_1}{BC}$  which is derived from the triangular CDB and is calculated by putting it in place  $l_1$  let's find  $l_1 = BC \cdot \sin B = 5\sqrt{3} \cdot \sin 30^\circ = \frac{5\sqrt{3}}{2}$  equality arises. Now created in the beginning  $l_1$  and  $l_2$  let's recalculate and check for equality. Here  $\alpha = 30^\circ$  equal.

$$l_1 = \frac{ab(4 \cos^2 a - 1)}{a + 2b \cos a} = \frac{5 \cdot 5\sqrt{3}(4 \cos^2 30^\circ - 1)}{5 + 2 \cdot 5\sqrt{3} \cos 30^\circ} = \frac{25\sqrt{3}(4 \cdot \frac{3}{4} - 1)}{5 + 10\sqrt{3} \cdot \frac{\sqrt{3}}{2}} = \frac{50\sqrt{3}}{20} = \frac{5\sqrt{3}}{2}$$

$$l_2 = \frac{ab(4 \cos^2 a - 1)}{b + 2a \cos a} = \frac{5 \cdot 5\sqrt{3}(4 \cos^2 30^\circ - 1)}{5\sqrt{3} + 2 \cdot 5 \cos 30^\circ} = \frac{25\sqrt{3}(4 \cdot \frac{3}{4} - 1)}{5\sqrt{3} + 5\sqrt{3}} = \frac{50\sqrt{3}}{10\sqrt{3}} = 5$$

It follows that the formulas we have created are correct.

## THE IMPORTANT ROLE OF GYMNASTICS IN THE LIVES OF GIRLS

**Asadova Shahlo Tulaboyevna\***

\*Teacher of school,  
Tashkent, UZBEKISTAN

### ABSTRACT

*This article identified the real reasons why you should enroll your daughter in gymnastics classes. The benefits of Gymnastics classes in girls life were discussed in this work. As far as I am concerned gymnastics is one way to help make that happen. I think the fact that it's largely a female sport, makes gyms an ideal place for little girls to start to learn self-confidence as they exercise their bodies. Children and adolescents between the age of 6 and 17 should get 60 minutes or more of physical activity a day. And as part of their 60 minutes of physical activity a day, they should include muscle and bone strengthening activities at least three days a week.*

**KEYWORDS:** *Flexibility, Physically And Mentally Healthy, Sports, Activities, Gymnastics Classes*

### INTRODUCTION

It is fact that we all want to help our daughters grow up to be physically and mentally healthy and to give them greater odds of success later in life. In this article I'm going to tell you the benefits of gymnastics: how gymnastics positively impacts young girls and the some real reasons you should enroll your daughter in gymnastics. I work at school №223 as a physical training teacher and I have my lovely girl pupils, I will want to do everything possible to make sure they are strong, confident, healthy women when they grow up. As far as I am concerned gymnastics is one way to help make that happen. I think the fact that it's largely a female sport, makes gyms an ideal place for little girls to start to learn self-confidence as they exercise their bodies. And as they grow up, become teenagers on a gymnastics team with girl friends that empower and root for one another.

#### **1. Gymnastics will help to make your daughter strong.**

Swinging on the bars and learning skills like cartwheels that require her to support her own body weight build strength from an early age. It's important to teach our girls when they are young

that not only is being strong good for the body, but it's important in life. Strong girls are healthy, pretty girls.

## **2. Gymnastics will increase your daughter's flexibility.**

Every gymnastics class begins with a warm-up that includes stretching and splits, and then throughout the rest of the class gymnasts learn and practice skills that require them to use their flexibility. According to statistics "Better flexibility may improve your performance in physical activities or decrease your risk of injuries by helping your joints move through their full range of motion and enabling your muscles to work most effectively". So, better flexibility will decrease the risk of your daughter getting injured from gymnastics or any other physical activity she does.

## **3. Gymnastics will keep her fit and help her develop the habit of staying active.**

We know that young people need to be more active and fit. It's such a problem in some countries that they try to solve the epidemic of childhood obesity. Children and adolescents between the age of 6 and 17 should get 60 minutes or more of physical activity a day. And as part of their 60 minutes of physical activity a day, they should include muscle and bone strengthening activities at least three days a week. Gymnastics is one of the most diverse sports in terms of the types of exercises and muscles it develops. Gymnastics works to enhance a gymnast's strength, flexibility, speed, balance and coordination. For example, the vault develops speed and power, bars is an endurance event and beam improves a gymnast's flexibility and balance. Having this flexibility and strength (especially core strength) skill set base as a teenager will prepare girls for yoga, pilates and other cardio exercise classes as young adults. Knowing they can take exercise classes like this without excessively struggling will help them maintain their healthy exercise habits while working or going to school.

## **4. Gymnastics will make your daughter a well-rounded athlete, and teach her skills that will enhance other sports.**

Gymnasts are flexible, agile and strong, with coordination, balance and flexibility. These are important traits in gymnastics and in other sports. For example, learning how to run fast for the vault would be important in not only track and field, but basketball or valley ball. Balance and flexibility are useful if she ever wants to join a dance team. And gymnastics skills such as tumbling skills and jumps are an important part of cheerleading. Wouldn't it be great if when your daughter's in high-school or middle school and she wants to try out for the cheerleading team, she had a decent shot? Taking gymnastics classes as a young girl will teach her skills that will help her participate in gymnastics, cheerleading or other sports if she wants to.

## **5. Gymnastics will teach your daughter balance.**

What better tool for learning balance than the balance beam? Learning to walk on a low beam first and then a high beam will teach balance at a young age. And this balance will help your gymnast learn how to ride a bike. Gymnasts learn to not only balance on their feet, but on their hands. A handstand is the ultimate balance skill, learning to control your body in order to hold yourself up on your hands.

## **6. Gymnastics will teach your daughter to fall, helping to prevent her from getting injured in other sports or activities later in life.**

One of the first things on the agenda in any beginner gymnastics class is to learn how to fall safely. Falling and putting your arms behind you is one of the first things gymnasts are taught not to do, as this is an easy way to break your arms. It's easier and safer to learn how to fall correctly in a gymnastics gym because of the many mats and foam pits to use when doing falling drills. Learning how to fall young will become instinctual and protect her from unnecessary injuries later in life.

### **7. Gymnastics will help her develop hand-eye and foot-eye coordination.**

Kids aren't just born with good body awareness and hand-eye, foot-eye coordination. Gymnastics is a great way for kids to learn how to make their body do what their brain is telling them to. Crawling through the pit, swinging from the bars, jumping on the trampoline, learning how to roll on floor mats—all of these exercises help kids learn how to move their body.

### INTRODUCTION

The development of modern society is characterized by ever-increasing dynamism, penetration to new levels of knowledge of nature, changes in social structure and the emergence of qualitatively new types of activity in previously unknown areas. In these conditions, the ability and desire to independently search for the necessary information, mastering the fundamental knowledge that constitute the theoretical foundations of professional activity, the ability to create and implement new strategies of conduct and activity becomes especially important for a modern specialist.

The current stage of development of society poses a number of fundamentally new problems for the education system, caused by political, socio-economic, ideological and other factors, among

which the need to improve the quality and accessibility of education should be emphasized. Increasing academic mobility, integration into the global scientific and educational space, creating economically optimal educational systems, increasing the level of university corporatism and strengthening ties between different levels of education.

The next challenge of the era was the reform of higher education, which implies a transition to a two-stage system of education: bachelor's and master's degrees, introducing a "commercial note" into the activities of universities. In this regard, the goals and content of education are being revised, the expectations and requirements of students for the educational process are changing, universities themselves are critically rethinking the key areas of their activities. Obviously, only highly qualified teachers who need to update theoretical and practical knowledge in connection with a fundamental change in modern approaches to solving professional problems can achieve these goals and fulfill the assigned tasks [1, 5].

As a key trend leading to a significant change in the principles and methods of organizing research and educational activities of universities, it is necessary to highlight the growing role of the project approach to university management [2, 8].

In science, a lot of attention is currently paid to the problems of the development of a creative personality. The share of concepts and curricula that set the main goals for the development of research competence, which presupposes the development of creativity, cognitive activity and curiosity, the global research attitude as a personality trait, and the development of research strategies in conditions of novelty and uncertainty, is increasing.

In recent years, a number of innovative teaching technologies have been developed in pedagogy, corresponding forms, methods and means that have great potential in the development of the research culture of students. Among them, such teaching technologies as problem-modular training and concentrated training, a fan of special methods and techniques aimed at developing students' creativity (brainstorming, bending, synectics, etc.).

This includes the technology of project-based teaching, which has great opportunities in the development of the personality of students, including research competencies. The actualization of the ideas of project-based education is currently due, among other things, to social changes that take place in social development.

The use of project methods involves the use of a wide range of problematic, research, search methods, focused clearly on the real practical result, significant for each student participating in the development of the project, as well as the holistic development of the problem, taking into account various factors, conditions for its solution and the implementation of the results [3.93 ].

Project education teaches the development of a project attitude towards the world, one's own life, allows to combine educational, research and quasi-professional activities of future specialists.

Research goals: to develop a model of the step-by-step use of project-based teaching technology for the formation of students' research competence based on theoretical ideas about the essence and content of research competence, the internal capabilities of this technology, the conditions for its combination with the requirements of problem-based, modular, concentrated learning technologies. The model provides for the consistent implementation by students in the learning process of projects corresponding to situational activity, focused on the formation of positive motivation for research activities.

Object of research: to develop and substantiate the use and condition of formation in order to prepare the research activities of students in the process of project learning.

**Research methods:** During the research, a theoretical method was applied (analysis, content analysis, synthesis, modeling, abstraction and definition, generalization); empirical method (test, pedagogical observation, expert assessment, study of normative documents, comparison, characterization, self-analysis of subjects of participants in the educational process); social methods (questioning, blitz poll, conversation).

Scientific research is as follows. The composition and structure of the model of research competence of the individual have been determined.

The set of interrelated components (organizational, content, activity, evaluative and productive), focused on the development of personal intellectual qualities in the course of students' scientific activities in the educational process of studying biology, has been substantiated. The effectiveness of the development of scientific activity of students: the criterion of effectiveness (provision of organizational and pedagogical conditions) is determined by the dynamics of creative development, manifested at a limited, acceptable and optimal levels.

The didactic means and conditions for the implementation of the developmental possibilities of project training are revealed, depending on the types of training (theoretical, practical).

In the process of theoretical training, they are: strengthening the research potential of tasks and assignments by giving them a problematic character; a consistent increase in the proportion and interdisciplinary nature of students' independent project activities; immersion of students in situations as close as possible to the real conditions of professional activity.

The formation of students' research competence in project-based learning will be effective if:

- to identify the composition of the structure, functions and basic properties of research competence, considered as the ultimate goal of the project learning process;
- to consider the formation of the research competence of students as a continuous step-by-step process from encouraging students to research activities to active creativity in educational and research work;
- selection and structuring of project assignments based on real professional problems;
- forms and methods of project training implementation ensure students' immersion in a situation as close as possible to the real conditions of professional activity.

In conclusion, we note that an integrated approach to the organization of scientific work in the university provides for systematic work on the development of creative abilities students, involving them in a variety of forms of research activities, equipping students with scientific research methods, increasing their mental culture. The development of a student's personality will be successful if cognitive and scientific activities are motivated; create creative teams with taking into account scientific interests, abilities and student opportunities; provide a research base; create situations of success when implemented into practice scientific results; encourage creative activity and independence of researchers in solving scientific problems.

Thus, scientific work is an integral part of the educational process of students. Students master the skills of creative, search work, learn to pose and solve actual tasks, master in practice

methods of experimental research work. The results of scientific research make it possible to identify the most promising young scientists for further teaching them in graduate school.

Conclusions on the content, structure and levels of research activities in biology. An applied-theoretical model of the formation of students' research competence in the context of project-based learning, which provides for the gradual complication of projects, an increase in the degree of productivity of dominant activities, an increase in their share of the interdisciplinary nature of independent activities.

## BIO ECOLOGICAL PROPERTIES OF IRIS PSEUDACORUS L

**Savutova Malohat Erkinovna\***

\*Magistr of Urgench State University,  
UZBEKISTAN

Email id: s\_malohat1978@mail.ru

### ABSTRACT

*The article describes bioecological features, morphological structure, distribution in nature, vegetation period and methods of reproduction of *Iris pseudacorus* L. The links of the rhizome of the current year are covered with leaf sheaths and the remnants of dead leaves of the generation of the last year, from below they bear a beard of adventitious roots, which die off every year. The complete absence of watering causes a slight decrease in morphometric indicators and almost excludes self-seeding, however, flowering and ripening of seeds, in this case, occurs annually. Thus, we have established the duration of the pregenerative period of ontogeny of *I. pseudacorus* under the conditions of the steppe zone culture (3 years) and the period of decorativeness of individuals (5–7 years).*

**KEYWORDS:** *Iris, Irispseudacorus L., In-Situ, Ex-Situ, Bioecological Features, Morphologi. Vegetation Period, Introduction.*

### INTRODUCTION

Despite the intensive efforts made in the world over the past twenty years, the process of loss of global biological diversity continues. Sustainable management of biological resources and their rational use requires urgent and decisive measures to conserve individual species and ecosystems. For this, at the national and international levels, it is necessary to strengthen the capacity in the field of study, systematic observation of biological diversity, to develop effective national measures to protect ecosystems in situ, to protect biological and genetic resources ex-situ and to improve the functioning of ecosystems [1].

Conservation and sustainable use of flora and fauna in Uzbekistan is one of the priority areas of state environmental policy. Effective protection of biodiversity components is inextricably linked with the degree of their knowledge. However, the degree of floristic knowledge of a number of

regions of Uzbekistan is insufficient. Since the publication of the last volume of "Flora of Uzbekistan", there has been no purposeful work to record new data.

*I. pseudacorus* was introduced by seeds obtained by delectus exchange in 2001 from France. In nature, it grows in swamps, along the banks and shallow waters of rivers and lakes in Atlantic and Central Europe, the Caucasus, Western Siberia, the Mediterranean and Asia Minor, while the rhizome is usually submerged in water, leaves and flower stalks are above the water (Fedchenko, 1935; Encyclopedia ... , 2017). However, when cultivated in arid conditions [7].

The history of introduction of 44 species of the genus *Iris* growing in Russia is analyzed. Chronology of introduction is given for 20 of them.

All species of the genus *Iris* L. of the flora of Russia are of interest for introduction and selection, almost all of them are grown in gardens; most of them have been tested with positive results. At the beginning, the introduction of irises into cultivation was of a collection nature (as for most other plants) and was aimed at both acquaintance with the diversity of natural forms and the initial testing of plants. Little is known about the history of the introduction of irises in Russia [2]. The purpose of this work is to give a brief summary of the history of the introduction of species of this genus. Some information about the cultivation of plants in the pre-Petrine period can be found in documents that speak of the state of vegetable gardens or gardens in which medicinal or any outlandish plants were grown, as well as in the analysis of lists of plants for medicinal gardens and orchards.

*Iris pseudacorus*, yellow flag, yellow iris or water flag is a species of flowering plants in the Iridaceae family. It is indigenous to Europe, West Asia, and Northwest Africa. Its specific epithet *pseudacorus* means "false calamus", referring to the similarity of its leaves to those of *Acorus calamus* (sweet flag), as they have a noticeably veined middle of the rib and sword-like shape. However, these two plants are not related [5].

This herbaceous flowering perennial plant grows to 100–150 cm (39–59 in) or the rare 2 m (6 ft 7 in) tall, with erect leaves up to 90 cm (35 in) long and 3 cm (1.2 in) wide. The flowers are bright yellow, 7–10 cm (2.8–3.9 in) in diameter, with a typical iris shape. The fruit is a dry boll 4–7 cm (1.6–2.8 in) long, containing numerous pale brown seeds.

Under open-field culture, *I. pseudacorus* is a perennial summer-green herbaceous short-rhizome-brush-root friable bunchy, sympodially growing, vegetatively sedentary polycarpic with a semi-rosette upright shoot. Leaves are light green, xiphoid, 2.5–3.2 cm wide, 47–75 cm long. Peduncle 50–70 cm tall, leafy, with 2–4 lateral branches each bearing 2–3 golden yellow flowers about 7 cm in diameter, 4 cm high. The fruit is a lower syncarpous three-nested capsule up to 8 cm long, the seeds are mostly semicircular, flattened, coffee-brown.

The rhizome is plagiotropic, reddish-pink on the cross section, consists of strongly thickened and shortened annual growths (links) 5–8 cm long and 2.5–3.5 cm in diameter. The links of the rhizome of the current year are covered with leaf sheaths and the remnants of dead leaves of the generation of the last year, from below they bear a beard of adventitious roots, which die off every year. The plagiotropic rhizome determines the loose bush type of branching, but in the arid conditions of Uzbekistan, the links of the *I. pseudacorus* rhizome are close together, as a result of which the plant approaches the dense bush type. By the nature of phenological development in the annual cycle, *I. pseudacorus* belongs to the spring-summer autumn-green species of late

spring-early summer flowering. The growing season begins after thawing of the soil, ends in early November. Blooms in May for 10 days.

The beginning of the growing season of *I. pseudacorus* is due to a thermal factor combined with a temporary factor, namely, an indicator of average daily air temperatures over a certain period of time. We consider the sum of average daily temperatures for the decade preceding the noted phenodate to be such a defining indicator. The lower limit that determines the beginning of the growing season of *I. pseudacorus* is the point of stable transition of average daily air temperatures through the + 10 ° C mark (while the sum of temperatures for the previous decade is at least + 100 ° C). A short-term increase in air temperature (less than a week), even significant, does not lead to the activation of growth processes.

*I. pseudacorus* grows best in very humid conditions and is often found in wetlands where it tolerates immersion in water, low pH, and anoxic soils. The plant spreads rapidly both due to rhizomes and due to water-dispersed seeds. It fills the same niche as *Typha* and often grows with it, albeit usually in shallower water. Although it is primarily an aquatic or marginal plant, the rhizomes can withstand prolonged dry conditions.

The large stands of *I. pseudacorus* in western Scotland are a very important feeding and breeding environment for the endangered corncrake.

*I. pseudacorus* is one of two species of irises native to the United Kingdom, the other is *Iris foetidissima* (fetid iris) [5].

*Iris pseudacorus* L. 1753, Sp. Pl. : 38. Described from Europe. For the first time in Russia, it was mentioned in culture in 1755 in the botanical garden of the Medical Academy in Moscow. In the same place since 1781 in P. Demidov's garden and near Moscow, in Gorenki since 1812. In the Pomological Garden of Regel and Kesselring in 1876-1917. live plants and seeds were offered for sale.

*Iris austrotschatkalica* Tojibaev, F. Karim. & Turgunov. The new species was first collected in 2010 in the low mountains of the Southern Chatkal (Uzbek part of the Chatkal Range). "Western Tien Shan. Southern slopes of the Chatkal ridge. Mount Ungor Tepa, 3 km north of the village of Poromon. Rocky slopes, 1200 m above sea level F.I. Karimov, M.D. Turgunov. TASH, iso - ALTB. The plants were planted at the collection site of the Botanical Garden of the Institute of the Gene Pool of Plant and Animal World of the Academy of Sciences of the Republic of Uzbekistan (Tashkent)" [3, 30].

Thus, we have established the duration of the pregenerative period of ontogeny of *I. pseudacorus* under the conditions of the steppe zone culture (3 years) and the period of decorativeness of individuals (5–7 years). These data, together with data on seed productivity, will allow organizing the process of seed reproduction of this species and predicting the long-term existence of exposures with its participation.

To obtain a relatively small amount of planting material, *I. pseudacorus* should be propagated vegetatively - by dividing the rhizomes of virginal or generative individuals according to the number of fans in early spring (April - early May) or in larger fragments during summer-autumn dormancy (August - September).

The complete absence of watering causes a slight decrease in morphometric indicators and almost excludes self-seeding, however, flowering and ripening of seeds, in this case, occurs annually. Based on the research carried out, *I. pseudacorus* is recommended by us as a stable and unpretentious plant for wide use in green construction in Uzbekistan - for reservoirs, mixborders, rockeries and gravel gardens, as well as for cutting. In landscape-type expositions, it is well combined with cornflower, willow-leafed grass, Siberian iris, small-flowered large-flowered petals, middle bell, chalcidony lychnis, oriental poppy and other tall perennials.

## POSSIBILITIES OF THE CREDIT-MODULAR SYSTEM IN TEACHER EDUCATION

**Ibaidullaeva Balkhash Rahmatullakizi\***

\*Master's Degree,  
Tashkent Pedagogical University named after Nizami,  
UZBEKISTAN

### ABSTRACT

*The article reveals the essence, functions and possibilities of the content of the credit-modular system in pedagogical education. Many people believe that the education system of Uzbekistan was formed in conditions of information deficit and limited opportunities for access to information. Therefore, the activity of a teacher in universities was reduced, first of all, to informational, or better to say informative, functions. This is based on an average school year of approximately 40 weeks. The number of ECTS credits per academic discipline is determined by dividing the total hours planned for studying the discipline by the credit price (rounded to 0.5 credits).*

**KEYWORDS:** *Credit Modular System, Credit-Modular System, Educational Process, Information Support, Function, Opportunity*

### INTRODUCTION

The Cabinet of Ministers adopted Resolution No. 824 of December 31, 2020 “On measures to improve the system of organizing the educational process in higher educational institutions”[1].

According to the decree, starting from the 2020/2021 academic year, the educational process in higher educational institutions is gradually transferred to a credit-modular system. The document approved the Regulation on the implementation of the credit-modular system in the educational process of universities.

A credit-modular system for organizing the educational process is a model for organizing the educational process, which is based on the combination of modular learning technologies and credit or credit educational units. Organization and implementation of the educational process is

a multifaceted and complex system of action and interaction. Attention in the credit-modular system is focused on two of its characteristics:

- On independent work of students;
- On the maintenance of the credit-modular system of organizing the educational process and the rating system for assessing the educational achievements of students.

Many people believe that the education system of Uzbekistan was formed in conditions of information deficit and limited opportunities for access to information. Therefore, the activity of a teacher in universities was reduced, first of all, to informational, or better to say informative, functions. The teacher played the role of the most important source of information. Since the student is the object of the educational process and at the same time the object of perception and assimilation of information, the planning of the educational process was carried out in such a way that the bulk of the work fell on classroom teaching. The current state of the development of information support opens up ample opportunities for access to information sources and therefore partially confuses the emphasis in planning the educational process towards independent work. The credit-modular system, as an integral attribute of the Bologna Declaration, is provided with two main functions:

1. Promoting student and faculty mobility and facilitating transitions from one university to another.
2. A clear definition of the scope of the work carried out by the student, taking into account all types of educational and scientific activities. The amount of credits determines what a student is capable of, who studies in one or another program.

### **THE MAIN FINDINGS AND RESULTS**

The introduction of a credit-modular system is an important factor in stimulating the effective work of the teacher and student. Modules are designed as systems of educational elements, united by the sign of compliance with a certain object of professional activity.

The latter is considered as a certain amount of educational information, which has an independent logical structure and content, which makes it possible to operate with this information in the process of the student's mental activity. The modular organization of the content of an academic discipline is less for everything a mechanical transfer of sections of the program to educational modules, since it requires deep analytical and logical work on the semantic content of the discipline, its structuring as a system, and not an arbitrary conglomerate of scientific information. With a credit-modular system of organizing the educational process, the content of the discipline is divided into meaningful modules (2-4 modules per semester), that is, the academic discipline is formed as a system of meaningful modules. The second condition for the implementation of the modular principle of organizing the content of an academic discipline is the ability to identify general cross-cutting ideas of professional activity, to the disclosure and assimilation of which each module is aimed.

For a student - a future specialist - it is important not only to comprehend and assimilate information, but also to master the ways of its practical application and decision-making. Under such conditions, the particle of direct, outside the applied information is reduced and the use of interactive forms and methods of students' work under the guidance of a teacher (tutor) and full-

fledged independent work in laboratories, reading rooms, at the objects of future professional activity, which is especially important for the distance education system, expands. The creation of a credit system should facilitate comparison of completed courses and maximize student mobility.

Credit is a conventional unit of measurement of a student's workload when studying a particular curriculum or a separate discipline (course) performed by a student during education. Credit is the minimum unit that is accurately documented, often means training for a week (the amount of classroom and independent student work). The system of credits is understood as a systemic definition of all the main aspects of the organization of the educational process based on the use of a credit unit (credit) as a measure of the labor intensity of educational work, expressing the totality of all components related to the organization of the educational process. For the first time, loans were introduced at US universities at the turn of the 18th and 19th centuries. Within the framework of the liberalization of university education that began during this period. The establishment of quantitative equivalents of the content of education and the degree of mastering of educational programs through credit units made it possible to provide students with the opportunity to independently plan the educational process make fundamental changes to the systems for monitoring and assessing the quality of the educational process, created conditions for improving educational technologies. The most acceptable of the credit systems that existed in Europe at the time of the signing of the Bologna Declaration was the ECTS system (European Credit Transfer System).

In the course of the pedagogical experiment, which was carried out by leading higher educational institutions, in Uzbekistan, the amount of ECTS credit was set - 36 academic hours and the annual student workload was set - 60 ECTS credits. This is based on an average school year of approximately 40 weeks. The number of ECTS credits per academic discipline is determined by dividing the total hours planned for studying the discipline by the credit price (rounded to 0.5 credits). For example, if 108 hours are allocated to study a discipline, then this corresponds to three credits. In this case, the discipline is formed from three modules. It is most convenient to determine the share of each discipline in the total workload by the number of classroom hours and proportionally distribute 30 credits earned per semester between the disciplines studied in this semester.

It is recommended to convert the study load into credits by mathematically dividing the total (classroom and independent) study load in the semester by a factor of 36 (36 hours of the total load). A bachelor during his studies must collect at least 180 credits (three years in accordance with the norm of 60 credits) or at least 240 credits (4 years); a master's degree must have earned at least 300 credits in total. This implies the dependence of the period of study for a master's degree on the duration of study for a bachelor's degree.

Advantages of the modular system:

- 1). Clear structure of the training course, orderliness;
- 2). Ability to track links between elements;
- 3). Visibility, awareness of perspective;
- 4). Individual approach to training the student;

Flexibility of the information presented;

5). Developing students' productive thinking;

6). Multifunctionality;

7). Possibility of self-control of the student's learning and the teacher's own activities;

8). Lack of severe stress among students,

9). The student himself operates with educational content, which leads to a conscious and deeper assimilation of the material [2].

## CONCLUSION

Preliminary results of the work of the credit-modular training system: 1. Promotes optimal planning of the content and methodological support of disciplines, taking into account the final results 2. Liberalizes the educational process and orientates it towards the student, stimulating his independent work. 3. Stimulates the improvement of the process of assessing the quality of mastering educational programs. 4. Improves the quality of the educational process and organizational and administrative work.

Bukhara, UZBEKISTAN  
Email id: faxrilo@mail.ru

### ABSTRACT

*Today in the world there is a high growth in the production of vegetable oil, which is one of the leading in the food production industry. Final distillation in an extraction system in vegetable oil plants is one of the most complex and energy intensive processes. Therefore, the introduction of intensive methods necessary for the production of vegetable oils, the creation of modern equipment and technology is of scientific and practical importance [1]*

**KEYWORDS:** *Distillation, Extraction, Preliminary*

### INTRODUCTION

Distillation is the process of heat treatment of a solution of oil in a solvent. It consists in transferring the solvent into a vaporous state, removing vapors and their condensation. The solvent should be removed from the oil as completely as possible at the lowest temperatures in the shortest possible time. Distillation is carried out in two periods: preliminary and final distillation.

In the first period, evaporation is carried out, which obeys all the known laws of this process and can be carried out both at atmospheric pressure and under vacuum. During this period, the miscella must reach such a concentration that the boiling point does not exceed 100°C.

In the second period, hot water vapor is additionally applied, therefore, the laws of the process are different. The system will consist of three components: solvent, oil, water, which represent three phases: two liquid (miscella, water) and one vapor - solvent. According to the phase rule, such a system has two degrees of freedom. This means that without disturbing the equilibrium, you can change two parameters, in this case - the total pressure and the concentration of miscella.

Usually the process of distillation of vegetable oils is carried out in the modes of spraying, flowing down and lifting in a film and distillation in a layer.

During spray distillation, the miscella exits the nozzle in the form of a jet, which is crushed into droplets. The interface between the liquid and gaseous phases significantly increases, which increases the productivity of the process and reduces its duration. According to hydrodynamic changes in the liquid phase, three periods are conventionally distinguished: the formation of individual drops, the development of turbulence within individual drops and the attenuation of this process. In the gas phase, the state and properties of the vapors are the same at any point due to mixing.

For preliminary distillation by spraying, only one period is characteristic-boiling; in final spray distillation, usually both boiling and evaporation.

Distillation is divided into falling film distillation and rising film. Film distillation by steam flow, so called "reverse flow". Film thickness is determined by the physical properties of the miscella, surface properties, its location, and distillation conditions. Removal of the solvent from the film is basically the same as from the free surface [2,3,4].

The presence or absence of heating of the surface on which the film is formed is of great importance. If the surface is heated, then evaporation occurs more intensively due to an additional heat source and changes in the mechanism of mass transfer on the heated surface.

Distillation in a bed is used for high concentrations of miscella (80 ... 85%). The solvent is removed by evaporation from the miscella bed. To intensify the process, a vacuum is used, and the micelle layer is bubbled with live steam. When using gasolines, distillation in the bed is a necessary stage in the final distillation; when switching to a low-boiling chemically homogeneous solvent (hexane), distillation in the bed can be excluded [9].

In low concentrations of vegetable oils in miscella, under normal conditions, the solvent is evaporated.

To lower the temperature in the distillation process and speed up the process, vacuum stripping of the solvent is used, as well as with water vapor.

In the world's industrial plants for the production of vegetable oil, miscella is carried out in two - and three-stage schemes.

The three-stage distillation unit consists of two film distillers operating in series at atmospheric pressure at temperatures of 80-90<sup>0</sup>C and a final distiller operating in a vacuum mode, in which the residual pressure in the apparatus is 0.04 ... 0.06 MPa at a temperature of 110-120<sup>0</sup>C.

The distillation method for purifying vegetable oils in a vacuum is based on the difference in vapor pressures and evaporation rates of the main component - oil and impurities contained in it. Vegetable oils are considered to be non-volatile up to a temperature of 225<sup>0</sup>C [5].

As mentioned above, in distillation, an important issue is the handling of heat-sensitive substances. In this case, it is necessary to use a vacuum, which allows the process to be carried out at sufficiently low temperatures. It is also necessary to ensure a short-term stay of the material in the heated zone. These requirements are met when distillation is carried out in a thin

film of the substance. A very thin film flows along the heated surface and is at the distillation temperature for only a few seconds.

Experimental research is widely used at all stages of development, production and operation of various technical objects, in particular, the development of equipment for the oil processing industry. When creating devices for carrying out technological processes, the main costs fall on their introduction into production and testing. The theory of experiment planning formulates techniques and methods for the optimal organization of research work.

Mastering the fundamentals of the theory of experiment and practical techniques of its use increases the efficiency of the researcher's work, allows solving many practically important research problems at the lowest cost, such as building a mathematical model of objects from experimental data and optimizing processes.

To improve the process and apparatus for the final distillation of vegetable oil miscella on the basis of multi-stage cutting, we used the method of planning experiments [6,7,8].

### Methods

Calculations of the coefficients of the process equation based on the results of the implementation of the PFE2 plan are presented in the table.

The main task, given  $y_i$ , is to predict  $y$ . To do this, first you need to find the type of connection between  $y_i$  and  $y$ .

If the values of  $y_i$  and  $y$  are given in the following table, then the type of relationship can be determined, i.e. linear or non-linear.

**TABLE1 INCOMPLETE PLAN OF THE PFE 2<sup>3</sup> PLANNING MATRIX**

№	Maincolumns			Processoutput			
	Z1	Z2	Z3	Y1	Y2	Y3	Y
1	-	-	-	100	10	0,00495	36,66831667
2	-	+	-	107	17	0,00636	41,33545333
3	+	-	-	114	24	0,00778	46,00259333
4	+	+	-	121	31	0,00919	50,66973
5	-	-	+	128	38	0,01061	55,33687
6	-	+	+	135	45	0,01202	60,00400667
7	+	-	+	142	52	0,01344	64,67114667
8	+	+	+	150	60	0,01485	70,00495

Then we find by what law  $Y$  and  $y$  are connected.

It can be seen from the graph that the connection can be taken as linear. The task is aimed at finding the coefficients  $b_0$ ,  $b_1$ ,  $b_2$ ,  $b_3$ . The determination of the coefficients is possible by the method of the smallest squares, i.e.

## RESULTS AND DISCUSSION

$$F(y) = \sum_{i=1}^n (Y_i - b_0 - b_1 \cdot Y_1 - b_2 \cdot Y_2 - b_3 \cdot Y_3)^2 \Rightarrow \min$$

If derivatives  $b_0$ ,  $b_1$ ,  $b_2$ ,  $b_3$  equate to zero, then we get the following system of equations, i.e.

$$\begin{cases} \sum y_i = N \cdot b_0 + b_1 \cdot \sum y_1 + b_2 \cdot \sum x_2 + b_3 \cdot \sum x_3 \\ \sum y_i \cdot x_1 = b_0 \cdot \sum x_1 + b_1 \cdot \sum x_1^2 + b_2 \cdot \sum x_1 \cdot x_2 + b_3 \cdot \sum x_1 \cdot x_3 \\ \sum y_i \cdot x_2 = b_0 \cdot \sum x_2 + b_1 \cdot \sum x_1 \cdot x_2 + b_2 \cdot \sum x_2^2 + b_3 \cdot \sum x_2 \cdot x_3 \\ \sum y_i \cdot x_3 = b_0 \cdot \sum x_3 + b_1 \cdot \sum x_1 \cdot x_3 + b_2 \cdot \sum x_2 \cdot x_3 + b_3 \cdot \sum x_3^2 \end{cases}$$

Having compiled a system of the given values in the table, we find the coefficients  $b_0$ ,  $b_1$ ,  $b_2$ ,  $b_3$ .

$$b_0 = 127,55; b_1 = -0,082; b_2 = 0,342; b_3 = -17,835$$

This means that the process we are examining is described by the following model.

$$y = 127,55 - 0,082 \cdot x_1 - 0,342 \cdot x_2 - 17,835 \cdot x_3$$

## CONCLUSION

We calculate the coefficients of the equation based on the average results ( $y$ ), using the appropriate formulas:

$$b_0 = \frac{\sum Y}{N} = \frac{(36,66831667 + 41,33545333 + 46,00259333 + 50,66973 + 55,33687 + 60,00400667 + 64,67114667 + 70,00495)}{8} = 53,08663333;$$

$$b_1 = \sum Z1_i/N = (-36,66831667 - 41,33545333 + 46,00259333 + 50,66973 - 55,33687 - 60,00400667 + 64,67114667 + 70,00495)/8 = 4,750471667;$$

$$b_2 = \sum Z2_i/N = (-36,66831667 + 41,33545333 - 46,00259333 + 50,66973 - 55,33687 + 60,00400667 - 64,67114667 + 70,00495)/8 = 2,416901667;$$

$$b_3 = \sum Z3_i/N = (-36,66831667 - 41,33545333 - 46,00259333 - 50,66973 + 55,33687 + 60,00400667 + 64,67114667 + 70,00495)/8 = 9,41761.$$

Therefore, the equation of the process will have the form:

$$y = 53,09 + 4.75 * Z1 + 2.42 * Z2 + 9.418 * Z3.$$

We determine the significance of the coefficients of the equation, for which we calculate the average variance for the entire experiment:

$$S_2(y) = (100 - 36,66831667)^2 + (10 - 36,66831667)^2 + (0,00495 - 36,66831667)^2 + (107 - 41,33545333)^2 + (17 - 41,33545333)^2 + (0,00636 - 41,33545333)^2 + (114 - 46,00259333)^2 + (24 - 46,00259333)^2 + (0,00778 - 46,00259333)^2 + (121 - 50,66973)^2 + (31 - 50,66973)^2 + (0,00919 - 50,66973)^2 + (128 - 55,33687)^2 + (38 - 55,33687)^2 + (0,01061 - 55,33687)^2 + (135 - 60,00400667)^2 + (45 - 60,00400667)^2 + (0,01202 - 60,00400667)^2 + (142 - 64,67114667)^2 + (52 - 64,67114667)^2 + (0,01344 - 64,67114667)^2 + (150 - 70,00495)^2 + (60 - 70,00495)^2 + (0,01485 - 70,00495)^2;$$

$$S_2(y) = 45891,51;$$

$$S_2(b_i) = 45891,51 / 8^3 = 956,0732215;$$

$$S(b_i) = 30,92043372.$$

Student's test for each coefficient  $q=5\%$ ,  $N=16$

$$t_1 = 0,625 / 30,92043372 = 0,020213171$$

$$t_3 = 13,125 / 30,92043372 = 0,424476581$$

$$t_2 = 4,375 / 30,92043372 = 0,141492194$$

$$t_{kp} = 2,12$$

Significant coefficients turned out to be  $b_0=53,08663333$ ;  $b_3=9,41761$  which we include in the regression equation:  $y^{\wedge} = 53,08663333 + 9,41761 * Z3$ .

Checking the adequacy of the model

Using the regression equation, we calculate the value of  $y$  for each point of the matrix design:

$$y1^{\wedge} = y2^{\wedge} = y3^{\wedge} = y4^{\wedge} = 53,08663333 - 9,41761 = 43,66902;$$

$$y5^{\wedge} = y6^{\wedge} = y7^{\wedge} = y8^{\wedge} = 53,08663333 + 9,41761 = 62,50424.$$

$$Sa\partial^2 = (43,66902 - 36,66831667)^2 + (43,66902 - 41,33545333)^2 + (43,66902 - 46,00259333)^2 / (8 - 2) + (43,66902 - 50,66973)^2 + (62,50424 - 55,33687)^2 + (62,50424 - 60,00400667)^2 + (62,50424 - 64,67114667)^2 / (8 - 2) + (62,50424 - 70,00495)^2 / (8 - 2) = 172,1546$$

Calculating the F-ratio:

$$F = Sa\partial^2 / S_2(y) \text{ или } S_2(y) / Sa\partial^2 = 45891,51 / 172,1546 = 266,5715$$

Determined by the table (Appendix 3)  $F_{krend} f1 = 6 = 8 - 2$

$$f2 = 8(3 - 1) = 16:$$

$Fkr=2,74$ .

Adequacy hypothesis is accepted.

**ALISHER NAVOI TRADITION IN THE WORK OF MUZZAMKHAN**

**Saydalieva Nasiba Farhodovna\***

\*Head of the Department of Languages,  
 Candidate of Philological Sciences,  
 SEIS Academic Lyceum,  
 UZBEKISTAN

**ABSTRACT**

*Tradition and skill are one of the factors that determine the longevity of literature. There is a creator of every age who has matured, intellectual qualities, who follows the creations of his predecessors, continues their most advanced traditions and strives to express himself, to have his say. Muazzamkhan's work is not without its events.*

**KEYWORDS:** *Sufism, Boda (Wine), Literature, Lyrical Heritage, Aesthetic Thinking.*

**INTRODUCTION**

As he grew up in a creative environment, it has been repeatedly acknowledged in scientific studies that from an early age he was well acquainted with classical poetry of the East, in particular, Uzbek and Persian-Tajik literature. Muazzamkhan's poetry is saturated with the Eastern style of aesthetic thinking. In it we meet the traditions used by a number of artists such as Rumi and Alisher Navoi, Fuzuli and Mashrab, Nodira and Uvaysi. As a mature poet of his time, Muazzamkhan creatively used these traditions, combined them with the problems of his time, tried to seal the sorrow in a unique way.

When we compare Muazzamkhan's poetry with the works of other poets, this originality becomes even more vivid.

Relying on the active participation of Muazzamkhan in his creative research, especially Alisher Navoi, the teacher diligently and lovingly studies the lyrical heritage. For example, in the poet's ghazal "Every Hour":

The doctors said: "that the cure for estrangement is to die.

That's why I'm sick every hour

(Tabiblar aytdi: hijron dardini dorusi o‘lmakdur,  
Aning-chun men bo‘libmen hajr ila bemor har soat)

This poet close to Alisher Navoi's lines:

If a person is suffering from separation,

His treatment will be either wine, or merging, doctor.

(Chorasi yo bodadur, yo vasl, yo marg, ey tabib,

Har kishikim topsa hijron dardidin bemorlig‘)

According to the sufism, "boda" (wine), "vasl" (merging), "Hijron" (estrangement) , "yor"(sweetheart) are concepts with symbolic meanings. Boda-the dream of the love of Allah, to achieve Vasl(merging), to become unique to the land of Allah. It is known that according to the sufism the ways to reach the will of Allah are different. For example, May, death, loss of consciousness can be avoided with Allah. Because to be born apart from Allah is to strive for the vision; Jalaliddin Rumi says:

Mo baroi vasl kardan omadem,

No baroi vasl kardan omadem

Alisher Navoi's byte talks about different ways to achieve this goal. According to the poet, this can be achieved only through death. Hijran is life. That is, man is separated from Allah while he is alive. In mysticism, death is a return to Allah. The representation of the verses of the Qur'an in afaq and anfus is interpreted as "death" and death is divided into general and specific. The first is the death of lusts and lusts. The second is to look at the whole being from the point of view of Truth, to attain monotheism. According to Junaid Baghdadi, "Sufism is that God will kill you and resurrect you. Therefore, the wisdom of resurrection with Allah is at the heart of "dying before death." In Alisher Navoi's verse, this is the philosophy of "dying before death", killing the lust and lust while still alive. Muazzamkhan, on the other hand, speaks of the only way to attain the guardianship of Allah.

Alisher Navoi is a poet who raised Uzbek mystical poetry to the highest level. Navoi's poetry is characterized by a deep, complex artistic philosophy, the richness of the image, the richness of the images, and at the same time, his poetry is so close to real life. Muazzamkhan's above lines are a simpler, more concise continuation of Navoi's creative traditions.

In Alisher Navoi, the cure for hajj is either boda, or vasl, or death, while in Muazzamkhan it is concluded that "the cure for hijrah is death." Without using the symbols of boda and visol, Muazzamkhan expresses his feelings in a special way in the second line, saying, "Because I am a patient with estrangement every hour." Muazzamkhan's:

I couldn't sleep on the night of your estrangement,

So tears flowed to my yellow face.

(Sani shomi firoqingda ko‘zimga kelmadi uyqu,

Aning uchun oqar xunob sariq ruxsor uza har su),

– Alisher Navoi's ghazal, which begins with:

Her promise of coming tonight that cypress-like belle didn't keep,  
 Looking forward to seeing her till early dawn I couldn't sleep.  
 I could've died of ghastly boredom but the stunner didn't come,  
 Feeling every moment nervous on my tiptoe I did creep

The same is true here: the situation expressed in both bytes is unique. Navoi's lyrical protagonist received, but his unfaithfulness condemned him to staying up all night. In Muazzamkhan, however, a general expression of estrangement is given. In this sense, time is clear and limited in Navoi's ghazal, and more general in Muazzamkhan.

Alisher Navoi wrote in one of his ghazals: These thoughts of the great poet may seem pessimistic to some. But according to Navoi, this mood purifies the heart, motivates a person to perfection. Muazzamkhan is also derived from this meaning in the above verse. The second verse of the verse makes it clear that this world is a test for the believer.

In terms of mystical terms, this world is a "dungeon". The dungeon is also used in the sense of body. That is, the fact that the soul entered the body from its celestial expanses like a narrow cage was likened to falling into a dungeon, and the word "prison" thus acquired a metaphorical meaning.

If they throw a scoundrel at you, and the arrow of slander pierces  
 your bosom like a pike, be patient.

(Sen sano et ta'na toshi gar yog'ilsa boshingga,

Tuhmat o'qi teshsa bag'ring misli paykon g'am yema.)

In the Muazzamkhan's poetry, inverted symbols to the "people of purity", "wisdom of the mind" are often encountered. These are: "kajrav" (crooked), "ignorant", "unscrupulous", "brave", and others. No matter how many "reproach stones", "the arrow of slander", that is, strangers from "wisdom of the righteous", your face before God is bright, - the poet appeals to him. Their schemings are not worth the grief.

Come, Muazzam, if you have hashed with a tesha, you will be the ground.

If they gossip, be silent and do not grieve.

(Kel, Muazzam, sen zamin bo'l, tesha birlan chopsalar,

Qil sukut gar qilsa dashnomi farovon g'am yema).

Attention is paid to the fact that the whole Gazelle is aimed at opening a poetic idea - the mood of a "stranger". The feedback around the same mood develops gradually and creates a distinctive set. Apparently, in Majestic poetry, internal activity is strong, and in this aspect it manifests itself one of the most remarkable features of Eastern poetry.

### ABSTRACT

*This article discusses the origins of phraseology, its different aspects with phraseological units and idioms. Phraseology (Greek phrasis - expression, expression and ... logy) - 1) a branch of linguistics that examines the phraseological structure of a language (phraseology) in its current state and historical development; 2) a set of phraseologies in a particular language.*

**KEYWORDS:** *Phraseology, Phraseological Units, Idioms, Phraseological Compounds, Lexicalization.*

### INTRODUCTION

Phraseological unit, or phrasema, is very much in terms of the origin of the phrase although ancient, the history of the science of phraseology (phraseology) spans several hundred years. Researchers have been working with phraseological units in Russian linguistics since the 18th century. In particular, MV Lomonosov, drawing up a plan of a dictionary of the Russian literary language, emphasized that, in addition to words, "folk (Russian) proverbs", "phrases" and "idiomatisms" should be expressed. By the 1960s and 1980s, phraseology had grown as rapidly in Uzbek linguistics as it had in foreign linguistics.

Phraseology (Greek phrasis - expression, expression and ... logy) - 1) a branch of linguistics that examines the phraseological structure of a language (phraseology) in its current state and historical development; 2) a set of phraseologies in a particular language.

As a branch of linguistics, the main focus of phraseology is on the study of the nature of phraseology and their categorical features, as well as on the laws of the use of phraseology in speech. The most important problem of phraseology is to distinguish phraseological units from those that are formed in speech (that is, not previously prepared), and on this basis to identify the features of phraseological units.

As a branch of linguistics, the main focus of phraseology is on the study of the nature of phraseology and their categorical features, as well as on the laws of the use of phraseology in speech. The most important problem of phraseology is to distinguish phraseological units from those that are formed in speech (that is, not previously prepared), and on this basis to identify the features of phraseological units.

Research in the field of phraseology in Uzbek linguistics began in the 50s of the last century. To date, phraseology has been studied from different angles (Sh. Rakhmatullayev, B. Yuldashev, A. Mamatov and others), several dictionaries on F. have been compiled (Sh. Rakhmatullayev, M. Sodikova), from writers Abdulla Qodiriy, Abdulla Qahhor, Hamid Olimjon, Aydin, The phraseological structure of Said Ahmad's works has been studied. In the 70s and 80s, SamSU had a center for the coordination of phraseological research and the production of special collections.

Phraseology is one of the branches of linguistics. Phraseology is derived from Latin, praxis means expression, logos means doctrine.

Phraseological unit is a fixed combination of two or more words in a language, which has a figurative meaning, the meaning of which is equal to one word.

Phraseologisms are stable combinations of figurative meanings that have a semantic integrity and consist of a stable relationship of two or more words before the speech process, ready to be introduced into the speech.

The part of language that studies expressions is called phraseology, and the set of expressions is called phraseology.

For example, sticking out the tongue, dropping a watermelon under the armpit, cracking the skin, and so on. . .

The term "semantics" is also used as a synonym for the term "semantics". Just as words cannot exist without meaning, so lexicology and semantics cannot exist without each other.

Lexicology is the study of the entire vocabulary of a language. It identifies historical changes in the structure of the lexicon, a variety of words borrowed from other languages, archaisms, neologisms, literary lexicon, slang, regional, dialectal terminology, specialization and other lexically divided words based on clear principles. considers different lexical categories and types.

The object of study of semantics is not lexical meaning in general, but lexical meaning. Semantics studies the lexicon of a language from a specific point of view, that is, from the point of view of meaning. So while the whole lexicon is studied by lexicology, semantics is a specific part of it and it is subordinate to lexicology.

Semasiology studies the spiritual side of lexical units and solves problems related to the nature of lexical meaning, types, laws of development of word meaning, different classifications of word meaning change. In traditional linguistics of the nineteenth century, the main task of semantic research was to study the types and causes of semantic changes specific to individual words and FBs. One of the most pressing problems in the history of language in the early twentieth century was the study of the structure of language as a system and the interdependence of specific semantic elements in language.

The lexical-semantic level covers all aspects of the semantic relations inherent in lexical units, the specificity of their diversity, their interaction with each other and with other elements of the system other than language (lexical paradigm). semantic diversity of specific features - conditions and forms of lexical expression (lexical syntagmatics). As the name implies, the term "lexical-semantic" suggests that it explores two different natures of the system. First, lexical semantics differs from grammatical semantics in the semantic boundaries of language. Second, using this system, word semantics can be broken down as a lexical element.

The language system, dictionary structure and lexical-semantic systems play an important role in distinguishing the set of nominative tools that make up the lexical system from the vocabulary. They represent the result of a complex interrelationship between a word and its meanings and the generalization of these results. Such interaction takes place in two areas of language: nominative-classification and lexical.

Idioms. The word idiom comes from the Greek word meaning "peculiar," "peculiar." Accordingly, idioms are also a form of phraseology and 'lexicalized' words. Therefore, when it comes to idioms, they are not considered as the fourth type of phraseology, along with phraseological complexes, phraseological integrity and phraseological compounds, nor as a separate linguistic unit. The reason for this is that while idioms are similar to phraseologies in terms of figurative meaning, sometimes they are also expressed in such a meaning not in the form of association, but within a single word.

Apparently, the term idiom includes both individual words and word associations. This is because the meaning of the term idiom can be limited to a range of phraseological connotations, but if this classification takes into account phraseological compounds based on only one word in a figurative sense, idioms can again be divided from stable associations into a single word. pulls towards.

The conclusion is that idiomatic words are similar to phraseological expressions in terms of their semantic development, especially phraseological confusions (in terms of equivalence to a word), but in idioms they are not portable with a primary meaning. The distance between the no and the distance from each other is stronger than in the expressions.

It is well-known that phraseological units give speech meaning, essence, validity, imagery and clarity. These features of phraseology are clearly preserved even in the style of speech, which does not involve any artistic image. Only in the artistic interpretation is the expressive nature of the phraseology more vivid, and in the hands of the writer the FBs serve as the main tool that can clearly express the culture, spirituality, intellectual potential of the protagonist.

Phraseology is the youngest branch of linguistics and gained the attention of linguists only in the 1960s. It was originally developed as a separate linguistics department by Russian linguists E.D. Polivanov and B. A. Larrin studied, and later V.V. Vinogradov, A.V. Linguists such as Kunin and Smirnitsky have worked on various internal issues. In general, the first researcher in the field of phraseology was the French-Swiss scientist Charles Balli. The development of phraseology as a separate science can be historically divided into three stages:

Covers the period from the middle of the XVIII century to the 30s of the XX century, the period of phraseological research MN Lomonosov, A.A. Potebnya, F.F. Fortunatov, A.A. In connection with the scientific activity of chess players;

30s-50s of the twentieth century E.D. Polivanov, V.V. Vinogradov, S.I. Abakumov, G.K. The period created by linguists such as Damilov, AI Yefimov, AY Rozhansky;

Continues from the 60s of the twentieth century to the present day. This period is characterized by the use of various methods in phraseological research, the rapid development of the field of phraseology and the development of many phraseologists.

Although phraseology is recognized as a separate discipline from the point of view of modern linguistics, it is developing in direct connection with lexicology, grammar, stylistics, phonetics, history of language, history of philosophical sciences, logic and geography.

### ABSTRACT

*This article discusses the comparative study of the expression of the meaning of temporality in German and Karakalpak languages, as well as the opinion of well - noun linguists on the comparative study of the expression of the meaning of temporality. The authors compare the expression of temporality in German and Karakalpak languages and gives examples.*

**KEYWORDS:** *Comparisons, Temporality, Adverbs, Comparison, Expressions, Similarity, Multi-System Languages, Cognition, Resistance, Research, Interactions, Combination, Relation, Analysis, Method.*

### INTRODUCTION

In connection with the increasing role of the study of foreign languages, there is a need for a more in-depth study of them. But, as you know, mastering the grammatical structure of a foreign language, in particular, in German, presents certain difficulties for students of national schools. This is due to the fact that students are faced with completely different grammatical phenomena than in their native language, in addition to that, there is a wide interest in the problems of comparative - typological study of languages of different systems.

R. Y. Barsuk explains the widespread of the comparative study of languages different systems in our country by five reasons (conditions) [1, 535-536].

In recent decades, we are very much faced with questions about the causes and similarities and differences in the structure of the language and in the evolutionary process from this or another soil. Comparisons of languages of this kind serve as the basis for extensive linguistic generalizations.

The importance of the comparative study of languages was pointed out by many scientists, including Academician L.V. Shcherba. He wrote: "The resistance of one language to another on the basis of comparisons, how the same thought in different languages is expressed in different ways and makes a person more attentive to the subtle nuances of thought and feeling"[2, 54].

Paying great attention to the comparison and comparative study of languages, V. I. Yartseva writes: Comparison always inevitably includes the knowledge of the studied material. Even in studies aiming at describing a language as a closed system with plans lying outside of it, as is the case, for example, when comparing the plane of expression and the plane of content. Therefore, comparison can be considered the most universal way of studying the material of a language. And this is quite reasonable, since the comparative method has not only theoretical, but also practical significance. Practical benefits are great for both translators and methodologists. The materials of these studies can contribute to improving the grammatical characteristics of words in bilingual dictionaries, improving the quality of illustrative examples in them, as well as being used by the authors of textbooks and teaching aids [3, 190].

Comparative study of the German and Karakalpak languages was obtained not only as a method in the development of linguistic science, but it equally benefits in the practice of teaching the German language in the national school, in improving the teaching methods of this discipline, in the development of translation. It should be stated that the comparative study of languages of different systems has now received its independent development. This method is constantly developing and improving with each new theoretical work, although some problems associated with the comparative method have not yet been finally solved.

The comparative method is a set of research techniques used to identify common and specific features in the studied languages, as well as the results of their interaction. Despite the importance of comparative study of German and Karakalpak languages, this problem has not yet been fully resolved. Expressions of temporal meaning in languages of different systems are of particular interest in terms of our research.

Temporal relations are widely used in all languages, including comparative German and Karakalpak. They are expressed in different ways, namely in different parts of speech. Both the German and the Karakalpak languages have a number of adverbs that express temporal relationships.

These adverbs are in German: heute, morgen, früh, spät, jetzt, sofort, abends, morgens, täglich, and jährlich.

Below we provide examples.

Und wir haben das bis heute nicht gewußt! ( Usbekische Sauber Märchen Churram Rachimov).

Am nächsten Morgen ging er damit zu dem Mann und sagte zu ihm: „ keine andere soll meine Gemahlin werden als die, anderen Fuß dieser goldene Schuh paßt „ . (Brüder Grimm. Aschenputtel und andere Märchen).

Sie gingen die ganze Nacht und noch einen Tag von Morgen bis Abend, aber sie kamen aus dem Wald nicht heraus und waren so hungrig. (Brüder Grimm. Aschenputtel und andere Märchen).

Früh morgens mußte Gretel heraus, den Kessel mit Wasser aufhängen und Feuer anzünden. (Brüder Grimm. Aschenputtel und andere Märchen)

Eines Abends gab es ein fruchtbares Umwetter; es blitzte und donnerte

Der Regen floss in Strömen, es war ganz schrecklich! (Nach dem Hans Christian Andersen. Märchen).

Abends legte es sich zu gewöhnlicher Zeit mit seiner Frau zu Bett: als sie glaubte, er sei eingeschlafen, stand sie auf, öffnete die Tür legte sich wieder. (Brüder Grimm. Aschenputtel und andere Märchen).

Clerfayt stand auf „Ich fahre jetzt ins Hotel. Wo können wir zusammen zu Abend essen?“, (Erich Maria Remarque. Der Himmel kennt keine Günstlinge).

„Wenn du erst Ministerpräsident bist, ist es zu spät“. (Erich Maria Remarque. Der Himmel kennt keine Günstlinge).

Eine Stunde später saß der Wagen fest. (Erich Maria Remarque. Der Himmel kennt keine Günstlinge).

In the Karakalpak language, the adverb: хәзир, бүгін, ертең, кеше, ерте, алдын, бурын etc. express this attitude.

-Маратсендаладакүтетур, Гүлзархәзиркийинипизиңненшығады, – деди. (Т. Қайыпбергенов. Уйқысызтүнлер)

ЕртеңинеМаратқакелдим. (Т. Қайыпбергенов. Уйқысызтүнлер).

Кеше кеште ол мени излеп емлеуғанаға келген екен. (Т. Қайыпбергенов. Уйқысызтүнлер).

Бурынғы өткен заманда бир бай болыпты. (Карл Райхель. Қарақалпақ халық ертеклери).

Our data on the comparison of sentences with adverbs in the German and Karakalpak languages show that the dialects of the Karakalpak language mainly correspond to the German dialects.

The German dialect hier, depending on the content of the structure of speech, can be transmitted: бунда, усында, hier - булжерде, täglich – күнсайынхәркүни.

Schon damals hatte Clerfayt gedacht.(Erich Maria Remarque. Der Himmel kennt keine Günstlinge).

Morgen beginnt für uns ein schweres und gefährvolles Leben (Erich Maria Remarque Der Himmel kennt keine Günstlinge)

A comparative study of the expression of the meaning of temporality in the German and Karakalpak languages comes to the following conclusion: This question is of interest because it has not been developed in a typological sense. Temporality is one of the most used linguistic phenomena not only in our comparable languages, but in all languages of the world.

Expressions of temporality in adverbs are characteristic for the German language as well as for the Karakalpak language. An analysis of our examples taken from the German and Karakalpak languages shows that the expression of the meaning of temporality in adverbs reveals a complete similarity rather than a difference in these languages.

### ABSTRACT

*Change in the Indian business environment because of globalisation has brought many advantages for those women who want to become entrepreneurs. The basic objectives of the paper are to find out the nature of women entrepreneurship ventures in India and examine the motivational factors of women entrepreneurs. Since India is a land of diverse culture, it is assumed that nature of women entrepreneurship ventures differ from place to place. The study is descriptive in nature and based on in-depth review of literature. The studies which have been published in various academic journals and articles in books on various aspects of women entrepreneurship in India during 1996 to 2016 have been considered.*

**KEYWORDS:** *Women Entrepreneurship, Diverse Culture, Globalisation, Motivational Factors.*

### INTRODUCTION

The population census 2011 clearly depicts that almost half of the total population of India is women. Since time immemorial women have been playing different roles in not only in the economic development of the country but also change in the social system. However, their contribution in the economic development is being hardly recognized in male dominated society like India. Until and unless women's unpaid work is recognized, efforts towards building a gender balance in society cannot be achieved (Islam, M.Aminul, n.d.). It is clearly depicted in

many studies that there are a good number of successful women entrepreneurs which makes the country feeling proud. There is an emergence of new class of women entrepreneurship in the country after 1991. This phase may be considered as a paradigm ship in the women entrepreneurship development in India.

According to Ahmad Ansari & Danish (2016), the work participation of women in India is the lowest in comparison to other countries. Women work participation in India has got momentum recently as the percentage of work participation went up from 14.2% in 1970-71 to 31.6% in 2010-2011. The expansion of job market which have been brought by neo-liberal -economic system along with aggressive entrepreneurship training programmes conducted by various promoting agencies, women of India have started participating in entrepreneurial activities. However, there are certain issues which need to examine that in which type of entrepreneurship ventures do women involve and are the types of women entrepreneurship ventures same in all the parts of the country.

The paper is presented in different sub heads and divided into five parts-the first part of the paper gives an outline of the paper including introduction, relevance of the study, objective of the study & preposition. The second part presents the research designs which have been followed and the third part deals with the review of literature and research gap. The fourth part presents the findings which are followed by conclusion & suggestions in the last part.

### **Relevance of the study:**

India is a male dominated society where women are considered as economically weak and socially dependent on male members. Empowering a woman is one of the prime factors that can help in achieving social harmony. A society cannot be termed as developed unless the participation of women in every walk of life is not fairly represented. In this regard, the participation of women in the field of entrepreneurship is positive trend in every society.. The introduction of MSMED Act, 2006 can also be considered as an important step by Government of India towards the development of MSME in India. The Act has introduced various schemes which provide skill training for needy women to make economically independent. It is evident from various studies that there is ever increasing trend in the involvement of women in entrepreneurial activities. According to Ghani, Kerr and O'Connell (2012) women owned business ownership share in India increased from 26% in 2000 to 37% in 2005.

Over the years women have made great strides in many areas with notable progress in reducing gender gap. Women are shifting themselves from traditional activities to modern activities. This paper looks at the literature to examine the nature of business run by the women entrepreneurs in India and to determine the various motivational factors of women in joining entrepreneurial activities. It is hoped that it will be useful to the policy makers and fellow researchers who are undertaking studies in this area.

### **Objective of the Study:**

1. To find out the nature of women entrepreneurship venture in India.
2. To examine the motivational factors behind the women entrepreneurship venture in India.

**Preposition:**

- i. Since India is a home of diverse culture, women who hail from different regions of the country operate different form of entrepreneurship ventures.
- ii. Economic condition of the family like poverty motivates women of India to start entrepreneurship ventures and hence, the majority of women entrepreneurship are not innovative ventures.

**Research Methodology:**

It is a descriptive research in nature and based on secondary data. An in-depth review of literature has been conducted in order to study the different dimensions in women entrepreneurship development in India. The studies which had been conducted and published during 1996 to 2016 have been reviewed for the present study. All the studies have been collected from journals, published books, and article. In this paper, India is divided into five zones they are: North (Uttar Pradesh, Himachal Pradesh, Haryana, Uttaranchal, Jammu & Kashmir and Punjab) South (Andra Pradesh, Karnataka, Tamil Nadu, Telengana and Kerela) East(- West Bengal, Orissa, Bihar and Jharkhand), West (Rajasthan, Gujarat, Goa, Maharastra, Madhya Pradesh and Chattisgarh), North-East (Sikkim, Assam, Arunachal Pradesh, Nagaland, Manipur, Tripura, Mizoram and Meghalaya). The findings are presented with the help of tabulation.

**Review of Literature:**

In this section, the literatures are reviewed under two heads which are nature of women entrepreneurship and motivational factors. According to MSMED Act, 2006 whether male or female enterprises are categorised into three types: (i) Micro, (ii) Small and (iii) Medium Enterprises and they are defined on the basis of the investment in plant and machinery (for manufacturing enterprises) or in equipment (in case of enterprises providing/rendering of services).

**(i) On the nature of women entrepreneurship venture:**

Many argue that women enterprises of India are micro, small and medium in nature. It is seen in the studies of Mishra, Dr.S.P. (1996), Samani, Veena S. (2008), Jyoti, Jeevan & Sharma, Jyoti (2011), Rai, Usha Kiran & Srivastava, Monica (2011), Das, Malika (2012), Sharma, Dr.Ajay; *et.al.*, (2012), Palaniappan, G.; *et.al.*, (2012), Kalayani P.R., Dr.Brinda & Kumar M., Dr.Dileep (2012), Pandey, Dr. Vivekanand (2013), Kurbah, Sairabell (2013), Kaushik, Sanjay (2013), Vijayakumar, Dr. A. & Jayachitra, S., (2013), Agarwal, Reena (2014), Chanu, Yumlembam Linthoi & Chanu, Dr. Ayekpam I. (2014), Murugesan, G, (2014), Chakraborty, Dipanjan & Barman, Dr. Ratan (2014), P.C., Sushail & Kamaludheen, K.M. (2015), Hameed, Dr. Syed Abdul (2015), Raval, Harishkumar M. & Swami, Leelaben M (2015), Ansari, Danish Ahmad (2016).

Women entrepreneurs of India also own manufacturing and service enterprises. This is revealed in the studies of Mishra, Dr.S.P. (1996), Rani, Lalitha (1996), Jesurajan, S.Vargheese Antony & Gnanadhas, Dr.M.Edwin (2011), Palaniappan, G.; *et.al.*, (2012), Chanu, Dr.Ayekpam I.& Teronpi, Monalisha (2012), Mehta, Dr.Pallavi (2013), Mukherjee, Sujata (2015).

There are also co-operative enterprises which women entrepreneurs have ventured recently in India. The studies conducted by Datta, Runita Bhatt & Gailey, Robert (2012), Levaku, Rajani (2014), Nanjappa, Dr.Chi & Nithya, K. (2015), Sudan, Falendra Kumar & Singh, Ishita (2015) clearly reveal it.

(ii) **Review of Motivating factors:**

Motivation is one of the most important factors effecting human behaviour. It can also change a performance of a person. Hence women entrepreneurs are also the outcome of motivation. Many studies reveal that there are various factors which motivate women to become entrepreneur. They are push factor, pull factor, internal factor, external factor, economic factor, social factor and psychological factors. The motivating factors behind women entrepreneurs are revealed from the studies of Dasgupta, B. (2004), Suganthi, J. (2009), Katoch, Sumita;*et.al.*, (2010), Goyal, Meenu & Prakash, Jai (2011), Jyoti, Jeevan & Sharma, Jyoti (2011), Jesuranjan, S.Vargheese Antony & G., Dr.M. Edwin (2011), Sorokhaibam, Dr. Robita and Laishram, Nandita, (2011), Rai, Usha Kiran & Srivastava, Monica (2011), Vatharkar, Poonam, (2012), Chanu, Dr.A.Ibemcha & Terangpi, Monalisha (2012), Kalayani P.R., Dr.Brinda & Kumar M., Dr.Dileep (2012), Babu, B.Dili & Rathnakumari, Prof.S. (2013), Bordoloi, Anjan Kumar & Machey, Ashwini, (2013), Mehta, Dr.Pallavi (2013), Sharma, Yogita (2013), Chakraborty, Dipanjan & Barman, Dr.Ratan (2014), Roy, Sujit & Manna, Samita (2014), P.C., Sushail & Kamaludheen KM, Muhameed (2015), Patel, Palak & Merja, Jay (2015), Bhuvaneshwari, P.Devi & Annapoorani, R (2015), Sharma, Jitendra K. & Gwal, Anant (2015), Reddy, K. Bhavika (2015), Srivivasu, b & Ratra, kanika (2015), Mukherjee, Sujata (2015), Rich, Ella (2015), Jha, Srabani (2015), Raval, Harishkumar M. & Swami, Leelaben M (2015), Baruah, Hemen Kumar & Bhorali, Devdas (2016), Yasmin, M. Shapna & Prathiba, Dr.N. (2016), Patel, Dr.C.K. & Desai, Shri P.K. (2016).

Push factors are those factors where behaviour of an individual forces themselves to complete in order to satisfy a financial need due to family circumstance or achieve a goal and Pull factors refer to the urge in women to undertake ventures with an inclination to start business (Jesurajan, S.Vargheese Antony & Gnanadhas, Dr.M.Edwin,2011)

According to Cohoon, et.al.,(2010), Jesurajan, S.Vargheese Antony & Gnanadhas, Dr.Edwin (2011), Revathi, D.Shanthi & Krishnan, Dr.Jayashree (2011), Datta, Punita Bhatt & Gailey, Robert (2012), Panchal, Rekha & Dua, Kavita (2013), Kaushik, Sanjay (2013), Pandey, Dr.Vivekanand (2013), Balhara, Shruti & Singh, Ajmer (2015) the factors which motivates women to become entrepreneurs are social factor, economic factor and psychological factors.

**FINDINGS:**

**A. Types Of Women Entrepreneurship Ventures in India**

There are different types of women entrepreneurship ventures in India. According to the nature of investment, there are three types of ventures. They are micro, small and medium enterprises. According to the types of products there are two types of ventures. They are service and manufacturing enterprises. Partnership and Co-operative form of enterprises is also another venture which is found in Indian context. A comparative picture on different nature and types of women entrepreneurship venture in different regions of the country are shown in Table 1.

**TABLE 1. TYPES OF WOMEN ENTREPRENEURSHIP VENTURES IN DIFFERENT REGIONS OF THE COUNTRY**

Different type of enterprises	NORTH	SOUTH	EAST	WEST	NORTH-EAST
	YES/NO	YES/NO	YES/NO	YES/NO	YES/NO

Source: Compiled from the Review of literature

Table 1 clearly indicates that there are different types of women entrepreneurship ventures in India. These types of ventures vary from place to place. It is seen that Micro, Small, Medium, Cottage, Sole-Proprietorship, Co-operative, Manufacturing, Service, Organised, Unorganised and Innovative enterprises are found in all the parts of India. Though large and Partnership form of enterprises are found in North, South, East and West India, these are not found in North-East India. The Imitative enterprise is found only in South India. Fabian and Drone enterprises are not seen any parts of India, whereas, innovative entrepreneurship ventures are found in all the parts of the country.

### **B. Motivating Factors Of Women Entrepreneurs in India**

Women in India have taken up entrepreneurial activities because of different reasons. These reasons are also known as motivational factors. The factors are depicted in the following table 2.

**TABLE 2. MOTIVATING FACTORS OF WOMEN ENTREPRENEURS IN INDIA**

Different	Motivational factors
Push factor	Poor income, unemployment, hereditary occupation, economic survival, family compulsion and trust upon them, need for additional income, need for money, desire for good life, no other alternative job, responsibilities to continue business, sudden fall in family income, death of earning member, inadequate income of family, family support, insufficient family income, difficulty in finding work and a need for flexible work schedule, economic difficulties & challenging, to secure self-employment, to fulfil the ambition of self/ parents/ spouse, shoulder one's responsibility.
PULL FACTORS	urge to do something new, education and qualification, role model to others, success stories of others, government policies, need to be their own boss, better work life, ambition, economic independence & challenge, economic status and interest, market potential, family background, feel proud to be entrepreneur, mental satisfaction, need for independence, ease to start business, existing business environment, to gain social recognition, entrepreneurial desire and desire for wealth, co-operation and support of family members and a strong network of contacts, self-achievement, self-perception, self-esteem, entrepreneurial intensity, to produce new products, self-realization/ awakening, competence in managing business, accessibility to information, government concession, threat of losing job, Entrepreneurship development programmes,
ECONOMIC FACTOR	Financial support from Government and other financial agencies, awareness about the loan scheme, profitability of business, to make use of idle funds.
SOCIAL FACTOR	Moral support of family, recognition given by the society, to achieve higher status in the society, to do social work.
PSYCHOLOGICAL FACTOR	Urge for learning, not afraid of failures and business risk, do not get discourage easily, high self esteem, self confidence & self perception, satisfaction with business earning, satisfied with family support, satisfied with workers, innovative instincts.

Source: compiled from the review of literature.

The findings of an in depth review of literature with regard to the motivational factors of women entrepreneurs in India clearly indicates that different factors motivate Indian women to join entrepreneurship. Different authors have considered the factors as push factors, pull factors, social factors, economic factors and psychological factors. It is also clearly revealed from the findings that not only the economic factors (poverty) but also different factors like psychological factors play an important role to bring the women in entrepreneurial race. Hence, the proposition which has been developed for the present paper is not supported by the findings, hence, it is rejected. However, empirical study is called for to test it.

---

**CONCLUSION AND SUGGESSTION:**

Various studies on women entrepreneurship have revealed that women play an important role in the economic development of the country. There are instances in the country where women have excelled in the field of entrepreneurship and effectively leading big corporate houses. The leadership qualities in women need to be harness. The government of India has lately introduced many schemes to promote start-up particularly among women but it is also painful fact that government sponsored schemes have not penetrated to all sections of the society in equal manner. In most of the cases illiteracy, remoteness of the place and lack of capital are the hindrance for women to choose entrepreneurship. It is therefore imperative to have a greater knowledge about the motivations among the women that will push them to pursue entrepreneurial activities. Our policies must ensure a good platform and atmosphere in terms of social and financial security (access to financial institution) for women to allow them to participate in the growth story of modern India. To conclude, in the words of former President APJ Abdul Kalam “Empowering women is a prerequisite for creating a good nation, when women are empowered, society with stability is assured.” Hence, women entrepreneurship development is required to bring women empowerment in India.

### ABSTRACT

*This article analyzes the issues of innovative consciousness and thinking of young people. It has been scientifically discussed that innovative thinking is an important factor in the innovative activity of young people.*

**KEYWORDS:** *Innovation, Creation, Creativity, Superior, Modern Education, Cognitive, Processes, Harmonious View, A Dynamic Features, Technical Research.*

### INTRODUCTION

A thirst for innovation, research and creativity is a human trait. It is this feature that motivates a person to look at himself as a subject of social existence and social relations. Doctor of Philosophy S.Norkulov writes: "Interest in knowing the world is unique for human. Due to the nature of the generalization of epistemological experiments and their use in changing the environment, man is the subject of social historical processes, created by civilization. These processes are related to mentality, consciousness, cognition, the pursuit of knowledge"[1]. The researcher reveals the laws of individual mentality and the transformation of consciousness into social mentality and consciousness, the first of which, no matter how important, becomes a product of "necessity" implied by N.A. Berdyaev through deterministic factors, especially social demands, the needs of society. To sum up, man's thirst for innovation, creation, and creativity is not just an individual phenomenon; they are related to social necessity. Here the demands of social development have a deterministic effect.

## **MATERIALS AND METHODS**

It should not be forgotten that there are also internal deterministic factors of creation. When it comes to creative mentality, this inner determinism is often referred. Internal deterministic factors include creative psychological phenomena such as ability, inspiration, the pain of thinking and creating, the desire to change the environment, the desire to further beautify and humanize, the ideal formed in the mind. These phenomena play a leading role in the lives of young people, especially in their imaginations. Eighty-two percent of our respondents consider it is a positive fact that the President and the government support the interest of young people in innovation and innovative research, and are ready to take advantage of these opportunities as much as possible. 78% of them emphasize that, schools, educational institutions and family institutions require young people to grow up as creative people, in this regard, first of all, parents help a lot, the spiritual and moral environment in the family, noble qualities, mutual support, altruism, respect to elderly people and traditions of honoring the little, spiritual support, encouragement.

69% of respondents say that family and school play an important role in a person's love for creativity, 51% say that the influence of friends is leading, 32% say that colleagues and classmates, and 21% say that special cultural and spiritual events of books and youth associations. At the same time, almost 94% of respondent youth express interest in this or that type of creative activity. It is true that among them artistic creation is in the lead (78%), young people interested in scientific and technical creativity are only about 3%. We specifically studied the answers of young people interested in scientific and technical creativity to our other questions. We found that in the family of these young people, either their father or brother was engaged in scientific and technical creativity. Among them are a few young people who are influenced by friends or others. It follows that the desire to engage in scientific and technical creativity is aroused by adults in the family. While the interest of young people in scientific and technical creativity is not formed by itself, the influence of external deterministic factors - family, friends - is in the forefront. The influence of special education and educational institutions is an axiom.

## **RESULTS AND DISCUSSION**

Youth is a formative stage of interest in the world, life, understanding them. There is no denying that there are innate abilities. For example, the famous composer Mozart wrote opera at the age of 4, the Russian composer Prokofiev at the age of 9, and Mendelssohn at the age of 14[2]. It is known that Alisher Navoi memorized Farid-ud-Din Attar's Mantiq ut-tayr at a young age, and that Beruni and Ibn Sina were interested in science from a young age and had unique abilities [3]. The abilities in these individuals have, of course, become a unique reality, perfected by external deterministic influences. It would have been impossible for these geniuses to reach the level of maturity if they had not worked on themselves, if they had not turned research into a way of life and thinking. Admittedly, sometimes there are exceptions in nature. For example, a 16-year-old boy comes to the famous Burdenko Research Institute. During the analysis, it is determined that the brain does not show any performance symptoms. Examination revealed that the young man had no right brain and the left side was insignificantly preserved. Nevertheless, the young man lived an active life, studied well, played sports, and was far superior to his peers in intellectual terms. This anomalous phenomenon surprised everyone [4]. This exception is not a simple natural phenomenon. Experts say that the human brain is 35 km long, has the ability to

send information to itself. There are enough prodigies who can memorize the whole pamphlet at once, write it fluently in both hands, memorize up to thirty numbers, and recite them in sequence at once. This means that a person, especially young people, can be taught the type of creation they want. Modern education, pedagogy is based on this principle. The above answers of our respondents also confirm this opinion. Innovation cannot be limited to the type of scientific and technical creation; it applies to all aspects and directions of human activity and interests. Therefore, in the literature there are such terms as "social innovation", "legal innovation", "agro-innovation", "and aesthetic innovation", "management innovation", "pedagogical innovation". Sometimes it is associated with scientific and technical research, innovation, it is considered that the introduction of scientific and technical innovations in the field, technological modernization. Replacement of production processes and services with modern equipment is interpreted as an innovation. In this interpretation, innovation is likened to any kind of innovation. In our opinion, it is appropriate to know it as a type of creative activity aimed at turning the field, object, process in an essentially new direction. The dynamic features and requirements of social existence, the development of society are one of the external determinants influencing innovative mentality.

In general, the cognitive phenomena that take place in the human mind and thinking are due to the influence of these determinants. "Social development affects people's thinking and consciousness through ambivalent events such as stable and changeable consequences and results, evolution and involution, revolutionary and counterrevolutionary, perceptual and coincidence, forcing them to live under the influence of certain ideas, views and spiritual values. In this case, social development comes as a product of certain ideas, views and spiritual values" [5] these contradictions of social existence are reflected in innovative mentality and research. Intuitive knowledge or inspiration in the field of creation is not always a perceived reality. Or the invention of a new technology may not always be of revolutionary significance. But every novelty, something of innovation, must in some way improve the function of the object. Only in this way does innovation meet the requirements of social existence, the development of society. Innovative mentality can be seen as a manifestation of social consciousness.

The fact that innovative mentality is a social being, derived from the demands of society, shows that it is in common with the social consciousness. True, this commonality is not absolute; they have their own characteristics, functional features. Cognitive processes related to social consciousness are also observed in innovative thinking. S.Norkulov sees the peculiarities of this process in the following: "Social consciousness is a simple sensory phenomenon, not an experience, it is a subjective reality based on scientific analysis of the external world, society and its immanent laws, political, economic, spiritual, cultural processes, life experiences, and the relationship between person and society, man and being .

## CONCLUSION

The nature of social consciousness in relation to social being requires an approach to human cognitive-sensory experiences in accordance with the laws and requirements of this being, the study of transformational changes in consciousness in terms of those laws and requirements, a harmonious view of endotransformation and exotransformation processes"[6].

To sum up, the connection between the requirements of social existence and innovative research is manifested in human sensory, cognitive experiences; the wavy, fluctuating course of these experiences is associated with fluctuation processes in this connection.

**ABSTRACT**

*The article presents a review of the literature on the main areas of prevention of the most common complication of abdominal and thoracic surgery - the adhesions. It is noted that adhesion processes have different clinical significance in the chest and abdominal cavities. At the same time, the experience of studying the causes of adhesion in the abdominal cavity can*

*serve as a foundation for further research on pleural adhesions. The key factor determining the pathogenesis of adhesion formation and its prevention is fibrinolysis. There have been several studies on this issue. Their results are promising, but most of them are contradictory and have been carried out in experimental models.*

**KEYWORDS:** *Abdominal And Thoracic Surgery, Postoperative Adhesion, Anti-Adhesion Coatings.*

## INTRODUCTION

Postoperative adhesions are a pathological condition that occurs in more than 90% of patients who underwent abdominal surgery and in 45-70% after thoracic surgery, and remains one of the most difficult problems in general surgical practice [5, 26]. Indirectly, the frequency of lesions of the pleural sheets by the adhesive process can be judged by the detection of pleural adhesions at autopsy, which, according to different authors, range from 48 to 80.5%. In a significant proportion of cases, pleural adhesions found at autopsy are an accidental finding and are asymptomatic [7].

Consideration of the influence of the adhesion process on the further course of the disease, and, therefore, the issue of management tactics (prevention and dissection of adhesions or stimulation of their formation) is reduced to solving the following main tactical points: the pathological process that led to adhesion formation; topography of adhesions; massive adhesions and the associated respiratory dysfunction.

According to most authors, the adhesive process in the pleural cavity is fundamentally different from that in the abdominal cavity and is of a compensatory and adaptive nature [2, 8]. In this connection, the attitude to adhesion formation in the pleural cavity cannot be considered unequivocally as a negative phenomenon, since in some cases (chest trauma, residual pleural cavity, spontaneous pneumothorax, etc.), adhesion stimulation may be a necessary component of treatment.

The available literature data indicate a high level of incidence of postoperative adhesive disease, while the mechanisms of adhesion formation are not fully understood [13]. The frequency of relaparotomy, according to various literature data, is estimated at 63% -97%. Repeated surgical interventions are more time-consuming and technically difficult, which, in turn, creates a potential risk of damage to vital structures. Approximately 1/3 of patients who undergo abdominal surgery are re-admitted within 10 years after surgery to address a problem directly caused by adhesions or complicated by adhesions, leading to serious clinical problems such as chronic pain, infertility and intestinal obstruction. More than 20% of all readmissions are noted within the first year after primary surgery [9].

Until now, a number of methods and anti-adhesive coatings have been developed, which have been successfully used in experimental studies. Their role is to activate fibrinolysis, hinder coagulation, reduce the inflammatory response, inhibit collagen synthesis, or create a barrier between adjacent wound surfaces. These prevention strategies can be divided into four categories: general principles, surgical techniques, mechanical barriers and chemicals [1, 23, 26].

As you know, some basic surgical principles must be followed in all abdominal surgeries. These principles are close to the Halsted Principles (W.S. Halsted 1852-1922), the first surgeon to

recognize the importance of these measures. Injury to the peritoneum should be avoided through careful tissue handling, careful hemostasis, continuous irrigation and avoidance of unnecessary drying out, ineffective use of foreign bodies, and suturing or clamping of tissue. The use of thin and biocompatible sutures, atraumatic instruments and starch-free gloves is also recommended. Starchy gloves are a significant risk factor for postoperative adhesions. Several experimental studies have shown that the use of gloves with powdered starch during laparotomy is associated with an increased risk of extensive postoperative peritoneal adhesions [23, 26]. However, recent evidence suggests that, in the absence of additional peritoneal trauma, foreign bodies are an infrequent cause of adhesion induction [16].

Certain intraoperative techniques should be employed, such as avoiding unnecessary pleural dissection or avoiding peritoneal closure. Many experimental studies have shown that non-closure of the peritoneum is associated with a decrease in the formation of peritoneal adhesion [18].

W.J. Brokelman et al. (2006) showed in a prospective study that there is no difference in the concentration of tPA antigen, tPA activity, uPA antigen or PAI-1 in abdominal biopsies taken at the beginning compared to the end of the laparoscopic procedure, regardless of whether high intra-abdominal pressure is created or light activity. In contrast, some studies have not reported a difference between both surgical approaches [10].

The role of CO<sub>2</sub>-pneumoperitoneum in adhesion formation after laparoscopic surgery has been reported [4]. It is known that, during laparoscopic surgery, CO<sub>2</sub>-pneumoperitoneum itself has a real effect on the peritoneum. It has been demonstrated that adhesion formation increases with the duration of the CO<sub>2</sub>-pneumoperitoneum and the insufflation pressure. Indeed, long-term laparoscopic surgery requires long-term and large volumetric gas insufflation, raising concerns about the adverse consequences of long-term gas insufflation. The standard CO<sub>2</sub> used in modern laparoscopic practice is cold dry CO<sub>2</sub>, which is not physiologic to normal abdominal conditions.

C.R. Molinas et al. (2001) demonstrated that CO<sub>2</sub>-pneumoperitoneum increases postoperative peritoneal adhesions depending on time and pressure, and that this increase decreases with the addition of 2-4% oxygen, which indicates peritoneal hypoxia as a driving mechanism. It is assumed that with a decrease in fibrinolytic activity, the process of adhesion formation no longer depends on the surgical approach, but develops on its own [27].

A multicenter, randomized, blind, controlled trial (2017) analyzed the short-term results of using an auto-linked polysaccharide (ACL) gel - a gel with hyaluronic acid. The use of ACL-hyaluronic acid gel showed a significant reduction in the frequency of intra-abdominal adhesions (13% versus 30.6% in the control group).

In a study by E. Aysan et al. (2020) prevention of postoperative adhesions was carried out using glycerol [6]. Previously, S. Mortier et al. (2005) reported that glycerol increases the efficiency of peritoneal dialysis and provides a protective effect on the peritoneal surface [28].

Glycerin is a viscous liquid alcohol with a molecular weight of 92.09 daltons [6]. It is soluble in water and alcohols, but not in liquid hydrocarbons. Glycerin is one of the most abundant molecules in living organisms and is also a central component of lipids. Adipose tissue is composed of one glycerol molecule combined with three fatty acid molecules.

In their early publications, E. Aysan et al. noted that 1% glycerol solution used in the process of mechanical separation of the healing surfaces of the peritoneum from the surrounding tissues is effective for the prevention of adhesions [6].

Aysan E, et al. (2020) increased the viscosity (3%) of glycerin in order to extend the absorption time and reveal a longer mechanical separation effect [6]. The authors studied the effect of a new composition of a solution of 3% glycerin and 3% sodium pentaborate on the prevention of adhesions, creating a synergistic effect; as a result, the frequency of postoperative adhesions was statistically reduced. According to the macromolecular structure, when injected into tissues or spaces in the body, absorption of glycerol through capillaries is difficult. Thus, glycerol remains in the injection site for a long period of time [29]. Consistent with the anti-inflammatory activity of sodium pentaborate in accelerating wound healing, there was less inflammation and fewer adhesive molecules were obtained with faster wound healing. Meanwhile, 3% glycerin provides effective mechanical separation around the wound healing environment. This synergistic activity revealed less PPA formation.

The positive effect of various boron compounds on the wound healing process has been demonstrated earlier [20]. In in-vitro and in-vivo studies, sodium pentaborate has been shown to have anti-inflammatory effects through cell proliferation and migration, and growth factor expression pathways, accelerate healing in various wound models [12].

Liquids such as crystalloids, dextran, hyaluronic acid, and icodextrin have been used to prevent adhesion. They separate damaged surfaces using "hydroflating", but their effectiveness is controversial. Crystalloids such as saline and Ringer's lactate are used in large quantities, but are rapidly absorbed. The most commonly used hypertonic solution was 32% dextran-70, but it was abandoned due to serious complications [Watson 2000]. Other liquid barriers that have the advantage of a longer residence time in the abdominal cavity such as hyaluronic acid (Sepracoat®, Genzyme Corporation, Cambridge, MA, USA), cross-linked hyaluronic acid (Intergel® Hyalobarrier gel; Baxter, Pisa), Italy) and Icodextrin (Adept®, Baxter Healthcare Corporation, Deerfield, Illinois, USA) has shown promising results in experimental and clinical studies. Brown et al. (2007) demonstrated that Adept is a safe and effective means of reducing adhesion in laparoscopy [11].

There are non-absorbable and bio-absorbent films, gels, or hard anti-adhesion membranes. The most commonly used mechanical barriers are oxidized regenerated cellulose (Interceed®; Johnson & Johnson Medical, Arlington, TX, USA), expanded polytetrafluoroethylene (Preclude Peritoneal Membrane®; WL Gore and Associates Inc., Flagstaff, Arizona, USA), hyaluronic acid- carboxymethyl cellulose (Seprafilm®; Genzyme Biosurgery, Cambridge, MA, United States) and polyethylene glycol (SprayGel®; Confluent Surgical Inc., Waltham, MA, United States).

The most widely studied bioabsorbable films are Seprafilm and Interceed. Seprafilm is absorbed within 7 days and excreted from the body within 28 days. Prospective randomized controlled trials have shown that Seprafilm is effective in reducing the incidence and severity of postoperative adhesions. However, Seprafilm can cause significant disruption of anastomoses and should not be used in cases of anastomosis [15, 24]. Other experimental studies have shown that covering lesions of the parietal peritoneum with microsurgical autologous peritoneal grafts can completely prevent the formation of severe peritoneal adhesion. However, the advantage of

the synthetic barrier is that the material does not need to be obtained surgically and can be cut to dimensions outside the abdominal cavity and then applied without sutures [34].

Chemical agents such as non-steroidal anti-inflammatory drugs (NSAIDs), corticosteroids, calcium channel blockers, histamine antagonists, antibiotics, fibrinolytic agents, anticoagulants, antioxidants, hormones, vitamins, colchicines, and selective immunosuppressants, prevent persistent fibroblastin formation [3] ...

NSAIDs reduce peritoneal adhesion in some animal models by inhibiting the synthesis of prostaglandin and thromboxane. They reduce vascular permeability, plasmin inhibitors, platelet aggregation and coagulation, and improve macrophage function.

In known studies, postoperative administration of anti-inflammatory drugs at the site of injury reduced the formation of postoperative adhesions in two animal models. An experimental rat model was used to investigate the efficacy of nimesulide, a selective cyclooxygenase-2 inhibitor, in preventing adhesion formation. Preoperative intramuscular or postoperative intraperitoneal injection of nimesulide into the injury site reduced the formation of postoperative adhesion [29, 33]. Typically, some anti-inflammatory drugs may be effective in preventing adhesions, but there is no clinically relevant evidence from any published study to recommend their use in humans for this purpose, and some side effects remain to be seen.

Corticosteroid therapy reduces vascular permeability and release of cytokines and chemotactic factors, and decreases peritoneal adhesion formation in some animal models. However, corticosteroids have side effects such as immunosuppression and delayed wound healing.

Kirdak et al. (2008) investigated the effectiveness of different doses of methylprednisolone in the prevention of experimentally induced peritoneal adhesions in rats. They found that there was no difference in the effectiveness of different doses of topically administered methylprednisolone in preventing peritoneal adhesion formation, and, furthermore, steroids did not prevent the development of peritoneal adhesion [22].

The positive effect of progesterone is known in a slight decrease in adhesion, formed after a small injury to the peritoneum. In addition, it was shown that neither estrogen nor gonadotropin-releasing hormone prevented adhesion formation [30].

The use of anticoagulants to prevent abdominal adhesions has been enthusiastically described in the scientific literature. Several studies are known using heparin or dicumarol, which prevent adhesion by increasing fibrinolysis and serinesterase activity [31, 33, 35]. However, their effectiveness in reducing adhesion formation, whether administered alone or in combination with an additional agent, has not been demonstrated in clinical trials.

M. Kement et al. (2011) evaluated low molecular weight heparin at a dose of 66 IU / kg every 12 hours for five days in an experiment undergoing laparotomy of horses, and there was no positive effect on postoperative complications or survival [21]. No favorable results have been obtained in humans. The recommended dose of heparin remains controversial. One recommendation is 20-150 IU / kg every 6-12 hours for two to five days. Although no intraperitoneal studies have been performed, 30,000 IU of heparin diluted in saline is commonly used and is informally called effective.

Fibrinolytic agents, such as recombinant tPA, when applied topically, reduce adhesion in animal models. However, these fibrinolytic agents can cause hemorrhagic complications [36]. Three different drugs, tPA (Actilyse®; Boehringer Ingelheim International GmbH, Ingelheim am Rhein, Germany), fondaparinux (Arixtra®; GlaxoSmithKline, France) and activated drotrecogin alpha (Xigris®; Ellie Lilly & Co., DSM Pharmaceuticals, Inc. Greenville, North Carolina, USA), which affect the coagulation process at different stages, were studied for their effectiveness in preventing the formation of intraperitoneal adhesion in rats. All three agents were effective in preventing adhesions when compared with the control group. However, activated Drotrecogin-alpha appeared to be most effective except where clinical applicability was considered, in which case fondaparinux appeared to have the greatest benefit. However, further studies have shown that all of these approaches can have only limited success, prevent the lack of safety, efficacy and many adverse effects without eliminating the problem of postoperative formation of peritoneal adhesion [30].

Vitamin E is the most studied vitamin in adhesion prevention. In vitro studies have shown that vitamin E has antioxidant, anti-inflammatory, anticoagulant and anti-fibroblastic effects and reduces collagen production. It has been found to be effective in reducing the formation of adhesion by some authors [36]. Research has shown that intraperitoneal vitamin E is as effective as the carboxymethylcellulose membrane in preventing postoperative adhesions. In contrast, the same effect was not achieved after intramuscular administration. A significant difference was found between intraperitoneal and intramuscular administration of vitamin E [36].

Today, prophylactic agents that have a certain value are viscous solutions of high molecular weight polymers, such as solutions of 1% carboxymethyl cellulose (CMC), hyaluronate and CMC bioabsorbable membranes, heparin and peritoneal lavage [19].

Viscous CMC solutions have lubricating properties, reduce trauma during processing and serve as barriers to serous surfaces. CMC demonstrates variable efficiency in rats and rabbits [19]. Despite low efficacy, intraperitoneal use of 1% CMC does not appear to affect anastomosis or surgical incision healing and doubles survival [29]. The use of a CMC solution is recommended at the beginning of the operation and whenever it is necessary to lubricate the serous surfaces, reducing tissue damage from surgical trauma [29]. Oxidative stress plays an important role in the mechanism of adhesion formation, mainly due to suppression of the fibrinolytic activity of mesothelial cells. Antioxidants used intraperitoneally reduce oxidative stress and increase fibrinolytic activity. N-acetyl-cysteine (NAC) is an antioxidant that acts on the synthesis of intracellular glutathione and is believed to inhibit adhesion through active cellular mechanisms of inflammation and angiogenesis. Seeking an evaluation of clinical use, S. MacKinnon et al. [25] used fucoidan in 33 colic underwent laparotomy. Fucoidan (PERIDAN concentrate) (50 ml) was mixed in 5 L of Ringer's lactate solution (LRS) or plasmolyte solution and 500 ml LRS or 1 L of plasmolyte. The solution was mixed and administered until the abdominal cavity was closed. In recent studies, a new hydrogel, poly- $\epsilon$ -caprolactone-poly-ethylene glycol (PCEC), has demonstrated the potential to prevent postoperative adhesions in rats [17]. PCEC is thermosensitive and at body temperature the solution containing the micelles turns into a hydrogel. PCEC is biodegradable and has low toxicity in vitro and in vivo [17]. Much more interest has been directed to the use of drugs such as angiotensin II receptor blockers (ARA-II) and HMG-CoA reductase inhibitors (statins) [14]. ARA-II decreases the levels of TGF- $\beta$ , and atorvastatin increases the profibrinolytic environment in the peritoneum, which leads to

inhibition of adhesions. P. Dinarvand et al. (2013) compared the use of losartan (1.5 and 10 mg / kg), atorvastatin (1.20 and 30 mg / kg), losartan (10 mg / kg) and atorvastatin (20 mg / kg) and sodium hyaluronate / carboxymethylcellulose ( HA / CMC) intraperitoneally to 90 male mice. After 7 days, the degree of adhesions was assessed, and the simultaneous intraperitoneal administration of losartan and atorvastatin resulted in a much greater reduction in adhesions compared to that in the HA / CMC group [14].

The results of a study by Z. Song et al. (2019) on the use of Xanthan gum XG polymer anti-adhesion coating with different concentrations (from 0.5% to 2%) and molecular weight (Mw)  $2.5 \times 10^6$  Da -  $6.9 \times 10^6$  Da showed that XG has an anti-adhesive effect in the abdominal rat cavities. The 1% high Mw XG gel ( $6.9 \times 10^6$  Da) was more effective in preventing adhesions compared to the commercially available gel (1.2% sodium hyaluronate). Histological and cytotoxic evaluation demonstrated that the XG gel showed no side effects during wound healing and had no in vitro cytotoxicity for L929 cells [30].

L.X. Lin et al. (2017) synthesized a gelatin hydrogel - cross-linking carbodiimide-modified chitosan hydrogel (cd-CS-gelatin). The results of an experimental study showed that the hydrogel solidified within 3 minutes after mixing the reagents. Caecum-abdominal adhesion was observed in all rats without anti-adhesion treatment. The use of cd-CS-gelatin significantly reduced the adhesion level from 100% to 50%, compared to liquid chitosan (only up to 88%). The decrease in adhesion tensile strength also showed that cd-CS gelatin was more effective than chitosan fluid in reducing postoperative intra-abdominal adhesion formation [23].

Summarizing the conducted literature review, the following conclusions can be drawn: Postoperative adhesion formation is the most common complication of abdominal and thoracic surgery. The adhesion process as a complication of the effect on the mesothelium is most fully studied, both clinically and experimentally, in relation to the abdominal cavity. Relatively recently, adhesive complications have become the subject of study of the consequences of injuries and surgical interventions on the organs of the chest. It should be taken into account that although the processes of adhesion have different clinical significance in the chest and abdominal cavities, the experience of studying the causes of adhesion in the abdominal cavity can serve as the foundation for further research on pleural adhesions. Fibrinolysis is a key factor in the pathogenesis of adhesion formation and its prevention. There have been several studies on this issue.

Their results are promising, but most of them are contradictory and have been carried out in experimental models. Despite the long-term existence of the problem, issues related to the prevention of adhesions and the treatment of adhesive disease are among the still unsolved problems of thoracoabdominal surgery. In the current state of scientific knowledge, preclinical or clinical studies are still needed to evaluate the effectiveness of several proposed strategies for the prevention of postoperative adhesions. The literature actively discusses the development of a universal scheme for the classification of adhesions, as well as a predictive assessment system for identifying patients with a high risk of postoperative adhesions, which is necessary to determine the indications for the use of anti-adhesive coatings. In the future, anti-adhesion agents and anti-adhesion measures will become increasingly important. Thus, a review of published studies devoted to the problem of abdominal and pleural adhesions shows the need for further experimental and clinical studies to find and develop new preventive measures, anti-adhesion coatings and a comparative analysis of their effectiveness.

## THE IMAGE OF A BIRD IN THE WORKS OF ALISHER NAVOI

**Mohira Islomova\***

\*Teacher,

Department of interfaculty Foreign Languages of Fergana State University,  
Fergana, UZBEKISTAN

### ABSTRACT

*This article deals with the ideas put forward in the world and Uzbek literature through the image of a bird, the artistic interpretation of lyrical experiences. In particular, social events expressed through the image of a bird are interpreted and studied in the works of Alisher Navoi. The image of the bird Simurg, popular among people in the form of a state bird, a bird of happiness, a nightingale, first appeared in Eastern literature in Firdavsi's "Shohnoma". Although his name is not mentioned in Abu Ali ibn Sina's Book of Birds, Simurg refers to the king of birds.*

**KEYWORDS:** *Reality, Belief, Imagination, Epic Image, Lyrical Expression, Idea, Literary, Tradition, Features*

### INTRODUCTION

Imagining, describing reality through the images of birds, searching for solutions to problems is one of the ancient features of human beings. Birds were formed on the basis of primitive concepts in the history of world thinking, primarily based on the religious-philosophical, mythological-mythological concepts. There is a fact that Prophet Solomon knew the language of birds and was able to subdue them to his rule is a clear proof the existing in the religious books.

These include the Phoenix in the west, the legendary bird **Qaqnus** in the East, the **Jarptitsa** in the Slavs, **Turan**, and **Humo** in Iran, and **the Semurg** (sometimes called Anqa) deified by our ancestors. In Uzbek folk tales such as "Kenja botir", "Guliqahqah", "Qora holli ot" there are scenes about birds that save and protect the hero. The image of the bird Simurg, popular among people in the form of a state bird, a bird of happiness, a nightingale, first appeared in Eastern literature in Firdavsi's "Shohnoma". Although his name is not mentioned in Abu Ali ibn Sina's Book of Birds, Simurg refers to the king of birds. In the ancient East, the legendary bird that sponsors the protagonist in legends, fairy tales and epics, Anqa is embodied in the work of Imam al-Ghazali in his work "Risalat-ut tayr" as a mystical symbol of Allah.

## MATERIALS AND METHODS

The works of the famous American naturalist Seton Thompson, the English writer Jack London, the masterpiece of the ancient Indian epic "Kalila and Dimna" (original name "Panchatantra"), the epic "Lison-ut tayr" by Alisher Navoi, "Zarbulmasal" by Muhammad Sharif Gulkhani, the details of the image of birds in world and Uzbek folk tales have been the subject of various studies, and research is still ongoing.

Regardless of the different styles, worldviews, attitudes, positions, views of different peoples of the world in the creation of the image of birds, at the heart of the reality they write, figurative images are the human person and his character, spirituality, spiritual world. In particular, the great Uzbek poet and thinker Alisher Navoi, although using a unique method of choosing the plot and composition, draws spiritual-enlightenment, moral-philosophical conclusions from the fate of the hero, who represents a certain environment in the formation of personality and character, analysis of events and the problems tried to find solutions.

Alisher Navoi is shown not only in his literary works, but also in his scientific works as a scholar of the world of birds. In particular, in the work "Muhokamat-ul lug'atayn" ("Discussion of two languages"), comparing the possibilities of the Turkic (Uzbek) language with the Persian-Tajik language, proves the lexical richness of his native language in the example of birds. *"Va qushlarki, anda muqarrar va mashhur ilbosun (yovvoyi) o'rdakdur. Va sort (fors) el ilbosunni xud bilmas. Tag'i turk o'rdakning erkagin "so'na" va tishisin (urg'ochisini) "bo'rchin" der. Va sort munga ham ot qo'ymaydur. Va nar va moda ikkalasini ham "murg'obi" (suv qushi) der. Va o'rdakning anvoi bilur Qushchilar qoshida, masalan, jo'rka va erka, suqtur va olmabosh, chokirqanot va temirqanot, aldaldag'a va alapaka, bog'chol va bu yo'sunluq derlarkim, etmish xil bo'lurkim, sort borisin murg'obi deb qo'ya qoladi.*[1.115]

Alisher Navoi in his work "Lison-ut tayr" artistically described the problem of nature and divinity with a human-being. The author expresses his views figuratively through the language, deeds and adventures of more than thirty birds, such as Hudhud (popishak), Parrot and Peacock. The scientists V. Zohidov and Sh. Sharipov have done significant research in their time and presented their findings. In any case, the epic "Lison-ut tayr", a collection of symbols and images of birds, has a special place in the author's work as a work that summarizes the advanced philosophical and mystical views put forward throughout the creative career of the great thinker.

## RESULTS AND DISCUSSIONS

In the lyrical heritage of Alisher Navoi, the image and image of birds are widely used. Here are some characteristic examples of them. The deaths of his close friends Abdurahman Jami, Said Hasan Ardasher, Pahlavon Muhammad and others have strengthened the poet's feelings of loneliness and sadness.

*Ey Navoiy, uhti bulbullar xazonda bog'din,*

*Men qanotsiz QUSH masallik aylab afg'on qolmisham.*

*Meaning: O, Navoi feels downhearted like a wingless bird.*

It is known that the main part of the samples of Eastern classical lyric poetry, in particular, consists of poems on the theme of love. Through such poems, the authors tried to express themselves artistically, from personal experiences to major historical and social events. While

addressing topics such as complaints about emigration, grievances, aggression and threats from rivals, the author has often focused on figurative imagery, impressive logos. Among such images and lyrical images is the image of a bird. For example, in one of Alisher Navoi's famous poems, the image of a bird falling in love is also referred to as a bird:

*Jahdim andoqdur etishgaymen deb vaslig'a bot*

*Kim, qabul etmon og'ir deb chiqsa egnimdin qanot.* [1. 75]

Here, the lyrical protagonist exaggerates that I am so in love with my friend that I will give it up, even if I have wings like birds, so that they do not weigh me down on the road.

Human life is fleeting, say the wise. It is the dream of the wise not to miss an opportunity, to rely on good and noble deeds, to make a good name. Alisher Navoi expressed similar ideas through various figurative expressions. In particular, views on the transience of life are lyrically expressed through the image of birds:

*Dahr bo'stonida qilmoq sayr aylab hoyu huy*

*Harza kezmaktur hayotning qushlarini urkutib.* [1. 55]

If we consider the short-lived world as empty, to miss an opportunity with various pleasures is to frighten the birds of life, to miss precious moments, says the poet.

The image of a bird also helps in the lyrical expression of the lover's heart tied to the yoke:

*Ko'ngul qushidur oning zulfi tobdori bila*

*Chibinki bog'liq erur Ankabut tori bila.* [1. 553]

The children turn on the lights in the dark of night, their eyes blinded by the light, and the wild birds, which have lost consciousness, catch them when they hit the lamp. This real and vital event, in which the image of a bird is involved, is compared to the actions of a spouse to win the heart of a lover:

*Hajr aro ul sho'x ko'nglum sayd etar ruxsor ochib,*

*Tifl oqshom QUSH tutarg'a Ravshan etgandek charog'.* [1.298]

When we learned the four devons of Alisher Navoi's "Khazoin-ul maoniy" turn by turn, according to our calculations, the number of bytes depicting the image of Bulbul in the devon of the poet "Gharoyib-us sig'ar" is forty. In the devon "Navodir-ush Shabab" this image consists of 28. We also came across this image in the 13th place in the devon Badoe'ul Vasat and in the 27th place in the devon Favoyid-ul Kibar.

In Khazayn-ul-Maoniy, we found the image of Bulbul (nightingale) in 122nd place. The great poet sometimes uses the term "Andalib" instead of "Bulbul"(nightingale). The word andalib, according to our observations, was used only in a few places. These are: 1). In the 330th ghazal of the devon Navodir-ush Shabab. 2). It is found in the 26th, 159th and 445th ghazals of the devon Favoyid-ul-Kibar. The remaining 118 bytes were used as Bulbul (nightingale). It is noteworthy that even if the poet refers to this image in more than a hundred places, the content of one byte does not duplicate the other, neither in character nor in meaning.

**CONCLUSION**

Every writer is a son of his time. First of all, he breathes with the environment in which he lives, is influenced by the events of life, writes them down, expresses his worldview, position, and attitude. Birds, on the other hand, are an integral part of the environment that surrounds every writer. Therefore, our approach from this point of view will be useful in analyzing the aesthetic ideals, ideological and philosophical conclusions, artistic skills of the poet.

**ABSTRACT**

*This article deals with upbringing a young generation on the basis of a comprehensive, harmonious, healthy lifestyle as one of the pressing challenges of today, and the use of rich, national, cultural, historical traditions, customs, and universal values and moral and ethical standards in the upbringing of young people.*

**KEYWORDS:** *Adolescence, Healthy Living, National, Cultural, Customs, Universal Values, Spiritual, Moral, Educational, Historical, Spiritual Heritage, Belief.*

**INTRODUCTION**

Every nation across the world has its own national religion and values, and on the basis of these values in different socio-economic systems emerge genres of folklore in a new form and content, expressing the desires, joys and concerns of the people. As long as there is a nation, members of that nation are used to create, reflect their heart, love and life experiences in their oral and written work. The patterns created by the people determine the place of this nation and the people in the spiritual development of society.

In the era of globalization and technology, the spiritual and moral upbringing of the individual, especially preschool children is the main criterion of state policy. To approach the development of a person correctly, it is necessary to know the nature of the person, his structure, his behavior and the means of influencing him.

---

## MATERIALS AND METHODS

One of the features of the process of spiritual and moral education in the system of preschool education is a pedagogical process organized for the purposeful formation of the personality of preschool children in the process of spiritual and moral education, which allows regular and systematic influence on the individual. Indeed, the process of spiritual and moral upbringing involves two interrelated activities, in which the child's spiritual consciousness is formed, emotions are developed, and moral habits necessary for social life and serving social relations are formed. In the process of upbringing, to develop not only the consciousness but also the feelings of the child, in order to develop their moral skills and habits that meet the moral requirements of society, the consciousness of preschool children (during lessons) and will (outside activities) in the process of managing behavior) is systematically and systematically affected. In the process of shaping the spirituality of preschool children, it becomes difficult to achieve the goal if any of these (consciousness, emotions, will) are ignored. Therefore, spiritual and moral education is called a consistent and complex process.

Another feature of the spiritual and moral education of preschool children is the multifaceted process of education, which is organized on the basis of internal and external (subjective and objective) factors that serve to illuminate the essence of the educational process. Subjective factors express the inner needs, interests, life relationships of the individual, and objective factors create the conditions for a person to live, form, positively solve life problems.

The most important goal of modern preschool education is to bring up, socially and pedagogically support the spiritually and morally mature, physically healthy, responsible, creative, enterprising, harmoniously developed citizen of the Republic of Uzbekistan. This is reflected in the "Concept of continuous Spiritual Education" adopted by the president of the Republic of Uzbekistan with the aim of ensuring the implementation of the resolution No. PD-4307 "On additional measures to improve the effectiveness of spiritual and educational work" on May 3, 2019 as well as educating young people to independent life as active citizens.

The fifth chapter of the concept provides for the implementation of continuous spiritual education in the system of preschool education, the development of positive behavioral motives of children from this period on the theme of "Uzbekistan is my homeland!" to form of a sense of respect for the symbols of the state, and moral qualities such as courage, enthusiasm, national pride, determination, entrepreneurship, shame, contentment, diligence, and using fairy tales, myths, legends, epic, proverbs on the theme "child is dear, manners are more dear to him" focused on the formation of spirituality and moral qualities of children, the development and implementation of specific methodological developments for educators of preschools and parents of children has been identified as one of the important tasks of today.

## RESULTS AND DISCUSSIONS

Today, the increasing incidence of preschool education as a part of spiritual and moral education and its components is caused by a number of factors that are observed worldwide:

- the growth of the requirements for the level of spiritual and moral upbringing of specialists in the field of preschool education for successful activity in the social space in a changing, multifunctional, modern environment with a high rate of development;
- professionalism for progress in all spheres of public life and moral foundations of

communicative processes; excessive and diverse cultural and artistic realities, at the same time developing in harmony with continuous flow of information, increasing demand for preschool education, their uniqueness and versatility;

- the ineffectiveness of the process of teaching high samples of spiritual and moral education to children of preschool age through samples of folk oral creativity, inconsistency of reflections, views on the line of striving for perfection as a specialist and a person;
- the need to establish, manage, support the process of spiritual and moral education of the growing younger generation in such conditions is realized through certain factors

The analysis of these factors shows that in moral education of preschool children, it is necessary to use more extensive samples of folklore of the people.

Fiction in the historical genre, which is an integral part of spiritual culture, reflects the past, sorrows, joys of the nation and the way of thinking. While the predominance of the ideas of love and mutual compassion in the works of this genre has a positive significance in the life of the nation, the predominance of inhuman ideas, superficial coverage of the past leads the nation to ignorance and self-delusion. There are priorities in the spiritual and moral education of preschool children and increase its effectiveness, and ensuring, developing and improving their solutions is an important factor in educating a spiritually and physically healthy generation. These priorities can be classified as follows.

- Ensuring continuity in the spiritual and moral education of preschool children;
- to inculcate the essence of universal and national values in the content of preschool education, taking into account the age characteristics of children;
- taking into account the world best practices in the field of preschool education, study and wide implementation of ideas specific to the mentality of our country;
- to achieve the improvement of the content of preschool education plans, curricula and methodological manuals in accordance with the requirements of the period, in accordance with our national values;
- organization of pre-school educational process on the basis of new educational-methodical complexes and innovative educational technologies based on our national values;
- extensive use of the rich spiritual heritage, intellectual potential and universal values of the people in ensuring the effectiveness of the preschool education system;
- creation of a new concept of cooperation between the organization of preschool education and all social institutions of society in the upbringing of a spiritually and morally harmoniously developed generation.

Spiritual and moral upbringing of preschool children, pedagogical study of educational results is an important criterion in the upbringing of a spiritually and physically healthy, perfect person.

## CONCLUSION

In short, to create a special program of pedagogical and psychological study of the spiritual and moral, harmoniously developed generation and its results are based on today's requirements; determine the methodological basis; determination of the content and principles of our national

values, including the examples of folklore; selection of effective methods; analysis, drawing conclusions, clearly defining ways of making recommendations is one of the current problems facing the science of preschool education pedagogy.

**ABSTRACT**

*The article highlights the current role of the Chashmai Ayub Water Supply Museum and some ancient waterworks in increasing the knowledge of young people about water science and the prospects for their effective use in the future.*

**KEYWORDS:** *Chashmai Ayub, Fountain, Baths, Cistern, Sewer, Ditch, Canal, Groundwater, Depth, Water Volume, Ditch, Mesh, Ditch.*

**INTRODUCTION**

**Relevance:** It is no secret that water resources are limited around the world today. It is no coincidence that 2003 was declared the Year of Freshwater by the United Nations and March 22 is International Water Day.

Due to the development of irrigation and population in Central Asia, including Uzbekistan, there is already a shortage of water resources. The adoption of the law "On water and water use" on May 6, 1993 in our independent land is a clear proof of our opinion.

It is very difficult to imagine life without water. Water is the source of life not only for humanity, but for all beings. Therefore, water should be used in moderation. Everyone, whether a child or an adult, should treat water wisely. Therefore, the study of the Chashmai Ayub Bukhara Water Supply Museum and ancient waterworks plays an important role in developing the worldview of our youth in water science.

**Goals and objectives:** In order to achieve our goal, we have studied some ancient waterworks and the Chashmai Ayub Bukhara Water Supply Museum as objects. The following tasks were performed to achieve the goal:

- to get acquainted with the relevant literature on the subject;
- Collection and analysis of data related to the object of study;
- To acquaint young people with some ancient waterworks and the Museum of
- Water Supply Chashmai Ayub Bukhara;
- To study the history of the Chashmai Ayub Water Supply Museum;
- Classification of some ancient water structures (ditch, ditch, meshkob, sardoba);
- Geographical forecasting of the practical significance of the Chashmai Ayub Bukhara Water Supply Museum in the future.

**Figure 1. The spring is a unique monument of Ayub-Bukhara**

**Brief classification of Chashmai Ayub water supply museum.** The fountain of Job is sometimes called the tomb, in fact it is the place where Job walked. Apparently, the veneration of the prophet Job originated in pre-Islamic times in connection with the worship of water. The construction of the building will take several stages.

**Figure 2. Exterior of Chashmai Ayub Water Supply Museum**

It is believed that its ancient part dates back to the XII century. At the same time, the date 1380 or 1384/5 is engraved on the surviving tombstone (which caused the inscription to be read differently because it was not well preserved) - this is the reign of Amir Temur, and later appeared the roof, dated 16th century. The building has six rooms, inside of which there is a sacred spring, behind which there is a large altar mosque.

Chashmai believes that the construction of the tomb of Job dates back to the XII century. According to legend, one of the prophets in the Bible, Ayub (Iov), hit the ground with his stick while passing through this arid part of Bukhara, and as a result, a pure, healing spring of water appeared here. In the 14th century, Khorezmian masters, brought by Amir Temur in one of his marches, built a building on a spring and a well, and gave a conical shape to the cone-shaped dome on the high traction device in the well, which is typical for Khorezm.

Chashmai Ayub is a spring in Bukhara, or a well. It is said that Ayub was called "the spring of the Prophet Ayub" because he was cured of this water. Chashmai Mayib was phonetically changed to Chashmai Ayub. In the Fergana valley, the spring of Hazrat Ayub was mentioned by the Arab geographers as Muqaddas. This spring in the Kosonsoy valley is still called by the same name.

Geographical analysis of the architecture of Chashmai Ayub. The building of the shrine is rectangular (19x26) and consists of 4 rooms stretching from west to east. Each room is covered with different domes. . Initially, the oldest room was a square (4.5x4.5 m) well.

**Figure 3.** Chashmai Job well.

Legend has it that this room was built by Arslankhan at the same time as the Minaret Kalon and the Mosque of Prayer. On both sides of it there was a mountain room (4.5x4.5 m) with two doors for pilgrims, which served as a roof. On the wall of the shrine with a double dome and a front roof, according to the order of Amir Temur, in 1379 it was written that a large room with a domed dome and a corridor with towers in the corners were built. The old part of the building remained inside.

**Figure 3. Interior of Chashmai Ayub Water Supply Museum.**

On the left hand side of the entrance to the Chashmai Ayub Water Supply Museum there is a map of the pools in Bukhara in the early twentieth century, photos of the ancient main settlements of Bukhara, such as Bolo Hovuz, Labi Hovuz (Figure 5).

**Figure 5. Bukhara in the early twentieth century map of pools in the city.**

Various utensils used in the previous period add to the beauty of the museum. In addition, the map of the baths in Bukhara in the late XIX and early XX centuries is reflected (Fig. 6). Baths are one of the proud places of Bukhara. At the beginning of the XX century in Bukhara there were 20 baths. Most of these baths were built in the XVI-XVII centuries and have not changed their shape. Bukhara baths are a unique place for residents and traders and visitors. The baths were built on the ground, and over the years and centuries, more than half of them have remained underground. The baths were operated in exchange for well water. These structures are similar in construction and differ from each other only in the number of rooms.

**Figure 6. Late XIX - early centuries XX Map of baths in Bukhara.**

Room 1 leads to the dressing room, then through the low and narrow corridor to the next room (basement) to the foot-washing room. It was followed by a domed, central room (miyonsaray), from which it was possible to move to a room with hot water (hot room), a room with cold water (ugly room) and a special room (vabjibixona). In addition, the site provides insights into the Bukhara sardobas, their importance, maps of the depletion of the Aral Sea, and the causes. The word sardoba is derived from the Forstil words sard - cold and ob - water. Sardoba is a domed monumental structure divided into two parts: the underground part is designed for water collection and storage, and the above part is built in the form of a round dome. Sardoba is a domed cistern for water buried deep in the ground. Construction began on caravan routes, usually from the X century. The water in such cisterns was cool even in the hottest time of the year. Irrespective of the size of the cisterns, they were up to 15 meters in diameter and 10-15 meters deep. The cisterns are filled with rain and melted snow, and sometimes with streams and canals, which are partially built in the way of underground canals-sewers. Most cisterns had one hatch for water. The Bukhara sardobas were distinguished by two hatches, but several hatches were installed around the Abdullah sardoba.

In Uzbekistan, the main building material for the cistern is high-quality and durable bricks of flat, rectangular shape. For centuries, cisterns have served as a guaranteed source of fresh water and storage in Central Asia. Their appearance is in the form of a dome made of bricks, with holes in the bottom. Through them through the wells or other underground tanks are passed radial ditches, which pay for the water of the barren during the rainy season. Due to the manuscripts of tourists, a detailed description of the cisterns has been preserved. "Half the distance between Malik and Mirza Rabot, on the side of the road, is a tall round domed building. At the top of the dome there is a round hole.

The descending path behind the steep gate leads into this circular building; The seven apex holes are symmetrical around a thick wall. The building is astonishingly strong, especially in the horizontal arrangement of flat square bricks in innumerable circular rows from the bottom of its magnificent dome to its highest point, so that each brick in the top row is inside the dome in

relation to the bricks below. the side is slightly bulging; In general, this dome looks like an overturned round amphitheater stairs. This unique way of building a building, no matter how primitive it may seem, amazes with its durability. Such desert buildings are known as "sardoba".

Under a high, stone dome the size of a few sarjins, a traveler who is tired of walking in the heat of summer, always in the shade and coolness, finds great comfort here, and in the bitter winter serves as a shelter from snowstorms. As you enter the building, you will see that its openings are three feet (1 foot = 2,134 m) from the bottom of the building, which is made of stone "from the outside to the level of the surrounding soil", so the hall itself is dug into the ground. seems to be warm.

**Figure 7. Sardoba.**

This explains the need to have two or three raised forts under each cistern. In the spring, when the snow begins to melt, all the surrounding water flows towards the cistern and passes through its holes. That's why they tried to build such basins on steep slopes.

Koriz - (Persian) underground structure for the collection of groundwater and its discharge to the surface, used for water supply and irrigation. Koriz is widespread in the Middle East, Southeast Asia. Occurs in mountainous and foothill areas of Central Asia. About 200 sewers have been dug near Ashgabat, Turkmenistan, Bukhara, Samarkand and Navai regions of Uzbekistan. Until the 1920s, sewage was used to irrigate crops in Central Asia. Excavation of the trench required a clear definition of changes in groundwater levels and the slope of the terrain. This was done with the help of special tools (astrolabe, waterpass). Once the sewer route was determined, wells were dug every 5-40 meters along this route. The depth of the wells ranged from 14-15 meters, sometimes up to 60-70 meters. The wells are connected to each other by a solder (tunnel) that connects to the aquifer. Lahim is 1.5 meters high and 1 meter wide, its walls are reinforced with wood or stone, and its length is up to several kilometers, depending on the slope.

Canal (waterway). Canal, irrigation canal - a specially dug waterway, the main part of the irrigation system. Depending on the function of the canals, the main (rivers, reservoirs, water flows from irrigated lands to irrigated lands);

- distributor (distributes water from main canals to districts or farms);
- farm (water flowing through the inter-district or inter-farm canal to the irrigated lands of the farm), temporary (ditch), which serves for the distribution of water to the owners. The canal starts from the water intake facilities. Through the intake facilities, the water flows into the canal itself, or is pumped through the pumping station (machine channels). The canal can be excavated or lifted. Usually its cross section is trapezoidal. In some cases, the canal itself is made of concrete or reinforced concrete, nowadays prefabricated reinforced concrete structures are widely used.

**Shohrud canal.** One of the canals supplying water to Bukhara. Shahrud, or rather the Shaharrud canal. Sometimes it is written as Shohrud - "king's arig"; The city of Rudi Bukhara - before the "city of Bukhara" was called Rudi Zar. Originally, Rudi Zar was mentioned in the works of Arab geographers (10th century) as Nahri Zar.

The city of Bukhara is located not far from the left tributary of the Zarafshan River. This river used to supply water to the fields and the city. The Shohrud (Rudizar) canal was dug in ancient times from the river to the city. The Shohrud canal is the main source of water for several canals in the city and more than 80 Bukhara pools. Bridges have been built across the canal everywhere in the city. Currently, most of the canal goes underground. Only a small part flows under the open sky as before. The canal flows from east to west in the southern part of Bukhara.

A ditch on the outskirts of the city of Zakhkash-Bukhara. A ditch with draining water. Zovur, zagor was actually called a flood. In the Middle Ages, moist soil was called zagor. In the following centuries, the term zakhkash began to be used instead of zagkash.

Mesh, mesh - a narrow bag with a sewn-on leather. Mesh has long been known, mainly liquids (water, milk, molasses, koumiss, etc.) Used for transportation and storage, chalop preparation and other purposes. Widespread among the peoples of the East, Central Asia and Siberia. From ancient times, the East, especially in the army of the Turkic-Mongol peoples, was used effectively during military operations, such as crossing deep rivers, making sal. In the past, in Mesh, a person who made a living by transporting water from water sources (pools, ditches, wells, etc.) to houses, guzars, teahouses, caravanserais was called a meshkob or meshkobchi.

Sharkhpalak - 1) a structure that flows much lower than the irrigated land and lifts water from streams; A large wheel with a blade on which the buckets are mounted. The size of the wheel diameter depends on the size of the river or ditch, the amount of water flowing. The number of buckets depends on the diameter of the wheel.

The flowing water affects the impellers and turns the wheel so that the buckets are filled with water. Charkhpalak is one of the oldest water structures. The first wheels appeared in 4-3 thousand years BC.

**Figure 8. Charxpalak.**

In ancient times, in the territory of Uzbekistan, the pump was the main means of drainage. With the advent of pumps in the XIX century, the need for wheelbarrows decreased, but in some places it is still used (Figure 8);

2) cultural and recreational facilities to be installed in parks and playgrounds, a large-diameter wheel on which the seats can be hung in a circular motion. Such a wheel is driven by an engine. Careful and rational approach to water, saving every drop of water, eliminating waste, improving water supply to the population of Uzbekistan for the production of consumer and non-consumable products in all sectors of the economy provides the required amount of water. Especially today, ancient waterworks are widely used as water-saving technologies in agriculture and various sectors of the economy.

#### **Suggestions and recommendations:**

- So have more opinions about the sights of Bukhara;
- To have more opinions about the sights of Bukhara;
- Reproduction of various types of trees around the building in the organization of domestic and foreign tourism;
- relocation of the adjacent market area to the interior;
- more trips to this place in the formation of the hydrological outlook of young people;
- to instill in our youth the idea that every drop of water is a source of life;
- to feel that the improvement of water ecology is in the hands of young people.

#### **CONCLUSION**

In conclusion, we hope that the Chashmai Ayub Museum of Water Supply and the ancient waterworks will serve as a program for the development of the hydrological outlook of students.

We must preserve historical buildings, including water structures, as the apple of our eye for future generations.

### ABSTRACT

*Today, in teaching of English as a foreign language in our country, the appropriate texts must be selected considering the students' vocabulary knowledge, grammar levels, interests and needs in multi-level reading instruction like in other levels, reading instructions in multi-level, determined by the criteria established by the Common European Framework, can include texts with events mentioned in personal letters, texts about feelings and thoughts and texts with words used frequently in work or daily life. In this study reading texts used in multi-level English language teaching will be exemplified. Literature review will be used in this study. For example, reading texts with the topics such as work life, an article from Latest UK news newspaper, airport security and film review can be used in the reading instruction. The type of questions that can be asked and how the texts can be examined during the teaching of these texts are explained.*

**KEYWORDS:** *Teaching English, Multi-Level, Reading Studies, Reading Activities, Teaching Reading.*

### INTRODUCTION

A good deal of the current research in the field of EFL reading is embedded in a Psycholinguistics framework (Goodman, 1970, Coady, 1979). In this view, the reader is seen as an active processor of information, one who selects only the most productive cues from the printed page. One way of facilitating a reader's interaction with a text for triggering and building background knowledge is through pre-reading activities (Hudson, 1982). Pre-reading activities provide orientation to content and context. They vary with the nature of the text, the reader's purpose and context of situation (Wallace, 1992).

### ***Importance of Reading***

Most scholars would agree that reading is one of the most important skills for educational and professional success (Alderson, 1984). In highlighting the importance of reading comprehension Rivers (1981:147) stated that “ reading is the most important activity in any language class, not only as a source of information and a pleasurable activity, but also as a means of consolidating and extending one’s knowledge of the language”.

Reading reinforces the learner’s other language skills. Krashen (1981) confirms that those who read more, have larger vocabularies, do better on test of grammar and write better (Kim & Krashen, 1997). Chastian (1988:218) while accepting the significance of reading for meaning claimed that all reading activities serve to facilitate communication fluency in each of the other language skills.

According to Eskey (1988), in advanced levels of second language the ability to read the written language at a reasonable rate and with good comprehension has long been recognized to be as oral skills if not more important.

In an early study on reading strategies, Hosenfield (1977) used a think aloud procedure to identify relations between certain types of reading strategies and successful or unsuccessful second language reading. The successful readers, for example, kept the meaning of the passage in mind while reading, read it in broad phrases, skipped inconsequential or less important words, and had a positive self-concept as a reader. The unsuccessful reader, on the other hand, lost the meaning of the sentences when decoded, read in short phrases, pondered over inconsequential words, seldom skipped words as unimportant, and had a negative self-concept.

In their study involving good and poor readers, Hopkins and Mackay (1997) found that good readers often have more ready access to a variety of purposeful reading strategies to undertake reading tasks successfully and that they use them with greater frequency and flexibility. They are active in making inferences and using dictionaries to resolve uncertainty about the meanings of words or larger units of discourse.

In another empirical study, Song (1998) studied 68 first year tertiary students majoring in Archeology, Esthetics, and religion at a university in Korea to investigate the impact of strategy training on the reading ability of EFL university students. He also aimed to obtain answers for the differentiated effect of the strategy training on students' reading proficiency level and types of reading comprehension questions. The findings of the study showed that the reading strategy training does improve EFL college students reading proficiency. Furthermore, the study demonstrated that less able readers might benefit from the training more than more able readers. Finally the study revealed that the students' ability of grasping main ideas and of making inferences from the given passages was significantly enhanced.

The findings of Song's (1998) study is confirmed by the results of Salataci and Akeyl's (2002) study who investigated the reading strategies of Turkish EFL students in Turkish and English possible effects of reading instruction on reading in Turkish and English. Salataci and Akeyl tried to find out whether strategy instruction in EFL reading affect EFL reading strategies and reading comprehension in English. Moreover, they investigated if strategy training in EFL reading affects reading strategies in Turkish. Their participants were 8 Turkish students enrolled in a pre-intermediate level class of a one-year intensive English course offered at a Turkish-

medium technical university. The data in their study come from think-aloud protocols, observation, a background questionnaire, a semi-structured interview and the reading component of PET (the Preliminary English Test). The results indicated that strategy instruction had a positive effect on both Turkish and English reading strategies and reading comprehension in English. This finding is in accordance with Falk and Wehby's (2007) study findings who investigated the impact of explicit reading instruction on students' with emotional/behavioral disorders. Their findings suggest that direct instruction offers a promising approach to increasing the reading achievement – and potentially the behavioral outcomes- of students with emotional behavioral disorders. Reading strategy instruction has also received some attention in Iran (Barati, 1992, Sedighi, 1998, Shirazi, 1999). In his study on the effect of reading strategies on recall and retention of Iranian EFL learners, Barati (1992) considered two reading strategies: underlining and note-taking. Through analyzing the subjects' performance on factual and conceptual questions, he concluded that in both experiments note-takers could significantly outperform underliners on factual questions; but with reference to conceptual questions there was no significant difference between the two strategies.

In another study, Sedighi (1998) studied the effects of training in the use of reading strategies on the improvement of reading comprehension of 110 students at Allameh Tabatabaei University and Islamic Azad University, Iran. His study consisted of three phases. In the first phase, he conducted a descriptive research to investigate the strategies reading teachers use to teach reading comprehension in EFL classes in Iran. In this phase, he found that teachers in Iran still use traditional method of language teaching without enough strategic content. In the second phase, he conducted a survey study to describe the strategies good readers and poor

readers use in reading their EFL reading assignments. Finally in the third phase which was the experimental one, he investigated the effects of training in the use of reading strategies on the improvement of reading comprehension. It was revealed that reading strategy instruction enhances comprehension ability of the students.

It was also shown that low ability comprehenders benefited from strategy instruction more than middle and high ability comprehenders.

While lots of studies on reading strategy instruction have been done in EFL and ESL context, few studies have been conducted on the impact of strategy training on ESP readers. In Iran, Shirazi (1999) conducted a research in order to determine the impact of pre-reading strategy instruction on the reading comprehension of Iranian ESP readers. The results of his study indicated that efficient comprehension requires effective activating of the learner's background knowledge. In other words, the readers' schemata should be tapped on prior to the reading. He concluded that if the pre-reading activities are employed efficiently, learning how to read is quite easy.

There is little evidence to show that whether ESP students can benefit from reading strategy training as much as EFL learners. Therefore, the findings of the present experimental study can shed more light on the issue of teaching reading strategies and it will set the ground for a comparison between the effectiveness of reading strategy instruction versus traditional teaching of reading comprehension. Moreover, this study has got the purpose of discovering students from which proficiency level all more likely to benefit most from strategy training. While Shirazi (1999) only focused on the instruction of a few pre-reading strategies, the present study intends

to investigate the effect of all pre-reading, during-reading, and post- reading strategy instruction on reading ability of ESP readers.

### ***Interactive View of Reading and its Relationship with ESP***

A significant body of literature posits that reading is an interactive process (Carrell, Devine & Eskey 1988; Grabbe, 1991; Rumelhart & Ortony 1977). According to Grabbe (1991:385) the notion of reading as an interactive process refers to “a kind of dialogue between the reader and the text” The notion of reading as an interactive process evolved from the schema theory and is often termed top-down approach to reading. Carrell (1983) distinguishes between formal schemata the reader’s knowledge of formal, rhetorical structure of the texts and content schemata – previous knowledge which the reader possesses.

In an interactive model, the reader is not seen to progress in just one direction (bottom-up or top-down) in understanding the text, but as being able to alternate approaches as necessary (Barnett, 1989). The reader is seen as able to draw simultaneously from a variety of sources to understand the text such as lexical, orthographic, schematic, semantic, syntactical, and visual (Davies, 1995). Thus reading is seen as a simultaneous perceptual and cognitive process (Rumelhart & Ortony, 1977). Interactive model of reading comprehension not only acknowledges the role of background knowledge, but also it stresses the significance of processing actual words of the texts. Goodman (1981:137) maintains that, “ ... the goal of reading is constructing meaning in response to text. It requires interactive use of graphophonic, syntactic, and semantic cues to construct meaning.” Although he is often referred to as a leading advocate of the top –down approach, his model by his own admission is interactive.

An interactive model of reading posited by Grabbe (1991) usually refers to interplay of both bottom-up and top-down reading strategies (Block, 1992). Bottom-up strategies include decoding graphic features and grammatical characteristics, while top-down strategies include predicting, applying background knowledge and recognizing global text structure. The notion of top-down strategies is usually used in the literature to include both global strategies for processing the text as well as activating conceptual knowledge of the world (Carrell, 1985 Shih, 1992).

According to Dubin and Bycina (1991), the interactive model entails the reading processes to be as such that the visual data are transmitted to brain where they are matched with existing knowledge. Then on the basis of this experience, predictions are made about the content of the text, upon which, further sampling of the data are either confirmed or revised.

Anderson (1999) claims that “many teachers now accept the view that reading is the result of a two way communication between the reader and the text, achieved through simultaneous processing (which involves word recognition, sound/spelling correspondence etc.) and top-down processing (which involves skills like predication, inference etc.)

How do the above notions relate to ESP reading pedagogy? Grabbe’s (1991) notion of reading as an interactive process implies that the ESP reader most probably has more limited content and formal schemata as well as less knowledge of language used in the text than the author has, thus, while an ESP reading course usually emphasizes building up student’s knowledge of rhetorical structures and improving their knowledge of the target language. The gap in content schemata should not be ignored. The issue of ESP reading instructor as a content specialist raised in ESP literature (e.g. Robinson, 1991). Grabbe’s interactive model of reading dictates that ESP

instruction should focus both on decoding language and on global reading strategies which (Duffy, 1988:763) defined them as “plans for solving problems, encountered in constructing meaning”. They can be taught to students and when taught strategies help student’s performance on tests of comprehension and recall.

### ***General Views on Pre-reading Activities***

The goals of Pre-reading stage are to activate the student’s knowledge of the subject, to provide any language preparation that might be needed for coping with the passage and, finally to motivate the learners to want to read the text (Celce-Murcia, 1991). Tudor (1989) call pre-reading activities “enabling activities” because they provide a reader with the necessary background to organize activity and to comprehend the material (these experiences involve understanding the purpose (S) for reading and building a knowledge base necessary for dealing with the content and the structure of the material). They say that pre-reading activities elicit prior knowledge, and focus attention. Various techniques have been suggested by some authors (e.g. Greenall & Swan, 1986) to mobilize existing knowledge including the use of pictures, movies and even role – plays. Research has not determined which of these is the most effective. So teachers are free to experiment according to the nature of reading material and inclinations of their classes (Carrell &Eisterhold, 1983). In an academic setting, however, more formal techniques might be appropriate, of course different scholars listed different types of pre-reading activities, (Celce-Murcia, 1991:225) suggests, Word Association,

### **Discussion and Text Surveys**

Word association tasks generally involve eliciting from the students as many ideas as they can offer regarding the announced subject of the text. Normally their suggestions are written on the board and sometimes arranged into semantic map or “graphic organizer” which indicates how concepts are related to each other.

Discussions have also been found to activate what students know and through the exchange of information, to enhance their knowledge of the subject. Discussions can be initiated by simply posing questions about the content of the text or by using “anticipation guide” which is a series of statements often provocative in nature, which are intended to challenge student’s knowledge and beliefs about the content of the passage (Celce-Murcia, 1991:225).

Nuttal (1982) claims that discussion promotes the active struggle with the text and students learn the processes of critical thinking that good readers use. Group work is ideal, because in small groups, even the weaker students should be active and learning. The procedure works in almost every level, and discussion can be in L1, if students cannot manage it in the FL.

Text Survey is often, but not exclusively, used with longer stretches of discourse, such as chapter from a textbook, the purpose of this activity is to quickly determine the structure of the piece and to identify the key ideas (Celce-Murcia, 1991).

Tudor (1989) gives five other categories of Content-related pre-reading activities (a) pre questions to be answered after reading the text; (b) pre questions to activate the reader’s knowledge about the topic; (c) content organizers (e.g., summaries); (d) predictions based on the title, subheadings, illustrations, or skim reading of the text; and (e) integrated reading preparation (combining the above). Taglieber (1988) found the last two activity-types (viz. Using illustrations to make predictions, and formulating questions) to be more effective in facilitating

EFL student's comprehension than vocabulary pre-teaching. This result is interesting, since it indicates that heightened background knowledge can enable students to use contextual clues to overcome specific vocabulary deficiencies.

Taglieber (1988) has indicated three major problems that interfere with reader's comprehension.

1. Lack of vocabulary.
2. Difficulty in using language cues to meaning.
3. Lack of conceptual knowledge.

She claimed that the following practical preceding activities may help address these problems:

1. Pictorial context
2. Pre-questioning
3. Vocabulary Pre-teaching

### ***Pictorial Context***

Illustrations can be an integral part of ESP courses. The justification is that they make ESP courses more tangible and understandable. Robinson (1991:62) asserted, "as well as print material ... one would expect that for teaching ESP there would be a rich supply of authentic visual and mechanical material"; however, he believed that there is not a great deal of discussion of this in the literature.

In this regard, Wilson (1986) referred to visual support for the avoidance of problems in the comprehension. She also suggested that visual aids may be exploited as a kind of elicitation strategy.

Furthermore, she favored a classroom in which students use illustrations to fulfill a specific task.

Ellis (1993:26) stated, "visual stimuli, like verbal stimuli, are organized in comprehension and memory" He further added that the organization for visual stimuli is a consequence of perceptual processing, which is bottom-up, or data-driven, in its earlier stage, but top-down processing is affected by conceptual knowledge later on.

As a supporting basis for teaching through illustration, Paivio (1971) proposed the dual coding theory of learning from words and pictures. The theory proposes that learners can construct three types of connections when they are presented with verbal and visual material. McDaniel and Waddill (1994) conducted a research to find out the extent to which pictures can enhance recall of textually presented information, particularly item specific (detailed) information and relational information. They concluded that providing readers with the requisite comprehension abilities to begin with, pictures enable the extraction and under ordinary circumstances do not encode effectively.

### ***Pre-questioning***

The questions we are discussing here in pre-reading stage are not intended to test. Their purpose is to make students aware of the way language is used to convey meaning, the questions are not necessarily different from questions in tests, but their purpose and the way they are used is quite

different. Nuttal (1982:160) suggests signpost questions would be of great help in pre-questioning. A signpost stands at a crossroads to show travelers the way.

In using signpost questions in pre-reading stage Nuttal (1982) states that you can ask an easy SPQ on the whole text, as an initial top-down activity; and / or you can ask one for each section. Write the SPQ on the board and ask class to read the text silently and find answer. After silent reading, perhaps followed by group discussion check whether they have been able to do this. If a fair number have not, leave it open and explain that you will return to it later avoid giving an answer yourself if you possibly can. Pre-questioning is taught by having the instructor ask questions about a passage and the students answer the questions, through pre-questioning students set purposes for reading, the method is supported by (Johnson, 1981).

### CONCLUSION

Finally, results of this study further show that although a great majority of the participants favor the effectiveness of using activities in teaching reading, they do not use activities as frequently as expected. Most of the participants express that this is because of the crowded classroom environments and the heavy load of the curriculum. With accurate planning and information passed onto the teachers, this problem should be dealt with to secure the benefits of activities in the foreign language classroom.

Lastly, in course-books and materials, the use of activities can be emphasized and by presenting alternative activities, foreign language teaching can be enriched so that primary school students enjoy learning English in a robust manner.

In a nutshell, this paper has presented a review and analysis of the literature on teaching English reading encompassing an overview of activities, classifications of activities in teaching reading, and the influence of using activities on the language learners' performance. Prior researches on using English reading activities have been included as well.

## DIALOGIC SPEECH TRAINING UNITS

**Paluanova M\*; Abishova G\*\*; Dauletbaeva R\*\*\***

<sup>1,3</sup>Karakalpak state University,  
 UZBEKISTAN

### ABSTRACT

*This article deals with the units of teaching dialogical speech, gives ways of conducting dialogical forms of communication, and their essence. The characteristics of the methodological deductive and inductive approaches are given. There are many examples from dialogical speeches.*

**KEYWORDS:** *Dialogical Speech, Unity, Structure, Short Dialogue, Deductive, Inductive, Process, Play, React, Replica, Utterance, Perception, Understanding, Use, Reproduction*

### INTRODUCTION

Let's start with the dialogic form of communication as the most characteristic for the manifestation of the communicative function of language. At the initial stage, the dialogic form of communication involves the ability to greet the interlocutor and respond to the greeting, as native English speakers do; the ability to say goodbye politely; the ability to introduce someone to someone; to express agreement and disagreement to do something; the ability to congratulate on a holiday, birthday, New Year, etc.; to express regret, apology; to express joy, delight, displeasure, etc.

**MAIN PART:** These general provisions and the various approaches and specific examples given in the articles are concretized in relation to the nature of the speech act, which is subject to modeling at this stage of training. Depending on whether we want to get a one-step or multi-step speech action, the composition of the components of the situation and their qualitative characteristics should change.

The units of teaching dialogic speech can be dialogic units. Dialogic unities can be different in structure. The most common ones are:

- question-answer:

Do you live near London? – Oh, yes, in a small country house.

Can you skate or ski? – I can ski.

- question – question:

Is it your pen? – Why do you ask me?

Will you help me? – What shall I do for you?

- statement-question:

I shan't go to the park. – Why? What will you do?

I want to know his address. – What for?

- statement-statement:

I'll go to the library after classes – - And I'll stay there.

This is a box of sweets for you. – Oh, thank you, I like sweets very much.

The unit of dialogue training can be not only a dialogic unity, but also a whole short dialogue-a sample consisting of several (2 – 3) dialogic unities. For example:

- Hello, Fred.

– Hello.

– It's a fine day today, isn't it?

– Certainly it is.

– Then let's go for a walk to the park.

– OK. Etc.

In the methodology of teaching foreign languages, there are two ways of teaching dialogic speech – deductive and inductive.

In the deductive approach, learning begins with a whole dialogical sample, which is considered as a structural and intonational standard for constructing similar ones. The sample dialog is a dialogic complex, it consists of several dialogic units. The training begins with the fact that the dialogue is listened to in its entirety, memorized by heart, then there is a variation of its lexical content, working out the elements, and, finally, the students are brought to conduct dialogues on the same topic as the one being learned. Proponents of this approach refer to the fact that in natural conditions, the child learns the language system "from top to bottom": from large intonation-syntactic blocks to their elements, development goes by isolating elements from the whole, belonging to the whole makes it easier to remember, etc. The disadvantage of this approach is that it does not develop the ability to independently use the material in speech, focusing on the formal side of speech. The path from the whole dialogue to the assimilation of its elements leads to the fact that there is a premature automation of the elements in the relationship in which they are used in the whole dialogue. This leads to its mechanical memorization and limits the possibilities of free conversation in new conditions.

The second approach-inductive-suggests a path from mastering the elements of the dialogue to its independent conduct on the basis of the educational and speech situation. This approach is gaining more and more supporters due to the fact that from the very first steps it directs to

learning the interaction that underlies dialogic speech; the formation of speech skills and skills in this way occurs in the process of communication. Relying on analogy plays a big role at the lower level of skill development, in the formation of primary skills, and here the reference dialogue can play its role, not for memorization, but as a role model. At a higher level, the task of teaching students to independently plan speech actions "through awareness of the motives, goals and possible results of the action", as well as "to develop the content and form of speech meanings that are adequate to the meaning", comes to the fore.

In accordance with the inductive path of learning, the preparation for conducting a dialogue includes:

- 1) Improving the mental mechanisms of dialogic speech;
- 2) Formation of skills of using language material typical for dialogic speech;
- 3) Mastering the ability to interact with partners in an internal and external speech situation.

Learning dialogic speech begins with learning to respond to the interlocutor's remark. First, the teacher gives stimulating cues, varying them depending on the type of dialogical units, and the students master the ability to respond to them. The variety of reactions depends on the class, on the language tools they have, on the individual characteristics of the students. For example, on the cue-stimulus What's his name? (photo shown) different reactions may follow:

P1 – Azat Dauletbaevich.

P2 – His name is Azat Dauletbaevich.

P3 – I don't know.

P4 – I don't know what his name is.

Or the teacher's cue-stimulus It's a fine day today may be followed by the following reactions:

P1-Oh, yes. It's great.

P2 – Not very.

P3 – It sure is.

P4 – I can't say so. It's windy. Etc.

Then the stimulating cues are given by the children themselves, and their companions react to them. After students learn how to respond to a stimulus easily and quickly with a single cue, the teacher shows them how to expand the responding cue into a short utterance. For example:

P1 – What season do you like, Gulxan Matchanovna?

T – I like spring. It's warm. The sun shines brightly. And I can work in the garden and what about you, Polat?

In order for the response training to be non-formal and have a communicative orientation, the teacher can use a variety of games. For example, it is very important to teach students to respond quickly to stimulating questions. To do this, you can use the game "Ping-pong".

– Do you like to play badminton?

– Yes, I do.

– Can you play it well?

– Yes, I can.

- Did you play it in summer?
- Yes, I did.
- Is it difficult to play it?
- No it isn't.
- Will you teach me to play it?
- Yes, it's my pleasure.

This game, conducted at a fast pace, forms the correct response of students to a variety of stimulating questions. The teacher starts this game, and then passes on his function to the children. By repeating this kind of work in the course of reaction training, and it should take place throughout the entire initial stage, because it is the essence of the conversation (dialogue), the teacher achieves the formation of this important skill. This work will allow you to prevent and eliminate typical errors such as:

T – Do you like to skate?

R. – Yes, it is.

Or a game of "Guess", for example, guess where Petya was on Sunday:

T – Where was Pete on Sunday?

- At the Zoo.

- I believe at the Zoo

- In the park.

- I think he went to the country.

- At the cinema.

- At his Granny's.

- I think he was at home.

Petya listens to the children, and the one who guesses becomes the "host" and offers his question, for example: Where was Sashya last Saturday? - and the game continues.

In the process of learning to respond, training and stimulation begins. The same purpose is served by a series of exercises that encourage students to start a dialogue through an indirect question.

T-Igor, ask Petya what he did yesterday.

Igor – Petya, what did you do yesterday?

Petya – I walked with my dog.

The same purpose is served by the game "Guess". The student leaves the class, and the class conceives of some object, its walking or action with it. The question for guessing should be very simple, of the same type: Is it a ...? or the guessers ask a number of questions, for example: What color is it? Where is it? Is it large or small? What can we do with it? Etc.

In this game, students learn how to stimulate speech with questions. However, the incentive to start a conversation can also be a statement. And this should be shown to the students. For example, the teacher gives a reacting remark and asks the children to choose different statements-stimuli that would cause this reaction. For example: T – With who did you go there? Possible incentives:

- I went to the theatre yesterday.
- I went to the country last Sunday.
- We went to the Zoo last Saturday. Etc.

The teacher may suggest that the students develop a stimulating statement. For example, the same reaction With who did you go there? it can be caused by the following stimuli:

- I like “Buratino” very much. I went to the theatre yesterday.
- The weather was so fine. We went to the country last Sunday.
- I like to sing and dance. We went to our friends last week.
- I am fond of animals. We went to the Zoo last Saturday.

If the training unit is a short sample dialog, then working with it goes through three stages:

1. Perception and understanding.
2. Playback (simple and with modification).
3. Use it in new situations.

Children listen to the dialogue either in a sound recording or in the performance of the teacher. The teacher provides and verifies the understanding of the dialogue. Then the children listen to it again with the support of the printed text and practice reading, that is, reproduce it. At home (and sometimes in the classroom) students memorize the dialogue and reproduce it from memory. Next, the teacher offers the students words to substitute, or the students do it themselves. Thus, the dialog with the modification is played back. For example, the dialog:

- Jack isn't at school today.
- What' the matter with him?
- He is ill.

Students can replace the name and the last remark (He is not well. I don't know. In this way, students memorize the structure of the English dialogue and the dialogic units themselves, which allows them to use those of them that are suitable for this communication situation in new situations.

The vast majority of exercises used in teaching dialogic speech are speech exercises. However, the initial introduction to new standard phrases in typical dialog combinations can be carried out in isolation from the speech situation. The purpose of such exercises is to establish in the memory of students strong connections between replicas that constantly or often enough appear as part of this dialogical unity, i.e. to work out contextual connections on a functional basis and structural connections between replicas. Outside of the speech situation, it is also possible to

provide lexical diversity of replicas, to teach the deployment and coupling of replicas, as well as to form automatisms in the grammatical and lexical transformation of replicas [ 1, 123]. Accordingly, we can distinguish three types of work on the material:

- 1) memorizing dialogic units by heart;
- 2) combining replicas based on functional relationships;
- 3) grammatical and lexical transformations of replicas.

The assimilation of new dialogic unities occurs by memorizing short dialogues consisting of one or two unities. This is how unities are learned, including greetings, addresses, formulas of politeness, as well as syntactic unities that allow for variation in the response:

- Happy New Year, Ann!
- Happy New Year, Peter!
- I wish you all the best.
- The same to you.
- Let us go to...
- With pleasure (I am sorry, but I can't).

In the process of memorizing dialogic units, when it is possible to focus students' attention on the form of speech, the most favorable conditions are created for practicing the intonation characteristic of different types of replicas. Learning a small dialogue is better to start with auditory perception. Then the first, most vivid impression will be a good basis for mastering the sound form of unity; auditory memory also develops, which is also important for dialogue. Learning dialogic unity by ear reproduces the conditions for operating with replicas in a natural dialogue. However, it would be wrong to limit ourselves to just auditory perception of the dialogue being learned, since this may lead to distortion and incorrect merging of words, incorrect articulation of the phrase. Therefore, it is advisable to reinforce the next stage of learning the dialogue with visual perception. The written text will be a good support for repeating the dialogue at home.

The reproduction of even a small dialogue should not take the form of an indifferent pronouncing of the learned. Trying to bring this exercise closer to the conditions of speech communication, the teacher describes verbally or shows in the picture a situation in which such a dialogue can occur. Students should imagine themselves as one of the actors and act in the style of this character, staging the dialogue. If the dialogue is reproduced by persons, it is desirable that each of the partners alternately act as the first or second interlocutor [3, 92].

An essential component of the preparation of language material is any kind of grammatical and lexical transformations of replicas in accordance with the variability of the conditions of their use in speech (change of the actor, time of action, etc.). The exercises recommended for this purpose are divided according to the structural principle into distributive (change of syntactic connections), substitution (expansion of associative connections) and transformational (expansion of both connections). The choice of exercises is related to the lexical and grammatical features of the replicas [ 2, 112].

Usually, two groups of exercises are used, which differ in the degree of independence of the students' reaction in the dialogue: to produce a dialogue with pre-set rules (in this case, models are used with the transfer of the action to another person, another object, another time, with a change in the nature of the action); to produce a dialogue caused by a stimulator embedded in the partner's statement. Cues learned as part of dialogic units should then be incorporated into new combinations. It is also necessary to enter into the dialogue phrases that were used earlier in monologue statements. For this purpose, you can use a series of exercises that combine replicas based on contextual relationships: selecting from two columns of replicas that match the meaning; naming a reference replica to a given reactive one; naming a reactive replica to a given reference one. At the stage of combining a speech sample with previously studied ones, exercises for expanding replicas are also offered.

The peculiarity of all these exercises is that they are aimed at establishing interverbal connections, i.e. they teach you to respond only to a linguistic stimulus. They can therefore be attributed to the number of preparatory exercises. Having prepared the material for dialogic speech in this way, you can start performing speech exercises. As you know, speech activity is modeled in the pedagogical process with the help of educational and speech situations (URS). URS is defined as a set of speech conditions set by students, necessary and sufficient for students to correctly perform a speech action in accordance with the intended communicative task

## CONCLUSION

As components of the URS, the formulation of the task of the exercise is considered, which models the motive or purpose of the speech action; the description of the situation (conditions and participants of communication), which models all the components of the speech situation, the URS should arouse interest in students, take into account their life experience and language capabilities; the conditions of the situation should be reported in an extremely concise form. The effectiveness of a situation is determined by the ratio between the volume of the speech response and the description of the situation.

These general provisions and the various approaches and specific examples given in the articles are concretized in relation to the nature of the speech act, which is subject to modeling at this stage of training. Depending on whether we want to get a one-step or multi-step speech action, the composition of the components of the situation and their qualitative characteristics should change.

## VISIBILITY IN TEACHING DIALOGIC SPEECH

Abishova G\*; Dauletbaeva R\*\*; Paluanova M\*\*\*

<sup>1,3</sup>Karakalpak state University,  
UZBEKISTAN

### ABSTRACT

*This article deals with clarity in teaching dialogical speech. A detailed description of visualizations, forms of their use, development, stimulation are given. The sequence of using the types of visualization with specific work and examples is recommended.*

**KEYWORDS:** *Visibility, Stimulus, Filmstrip, Overhead, Replica, Screen, Dialogical Speech, Verbally, Situation, Listening, Fantasy, Assimilation, Fantasy, Reproduction, Activity, Use, Meaning, Guess*

### INTRODUCTION

Projecting the words of the father on the screen, the teacher invites you to join the conversation. This work should be done in pairs. During the work of the students, the teacher observes them, provides assistance to those who need it, and calls one or two couples for control. In a weak class, before working in pairs, you can give a sample of the task performance either in a sound recording, or in the performance of a teacher with a strong student.

**MAIN PART:** Teaching dialogical speech can be stimulated by visualization, listened to or read, watched a filmstrip, slides, or a verbally given situation. Dialogue speech can be developed and stimulated by printed text, based on the text heard, watching filmstrips, work on pictures. The choice of the type of work depends on what is being worked out in the lesson.

The use of such clarity as: overhead scope, printed text and pictures with a complicated, undeveloped situation, when teaching dialogues in a foreign language, is important and necessary.

Learning dialogic speech can be stimulated by visual clarity, text listened to or read, viewed by a filmstrip, slides, or a verbally set situation. For example, when teaching dialogic speech, you can use a codoscope. The teacher prepares a banner on which the words of the father addressed to the son (or stimulating remarks) are presented. The task of the students is to select the reacting cues that match the meaning, so that the dialogue turns out.

Father: I say, Sonny, what shall we buy for Mummy on Woman's day?

Sonny (1) ...

Father: That's a good idea! And what will you say to Mum?

Sonny: (2) ...

The reacting cues can be:

(1) Let's buy her some flowers.

Let's buy her a large box of sweets.

Let's buy her the book about Moscow. Etc.

(2) I'll say, "Dear Mum, I love you so much".

I'll say, "Best wishes for Mother's Day".

A good, useful exercise that forms dialogic speech is a task of the type Listen, read and act. The meaning of these tasks, which develop the ability to conduct a conversation, is in their last part (act), which, unfortunately, is not always performed in the classroom [1, 86].

Dialogic speech can be stimulated by printed text that is easily dramatized. For example, "William and Mr. Romford". After reading the text, the children act out the following dialogue between Mr. Romford and William:

- Hello, Mr. Romford!

- Hello, William! Are you going home now?

- Yes.

- Give this to your sister, please. Tell her it's a present from me for her birthday. But don't open the basket. There is a nice little cat in it.

- All right.

- You must give it to Ethel, but you mustn't open it in the street.

Dialogic speech can also be developed on the basis of the listened text. For example, "It doesn't matter". Before listening to the text, students receive a task: "Dramatize the text". The result may be the following dialogue between Betty and Mary.

- What are you doing, Betty?

- I'm writing a letter to my friend Kitty.

- But how can you? You can't write.

- Well, it doesn't matter, because Kitty can't read.

The incentive for the development of dialogic speech can also be a verbally given situation. For example, you meet a friend. He (she) says he (she) has a new flat (house). Have a talk with him (her) about his (her) new flat. In a strong class, this task is enough. In a weak class, you can give support in the form of questions or only interrogative words: When ... Where ... How many rooms ... Is it far from ... Etc.

Dialogic speech can be stimulated by viewing filmstrips and organizing a conversation between the teacher and the class, the student and the student: who (what) they learned from the filmstrip, whether they liked the filmstrip, what they liked. For example, children are invited to watch the filmstrip "Tim Goes to School" and talk about this topic [2,121].

Work on images with a complicated non-expanded situation. The development of students' speech on the basis of images with an unfolded situation is not carried out in isolation from the main work in the lesson on educational and methodological complexes, but is included in the lesson when introducing and activating language material, with thematic repetition of such, as well as for the development of listening skills, dialogic and monological speech of students. Working with this type of images is characterized by the fact that, regardless of the techniques used to work with the material of the manual, both the teacher and the students, starting from the situation proposed in the picture, creatively approach the deployment of this vaguely outlined situation in a number of different content options that correspond to the interests and capabilities of each student. The main thing should be the development of students' speech activity based on imagination, speculation, internal visibility, with the natural use of language material in their speech, learned during the entire previous course of English language training.

The choice of the type of work depends on what is being worked out in the lesson. A variety of forms of work on pictures with both simple and complicated non-inverted situations is designed to help avoid monotony and promote proactive foreign language speech creation of students in the process of developing mental activity.

The recommended sequence of using the types of work for this type of images is as follows:

- 1) The teacher's stories to develop the perception of English speech by ear and create an attitude to use speculation when drawing up new options for the deployment of the situation proposed in the picture.
- 2) Students' questions to the teacher on the picture to create a new version of the situation.
- 3) Work of students in pairs. This type of work can have several options: a) a conversation about any person depicted in the picture; b) unfolding the original situation; c) drawing up a dialogue that could occur between the persons depicted in the picture. After the pair work, a new conversation between two or more students can be played out in front of the entire class.
- 4) Drawing up a story by students along the chain.
- 5) Students' own stories, compiled on the basis of the original situation shown in the picture. It should be recalled that when working with this type of visualization, the teacher should suggest to students the language material that they have partially forgotten or go beyond what they have learned, but they need it for their own development of the initial situation shown in the figure. It is necessary to strive in every possible way to ensure that the speech activity of students proceeds as smoothly as possible [3, 95].

The same image can be used in classes at different stages of language acquisition in accordance with the development of the relevant thematic material. Students can also be asked to remember the scheme of the non-expanded situation depicted in the picture, according to which they worked in the lesson, and make a story based on it at home, unfolding the situation based on

individual speculation, a story on behalf of one of the persons depicted in the picture, and in some cases, a dialogue between them.

When working with pictures with a complicated non-inverted situation, it is recommended to use the composition of stories by the class in a chain or a conversation according to the scheme class - teacher, class – student, teacher - class as a speech charge, which is quite achievable with a certain training of students.

The proposed system of work on pictures with a complicated non-expanded situation does not involve the reproduction of the teacher's stories by students, since retelling, not being an independent type of speech in terms of content, does not sufficiently involve the students' own thinking in foreign language speech activity, does not stimulate the development of speculation and fantasy, does not bring the situation depicted in the drawing closer to the life experience of each student and, therefore, can not be considered either creative or, especially, initiative speech.

Retelling (reproduction) relies mainly on the mnemonic abilities of the student. When performing this type of work, students' attention is focused not on expressing their thoughts, images, emotions, attitudes, etc., but on recalling the details of what was given in the source text. The latter takes time, since the pace of speech activity naturally decreases, and only a limited number of students are involved in the educational process. This does not mean that the use of such a technique as playing back what you have listened to or read is not recommended [2, 87].

The main tasks of the teacher's stories when working on pictures with a complicated situation are as follows:

- 1) Show students that the same picture can be a starting point for the deployment of a wide variety of situations and that the main thing in this case is not the image, but the internal visibility, own imagination, imagination, interests and language capabilities of each student;
- 2) become a kind of "spark plug" for the active speech activity of students. Therefore, it will be more fruitful if students, after listening to the story, begin to clarify the details with the teacher or another student, or express their attitude to what they have heard.

For example, after listening to a text on the topic "Appearance" about a girl, students may begin to ask: "Does she have this or that? "(Has she (a)...?), " Does she like this or that? "(Does she like...?), etc., or say: "I don't think she is ..." (I don't think she is (can, will)...), etc. With a certain habit of using creative and proactive speech, which should be formed from the younger stage of language learning, students will be able to ask a variety of questions for each text and give the most unexpected judgments, through which they control not only the degree of understanding of what they have listened to, but also the attention of each student during the teacher's story. Questions and statements of individual students should strive to turn into a conversation between them, to make it the property of the entire class.

If a question is asked that repeats the material of the text or contradicts it, the teacher can turn to one of the students for the appropriate clarification: "So what color are Masha's eyes?" (What was the color of Masha's eyes?), "So what was Kolya in his hand: a bag or a book?" (What had Kolya in his hand – a bag or a book?), etc.

The main thing is to stimulate the independent speech of students in a natural fast-flowing conversation according to the scheme class • teacher, class-student, class-class. With a certain level of training of students, which is achieved only with systematic and purposeful work, this can be achieved. Then it will take less time to complete the task, and the results for the development of students' oral speech will be higher [1.89].

The teacher can use different texts, make partial changes to them in accordance with the conditions and interests of each specific group of students, and compose their own by analogy. Such inclusion in the texts of unfamiliar vocabulary is determined by the need to teach students to perceive texts that have not only a well-known vocabulary, to develop their semantic guess, as well as the desire to bring the language of texts closer to the natural, as far as possible with its limited composition. Words that may cause difficulty in understanding may be given in a text with a Russian equivalent, so that the teacher can immediately give it to the students if necessary. They are necessary for the student only to understand this text, and their possible transfer to the long-term memory of students should be based on involuntary memorization. Since the texts are compiled mainly according to the language minimum of educational and methodological complexes in English, they should not be difficult for students; a difficult place to understand should be calmly explained, without interrupting the main line of the story, for example: "My friend told me a funny story – a funny story – so he told me a funny story about ..." etc.

**CONCLUSION.** To increase the emotional impact of texts on students, to increase their interest in what they say, they should be told based on a picture, and not read from a book. It is necessary to achieve a direct understanding of what is said, followed by a speech reaction on the part of students in the form of a series of clarifying questions and their own statements, that is, in creative or initiative forms of speech – this is the recommended way in this manual to further intensify the process of teaching a foreign language, the need for which is caused by a limited amount of time allocated to the study of this subject.

The most important thing in the organization of dialogical communication is to create a positive emotional attitude to the activities performed by children. The formal performance of tasks that promote the development of dialogic speech skills negates the practical result.

The use of such visualizations as: a codoscope, printed text, and pictures with a complicated non-expanded situation, when teaching dialogues in a foreign language is important and necessary.

## GENITIVE CASE PREPOSITIONS IN GERMAN LANGUAGE AND THEIR PECULIARITIES

Babaeva Gulzira\*; Bakbergenov Aybek\*\*; Otebaeva Aysuliu\*\*\*

<sup>1,3</sup>Karakalpak State University,  
UZBEKISTAN

### ABSTRACT

*This article discusses German genitive case prepositions, classification and distinguishing peculiarities of types of genitive case prepositions and meanings according to their functions. As well as, the translation of genitive case prepositions into the Karakalpak language is analyzed with examples and the similarities and differences between their semantic aspects in two languages are extensively assessed.*

**KEYWORDS:** *Preposition, Case, Adverb, Noun, Dative Case, Genitive Case, Accusative, Nominative, Prepositions Of Time, Prepositions Of Place, Alternative, Conjunction*

### INTRODUCTION

In linguistics, there is a great number of words that lexically and grammatically to connect nouns, pronouns, verbs and other words in sentence structure. In the Karakalpak language, case affixes serve to combine one part of the sentence with the others, while **prepositions** (Präpositionen) are the main connectives in German language. In a sentence, a preposition is never a separate part of it, either it goes with the following word to form an object, adverbial modifier, or predicative and attributive. Prepositions come before articles, adjectives and nouns, denoting the location, time, direction and cause of the action. In the sentence, prepositions usually come in relation to grammatical cases. In German, grammatical cases divided into four categories namely: **Nominative, Genitive, Accusative, Dativ** and they are associated with the noun, determining its syntactic function in the sentence.

### MAIN PART

In German, **Dativ** and **Accusative** cases have their own prepositions, which are constantly used together. For example, prepositions like **mit** (with), **bei** (at), **von** (from; about), **nach** (after; to), **aus** (out of; from), **zu** (to; for) are always accompanied by dative case, at the same time accusative case is related to the following prepositions: **durch** (through), **für** (for), **um** (around),

**gegen** (against), **ohne** (without). Therefore, through the preposition before the noun, it is possible to find out in which case is the subject. If the preposition **mit** is used in the sentence, then the noun and article in front of it automatically require dative case. For instance:

*Ich fahre mit der U Bahn.* [1]

*Men metro menen baraman.*

*(I will take the subway.)*

However, in German, there are also prepositions that are used in both cases, particularly dative and accusative cases. In that regard, the grammatical case of the preposition is recognized by determining whether the verb is an action or non-action word. On condition that the verb means an action that moves from one place to another, then the preposition takes accusative case, but if the verb is not in motion, then the preposition directly demands dative case.

In addition, there is a wide range of German prepositions which are used in correlation with genitive case. Nevertheless, since they are grammatically complicated, people who learn German as a foreign language make use of those prepositions rarely in oral speech. Instead of this, dative and accusative prepositions which are simple to understand are frequently used, on the other hand, this phenomenon occurs only in colloquial language and they are encountered in expanded scientific literature. The most important and useful prepositions, which require the Genitive case are **während** (during), **wegen** (because of), **trotz** (in spite of; despite). There is a wide range of such genitive case prepositions meaning time, place and cause, which are occasionally used in German.

Although, the number of prepositions that are used in the meaning of time in genitive case is limited, they play an influential role in the semantic meaning of the sentence, being an answer to the question word **qashan?** (when?). In particular, this includes prepositions like **außerhalb** (outside of), **innerhalb** (within), **während** (during) and **zeit** (while).

When we translate the word **außerhalb** from German, means **-tın' sırtında, - dan tısqarı** (outside of something), functioning as genitive case preposition of time:

*Außerhalb der Geschäftszeiten ist niemand im Büro.* [2]

*Jumıs waqtınan tısqarı mekemedede heshkim bolmaydı.*

*(Out of working hour, there is no one in the office)*

In this example, the word **außerhalb** has served as time preposition, expressing the unlimitedness of time and event which takes place out of a specific period of time.

The word **innerhalb** means **-tiñshinde, -tiñ waqtında, -tiñ dawamında** (within), performing the function of Genitive case preposition:

*Meine Doktorarbeit muss innerhalbeines Jahres fertig sein.* [3]

*Meniñ doktorlıq jumısım bir jildiñ ishinde tayar bolıwı kerek.*

*(My doctoral dissertation should be ready within a year)*

In the given example the word **innerhalb** is used to express the fact that it is necessary to carry out an action within a specific period of time. Apart from the meaning of time, the word

**innerhalb** is used to express the location. When translated from German, it means **-tń ishinde** (inside of):

*Innerhalb dieser Stadt gibt es viele Parks. [4]*

*Bul qalanń ishinde kóp parkler bar.*

*(There are lots of parks inside the city)*

With the help of the preposition **innerhalb** in this sentence, we can infer information about a particular place.

The word **Während** is used as a preposition and a conjunction in German. In both cases, **während** is used in relation with time, in other words, when it is used as a conjunction, its translation into Karakalpak is **sol waqıtta, dawamında** (during, while). To be more precise, the word **während** serves to connect two or more simultaneous actions.

*Während ich koche, sieht mich meine Katze die ganze Zeit an. [5]*

*Men awqat pisirip atırǵan waqıtta, meniń' pıshıǵım maǵan uzaq waqt qarap turadı*

*(While I am cooking, my cat looks at me all the time)*

The function of the word **während** in this example is to join two sentences which take place at parallel time.

If the word **während** comes in the form of a preposition, then its translation is **-tń waqtında** (when). The word **Während** is among prepositions which are frequently used in genitive case and we can see that it is used only in expressions of time.

*Während des Sonnenuntergangs blieben die Tiere ganz still.*

*Quyashtıń batqan waqtında haywanlar tım tırıs bolıp qaldı.*

*(All the animals remain very calm during the sunset)*

In the above mentioned example, the article **des** has taken the form of genitive case, linking the preposition **während** with the noun.

The word **Zeit** has its own grammatical function, that is, it serves as a noun, it is translated into Karakalpak as **waqt** (time). When the word **Zeit** comes as a noun in the sentence, it is written with a capital letter:

*Hast du heute Zeit? - Ja, ich habe heute Zeit. [6]*

*Búgin seniń waqtıń bar ma? Awa búgin waqtım bar.*

*(Do you have time today? Yes, I do)*

The word **Zeit** is used in German not only as a noun, but also as a preposition in some cases. When the word **Zeit** is used as a preposition in the middle of the sentence, it is spelled with a small letter. The word **Zeit** means **dawamında, boyı** (throughout, along) when translated from German. The preposition **Zeit** comes only before the noun word **Leben** (life), but it necessarily requires a possessive pronoun between the preposition and noun. The preposition comes in the function of meaning occasions which have been happening for a long period of time. Thus, it is

true to mention that other types of genitive case prepositions are not used with this word, when it comes in front of the word **Leben** with possessive case.

*Viele Hausfrauen arbeiten zeit ihres Lebens für ihre Familie.*

*Kóplegen úy biykeleri ómir boyı óz shańaraqları ushın jumıs isleydi.*

*(Many housewives work for their family throughout their lifetime)*

The prepositions used in the meaning of place in German are very numerous. Being an answer to the questions **qay jerde? qayda?** (where?), these prepositions come on the right and left side of the noun, indicating its position in the sentence.

In addition to the function of preposition, the word **abseits** serves as an adverb. When it comes as an adverb, it means **shette, qaptalda** (beside), denoting the location of the noun.

*Das Haus lag abseits. (Adverb)*

*Úy shette jaylasqan.*

*(The house is located offside)*

*Das Haus lag abseits der Straße. (Preposition)*

*Úy kóshenin' shetinde jaylasqan.*

*(The house is outside the Street)*

In the given example, the word **abseits** is used as an adverb and a preposition. When it comes as a preposition before the noun, it changes the meaning of the noun, determining the place where it is situated. However, when it comes as an adverb, no clarity has been added to the sentence.

The word **entlang** in German comes in genitive and accusative cases. When we translate it into Karakalpak, it means **boylap, -tıń boyında** (along). If it is in genitive case, it comes before the noun, influencing its meaning:

*Entlang des Flusses stehen die Bäume.*

*Dáryaniń boyında terekler ósip tur.*

*(There are trees along the river)*

As seen in the example above, the word **entlang** is associated with the noun, conveying its exact location. At the same time, **entlang** can be placed after the noun, when it is connected with Accusative case.

*Gehen Sie immer die Straße entlang!*

*Kóshe boylap júriń!*

*(Go along the street!)*

As you can see in the following example, the word **jenseits** translated from German, means **-tıń basqa tárepinde** (on the other side):

*Unsere Freunde wohnen jenseits des Gartens.*

*Meniń doslarım baǵdın' basqa tárepinde jasaydı.*

*(My friends live on the other side of the garden)*

The preposition **diesseits** comes in the opposite meaning of the word **jenseits** in Karakalpak, to be more specific, when it is translated from German, it means **-tñ bergi tárepi, -tñ bergi tárepinde** (on this side of).

*Diesseits des Tales liegt ein schönes Schloss.*

*Oypatlıqtñ bergi tárepinde ájayıp saray jaylasqan.*

*(There is a beautiful castle on this side of the valley)*

The words **oberhalb** and **unterhalb** are used in genitive case, possessing contradictory meanings to each other. **Oberhalb** comes in the meaning of **-tñ ústinde, -tñ joqarisında** (above), while the word **unterhalb** means **-tñ astında, -tñ tómeninde** (below):

*Die alte Burg liegt oberhalb der Stadt. [7]*

*Eski saray qalanıñ joqarisında jaylasqan.*

*(The old castle lies above the city)*

*Unterhalb der 1000 Meter - Grenze befinden sich viele Rastplätze.*

*Mñ metrli biyikliktegi shegaranıñ tómeninde kóplegen dem alıw orınlari jaylasqan.*

*(There are many resting places 1000 metres below the border)*

In the given examples, the words **oberhalb** and **unterhalb** express the precise positions of definite areas.

The word **unweit** serves to express meaning of a place or destination that is not distant in space and translated as **-tñ qasında, -tan uzaq emes jerde** (not far from, near).

*Besuchen Sie oft das Kino unweit Ihres Hauses?*

*Úyiñizdiñ qasındağı kinoteatrğa tez-tezden barıp turasızba?*

*(Do you often go to the theatre near your house?)*

In German, causative prepositions of genitive case connect the two words or sentences in the sence of causation. To illustrate, several types of such prepositions are given in the following examples.

The word **aufgrund** is translated into Karakalpak as **-tñ sebebinen, sebepli** (because of; due to), identifying the reason of the result of the acton in the sentence. It can be seen in the next example:

*Aufgrund deiner Faulheit wirst du die Prüfung vielleicht nicht bestehen.*

*Seniñ jalqawlıgıñnıñ sebebinen imtihannan óte almaysañ-aw!*

*(You probably cannot pass the exam because of your laziness)*

*Anlässlich der 1000 - Jahr - Feier unserer Stadt findet im August ein internationales Musikfestival statt.*

*Bizlerdiñ qalamızdñ 1000 jullıq yubiley bayramınıñ múnasibeti menen avgust ayında xalıqaralıq koncert festivalı bolıp ótedi*

*(Due to the 1000th anniversary of our city, an international music festival will be held in August)*

In the second example above, the word **anlässlich** has been used to indicate a definite cause in the sentence.

The preposition **infolge** means that there is a continuation of some kind of event. Its literal translation in Karakalpak is **-tıñ sebebinen, -tıñ nátiyjesinde** (as a result of). For instance:

*Infolge des Unfalls ist das Auto kaputt geworden.*

*Baxıtsız waqıyanıñ nátiyjesinde mashina buzılıp qaldı.*

*(The car broke down as a result of the accident)*

Moreover, it is essential to state that the genitive case prepositions such as **mangels** and **wegen** come in the meanings of cause and result as well.

*Mangels ausreichender Beweise wurde der Angeklagte freigesprochen.*

*Jeterlishe dálillerdiñ jetispewshiligi sebebinen ayıplanıwshı aqlandı.*

*(Due to the lack of sufficient evidence, the suspect was acquitted)*

*Mangels Arbeitsverträgen können sie jederzeit entlassen werden.*

*Jumis shártnamalarınıñ bolmağanlıǵı sebepli olar qálegen waqtında jumıstan bosatıwı múmkin.*

*(Because of the absence of employment contracts, they may be dismissed at any time)*

In the given examples, the preposition **mangels** is translated from German as **-tıñ bolmağanlıǵı sebepli, -tıñ jetispewshiligi sebepli** (due to the lack of).

The word **wegen** comes in the same meaning as the word **aufgrund** in Karakalpak.

*Wegen des Streiks kamen viele Menschen verspätet zur Arbeit.*

*Des Streiks wegen kamen viele Menschen verspätet zur Arbeit.*

*Tártipsizliklerdiñ sebebinen kóp adamlar jumısqa kesh keldi.*

*(Due to the lack of order, many people came to work late)*

Only two prepositions of genitive case, namely **trotz** and **ungeachtet**, come in the contrary meaning, and translated as **qaramastan** (despite of). In German, these prepositions are considered synonyms, and both of them perform the same function. The unique difference between them is that **ungeachtet** is used only in the written style, whereas the word **trotz** is used in both written and oral speeches.

*Ungeachtet des Schmerzes setzte er fort, zu laufen.*

*Awırıwına qaramastan ol juwırıwdı dawam ettirdi.*

*(Despite his illness, he continued to run)*

*Trotz des Telefonanrufs haben wir weitergegessen.*

*Telefon qońurawı bolıwına qaramastan bizler awqatlanıwdı dawam ettik.*

*(Despite the phone call, we continued to eat)*

In the given examples, the words **trotz** and **ungeachtet** have been used to express the acting against regardless of the current circumstances. Apart from the genitive case, the word **trotz** comes in correlation with dative case, however this occurs in oral speech only. The preposition **trotz** comes without any articles, and adjectives in front of it in a sentence.

In German, two synonym words **anstatt** and **statt**, serve to express two things which are mutually exclusive, and translated as **-tiń ornına** (instead of). These prepositions are used just in genitive case, possessing the similar meaning and function.

*Statt/Anstatt eines Blumenstraußes verschenkte er ein altes Buch.*

*Ol gúl dásteniń ornına eski kitap sawǵa qıldı.*

*(Instead of a bouquet of flowers he gave away an old book)*

As it can be seen in the example, the words **anstatt** and **statt** can be used as an alternative to each other. In German, these prepositions come before the noun, giving the meaning that one person, thing or action replaces another.

## CONCLUSION

Thus, from the examples mentioned above, it can be inferred that each of the prepositions of genitive case has its distinctive characteristic. It is also worth noticing that they play a vital role in the structure of the sentence as they provide various meanings that have significant impact on the content of the text. We can conclude from the examples illustrated in this research, genitive case prepositions are used to determine the place and time in which the event takes place, contrast which show the difference between two statements, cause which identifies why something happens, and alternation. This means that, in German, in most cases the prepositions of genitive case are used in compound sentences in order to connect one word or sentence with the others. Especially, it is possible to encounter such prepositions in scientific records in linguistics of German language.

### ABSTRACT

*The article describes the seasonal expeditions in the orchards of Kashkadarya according to the seasons, eggs of *Liotryphon punctulatus*, *Four-toothed ascogaster*, *Red-footed microdus* *Braconidae* were collected from the external parasites of the main pest of the garden, codling moth, and studied in the laboratory. According to laboratory results, the most dominant species is *Liotryphon punctulatus*.*

**KEYWORDS:** *Population, Pests, Entomophagous, Ichneumonoidea, Red Foot Microdus, Parasite, Fungus.*

### INTRODUCTION

In reducing the pest population size of entomophagous use reduces their number of species to a certain extent. According to the article, according to the seasons of 2020, seasonal expeditions were carried out in the gardens of Kashkadarya. According to the scientific research results, the collected entomophages were analyzed in collaboration with experts from the Institute of Zoology of the Academy of Sciences of Uzbekistan entomology laboratory. As an analysis result, the parasite *Liotryphon punctulatus* was recorded as a dominant species. Therefore, we have studied the parasite development as follows. During the winter, under the old bark of the

apple tree, 350 pieces of adult larvae of the apple worm, which had crawled into the cocoon, were stored in the laboratory. Observations continued. As a result, 214 liotryphon parasites flew out of the cocoon. The analysis showed that the parasite overwinters in the larval phase of the adult larvae. Laboratory observations show that the parasite larvae can withstand winter temperatures up to 20°C. The most common external parasite of apple caterpillars (ectoparasite), the oligophagous parasite overwinters in the larval stage of the adult apple caterpillar and turns into a fungus in February next year. Wintering larvae of ichneumonidae also tolerate temperatures down to -20°C. In Uzbekistan, liotryphon flies from mushrooms, mainly in late March to early April. The flying ichneumonidae codling manages to infect the wintering worms of the moth. *Ichneumon idea* lays its eggs on or next to the codling moth. One worm can lay up to seven eggs, but only in one of them does the larva develop fully, in the rest, the larvae die by injuring each other.

The laid eggs can be fertilized or unfertilized, females in fertilized eggs; only male *ichneumon idea* develops from unfertilized. Liotryphon flies out of the fungus before puberty. In the fungi, first the males of the parasite and then the females emerge. After the females are fed with flower nectar and the hemolymph of the host, its eggs mature and begin to lay eggs in 5-6 days. Females that consume protein and carbohydrate supplements live 30 to 40 days, while male insects live 15 to 20 days. The female liotryphon lays up to 120-130 eggs.

**Fig.1. Liotryphon punctulatus**

In the laboratory, one ichneumonidae was found to have paralyzed up to 118 codling moth worms. During the growing season, liotryphon reproduces up to 6 times.

*Four-toothed ascogaster* – *Ascogaster quadridentatus* (Hymenoptera group, Braconidae family). Codling moth is an effective parasite that kills at the expense of eggs and worms. Codling moth is found in all regions where it is widespread. In Uzbekistan, the emergence of ascogaster codling moth worms in the first half of May coincides with the mass laying period of apple butterflies. They begin to lay eggs when they are sexually mature or after 5-6 hours. Ascogaster searches for the apple caterpillar's egg and lays an egg in it. Only male insects develop from unfertilized eggs. In the laboratory, it was found that the female lays up to 700 eggs. The larva of the parasite flies out of the host embryo and stops developing and the master

worm feeds vigorously with its inner head during cocoon wrapping. After feeding, the host worm wraps itself around the cocoon and turns into a mushroom. The 520 laid eggs flew.

Fig 2. The parasite propagated in the laboratory

It takes 30 to 34 days for *Ascogaster* to fully develop, during the growing season braconid gives 3–4 generations.

**Red foot microdus - *Microdus rufipes* Ness.** (Hymenoptera turkumi, Braconidae oilasi). A common parasite of codling moth worms and several other butterfly worms overwinter inside the codling moth worm cocoon during the larval phase in the microdus range. The parasite flies a few days earlier than the codling moth worm before it reaches sexual maturity and needs to be fed extra carbohydrate food. 2–4 days later, the female lays eggs in the first and second year larvae of the codling moth under the skin and core of the microdus apple and at the age of 4, the parasite larvae emerge from the larvae and feed on its remains after the codling moth worm has hatched into an internal parasite (endoparasite) up to the larval stage inside the master cocoon, the cocoon wraps around the cocoon and turns into a mushroom. *Microdus* develop synchronously with its master, the apple worm, and the parasite reproduces as many generations as the pest does. Out of the 500 eggs bred in the laboratory, 357 were hatched.

#### Research results

Parasites types	Number of eggs laid in the laboratory (pcs)	The number of parasites hatched from eggs in the laboratory (pcs)	Parasite damage In %	Damaged codling moth (pcs)
<i>Liotryphon</i> <i>Liotryphon punctulatus</i>	350	214	61.14%	131

<b>Four-toothed ascogaster</b> – <i>Ascogaster quadridentatus</i> Wesm.	700	520	19%	98
<b>Red foot microdus-</b> <i>Microdus rufipes</i> Ness	500	357	25.2%	90

According to the scientific research results conducted in the laboratory, the damage rate of codling moth was 131 pieces and it was found to be high.

**Liotryphon** – *Propagation of Liotryphon punctulatus in the laboratory and distribution to apple orchards before the start of each phase of codling moth gives high efficiency.*

### Rezyume

Olib borilgan tadqiqot natijalaridan kelib chiqib codling mothga qarshi quyidagi turlar o`rganildi **Liotrifon** – *Liotryphon punctulatus*, **To`rttishli askogaster** – *Ascogaster quadridentatus*, **Qiziloyoq mikroodus-** *Microdus rufipes* bu turlar orasida *Liotryphon punctulatus* ustun tur sifatida aniqlandi.

### Резюме

По результатам исследования на яблоневых садах изучены следующие виды:

Liotrifon – *Liotryphon punctulatus*, квадридентатус– *Ascogaster quadridentatus*,

Qiziloyoq mikroodus- *Microdus rufipes*. Среди этих видов *Liotryphon punctulatus* был определен как доминирующий вид.

### Resume

Based on the results of the study, the following species such as Liotrifon - *Liotryphon punctulatus*, Quaternary ascogaster - *Ascogaster quadridentatus* and Red-footed microdus - *Microdus rufipes* were studied against apple orchards. Among these species, *Liotryphon punctulatus* has been identified as the dominant species.

**ABSTRACT**

*The article deals with lithological, geomorphological and hydrogeological conditions of the soils of the Republic of Karakalpakstan. According to the topography of groundwater, the causes of changes in their location and the laws of formation are studied. In protected areas located in irrigated areas, groundwater averages 1-2.5 m. around, their highest stay corresponds to the period of saline washing and vegetative irrigation. In Chimbay, Bozatov, Kungrad, Takhtakor, Shumanay and Karaozak districts, the average groundwater level is 2.5 m. stands at. In the former coastal areas of the dried bottom of the Aral Sea, the average groundwater level was 1.5-2.0 m.*

**KEYWORDS:** *Delta-Alluvial Plains, Groundwater, Hydrogeological Conditions, Chemistry And Type Of Salinity, Relief*

## INTRODUCTION

The Republic of Karakalpakstan occupies the Amu Darya delta, the southern part of the Aral Sea and the adjacent regions of Ustyurt and Kyzylkum. Karakalpakstan is a country of large and far from fully utilized opportunities for the development of diversified agriculture. It is based on oasis, irrigated agriculture. But due to the presence of vast pastures, reed thickets and numerous reservoirs, agriculture here is uniquely combined with semi-stale animal husbandry, as well as fishing, hunting and fur farming [1; 2].

### **The object of research and their methods of implementation**

According to climatic conditions, the territory of the Aral Sea is located in the northern part of the subtropical and in the southern part of the subboreal subzone of the desert zone of Central Asia. The average annual air temperature in July reaches 25.8-28.1 °C, with an absolute maximum of 41-42 °C. The wide annual range of temperature fluctuations from absolute maximums to minimums indicates a sharp continental climate.

The territory of the Aral water area is located on ancient, old and partly on relatively young surfaces of the Amu Darya delta. Ancient and old surfaces long ago emerged from the influence of flood floods and at a certain stage of their development - even before their irrigation development - went through the stages of drying and desertification. This area, like the entire former "living delta", has dried up and is now undergoing intense desertification.

The research is based on the comparative-geographical method, taking into account the conditions of soil formation, which will make it possible to study the genesis of soils in the main directions of the soil-forming process. In the field studies, morphological methods were used to ensure the reliability of field diagnostics of soils and their main morphogenetic properties. Laboratory and analytical studies on selected soil samples were carried out at the analytical center of the Research Institute of Soil Science and Agrochemistry according to generally accepted methods [3; 4; 5].

### **Results of the study**

The hydrogeological and meliorative conditions of the region are unfavorable, which is caused by the extremely difficult general groundwater runoff. This is facilitated by the weak slopes of the delta, the composition of the soil-forming rocks, characterized by high dustiness, and the structure of the soil-soil strata, characterized by the absence of continuous drainage layers. Therefore, the depth of occurrence and the regime of the groundwater level here are determined by the ratios of their arrival and discharge.

The groundwater level in different parts of the Amu Darya delta is different and depends on the degree of development, watering and drainage of the territory. On irrigated areas and virgin-fallow lands located among them, it fluctuates within 1-2.5 m. Their highest standing falls on the periods of leaching and vegetation irrigation. On the periphery of the oases in Chimbay, Bozatau, Kungrad, Takhtakupyr, Shumanay and Karauzyak districts, groundwater occurs at a depth of 2.5-4 m.

The almost stagnant nature of groundwater, when its consumption is mainly for evaporation and transpiration by vegetation, determines their variegation in terms of the degree of mineralization,

which ranges from slightly saline to brines (on virgin lands), especially this phenomenon is observed on the old coast of the Aral Sea (depth of ground water 1, 5-2.0m).

Over the past 30-35 years, studying and comparing soil maps and other materials, it can be established that automorphic - takyrs and semi-hydromorphic - takyrs-meadow soils, which dominated in the Aral regions and occupied significant areas in other regions, over the past decades have largely evolved into meadow soils are typical representatives of the hydromorphic series [6; 7; 8]. After a sharp decrease in the water content of the Amu Darya and the global drying out of the floodplain-alluvial plains, meadow and bog-meadow soils, drying and desertification, evolved into meadow-takyr (kinky residual-meadow and residual-boggy) soils. Here, slightly saline and non-saline (washed) soils occupy more than 27.3% of the area, but the prevailing area of land is saline in an average (37.4%) and strong (35.3%) degree. Particularly unfavorable land reclamation is observed in Muynak, Karauzyak, Kegeili, Bozatau, Kungrad and Takhtakupyr districts, where the share of highly saline soils reaches 43-86%, and slightly saline and washed soils - 12-23%. The reason for this situation was, first of all, the poor condition of the collector-drainage network, as well as under-washing and under-watering caused by a shortage of irrigation water.

The Amu Darya delta is characterized by a relatively homogeneous leveled surface with a general slight slope (0.00010-0.00020) from the top to the mouth. The flatness of the relief is only slightly complicated by elevated stripes along the numerous active and dead channels and extensive inter-channel depressions. The height of the riverbed shafts depends on the size of the channel and the position in the delta. In the upper reaches, they have a height of up to 4-6 m, and in the lower reaches, where the river-side banks are located, in the stage of formation, their height rarely exceeds, 1-2 m. The width of the riverbed shafts also depends on the above reasons and ranges from hundreds of meters to several kilometers. In the areas of the modern delta of the Amu Darya, the riverbed swells of dead channels are natural dams that determine the spread of flood floods. In river valleys, the farther the terraces are from the channels, the higher and older they are. In the delta, however, all the difference in relief is associated with the uneven accumulation of alluvium. In the immediate vicinity of the channel during flood floods, the maximum amount of material suspended in the water is deposited, and in the distance it is minimal, but both the riverbed swells and the inter-channel depressions are of the same age. To the south of Nukus, the current bed of the Amu Darya is cut into the alluvium. There are no near-river banks along the river in this area, and even a floodplain terrace stands out. There are areas of hilly and ridge sands scattered throughout the delta, rising above the plain from 2-3 to 6 m and more.

By genesis and relief, two types of sands are distinguished: hilly and cumulus gray mica sands formed by crumbling alluvial deposits, ridge-hilly reddish sands of bedrocks carried by the wind from the Kyzylkum plateau [9]. Reddish sands are distributed mainly on the alluvial plains adjacent to the Kyzyl Kum. In areas of intensive farming, the delta-alluvial relief is significantly transformed. As a result of the field leveling, the unevenness of the relief is leveled, and with prolonged cultivation due to agro-irrigation sediments, the surface of the inter-channel depressions slightly increases.

The high turbidity of the Amudarya water contributes to the rapid siltation of the canals. Therefore, in irrigated areas, there are often accumulations of irrigated sediments, thrown out during cleaning. The complexity of the geological and geomorphological structure of the

territory of Karakalpakstan has also caused an extraordinary variety of its hydrogeological conditions. Ground waters of different age and structure areas have different feeding areas, depth of occurrence, chemistry, salinity, etc. Delta-alluvial plains, composed of loose sandy-clayey strata, for example, have a single hydraulically connected groundwater table. The sources of groundwater supply here are the waters of the Amu Darya, which come in the form of a ground flow from the channel, as well as from flood floods and irrigation canals. Therefore, remote feeding in the form of groundwater transit prevails.

The formation and regime of groundwater in the area under consideration is largely determined by its lithological and geomorphological features, climate and groundwater regime. Due to the small slopes of the terrain, high dustiness and sharp stratification of soils, showing to some extent the properties of a "layered screen", there is an extreme difficulty in the total underground runoff. The speed of movement of the soil flow is measured in tens of centimeters per year. The formation and regime of groundwater in the area under consideration is largely determined by its lithological and geomorphological features, climate and groundwater regime. Due to the small slopes of the terrain, high dustiness and sharp stratification of soils, showing to some extent the properties of a "layered screen", there is an extreme difficulty in the total underground runoff. The speed of movement of the soil flow is measured in tens of centimeters per year.

Studies have shown that the complexity of the geological and lithological-geomorphological structure of the territory of Karakalpakstan has led to the extraordinary diversity of its hydrogeological conditions. Ground waters of different age of development and structure of soils have different sources of nutrition, depth of occurrence, mineralization, salinity chemistry, etc. The main source of groundwater supply is the water of the Amu Darya, coming in the form of a ground flow from hypsometric, higher located territories, as well as filtration water from irrigation canals, irrigation networks and irrigated areas [10].

The hydrogeological conditions of the territories of the Republic of Karakalpakstan contributed to the fact that the formed groundwater, as well as a large amount of surface irrigation water, do not have sufficient runoff and are spent mainly on evaporation and transpiration. Infiltration waters, superimposed on the groundwater, raise the groundwater level. The conditions of the local outflow of groundwater, provided by the outflow, determine the different rate of this rise. The depth of the groundwater level in the main part of the irrigated area, at the end of the growing season of agricultural plants, is above the critical 2.5-3.0 meters, during vegetation irrigation this figure is 1-2 meters.

The ground waters of the delta-alluvial plains have different mineralization. There are both fresh, containing less than 1 g / l of salts, and brines with a salt concentration of more than 110-120 g / l. In general, groundwater salinity increases with distance from food sources. In March-April, when there are massive leaching of lands before sowing, the water table rises throughout the oasis. Further, with an increase in temperature in the month of May, evaporation increases, and from the second half of June - and transpiration, as a result of which the groundwater level gradually decreases. In autumn, starting from the month of October and in winter, groundwater is the lowest.

Periodic studies of the soil cover indicate a deterioration in the subsequent years of the qualitative state of lands in all territories of the Aral Sea. This is due to the increasing processes

of soil salinization, an increase in groundwater, the development of wind erosion and desertification, which together leads to soil degradation.

In this regard, it is necessary to develop agricultural measures for the conservation and protection of soils. The main measures for soil protection are: A set of agrotechnical measures, a set of reclamation measures and a set of anti-erosion measures.

## CONCLUSION

Unfavorable hydrogeological conditions, despite artificial drainage, create preconditions for a rise in the level of saline groundwater and the appearance of secondary soil salinization in irrigated areas. To maintain the groundwater level below the critical depth, annual cleaning, if necessary, and the installation of new additional drainage is necessary. To remove toxic salts from the root layer, high-quality flushing is also necessary.

When installing the irrigation regime, it is necessary to be guided by the hydromodular zoning, which gives the calculated irrigation rates, irrigation schemes and irrigation rates, the use of which, against the background of an efficiently working collector-drainage network, will allow the groundwater to be kept below the critical level. The widespread introduction of crop rotations as a powerful means of improving the reclamation state of soils and increasing their fertility. To carry out a complex of anti-deflationary measures on sandy-sandy soils and sands.

Thermal resources will make it possible to grow here under irrigation conditions medium-fiber varieties of cotton, as well as grain, vegetables, melons, fruit, fodder and other agricultural crops; even in these territories, gardens, vineyards and others can be created.

**ABSTRACT**

*The Uzbek dictionary characterizes the concept of academic conflict as follows: "Pedagogical conflict is a conflict between the teacher and the pupil, the master and the student, the teacher and the student, or the conflict, hostility, enmity, attitude, conflict, discord". Hatred, discord, strife, due to common quarrels happens. When people think of conflict, they cruel incidents such as hostility, terrorizing, aggression, strife. This article gives exhortation and guidance on the training of modern management staff.*

**KEYWORDS:** *Formal Teacher, Informal Teacher, Constructive Conflicts, Objective Conflicts, Subjective Conflicts.*

**INTRODUCTION**

Conflict is frequently alluded to as conflicting views, clashes that are expressed through intergroup or interpersonal connections related to obnoxious enthusiastic experiences.

From a psychological point of view, a situation that features a devastating effect on people is not the conflict itself, but their result. Conflicts cause negative sentiments in the human mind, such as fear, panic, and animosity. If these experiences are solid and last a long time, a protective reaction can develop and be reinforced in a person.

---

## THE MAIN FINDINGS AND RESULTS

Negative circumstances as a result of conflict cause certain changes in a person's sentiments, behaviors, thinking, and even character. These changes are shown in the behavior of the individual, spread to other situations in which the subject partakes, and begin to involve a wide extend of connections. For case, a person rose in an environment of fear and peril is more likely to afterward end up a source of the same environment. He indeed raises his children in such an environment or manages his subordinates in this style.

It was found that the post-conflict temperament swings in labor communities and the time it takes to calm down take up three times more time than the period of preparation for the conflict.

A study of the causes of conflict in communities has identified a number of components that create conflict. These include constrained labor resources, the interconnectedness of production issues, vulnerability about the future of the organization, dissatisfaction with communication inside the organization, low level of training, and so on.

*Constructive and destructive conflicts.* Conflict can play a positive role in community life in case the source of the struggle isn't hidden when contradiction is clear. This include of conflict is what scholars call the "constructiveness of strife." Constructive conflicts within the organization emerge, first of all, on the fundamental issues emerging from labor action. When there's strife of intrigue, for someone the working environment is vital, and the work they do is of awesome significance. At the same time, another representative sees personal non-work-related eagerly as a major issue. In this case, in case the issue that caused the strike is settled, this struggle will vanish. In any case, a conflict that emerges over any work can have a solid impact on a person's enthusiastic circle and show its claim damaging nature. Destructive conflict debilitates the effectiveness of the group.

*Types of conflicts.* The following basic types of conflict are distinguished:

- Personal;
- Interpersonal;
- Between an individual and a group;
- Intergroup;
- Social.

The leader encounters each of the enumerators listed in his or her management activities. In this regard, we will provide information on them below.

*Personal conflicts.* This type of conflict is sometimes referred to as internal conflict. This type of conflict is caused by internal conflicts of the individual, and the factors that lead to such differences can be divided into two main groups:

- 1) The needs and aspirations of a person are in conflict with the responsibilities he assumes;
- 2) Internal relatives as a result of a person's disobedience to the requirements imposed on him. As an example, we can recall the following situations that occur at the level of the organization: The employee wants to do something carefully, but the deadline for completion of the task is increasing. As a result, there is a conflict between the two desires, such as the desire to be on

time and a serious attitude to work. Hence, such a mismatch between a person's worldview and habits is at the heart of an internal conflict. Another example of an internal conflict is when an employee has difficulty getting an assignment from two managers at the same time and which one to do first. The cause of the conflict covered in these two examples was determined by the external environment.

*Interpersonal conflict.* This type of conflict is common in work communities. According to most managers, the only reason for such a conflict is the disproportion of employee character. However, the analysis of the circumstances of this conflict shows that the basis of interpersonal conflicts, in most cases, lies in objective reasons. One of these is the limited resources in the organization. For example, problems arising from the use of means of production, their ownership, adherence to working hours and discipline, and the demand for labor. Typically, any employee feels that such resources are needed by someone else, not themselves. When a dispute arises between a manager and an employee, the employee may feel that the amount of work allocated to him or she is unfair, and the manager may feel that the employee is looking at the job with indifference.

*Conflict between an individual and a group.* Within any group, norms of interaction, labor activity, and behavior are formed. Any member of the group must comply with the requirements arising from these norms. Deviation from the accepted norm is considered a negative event and causes a conflict between the individual and the group. This type of conflict occurs even between the leader and the employees who obey him. For example, a change in management style applied by a manager can, in many cases, lead to a conflict between him or her and his or her employees.

At the organizational level, most problems arise on the basis of intergroup and social conflicts. In resolving such conflicts, the leader will need the support of peers and assistants.

*Conflicts among groups.* One of the sources of this conflict is the existing tensions between formal and informal groups in the community. For example, conflicts between the management of the organization and employees, between informal groups within the department, between the administration and the trade union are examples of this.

Technologies for the development of effective management activities in the resolution of conflict situations of heads of educational institutions

Another group of reasons for the occurrence of conflict can include a system of perceptions that arise in human perception in a conflict situation. A.G.Shmelev, a Russian researcher, while studying the factors that cause conflicts in small groups, argues that the conflict situation escalates into a conflict mode with such a system of perceptions. In particular, in the "system of egocentric perceptions" that take place in human perception, the participant in the conflict puts his interests, goals and needs at the center of the whole situation. Such a person analyzes the consequences of the conflict only in terms of the satisfaction of his personal interests. People, things and events around them are perceived as a means to an end. Such an approach to a situation arising from a conflict of interest is the basis for further escalation of the conflict.

The third type of attitude that is formed in a conflict situation is debated as a "system of socio-centric perceptions". Such a system has a polycentric, i.e. multi-centric, appearance, unlike the previous two monocentric (single-centered) systems. In the "socio-centric system", the resolution

of the situation is in the interests of all parties to the conflict, and the person takes into account the needs of the majority in resolving the problem situation.

## CONCLUSION

*"You-I" information.* Usually, any participant in a conflict claims that their interests are being discriminated against and often tends to blame the other party as the cause of the conflict. In many cases, the development of a conflict situation goes from exposing the faults and shortcomings of the other party to mutual insults. The attention of the parties to the conflict is focused on the other person's personality and lifestyle. For example, "If you didn't do that, it wouldn't be the same result," "Did you forget again," "How many times should you be assigned this task?" It should be noted that the main form of communication in conflict escalation is the focus on the person and even the personality of the other person.

## HISTORY OF THE UZBEK NATIONAL THEATER AND MAKE-UP

**Feruzat Suratovna Jalilova\***

\*Associate Professor,  
 State Institute of Arts and Culture,  
 UZBEKISTAN

### ABSTRACT

*This article examines the history of the Uzbek national theater and the history of makeup. The purpose of the article is to analyze the study of the history of makeup and its appearance in the theater. Particular attention is paid to the work of the director and make-up artist in the performances. And also the founders of the Turon troupe consisted of such actors as Hasan Kary, Ishanhoja Khani, Sami Kary (Abdusame Ziyabov), Abdulla Avloni, Badriddin A'lamov, Shorahim domla Shokhinoyatov, Nizomiddin Khojaev, Shokirjan Rakhimsham, Kudzhamratzhaev Abdulaziz Khodjaev, Musakhon Mirzakhanov, Umarkul Anarkulov, Fusail Zhonboyev, Salimkhon Tillakhonov, Kudratulla Yunusiy, Tulagan Khuzhamyarov, Ubaydulla Kary Ergoziev. The article is devoted to the current problem of makeup.*

**KEYWORDS:** *Make-Up, Director, Performance, Actor, Stage, Play, Poster, Troupe, Study, Theater, Character, Drama, Comedy, Character, Role, Staging, Epic Heroisms.*

### INTRODUCTION

The history of the Uzbek theater is also the history of makeup. Because at the very beginning of the activity of the national theater, the first signs of makeup appeared, although they were completely simple.

In the middle of 1913, the first professional theater group was formed on the territory of Uzbekistan, which at the beginning of 1914 showed its first national play on stage, and thus officially began its activities as a theater troupe. Since at the beginning of the 20th century, Turkestan was under the rule of Tsarist Russia, the theatrical sphere had to submit to the dominant beliefs of the empire, in particular the registration of such a large cultural institution as a theater, and permission to operate it.

The troupe unofficially showed its first performances in June and July 1913. The head of Tashkent enlightenment Munavvar Kara Abdurashidkhanov actively participated in the organizational and propaganda activities of the creative group. In 1913, on August 8, the troupe presented its first performance "Tomosha Kechasi" in the garden of Sheikh Hovand Takhur. At that time, there were no national theaters in any city of the Turkestan Territory. In the Samarkand weekly magazine "Oyina", in circulation since November 14, 1913, it was published about the play "Padarkush", which was still not staged, despite permission from the author to stage it.

Beginning in December 1913, preparations were made in Tashkent for the showing of the work "Padarkush". In the process of creation, teachers of modern schools took an active part. Such representatives of the enlightenment as Chunonchi, Abdulla Avloni, Muxammadjon kary, Nizomiddin Khojaev, Shokirjon Rakhimiy showed their dedication in this matter. The Tatar intellectual Mukhamedyarov was directing the performance, prepared by Tashkent amateurs. But due to the delayed preparations, the production of the drama is delayed. At the beginning of 1914, Aliaskar Askarov arrived from Samarkand and took responsibility for the work of the director of the play. In February 1914, the play "Padarkush" is planned to be staged together with the Azerbaijani comedy "Khur-Khur".

First performance. On February 27, at seven o'clock in the evening, amateurs of the Tashkent theater officially begin showing their performances in the one thousand one hundred local hall of the Colosseum Theater in the New City of Tashkent. A poster issued for this reason indicated that the performance consisted of three parts.

In the first part - the screening of the play Padarkush, based on the play of the same name by Mahmudhoja Behbudi; in the second - the humorous scene "Khur-Khur" by the Azerbaijani actors Aliaskar Askarov, Guluzorkhonim and Shahbalov; in the third part it was said about "Milliy ukish va zhurlar", where it was envisaged to show a concert of eight numbers. Hafiz Mulla Tuychi, dancer of Kurbanhon, Mulla Ahmadjon tour, were supposed to participate in the concert, as well as read Avloni's poems "Turkiston faryodi" and "Tuy". At the end of the poster, the head of the evening, Abdulla Khoja, was indicated, and the director, Askarali Askarov. On that day, a theatrical performance was shown that met European criteria and also based on the traditions of national performances, which led to the beginning of theatrical art in Turkestan.

Abdullah Avloni. Beginning in 1915, the Turon troupe staged new examples of the emerging Uzbek playwright. For example, "The Unhappy Bridegroom" by A. Kadiri (1915), "The Oppressed Woman" by H. Muin (1916) took places from the troupe's repertoire. The troupe, starting from the first steps, strived for innovation and cooperation, for the formation as a professional team, for creative growth, for the development of the cultural and educational level of the people in difficult conditions, and for this it tried to present its bold initiative.

The basis of the "Turon" troupe was made up of such actors as Hasan Kary, Ishankhodja Khani, Sami Kary (Abdusame Ziyabov), Abdulla Avloni, Badriddin A'lamov, Shorahim domla Shokhinoyatov, Nizomiddin Khojaev, Bashirjan Rakhimi, Kudzhashullahruhruh, Musakhon Mirzakhanov, Umarkul Anarkulov, Fusail Zhonboev, Salimkhon Tillakhonov, Kudratulla Yunusiy, Tulagan Khujamyarov, Ubaydulla kary Ergoziev. Since 1916, they were joined by Sulaimon Khodjaev, Mannon Uygur, Gulom Zafari. Some scientific sources indicated that Abdurakhmon Akbarov, Yusuf Aliyev, Sadullohoja Tursunkhodjaev, Muso Azizov, Mirmulla Shermukhammedov, Mukhiddin Sharafiddinkhodjaev also worked in the troupe. By 1917, until

the revolution, "Turon" was a theater troupe, which consisted of about thirty permanent actors, directors Nizomiddin Khojaev, Abdulla Avloni, Badriddin Aylamov, with a registered charter, with a repertoire of works in the national and universal spirit, with winter and summer scenes city of Tashkent, and full of hope and challenges. She also served as the basis in the formation and development of the culture and traditions of European theater not only in Tashkent and on the territory of Uzbekistan, but also in the countries of Central Asia.

The coming to power of the Bolsheviks in 1917 had a negative impact on the development of the theatrical culture of the Uzbek people. Those events forced the recently opened national Uzbek theater to sharply change its course in a completely different direction. The remaining members of the already disbanded Turon troupe on the eve of 1917, Nizomiddin Khodjaev, Gulyam Zafari, Badriddin Alamov, Gazi Yunus, Shokirjon Rahimi and Kayum Ramazon, led by Mannon Uygur, decided to renew the Turon theater and continue its progressive and educational traditions.

But there were still no works that fully responded to the new requirements of the new government, therefore, in the period from March 1918 to September 1919, sixteen plays had to be shown at the Turon Theater, fifteen of which were one-act. Among these works were the musical pieces "Wish", "Bad Son", "The Merciful Apprentice" by the poet and composer G. Zafari.

In the 1920s, they served as the basis for the formation of an Uzbek children's playwright and musical drama theater. In 1919, the Uzbek troupe named after S. Karl Marx under the leadership of M. Uygur. In March 1920, after merging with the amateur club "Tarakki", the Exemplary Regional Drama Troupe was created. The Tatar theater figure Kamal I was invited to the troupe as a director. And E. Bobozhonov, M. Korieva, O. Jalilov, S. Olimov, M. Mukhamedov, A. Ardobus (Ibragimov), Sh. Nazhmiddinov formed the creative basis of the troupe. Before moving to the capital (at that time the city of Samarkand) in 1925, the troupe set goals: rapprochement to the life of the people and the country, addressing the main exciting life issues of society. Released on March 26, 1920, the drama "Poisonous Life" by Hamza, the musical drama "Halima" by G. Zafari played a significant role. And two years later, on June 20, 1924, "Farhad and Shirin" by Alisher Navoi (based on Khurshid's staging) was shown, and on December 15 - Leili and Majnun by Fizuli (based on drama and music by Uziyar Khodjibekov).

In 1929 the troupe moved from Samarkand to Tashkent and was transformed into the State Uzbek Drama Theater named after A. Hamza. In the 30s of the twentieth century, the theater achieved significant success. This period was also characterized by the formation of art schools for actors and directors. The best works of the Uzbek playwright determined the development of the Uzbek theatrical art, on the stage - the theme of the principles of nationality. Ideologically and artistically developed performances, a variety of colors and solutions in them, are also associated with the achievements of Uygur and Babadzhonov in directing. Some of the best local, Russian, Soviet and Western European plays were in the theater's repertoire: Khamza's Bai and the Laborer (1939), Gogol's Inspector General (1935, 1952), Ismailov's Rustam (1934), Fatkhulin's Mask Torn Off (1932), "Honor and Love" (1936) by K. Yashen, "Hamlet" (1935, 1939, 1940) and "Othello" (1941) by Shakespeare and other performances became grandiose achievements of the Uzbek theater. In 1933, the theater was awarded the title of academic, and in 1937 was awarded the Lenin Order.

During the Second World War (1941 - 1945) patriotic performances "Death to the occupants" by Yashen, "Mother" by Uygun, "Flight of the Eagle" by I. Sultan, reflecting the heroism of the Uzbek people in the past, "Mukanna" Alimjan and "Jalaliddin Manguberdi" by Shaikhzoda were shown together with temporarily arrived Russian and Ukrainian representatives of the theater. In the post-war years, the theater's repertoire was enriched with works of contemporary themes. Developing folk heroic and romantic traditions close to Uzbek art, the theater created performances that deeply revealed the social essence of the characters. In such works as "For those at sea" by Lavrenev, "Russian question" by Smolov, "General Rakhimov" by Yashen, magnificent images of the participants in the war were created. During these years, performances were shown in various genres that presented the images of the Soviet person building communism: "The Honor of the Family" by Mukhtarov, "Song of Life", "Navbahor", "Hurriyat" by Uigun, "Silk Suzane" by Kakhkhara, "Makar Dubrava" by A. Korneichuk, "Secrets of the Heart" by B. Rakhmonov and others. The theme of the struggle of the Eastern peoples against colonial oppression was also included in the repertoire of the theater: "A Story about Turkey", "A Legend of Love" by N. Hikmet, "Daughter of the Ganges" based on the novel by R. Tagore "Downfall", "Algeria is my homeland!" M. Diba. Deeply philosophical humanistic confession of socially and historically generalized images are expressed in the performances "Alisher Navoi" by Uigun and Sultanov (1945 - 1948), "Kremlin chimes" by Pogodin (1947), "Family" by Popov (1952), "Guilty without guilt" by A. N Ostrovsky, "Bourgeois", "Vassa Zheleznova" by M. Gorky, "Dawn of the East" by Safarov (1951), "Inspector General" by Gogol (1952), "Julius Caesar" by Shakespeare (1958), "Guiding Star" by Yashen (1958), Schiller's "Robbers".

In the early 50s, young actors Z. Mukhammadzhanov, Y. Abdullaeva, E. Malikbaeva, T. Azizov, Y. Akhmedov, I. Alieva, R. Ibragimova and others joined the theater. A.I. Ginzburg (1951 - 1958, 1960 - 1965, 1971 - 1976) and T. Khuzhaev (1958 - 1960, 1966 - 1971) played the role of the chief director.

During this period, the change of generations intensified in the theater. After T. Khojaev, the director was A. Kobulov, N. Otaboev, B. Yuldashev, R. Khamidov, H. Apponov, H. Kuchkarov, S. Kaprielov, T. Isroilov, L. Fayziev. T. Azizov, P. Saidkasymov, O. Yunusov, T. Yusupova, R. Ibragimova, O. Norboeva, G. Dzhamilova, D. Ismoilova, M. Ibragimova, G. Zakirova, T. Todzhiev, T. Oripov, T. Karimov, R. Avazov, Y. Akhmedov, E. Komilov, T. Muminov, S. Umarov, Y. Sadiev, J. Zokirov, M. Abdukunduzov, G. Khodzhiev became active participants in the theater. In the 1960s - 1970s, the theater staged epic heroisms, social psychological drama, comedy, journalistically poignant and satirical, lyrical plays. The best performances of that time of the theater were "People with Faith" by Sultanov (1960), "Mirza Ulugbek" by Sheikhzade (1961), "Optimistic Tragedy" by V. Vishnevsky, "Voice from the Coffin", "My Dear Mothers" by A. Kakhkhara, "Poplar mine in a red scarf" by Aitmatov (1964), "Bloody Mirage" by Azimov (1964), "Stolen Life" by Morimoto Kaoru, "King Lear" by Shakespeare, "Parvona", "Flight" by Uigun, "Enemies" by M. Gorky, "Oedipus the King" by Sophocles (1969), "Mary Stuart" by Schiller, "The Sixth of July" by Shatrov, "Dawn of the Revolution" by Yashen (1973), "Don't Throw Fire, Prometheus!" M. Karim, "Living Corpse" by L. Tolstoy, "Before Sunset" by Gauntmann and others.

After the proclamation of independence of Uzbekistan, dramatic changes took place in the activities of the theater. Now the creative group had the right to freely conduct activities and compose their own repertoire. As a result, the drama Sahibkiran Temur K. Marlo was staged for

the first time on the Uzbek stage. Tesha Muminov, Madina Mukhtorova, Saida Rametova, Nadira Makhmudova, Uchkun Tillaev and others became the leading actors of the theater. The theater was directed by Valijon Umarov (2005). On September 21, 2001, a decree of the President of the Republic of Uzbekistan was issued on assigning the status of "National Theater" to the Uzbek Academic Drama Theater named after Khamza and calling it "Uzbek National Academic Drama Theater".

In January 2014, the President signed a decree "On the celebration of the 100th anniversary of the Uzbek National Academic Drama Theater" and on November 28, 2014, the theater celebrated its 100th anniversary. President of the Republic of Uzbekistan Islam Karimov congratulated and awarded the theater workers with titles, medals and orders. In accordance with the decree, the theater actor Asadillo Nabiev was awarded the title "Honored Artist of the Republic of Uzbekistan", actress Tuti Yusupova was awarded the order "Fidokorona Hizmatlari Uchun", actors Dildorkhan Ikramova and Fatkhulla Masudov - the order "Mehnat Shukhrati". The theater actor Abduraim Abduvahobov and artists Babaniyaz Kurbanov and Svetlana Tsoi were awarded the Dustlik order, the actor Mirolim Kilichov and the head of the theater lighting department Mahmudjon Aripjanov were awarded the Shukhrat medal. In 2001 the theater building was reconstructed. After the renovation, the theater completely changed its appearance, equipped with new equipment. There is a specially equipped room for make-up and is equipped with modern technology, as well as separate dressing rooms.

UZBEKISTAN

**ABSTRACT**

*The article explores the solution of practical problems using derivative and differential equations in improving the professional training of civil engineers through a high level of teaching mathematics, which is fundamental in the field of technical education. At the same time, practical problems are given and mathematical solutions are given.*

**KEYWORDS:** *Mathematical Model, Product, Maximum And Minimum Values Of Function, Differential Equations, Equilibrium Equation, Air Exchange Equation, Heat Dissipation Intensity Of Concrete, Free Vibration Processes In Construction.*

**INTRODUCTION**

In today's fast-paced world, higher education institutions are able to deal with problematic situations with in-depth theoretical and practical knowledge, as well as the ability to work independently in their chosen field, independently improve their knowledge and skills, and take a creative approach. The task is to train specialists who can identify, analyze and adapt quickly to the conditions.

It is impossible to train modern personnel without raising the level of knowledge in mathematics, which is considered fundamental. Therefore, the science of mathematics is of great importance in the formation of a wide range of builders, architects and designers. In addition, mathematics serves as a tool for the successful mastery of many techniques and special disciplines related to economics. In particular, the use of professionally oriented tasks in the teaching of mathematics to students of construction specialties allows forming the necessary professional qualities of the future specialist.

---

## THE MAIN FINDINGS AND RESULTS

The purpose of studying mathematics in higher education in the field of engineering (architecture and construction) is to acquaint students with the mathematical bases used in solving theoretical and practical economic, technical problems, to develop logical thinking skills, to get used to independent study of scientific literature, raising the level of general knowledge, the ability to analyze technical processes, practical problems with mathematical methods and to translate projects into the language of mathematics. The study of economic processes in construction, industry, agriculture and other areas is carried out using mathematical models. In order to be able to construct mathematical models of these processes and to be able to economically analyze the constructed models, the future specialist must have sufficient mathematical knowledge.

The main requirements for the mathematical training of a civil engineer in accordance with the program of mathematical science are:

- Strict assimilation of basic theoretical concepts of mathematics;
- understand the definitions, affirmations and theorems given in the mathematics course;
- be able to apply basic mathematical facts, formulas in practice;
- understand the relationship of mathematical models with the considered material phenomena;
- Analyze and interpret the results in accordance with the practical guidelines.

The above requirements for the mathematical training of a civil engineer imply not only to equip students with a certain set of mathematical knowledge and methods, but also to consider their practical application.

Thus, a career-oriented problem is a mathematical problem, the condition and requirement of which determines the model of a particular situation that arises in the professional activity of a civil engineer, and the study of this situation with the help of mathematics contributes to professional development.

The above allows you to formulate the requirements for the professionally oriented tasks used in the mathematical training of the future builder:

- the issue should describe the situation that arises in the professional activity of a civil engineer;
- The assignment should have the unknown properties of some professional object or event, which should be studied according to the known properties available using mathematical tools;
- In solving problems, the construction engineer should help to master the mathematical knowledge, techniques and methods that form the basis of his professional activity;
- Tasks should ensure the mastery of the interaction of mathematics with general technical and special disciplines;
- The content of a professionally oriented mathematical problem determines the propaedeutic stage of the study of the concepts of special disciplines;
- Solving a practical problem should ensure the mathematical and professional development of the civil engineer's personality.

Here are some examples of professionally oriented tasks that use mathematical hardware.

1. In the practice of designing a network of highways, it is often necessary to design branching nodes.

The location of the intersection and the relative condition of the roads passing through it are determined by a set of economic and geographical conditions, but the first step in solving this problem is to save only the time spent on transportation. Therefore, the following auxiliary task is solved first.

That should be the angle of contact of the road (CE) with the highway (AB)  $\alpha$  to minimize the time spent on transportation along the AEC route.

Speed  $v_m$  on the highway and  $v_y$  on the roundabout.  $v_m > v_y$

Draw a CD of length  $h$  perpendicular to the line AB through point C. Let the length of the section AD is  $l$ .

It is known that  $CE = \frac{h}{\sin \alpha}$  and  $DE = h \operatorname{ctg} \alpha$   $CE = \frac{h}{\sin \alpha}$ .

On the AEC route we find the travel time of the car:

$$t = \frac{l}{v_m} - \frac{h \operatorname{ctg} \alpha}{v_m} + \frac{h}{v_y \sin \alpha}$$

Point A is conditionally assigned, only it determines the direction of movement along the trunk.

Angle  $\alpha$  can vary in the range of  $(0; \frac{\pi}{2})$ .

We came to the problem of finding the smallest value of  $(0; \frac{\pi}{2})$  intervals of  $t(\alpha)$  functions.

We take this  $t(\alpha)$ .

$$t'(\alpha) = \frac{h}{v_d \sin^2 \alpha} \left( \frac{v_d}{v_m} - \cos \alpha \right).$$

Since  $0 < \frac{v_y}{v_m} < 1$  and  $\alpha \in (0; \frac{\pi}{2})$ , we see that  $\alpha_0 = \arccos \frac{v_y}{v_m}$  is  $t'(\alpha) = 0$ .

Since  $\alpha \in (\alpha_0; \frac{\pi}{2})$  is  $\alpha \in (0; \alpha_0)$  and  $t'(\alpha) < 0$ , we see that  $\alpha \in (0; \alpha_0]$  functions decrease in  $t'(\alpha) > 0$  and  $\alpha \in [\alpha_0; \frac{\pi}{2})$  functions increase in  $t(\alpha)$ . So  $t(\alpha)$  functions reach the smallest value in  $\alpha_0 = \arccos \frac{v_y}{v_m}$ .

2. The length of the boundary of the cross-sectional area of the channel is called the wet perimeter of the channel. Theoretical calculations and experimental cross-section revealed that the smallest wetted channels of all channels differed in maximum permeability and at the same time in minimum filtration. Experts note that such channels have the most hydraulically optimal profile. In reclamation practice, canals or trays are often built in the form of rectangular, triangular, trapezoidal and circular segments. Therefore, it is interesting to calculate the most hydraulically profitable profile for channels of this shape.

a) What is the ratio of the width and depth of a channel with a rectangular cross-section to have the most hydraulically optimal profile?

Let the width of the channel be  $x$  and the cross-sectional area be  $\omega$ .

The wetted perimeter of the canal is  $\lambda(x) = x + \frac{2\omega}{x}$ .

We come to the problem of finding the smallest value of function  $\lambda(x)$  in the interval  $(0; \infty)$ .

That can be  $\lambda'(x) = \frac{x^2 - 2\omega}{x^2}$ .

Solve  $\lambda'(x) = 0$  equations to get  $x = \sqrt{2\omega}$ .

Since  $x \in (0; \sqrt{2\omega})$  is  $\lambda'(x) < 0$  and  $x \in (\sqrt{2\omega}; \infty)$  is  $\lambda'(x) > 0$ ,  $\lambda(x)$  functions have the lowest value at  $x = \sqrt{2\omega}$ . This means that the width of the channel should be  $\sqrt{2\omega}$  and the depth  $\frac{\omega}{\sqrt{2\omega}}$ . The ratio sought is  $\frac{1}{2}$ .

b) The angle of inclination of a channel with a cross-sectional area of  $\omega$  and an equilateral trapezoid is  $\alpha$  ( $\text{ctg} \alpha = m$ ). What is the ratio of the width of the bottom of the channel to its depth, which has the most hydraulically optimal profile?

Let the bottom of the channel be  $b$  feet wide and  $h$  feet deep.

In that case  $BC = h \text{ctg} \alpha = hm$ ,  $AC = \sqrt{AB^2 + BC^2} = h\sqrt{1+m^2}$

Cross-sectional area  $\omega = \frac{1}{2}h(2b + 2hm) = bh + mh^2$ .

The wetted perimeter of the channel is  $\lambda = b + 2AC = b + 2h\sqrt{1+m^2}$ .

We find  $b = \frac{\omega - mh^2}{h}$  on the surface of the cross section.

As a result, we get  $\lambda(h) = \frac{\omega}{h} - mh + 2h\sqrt{1+m^2}$ .

We come to the problem of finding the smallest value of the function  $\lambda(h)$  -in the range  $(0; \infty)$

. Solving using the product we get  $h_0 = \sqrt{\frac{\omega}{2\sqrt{1+m^2} - m}}$  results.

The resulting ratio is  $\frac{b}{h_0} = 2\sqrt{1+m^2} - m$ .

c) Let the cross-sectional area of the channel be a segment.

What is the central hydraulic profile of the channel at a central angle of  $\alpha$  ?

Let be the radius of circle  $R$  . The cross-sectional area of the channel is

$$\omega = S_{\text{sek}} - S_{\Delta} = \frac{R^2}{2}(\alpha - \sin \alpha) . \text{ From it } R = \sqrt{\frac{2\omega}{\alpha - \sin \alpha}} .$$

$$\text{Wet perimeter of the channel } \lambda(\alpha) = R\alpha = \sqrt{2\omega} \sqrt{\frac{\alpha^2}{\alpha - \sin \alpha}} .$$

Instead of checking the  $\lambda(\alpha)$  -function, we can find that the simpler

$$f(\alpha) = \frac{\alpha^2}{\alpha - \sin \alpha} \text{ function is } \alpha = \pi \text{ by checking the minimum using the product.}$$

This means that the cross-sectional area of the channel should be a semicircle.

3. Mixing problems are common in the sewage system (water supply, sewerage, chemical industry).

We explain how to solve a basic problem involving a single reservoir.

The tank in the picture contains 1000 liters of water, which dissolves 100 kg of salt.

The mixture (salted water) operates at a rate of 10 liters / min and contains 5 kg of dissolved salt. The mixture in the tank is kept flat by stirring. The tank runs out in 10 minutes. Find the amount of salt in the container at any time  $t$  .

Let us determine the amount of salt t time  $y(t)$  in the tank.

Its  $t$  time changes rate.

$$y'(t) = \text{Salt infiltration rate} - \text{Salt exit rate}$$

5 kg of dissolved salt is 50 kg of dissolved salt in 10 minutes.

As 10 liters of mixture is expelled every minute,  $\frac{10}{1000} = 0.01$  parts of the total amount is expelled. The result is  $0.01y(t)$  salts.

In the above we come to the following simple differential equation.

$y' = 50 - 0.01y$ . Solve the equation for which this variable is divisible by  $\frac{dy}{dt} = -0.01(-5000 + y)$

$$\frac{dy}{y-5000} = -0.01dt; \ln|y-5000| = -0.01t + \ln C \Rightarrow y-5000 = Ce^{-0.01t}.$$

We find the variable using  $y(0) = 100$  (initially 100 kg of salt) starting balls.

$$100 - 5000 = Ce^0 \Rightarrow C = -4900$$

We have  $y = 5000 - 4900e^{-0.01t}$  solutions.

4. The rate of heat dissipation of concrete in proportion to the amount of heat released at a given

time:  $q = \frac{dQ}{d\tau} = m(Q_{\max} - Q)$  views.

With complete hydration of cement  $Q_{\max}$ , the maximum amount of heat that can be released in the concrete of this composition, parameter  $m$ , varies depending on the type of cement (for concrete in cement it is in the range of 0.010 - 0.015 1 / h). Determine the heat generation function of concrete.

5. In construction work, great attention should be paid to various issues related to vibration. Earthquakes can shake buildings, their structures, and the foundations on which engines and machinery are installed. The buildings in which they are located must be constructed in such a way as to exclude vibrations for the normal operation of the mechanisms and the integrity of the structure. All the practical problems associated with vibrations, despite their natural properties, are combined with general principles and methods that constitute the essence of the theory of vibrations. Vibration processes, which are practically completely different in nature and nature, are characterized by differential equations of motion that are uniform in form. The following

differential equation  $x''(t) + 2hx'(t) + \omega_0^2 x(t) = 0$ ,  $h = \frac{b}{2m}$ ,  $\omega_0^2 = \frac{k}{m}$  represents the process of free oscillation in construction constructions.

The solution of this equation is illustrated in the figure.

The specificity of each specific problem is determined by the constants included in these equations, which depend on the physical nature of the phenomenon being studied. Using the given parameters of the problem (construction), we can analyze the integral curve and determine the nature of the oscillation.

6. In winter, the daytime temperature in a particular office building is maintained at 24 °C.

The heating was turned off at 10:00 a.m. and turned on again at 6:00 p.m. At 14:00 on a certain day, the temperature inside the building was found to be at 20 °C. The outside air temperature was 18 °C at 10:00 a.m., and dropped to 10 °C at 6:00 p.m. What was the temperature inside the building when the heat was turned on at 6:00 in the morning?

## CONCLUSION

Analysis of the solution to the problem allows determining the degree of formation of the professional qualities of the construction engineer personality. Along with providing professional motivation, it strengthens the connection between mathematics and practice.

The practice of teaching in technical higher education institutions shows that the educational process, organized in terms of the regular demonstration of the professional direction of students' mathematical training, shapes the professional qualities of the individual. The specialist will always be able to continue the education in the right direction with a good knowledge base.

**ABSTRACT**

*The article is devoted to the development of software for computer linguistics, which highlights the level of research on the problem in world and Uzbek linguistics. Types of speech-related computer programs according to the methods of creation, technology and function are discussed. The study discusses the role of speech recognition software in the development of Uzbek computer linguistics, the mechanism and possibilities of creating a program for digitizing voice messages.*

**KEYWORDS:** *Language, Speech, Computer Linguistics, Speech Synthesizer, Speech Recognition Software, Artificial Intelligence, Audio Information, Digital Technology, Linguistic Software, Speech Corpus.*

**INTRODUCTION**

Ensuring the integration of language into modern media has become one of the priorities of socio-political activities, with a special focus on the development of a system of economic and cultural relations based on digital technologies. The results of research in computer linguistics are extremely important for innovative solutions to problems in this area. To date, a number of scientific and practical results have been achieved in world computer linguistics: an automatic translation system in natural language, an automatic search system for textual information, automatic analysis and synthesis of spoken speech, optimized human-machine (computer) communication, natural language processing (Natural Language Processing) system was formed. In the world of computer linguistics, the implementation of research such as text editing software, speech synthesizer, text corpus, software for linguistic-statistical analysis of texts, abstracting texts has contributed to the creation of large-scale linguistic databases. [1]

M.Ayimbetov [2, 47], S.Rizaev [3, 50], S.Muhamedov, A.Pulatov, S.Muhamedova, A.Rahimov, N.Abdurahmanova, who conducted linguostatistical researches on the basis of Uzbek language materials in the formation of computer linguistics in our country, The scientific researches of M.Abjalova are of special importance. S.Muhamedov and R.Piotrovsky's study "Engineering Linguistics [4, 25] and the experience of system-statistical research of Uzbek texts" [5, 420] discusses linguistic models, modeling and its general principles.

N.Abdurahmanova's research draws conclusions on the creation of linguistic support for machine translation, provides morphological and syntactic models of Uzbek and English, bilingual affixes, morphological dictionary, linguistic support of verb phrases, simplicity of English translation of models, based on the principles of morphological, syntactic-semantic analysis of texts for machine translation, developed recommendations for the coordination of paradigmatic (associative) relations on the principles of linguistic software for electronic dictionaries and software [6, 141-148].

The research conducted by M. Abjalova created the theoretical basis for the formation of the linguistic support of the system of automatic editing and analysis in Uzbek computer linguistics; the principles of morpheme valence, categorization, syntagmatic and methodological separation of words in the formation of the linguistic supply of automatic editing and analysis are developed, based on the importance of linguistic module and modulation; the provision of grammatical categories of the Uzbek language on official and scientific texts, grouping by word groups, the formation of models of connection by conjugation, adaptation and management in the sentence structure; graphic editing, morphological and syntactic analysis modules have been developed to provide automatic editing / analysis technology and software excellence [7, 104-106].

In recent years, in Uzbek computer linguistics, special attention is paid to the development of speech-related programs. In particular, as part of a practical research project at the AlisherNavoi Tashkent State University of Uzbek Language and Literature, a program was developed to translate the Uzbek text into a voice message - the first interpretation of the national speech synthesizer (M.Kurbanova, B.Mahsudov, E.Isoev, 2020), TTSuzbot telegram launched online via the bot. This software product is a user-friendly interface, especially for blind people to work independently with electronic text in Uzbek.

## **THE MAIN FINDINGS AND RESULTS**

Speech-related computer programs also play an important role in translating a voice message into text. This process is carried out through the speech recognition system [8]. This system is a technology designed to be able to receive verbal expressions of all level units of a program or machine language system and to convert them into a machine-readable format. Although there are interpretations of speech recognition software in English, Russian, Japanese, Korean, Chinese and other languages in world computer linguistics, this issue is one of the problems in Uzbek computer linguistics.

The first device for voice recognition was created in 1952, which detected numbers pronounced by humans. In 1963, a miniature detection device called the "Septron", a fiber-optic memory device developed by engineers at Sperry Corporation, was introduced in the United States.

They served to carry out this or that sequence of actions according to certain sentences pronounced by the human operator. “Septrons” are designed to automate voice dialing in the recorded wired area and to automatically record the text that is pronounced on the teletype (in the voice control of complex military equipment); aviation (in the creation of “smart avionics” subject to the orders of pilots and crew members), used in automated control systems.

Commercial programs for speech recognition originated in the 1990s. Typically, they are used by users who cannot type large amounts of text because of a hand injury. These programs (e.g., Voice Navigator) [9] convert the user's voice to text.

It is well known that speech recognition software is widely used in search engines in the global network. Initially, Google researchers developed a voice search for the Chrome Internet browser and the Android mobile device. Sophisticated technologies have been added to the Google search engine's voice software for Android and Apple Phones. The user can use them to press a phone button and express an optional question through sounds. The audio is then converted to a digital file that is intelligible to the software and sent to a Google server.

An important aspect of Microsoft-Tell Me, which serves as a speech recognition program, is the natural interaction of tools used in daily activities. “Tell me” works on the basis of human voice, which means that the user can send a voice message and receive any information on a mobile device. In this case, the user says a message; the phone receives this information in the form of text. South Korean Information Technology Research Institute in collaboration with Google search engine English, Korean and Chinese speech recognition device and developed voice technology that allows viewers to search for a television program using the IPTV system. The advantage of these technologies is that they add many applications to the automatic speech recognition program for the “provision of voice functions”.

Innovative technologies require the creation of speech corpora at the initial stage of the formation of a speech recognition system based on modern research methods. To do this, tens of thousands of different types of sentences are selected according to the options of phonemes available in the language, adapted to different speech styles, structure, purpose of expression, and their audio database is created. Because each person's voice is individual and the program is not limited to recognizing only the same voice, each speech in the database is read by several speakers who differ in factors such as age, gender, and region.

Unlike audiobooks, there are certain technical requirements for this program, in the process of preparing audio information on speech parameters, it is necessary to remove the noise in it using a sound processing program. Each sentence and its phonetic expression are stored in a separate file and compared with each other using machine learning technology. To do this, you will also need to include transcripts of linguistic materials in the program database.

Pronunciation and spelling dictionaries serve as a valuable lexicographic source in the formation of the speech recognition system. When compiling dictionaries for the program, special attention should be paid to the orthography of words. Machine learning technology determines the specific phonetic laws, orthopedic norms, and linguistic features in general through the practically independent study of language.

At the next stage of the activity, acoustic and linguistic models will be developed and program algorithms will be developed based on the results obtained in this regard. This creates the initial interpretation of the speech recognition program.

Voice recognition technology is one of the fastest growing areas of artificial intelligence. This technology is improving qualitatively in the XXI century. As a result, new approaches to the processing of natural language are emerging.

## CONCLUSION

Speech recognition software Voice control of mobile phones and other automated technical devices by persons with limited hand movements; voice input and editing of text on a computer; independent use of search engines in the global network; providing information and advice, ordering for branded services; conducting public surveys, conducting surveys, reading audio sources by people with hearing impairments into text, entering the diagnoses of patients in the form of text by voice on an electronic record sheet, preparation of audio recordings of interviews, text of meeting minutes and transcripts, teaching students to pronounce correctly, plays an important role in increasing their literacy rate. In this regard, the creation of an interpretation of the speech recognition program in our national language is one of the urgent tasks in Uzbek computer linguistics.

### ABSTRACT

*The paper is devoted to fostering the innovative thinking of students in technical and scientific spheres. The research, aimed at finding the ways for fostering the students' innovative thinking, incorporates the definition and analysis of innovative mentality, including its cognitive and instrumental components, and various characteristics such as creative, theoretical, social, constructive, transformative, and pragmatic ones, which constitute a complex structure of innovative thinking.*

**KEYWORDS:** *Innovative Thinking, Characteristics Of Innovative Thinking, Fostering The Students' Innovative Mentality.*

### INTRODUCTION

Although we clearly see today that there can be no social development without scientific and technical discoveries, no work on spirituality mentions the importance of scientific and technical knowledge, the methodology of their study does not reveal. Scientific and technical knowledge is also a reflection of the objective laws and requirements of spiritual development. Actually, there is no place in our spiritual heritage to solve this problem, but the present time requires scientific and technical research; the effective use of the achievements of the scientific and technological revolution in all spheres of social life has become a necessity. Undoubtedly, such qualities as social justice, ideal society, perfect man, high spirituality, humanity, patriotism, faith, good behavior, community, unity, humility, generosity, peace-loving, diligence, family-oriented, which are glorified in the spiritual heritage of our people, are immortal. It is our duty to assimilate and inculcate it in the hearts of the younger generation. However, it is also true that

the objective laws of social development, the requirements of innovative development expect from us scientific and technical knowledge, discoveries. At the same time, it should be noted that historicalism and traditionalism prevail in spiritual-moral imperatives, which can sometimes lead to stagnation, conservatism. This historianism helps to ensure stability and unity in society, in interpersonal relations, strengthens the ties between the individual and society, it makes intergenerational diachronic ties into important values. However, they can also be an obstacle to innovative changes.

## **MATERIALS AND METHODS**

So we need to focus on deciding on a certain consensus, conformity, between traditionalism and modernization. Where historicism prevails, any innovation remains a dry desire. Therefore, it is necessary to pay due attention to young people who are active subjects of innovation, to form in them not only the ability to master innovations and creative activity, but also the ability to live with moral imperatives embedded in the spirituality of our people. Reconciling these two hypocritical, contradictory sides, no matter how complex and difficult the task, is an objective requirement of our national development.

Spiritual and moral imperatives are, in essence, the values created by our ancestors, inherited from them, the mentality, way of life and cultural life of our people and nation. Their connection with different interests and hobbies has formed the categories of "I" and "We" in the spiritual and moral life. "Rituals, traditions, and customs that have been formed and developed in a society over the centuries are also a manifestation of the moral relationship that exists between the individual and society. Based on these, the relationship between the individual "I" and the collective "We" is harmonized [1].

Many literatures emphasize the predominance of "We" in the spiritual and moral imperatives of the East. The fact that this communism has risen to the level of tradition is not a negative, conservative case, of course. But in the development of society, the category of "I" or "We" has never been absolutely dominant, it was impossible to live without harmonizing them. It is natural that there is a contradiction between these categories. Because "the development of the relationship between the individual and society is not just about commonalities. There will also be contradictions in this relationship.

The basis of these contradictions is the disproportion in the understanding and formation of the relationship between the individual and society. A individual is a special person. And society is the unity of such individuals formed on the basis of certain goals. Conflicts occur as a result of society not understanding the individual, the individual not understanding society. Take the life of Maria Curie Skladovskaya, a two-time Nobel laureate, for even major social tragedies, such as the contradictions that arise as a result of personal selfishness or, conversely, the complete shadowing of personal interests. Having a unique scientific ability, the genius creator is so devoted to her interests and research that she do not even think that a woman should have at least three or four dresses. Her "I" is Polonia, in search of radius. She wants to be alone all the time in this quest. Only her partnership with her husband, Pierre Curie (who is also a Nobel laureate), gives her peace of mind and satisfaction in life. It can be called creative (positive) selfishness, but still selfishness [2].

Many great artists are obsessed with one or another flaw, arrogance, as if glorifying their "I"[3]. That is why the Italian psychiatrist Lombroso notes the encounter of conceit, even madness, in

great creators [4]. Discovering something new, giving in to creativity is something that can lead to indifference. But this creative psychological state is unique to some individuals, and the whole society cannot live in such a state. In innovative mentality, there is a surge of creativity, but this is also typical of true inventors. The pain and joy of creating something activates the "I", sometimes making it a rival to those around him. That's why the great creators are introvert; don't like the circles, the crowds and the hassles.

We find these qualities in Beruni, Ibn Sina, and mystics. The "I" is not limited to Western artists, we observe it in the qualities of almost all great personalities. However, the traditions of the East have always embodied the "I", and it is rare to go beyond the "We", even in the most talented people. In our opinion, this is the reason why scientific and technical mentality in the East is not sufficiently developed. This can be seen in the following reasonable thoughts of E. Yusupov: "Social moral duty and responsibility sometimes contradicts a individual's personal interests.

## RESULTS AND DISCUSSION

Man sometimes seeks to circumvent traditions, customs, which are part of social moral duty and responsibility. The tendency to deviate from certain traditions in the context of social problems is more common in young people who are influenced by emotions and passions. They sometimes tend to adapt them rather than adapt to a particular social, moral environment. In the field of love, there are times when parents try to achieve their goals without taking into account public opinion, and emotions sometimes lead a person astray. Some people go so far as to commit suicide when they cannot find a way to resolve the conflict between public opinion and personal interests"[5].

According to the scientist, the spiritual life of young people should be in line with public opinion, a reflection of the requirements of "We". Giving personal interests to the public is seen as a sign of spiritual maturity. Eastern traditionalism does not allow the individual to go beyond its own limits; it keeps it within the bounds of spiritual-moral imperatives. Is it good or bad? If there is a positive case, what are the positive aspects, and if there is a negative event, what are these aspects? What do these aspects have to do with the topic, innovative mentality? On the first question, academician E. Yusupov states the following: "Morality is the result of the fact that each person feels responsible and accountable to others.

Based on this, it can be concluded that moral maturity is the understanding, reliance and development of spiritual values that have been formed over the centuries in the course of one's life and activity. The key issue is not only what moral heritage each nation has, but also to what extent new generations adhere to and develop it. For this reason, it has always been a sign of morality that every person should follow the rules of behavior, manners, treatment and attitudes that exist in society. Deviation or disregard for traditions and values in this regard is considered immoral. Immorality is a violation of the balance between "I" and "We"[6].

It turns out that the values that have been formed over the centuries determine a person's behavior that following them is moral, that violating them is considered immoral. The centuries-old balance between 'I' and 'We' is transformed into a firm moral imperative that cannot be broken.

From a spiritual and moral point of view, this idea is remarkable, but there is a danger of translating it into all human behavior, including creative activity, innovative research. If we

remember that almost all human activity in the East has been measured according to spiritual-moral imperatives, we find that the above danger is not unfounded. At the same time, there is a positive side of this idea, the spiritual-moral imperative. The scientific and technological revolution in the West rejected the traditions formed over the centuries, saw the intellectual power of man, his scientific potential as the only factor that ensures social development. As a result, Western civilization has made great strides, rescuing man from muteness in the natural environment, making his life prosperous, his mind free and his possibilities wide, colorful and enjoyable.

But wealth, money, and prosperity, which the West worships as its core values, have become, according to E. Fromm, "universal arguments that will overthrow the world, change and destroy all natural things and human qualities"[7]. The scientific and technological revolution and that it gave birth the life ideals, lifestyle and way of thinking to play an important role in this. It is widely acknowledged that the scientific and technological revolution has caused global environmental, demographic and spiritual crises, and that it has brought humanity to the brink of destruction. These tragic consequences of the addiction to the development of scientific and technical mentality should not be transferred to innovative development. This can be prevented, first of all, by our spiritual and moral traditions, oriental traditionalism. This is where the conditionality of the dialectical relationship between spiritual and moral imperatives and innovative mentality is manifested. This is the answer to the first and second question above. Eastern traditionalism is based on the principles of "seven measures, one cut" and "thanks for everything." It is a priority to rely on traditions, to measure behavior in accordance with the norms and views decided in the social environment, to support only the initiative that conforms to these norms and views. The novelty seems to be atheism, even a violation of existing routines, traditions. Innovative mentality cannot be limited to such norms and views; it is characterized by constant restless research, creation of something, striving to improve existence. Continuous improvement is its element and demand. It is not possible to completely eliminate these contradictions, but they can serve each other syn harmonically. For this, society and the state must be interested in ensuring such harmony. In our opinion, this interest can be reflected in the following areas, tasks: 1) the development of creative, innovative young people, intellectual forces; 2) creation of a new pedagogical technology for the formation of scientific and technical mentality on the basis of humanism, within the framework of spiritual and moral imperatives; 3) the formation of moral responsibility, social duty and scientific ethics in society in a way that supports the potential of artists with great intellect.

These directions, tasks seem trivial from the surface. The global crises caused by the scientific and technological revolutions worried first the members of the Club of Rome [8] and then the whole of humanity [9]. There is no social development without scientific and technical discoveries; the deterministic impact of these discoveries has raised the question of how scientific and technical research should be conducted and what educational model young people should be trained. Training young people capable of discovering creative, innovative techniques required a new pedagogical technology, an educational model, without addressing this issue, the training of scientific and technical personnel would cause to deepen the crisis. Between 1945 and 2000, about 400 globally-minded universities and academies were opened in European countries, training highly educated scientific and technical personnel. The policy of humanization of

scientific and technical discoveries, that is, the support of discoveries that meet the fundamental goals of man, has been implemented [10]

### CONCLUSION

In life, morality should be subordinated to morality, not interest. If interest is seen as superior to morality, people will go down the path of denying even the simplest truth that is known to all. There have been and will continue to be such people among mankind. The relevance of educational work is determined by the same reasons". Scientific and technical mentality, it is observed that discoveries are made in terms of certain interests. The great philanthropists seek to expand their material possibilities when they support this or that scientific and technical invention. This is a common tradition in the intellectual world. Hence, there is a danger that innovative discoveries contradict universal moral imperatives and requirements. The supremacy of the interests of over universal imperatives and demands is in stark contrast to the principles of stability, unity and justice in society, which inevitably causes unrest in social life. That is why E. Yusupov emphasizes educational work.

**ABSTRACT**

*Currently, formalin is gaining more and more practical importance as a very valuable intermediate product on the way of obtaining various organic compounds and polymeric materials with a wide variety of properties. The world consumption of formalin is growing all the time. Today, there is a significant deficit of formalin, both in the domestic market and in the markets of foreign countries. In this regard, there is a need to create new production facilities, as well as reconstruction (expansion) and modernization of existing production facilities. The article presents an analysis of several technological schemes for the production of formalin.*

**KEYWORDS:** *Formalin, Methanol, Alcohol Evaporator, Reactor, Absorber Pumps, Steam Generator, Circulating Coolant Pump, Collector Of The Coolant, Water Pump.*

## INTRODUCTION

Formalin is one of the large-tonnage products of the chemical industry. Formaldehyde, which is part of formalin, has a high reactivity, availability and low cost, therefore formalin has become one of the most important intermediates in the chemical industry. Its importance for modern industrial organic synthesis can hardly be overestimated. Formalin is used for the production of synthetic resins, plastics, plasticizers, organic dyes, various adhesives, varnishes, pharmaceuticals and other products. Formalin is also used in agriculture for seed dressing, in the leather industry for tanning leather, in medicine and animal husbandry as an antiseptic, etc. The world production of formalin is estimated at 14-45 million tons per year.

**LITERATURE REVIEW:** One of the first industrial production facilities for formalin on metal oxide catalysts was built by the Italian firm Monteedisson, which has extensive experience in chemical engineering (Fig. 1).

Figure 1 - Technological scheme of the Italian company "Monteedisson"

1 - methanol pump; 2 - blower for air / offgas mixture; 3 - alcohol evaporator; 4 - reactor; 5 - heater for the mixture of air with exhaust gas; 6 - working mixture superheater; 7 - coolant cooler - steam generator; 8 - water pump; 9 - circulating coolant pump; 10 - collector of the coolant; 11 - absorber; 12 - absorber pumps; 13 - absorber coolers; 14 - coolant heater at start-up.

At this installation, the production of a working air-off-gas methanol-containing mixture is carried out by adiabatic evaporation of methanol due to the heat accumulated by the heated mixture of air and off-gas. "The process of evaporation of alcohol is carried out in a packed column apparatus. Methanol is fed into the middle of the apparatus through spray devices, the upper part of the nozzle serves as a spray catcher. The mixture of air with offgas entering the lower part of the apparatus and the resulting working mixture are heated in a two-section heat exchanger by hot reaction products leaving the reactor. The composition of the resulting mixture of air with abgaz in terms of oxygen concentration and the composition of the working mixture in terms of methanol content are automatically maintained at all operating installations of this and other companies. Initially, the heat exchanger, which acts as a waste heat boiler for removing

the heat of the reaction products and heating the air-exhaust gas mixture and overheating the working mixture, was installed horizontally, and in subsequent schemes - vertically. The catalyst in the reactor tubes is cooled by a circulating refrigerant - a high-temperature organic coolant (HERE). The refrigerant is forcibly circulated in the system "reactor shell - waste heat boiler (where the heat exchanger is cooled by evaporating water) - circulation pump - reactor". The preset catalyst temperature is automatically maintained by the amount of circulating heat carrier. At start-up of the installation, the catalyst is heated to the initial reaction temperature by a circulating coolant in a special furnace with flue gases or heating elements. Reaction products cooled in a two-section heat exchanger

go down the absorption column, where formaldehyde and methanol are extracted from them with water flowing in countercurrent to the top of the absorber. Water for irrigation is supplied on the basis of obtaining a given concentration of formalin. Exhaust gas leaves the upper part of the absorber, about 75% of which is returned back to the process for mixing with air and vapors of methyl alcohol. The disadvantage of the technology for producing formalin using metal oxide catalysts from Monteedisson is the high specific power consumption, since to obtain an equal amount of formalin in comparison with the use of a silver catalyst, a 6-fold volume of the reaction mass is passed through the system. Accordingly, the power of the installed blowers and the electricity consumption are also six times higher. A significant amount of it is consumed by the pump for circulating the liquid coolant in the "reactor - waste heat boiler" system. According to experts, the power consumption can be reduced if the methanol content in the working mixture is increased or, instead of the liquid cooler of the reactor, evaporative heat removal with the elimination of the circulation pump is used.

#### ***Analysis of the installation of the firm "Perstorp Formox"***

Almost simultaneously with the Monteedisson firm, the process of formalin production by a similar method was carried out by the Swedish company Perstorp Formox, which has been producing formalin since 1905. Differences of the technological scheme "Perstorp Formox" from "Monteedisson" are as follows [2, P.33]. First, the production of a methanol-air-gas mixture and its overheating are performed without an alcohol evaporator by injecting a given amount of methanol into the pipeline of the air-gas mixture supplied to the tubular heat exchanger. At the same time, water vapor obtained at the installation is directed into the shell space of the heat exchanger, and methanol evaporates and its vapors are mixed in the tube space with an air-gas mixture.

Secondly, an evaporating Dowtherm coolant, a mixture of biphenyl and biphenyl oxide, is used to cool the catalyst in the reactor. The coolant vapors are condensed in a heat exchanger - heat recovery boiler and return by gravity to the catalytic reactor, that is, the thermosyphon principle is implemented. Water vapor obtained during the condensation of heat carrier vapors is issued as a commercial one. Thirdly, the cooling of the reaction products is carried out in a heat exchanger with water to obtain water vapor, which is used to heat the heat exchanger, in which the working mixture is obtained and overheated (Fig. 2).

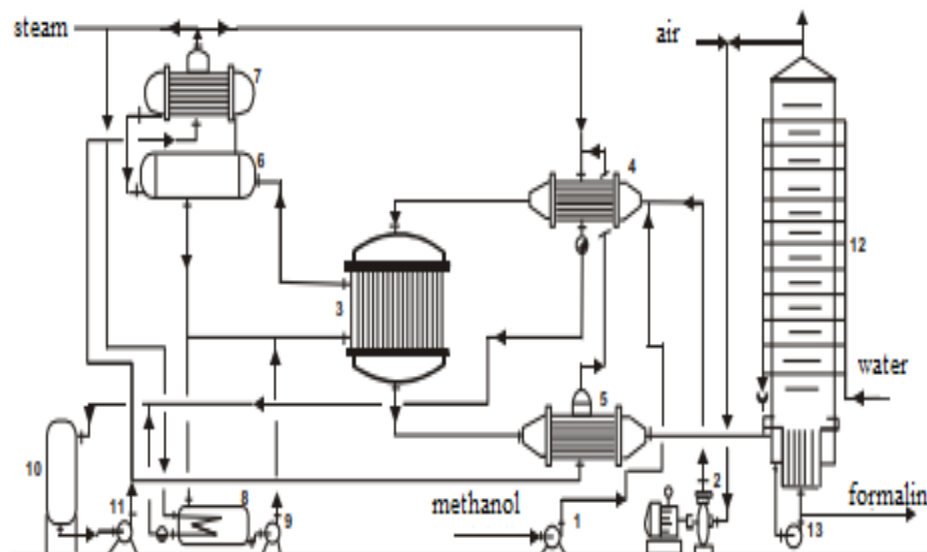

Figure 2 - Technological scheme of the Swedish company "Perstorp"

1 - methanol pump; 2 - blower for air / offgas mixture; 3 - reactor; 4 - apparatus for obtaining a working mixture; 5 - cooler of reaction products; 6, 7 - refrigerant vapor condensers; 8 - coolant collection; 9 - pump for circulation of the coolant at start-up of the installation; 10 - condensate collector; 11 - condensate pump; 12 - absorber; 13 - formalin pump

The regulation of the temperature regime of the catalyst operation with the evaporating coolant can be performed by two methods - direct and indirect. With the direct method, the amount of heat taken is directly related to the vapor pressure of the coolant. With a decrease in their pressure, more heat is taken away, which helps to lower the catalyst temperature. The indirect one consists in changing the pressure of the water vapor obtained in the heat-transfer boiler. Maintaining the set temperature in both methods is performed automatically.

The absorption system consists of one column with a bottom formalin cooling heat exchanger and heat removal on each plate. For this reason, the technological scheme of the Swedish company "Perstorp Formox" is more perfect and economical than in the case of "Monteedisson".

#### ***Firm "Haldor-Topsoe"***

The technology for obtaining formalin from the Danish-Japanese company Haldor-Topsoe is close to Perstorp, which is easy to see when looking at Figure 3 in detail .

Figure 3 - Technological scheme of the Danish-Japanese company "Halder- Topsoe "

1 - blower for a mixture of air with offgas; 2 - methanol pump; 3 - methanol evaporator; 4 - working mixture superheater; 5 - reactor; 6, 7, 8 - coolant vapor condensers; 9 - water pump; 10 - absorber; 11 - formalin pumps; 12 - absorber refrigerators; 13 - condensate separator; 14 - coolant reservoir; 15 - pump for circulation of the coolant when starting up the installation; 16 - heat carrier heater.

In the proposed technological scheme, the evaporation of methanol is carried out in a special apparatus with the subsequent mixing of its vapors with a mixture of air and offgas. Condensation of methanol vapors does not occur in this case, since, when compressed in a supercharger, they are heated above the boiling point of methanol. Overheating of the working mixture is carried out in a heat exchanger by hot reaction products leaving the reactor.

For the absorption of formaldehyde, one three-section absorption tower is used. The two lower sections are packed with the outlet, cooling and forced return to the top of their section of the liquid phase, and the third one performs sanitary functions and is intended for additional binding of formaldehyde from the abgas.

### ANALYSIS OF THE PLANT OF THE FIRM "LUMMUS"

According to the scheme of the American company Lummus (Fig. 4), two industrial plants for the production of 37% formalin were built: in 1967 in Calver City by GAF (General Aniline Fabrik) and in 1970 by a Japanese company "Semitsu" in Osaka [2].

The capacity of each was approximately 25 thousand tons per year.

Figure 4 - Technological scheme of the company "Lummus"

1 - methanol pump; 2 - blower for air / offgas mixture; 3 - reactor; 4 - working mixture superheater; 5 - methanol evaporator; 6, 7 - coolant vapor condensers; 8 - pump of demineralized water; 9 - absorber; 10 - formalin pumps; 11 - formalin refrigerators

In this scheme, methanol is vaporized by hot reaction products, which first enter the heat exchanger, overheating the working mixture. Cooling of the catalytic reactor is carried out with an evaporating coolant to obtain commercial water vapor. The formaldehyde absorber is three-section, as in the previous schemes - two sections are packed and one is disc-shaped. This design ensures good absorption of formaldehyde from the offgas. In addition, during the implementation of the process, an additional stage of neutralization of acidic formalin is provided in the installation using ion-exchange resins, which significantly complicates the process. To prevent corrosion, the reactor is made of low alloy carbon steel.

It should be noted that due to the noted shortcomings, the technological processes of Lummus are less known than other licensors.

### **ANALYSIS OF THE INSTALLATION OF THE COMPANY "KLEKNER-HUMBOLT"**

Process flow diagram developed by Klöckner

Humboldt ", the hardware design is somewhat different from previous (Fig. 5).

Figure 5 - Technological diagram of the German company "Klöckner-Humboldt "

1 - methanol pump; 2 - blower for air / offgas mixture; 3 - steam turbine; 4 - methanol evaporator; 5 - working mixture superheater; 6 - reactor; 7, 8 - coolant vapor condensers; 9 - condensate pump; 10 - condensate collector; 11 absorber; 12 - formalin pumps; 13 - absorber coolers; 14 - coolant reservoir; 15 - pump for circulation of the coolant when starting up the installation; 16 - heating agent heating furnace

Here, the injected mixture of air with exhaust gas enters the conical cover and then into the tube space of a vertical heat exchanger heated by hot steam condensate from a steam turbine. Methanol is fed into the same top cover through a shower-type spray nozzle and evaporates. This heat exchanger is installed on another horizontal heat exchanger, in which the working mixture is overheated by the hot reaction products passing through it and then enters the contact apparatus. Heat is removed by an evaporating heat carrier. The absorber, as in the previous schemes, is three-section: the first two sections are packed, the upper one is disc-shaped.

The reaction products are pre-cooled with evaporating water in a coil mounted in the front chamber of the heat exchanger. The blower is driven by a steam turbine running on steam from the installation. In the proposed technological scheme, the power consumption is the lowest in comparison with all other schemes, but there is no commercial water vapor.

### **Research Methodology: System analysis of the formalin production process flow diagram at Navoiazot JSC in Uzbekistan.**

The description of the technological scheme is given in accordance with [3].

The method for the production of formalin from methanol consists in obtaining formaldehyde on a catalyst "silver on a carrier" at a temperature of  $550\text{ }^{\circ}\text{C} \div 700\text{ }^{\circ}\text{C}$ , followed by its absorption in water and rectification. The formalin production process for one technological line consists of the following stages:

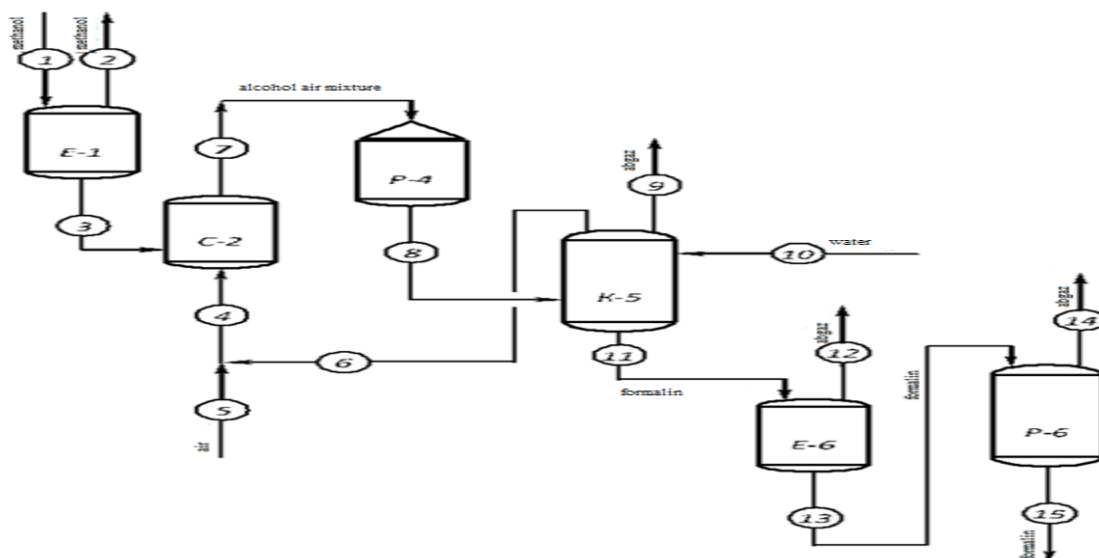

- obtaining a methanol-air mixture;
- synthesis of formaldehyde;

- absorption of formaldehyde to obtain "raw formalin";
- rectification of "raw formalin". The knots common to all threads are:
- collection and processing of substandard and drained products,
- purification of gas emissions,
- Combustion of absorption gases in a flare, heat supply, collection and pumping of condensate.

The auxiliary nodes are:

- preparation of the catalyst,
- storage and shipment of formalin,
- thermal disposal of waste.

A graphic representation of the stage of obtaining a methanol-air mixture and the stage of contacting is given on FYURA PF 000.000 ST.

### Analysis and results: Getting a methanol-air mixture

Methanol from the warehouse is fed through check valves to the "methanol manifolds", where return methanol from the rectification units is added to the "fresh" methanol. Methanol (for one process line) from

"Methanolic comb" pre warmed in embedded heat exchangers absorption column pos. K16 up to 65 ° C and enters the alcohol evaporator for the formation of a methanol-air mixture. To reduce the side reactions of the formaldehyde production process, methanol in the mixer pos. X11 is miscible with demineralized or oversized water.

**CONCLUSION/RECOMMENDATIONS:** The work was to determine the possibility of expanding the production of formalin using the example of a formaldehyde synthesis unit.

However, an increase in productivity entails an increase in the heat load on heat exchangers and, as a consequence, an increase in the consumption of heat carriers (refrigerants). Also, to

ensure the required degree of conversion of methanol into formaldehyde, it is necessary to increase the amount of catalyst loaded into the contact apparatus.

Along with this, in the project, the issues of analytical and technological control of the process, ensuring safe production conditions and environmental protection were considered.

### ABSTRACT

*Provision of the feed base of the livestock sector of the Republic with new, nutritious feed pellets and automation of these systems on the basis of modern information and Communication Technologies is an urgent issue.*

**KEYWORDS:** *Grinding; Wetting; Granulation; Drying (Final Step);*

### INTRODUCTION

In recent years, a valuable source of raw materials for the food industry has appeared on the world market - amaranth seeds with high nutritional and biological value, containing a wide range of functional ingredients and biologically active substances, which determines the prospects for their use in food. [1]

Amaranth (shiritsa) is an agricultural crop that attracts the attention of researchers due to its high yield, protein richness and balance, high content of vitamins, minerals and dietary fiber. According to the FAO / WHO (Food and Agriculture Organization of the United Nations) in the 21st century, this plant is able to take a leading position as a food, feed and medicinal crop. In connection with the expected global climate changes on Earth, the use of amaranth becomes even more urgent due to its high ability to adapt to adverse environmental conditions. [2]

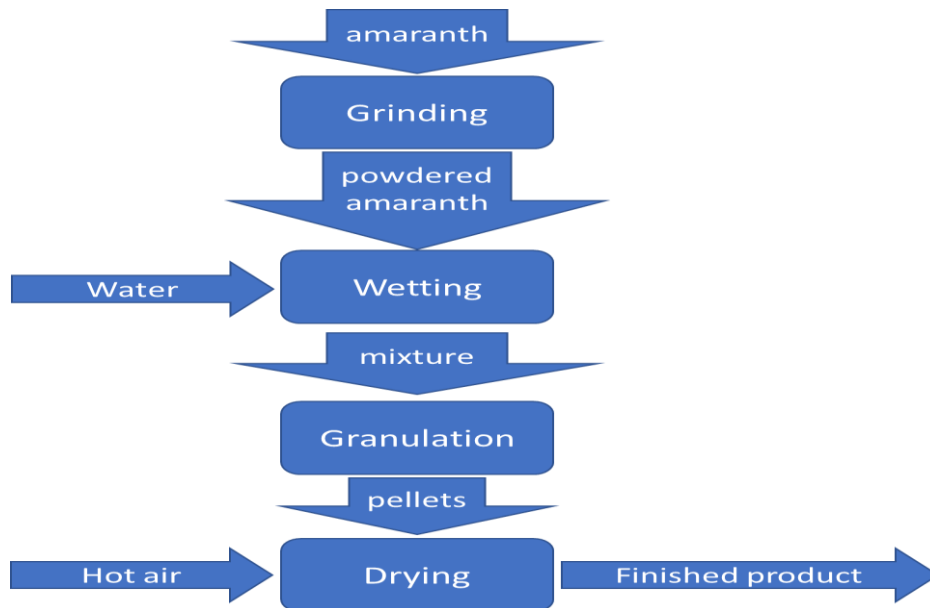

Amaranth in livestock and poultry farming is a profitable feed with high productivity indicators, which, when properly grown, is environmentally friendly (since it does not require the use of a number of chemicals necessary for growth, for example, barley). Amaranth feed grains contain about 14-18% protein, 5-6% healthy fats, 55-62% starch, pectin, 5 micro and macro elements each. Amaranth green grass meal and grass pellets are superior in terms of vitamins to standard grass meal and pellets used in feed for pigs, cows, chickens and rabbits.

**Method.** The black box method is chosen as the automation method of the drying process. The main point of view using the black-box method is that input and output parameters in the technological processes are related to each other with material balance or heat balance. The black box is can be defined as a rectangle scheme. On the black box, we can see how particular output parameters that we need to automate the process (exp. humidity, temperature) have a dependence on input parameters like drying agent consumption (gas consumption), the temperature of drying agent, or others.

- **Process of producing feed granules on the basis of amaranth**

Obtaining feed granules on the basis of Amaranth consists of several stages, which can be described as follows (figure 1): 1. Grinding; 2. Wetting. 3. Granulation. 4. Drying (final step)

First, the raw amaranth product goes to grinding, where the plant turns into powder, afterward for the improving adhesive feature the water is adding to it (moreover some ingredients will be added to thicken the mixture). Then the ready batch is granulated in a granulator press, at the end the granule is dried with hot air, and the finished product is taken. [5]

**Figure 1.** Production of feed granules on the basis of Amaranth.

- **Problem formulation.**

*The main parameters of the drying agent and material, as moisture carriers.*

*Relative humidity of the drying agent  $\phi$ :*

$$\phi = \frac{P_p}{P_n} \quad (1)$$

*Based on the Mendeleev-Clapeyron equation, one can obtain*

$$\phi = \frac{P_p}{P_n} \quad (2)$$

*The relative humidity of the material  $\omega$  is - the ratio of the mass of moisture  $M_m$  to the total mass of wet material  $M=M_{dm} + M_m$ , or to the mass of absolutely dry material  $M_{dm}$ :*

*Humidity attributed to the whole substance:*

$$\omega = \frac{M_m}{M} * 100, \% \text{, where } M=\text{var} \quad (3)$$

*Humidity, referred to the mass of absolutely dry material*

$$\omega^C = \frac{M_m}{M_{dm}} * 100, \% \text{, where } M_{dm}=\text{const.} \quad (4)$$

- **Controlled object.**

The belt dryer serves as a controlled object. The material is dried continuously at atmospheric pressure. In chamber 1 of the dryer (figure. 2), the layer of dried material moves along an endless belt 2 stretched between the leading 3 and driven 4 drums. Wet material is fed to one end of the tape, and dried material is removed from the other end. Drying is carried out by hot air or flue gases, which move countercurrent or cross current to the direction of movement of the material.[6]

**Figure 2.** Belt dryer scheme.

Non-uniform drying of the material is usually observed in single-belt dryers with a continuous tape: in the inner part of the layer facing the tape, the final humidity is higher than in its outer part washed by gases or air.

More effective is the use of many belt dryers with metal mesh tapes. In them, the drying agent moves perpendicular to the plane of the tape through the layer of material located on it, i.e. cross current. When pouring material from tape to tape, the surface of its contact with the drying agent increases, which contributes to an increase in the speed and uniformity of drying. Belt dryers can work on various options for the drying process. [8]

**Process performance indicator - moisture of dry material  $\omega_{dm}$**

*The purpose of process management is to maintain -  $\omega_{dm} = \omega_{dm}^{\text{given}}$*

- **Material balance in terms of the total amount of moisture in the drying process**

**Dynamic equation:**

$$\rho_{dm} * V_{dm} * \frac{d\omega_{dm}}{dt} = G_{wm} * \omega_{wm} + G_{da}^{in} * \phi_{da}^{in} - G_{dm} * \omega_{dm} - G_{da}^{out} * \phi_{da}^{out} ; (5)$$

Here  $\rho_{cm}$ - dry material density;

$V_{dm}$  - dry material volume;

$\omega_{dm}$  - dry material relative humidity;

$G_{wm}$  - wet material consumption;

$\omega_{wm}$  - wet material relative humidity;

$G_{da}^{in}$  - input drying agent consumption;

$\phi_{da}^{in}$  - input drying agent relative humidity;

$G_{dm}$  - dried material consumption;

$G_{da}^{out}$  - output drying agent consumption;

$\phi_{da}^{out}$  - output drying agent relative humidity;

**Static equation**  $\frac{d\omega_{dm}}{dt} = 0$ :

$$G_{wm} * \omega_{wm} + G_{da}^{in} * \phi_{da}^{in} = G_{dm} * \omega_{dm} + G_{da}^{out} * \phi_{da}^{out} ; (6)$$

(5) and (6) one can get the following from expressions

$$\omega_{dm} = f(G_{wm}, G_{dm}, G_{da}^{in}, G_{da}^{out}); (7)$$

We get below in the analysis of the combustion chamber

$$G_{da}^{in} = f(G_f, G_{pa}, G_{sa}); (8)$$

Here  $G_f$  – fuel consumption;

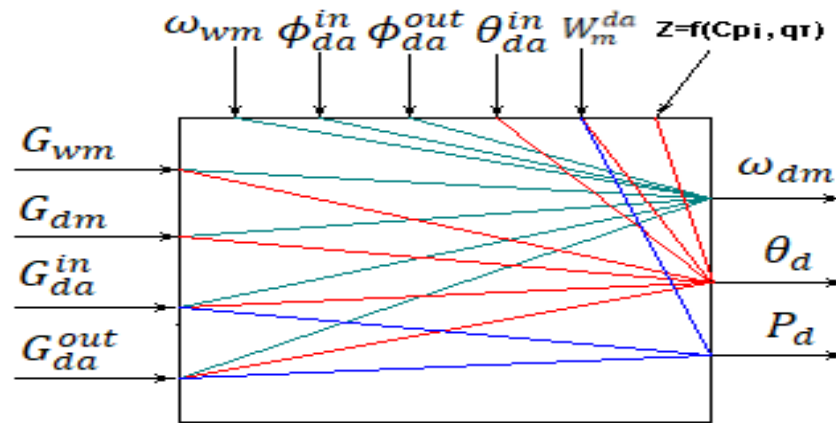

$G_{pa}$  – primary air consumption;

$G_{sa}$  – secondary air consumption;

(7) and (8) of all possible controlling effects to adjust the final moisture content of the material from the statements listed, the  $G_f$  fuel consumption is the most informative one. [3]

From these dynamic and static material balance equations, we take the following relationships, in which we see a connection between fuel consumption and the main process parameters - product humidity, this method shows the relationship between control parameters and controlled variables.

- “Black box”

**Figure 3.** Information scheme of drying machine

- Possible control impacts:

$$G_{wm}, G_{dm}, G_{da}^{in} (G_f, G_{pa}, G_{sa}), G_{da}^{out}.$$

- Possible controlled disturbances:

$$\omega_{wm}, \phi_{da}^{in}, \phi_{da}^{out}, \theta_{da}^{in}, \theta_{wm}.$$

- Possible uncontrollable disturbances:

$$W_m^{da}, C_p$$

- Possible controllable variables:

$$\omega_{dm}, \theta_d(\theta_{da}^d), P_d(P_{da}^d).$$

- A dryer is a complex, multi-connected object.

## • RESULTS AND DISCUSSIONS

From the scheme for automation (picture 4), it can be seen dryer and sign of automation elements such as sensors, regulators and valves. Wet feed granules come from the press granulator to the ceil of dryer.

**Figure 4.** Scheme for automation of the drying process

- **Regulation**

- Regulation  $\omega_{dm}$  with fuel supply  $G_f$  - as an indicator of the effectiveness of the drying process
- Regulation of the ratio of fuel consumption  $G_f$  and primary air  $G_{pa}$  for the supply of primary air

$$G_{pa} = \gamma * G_f \text{ to ensure the efficiency of fuel combustion.}$$

- Regulation of the temperature of the drying agent  $\theta_{da}^{in}$  at the entrance to the drum secondary air  $G_{sa}$ .
- Stabilization of the costs of wet and dry material  $G_{wm}$  and  $G_{dm}$  with automatic dispensers - to ensure material balance in the solid phase.

- **Control**

- Consumptions-  $G_f, G_{pa}, G_{sa}, G_{wm}, G_{dm}$ ;
- temperature -  $\theta_{da}^{in}, \theta_{cada}^{out}, \theta_d$ ;
- Underpressure -  $P_d$ ;
- humidity -  $\omega_{dm}$  ( $\omega_{given}$ ).

- **Signaling**

- significant deviations  $\omega_{dm}$  from  $\omega_{given}$ ;
- significant increase in  $\theta_{da}^{in}$ ;
- Unplanned shutdown of the drive, at the same time a signal “To protection circuit” is generated.[9]

- **Protection system**

At the signal “To the protection circuit” - stop the flow of material and fuel into the drying unit.

## CONCLUSIONS

Amaranth has been gaining even more popularity in agriculture for more than twenty years. In the feed for livestock, its application takes place slowly. Nevertheless, now many farmers and peasants recognize that Amaranth is much more useful than nutrient varieties wheat, soybeans, barley and other traditional cultures. Considering the above, we carried out an analysis of the drying process where the main parameter is the humidity of the product, using the black box method to automate the drying process. “Black box”, which is considered as a belt dryer, portrays the relation between input (consumptions) and output (humidity, temperature) parameters. Material balance, in terms of the total amount of moisture in the drying process, substantiates these relations. Based on these interconnections on a black box, an automation functional scheme was built.

**Abstract.** The article describes the use of the “Black Box” method to automate the drying process in the technological system of producing granules based on amaranth. For this purpose, the correlation between the parameters involved in the drying process has been investigated and an information schematic illustrating these relationships is presented. Based on the given equations and information scheme, functional scheme of process automation is developed.

### ABSTRACT

*This article informs about the the importance of strategies of making business information. As well as security strategic faktors economy in use. Often times, the information contained within these environments is very sensitive and can potentially be put at risk if accessed or changed by an unauthorised user. This lack of security planning creates unnecessarily high costs and project delays. Generally, it costs far less to "build security in" than it does to "bolt it on" at the end. And while the recent economic downturn will certainly drive security teams to focus on finding operational efficiencies, it is important to note that efficiencies alone will not be sufficient to get us out of the economic crisis the world is facing.*

**KEYWORDS:** *Innovation, Business, Information Security, Strategy.*

### INTRODUCTION

Information security is undergoing a critical transformation. Traditionally viewed as a necessary evil or worse, a hindrance to business advancement, now, more than ever, it is critical that security strategy aligns to business priorities and enables innovation. And while the recent economic downturn will certainly drive security teams to focus on finding operational efficiencies, it is important to note that efficiencies alone will not be sufficient to get us out of the economic crisis the world is facing. Political and business experts agree that business

innovation is key to the return of global economic stability and growth. And information security has a critical role to play in the drive toward innovation.

Why? Because at the heart of many critical innovations is the secure and fluid exchange of information. We are an information-centric economy, heavily dependent on the information we create and share; and we find ourselves in an age of digital warfare where that information is put at risk everyday. The goal of the security organisation must be to enable the business to safely manage risk to gain maximum business advantage.

**Security is a Balancing Act.** What does this mean for today's businesses? It is important to note that how organisations innovate has changed over time from internal groups working side-by-side creating new products in a lab to geographically dispersed teams collaborating across organisational and physical boundaries. Innovation now requires open collaboration, direct interaction with customers, tighter integration with partners, and the incorporation of external talent and resources.

It demands sharing intellectual property, infrastructure and ideas, while at the same time safeguarding trademarks, copyrights, and patents. Forward-thinking security leaders have made tremendous progress in driving tighter linkages between business innovation goals and security actions. A critical element has been taking a more structured and strategic approach to organisational risk assessment.

Without the right security strategy, business innovation could be stifled or put the organisation at great risk. But because the business and security teams operate in separate silos, security is often applied as an afterthought. This lack of security planning creates unnecessarily high costs and project delays. Generally, it costs far less to "build security in" than it does to "bolt it on" at the end. It is imperative that security teams understand key business priorities and ensure that they are brought into the planning process early. To do this they will need to speak the language of business, not security.

**Setting Risk Management in Motio.** Recently, there has been a growing recognition of the need to take a risk-based approach to security. Different organisations are at different stages along this progression, based not only on how they view information security and its importance to the business but also on the maturity of their enterprise risk management program. There are some preconditions that are essential to the success of any security team's efforts.

First, the organisation must already be using the construct of "risk" in how they make investment and operational decisions. Some organisations may not have the culture for a risk-based approach as their strategy is still too tactical or "targeted opportunity" focused. The other key prerequisite is that there has to be sustained attention from the top. If there is no attention for enterprise risk management or at least some notion of assessing risk at the board or senior leadership level, then trying to be effective in information risk management is likely beyond the organisation's current capability.

A key component of building a security program that enables innovation is moving from "information security" to "information risk management (IRM)." IRM must incorporate the idea that information security is striving for an acceptable level of risk. The goal is to match risk exposure to risk appetite, not wipe out all risk. Having specific expertise in information security per se is still a crucial part of the program as it is essential for determining the optimum security

controls. Managing information risks must be conducted in a way that is meaningful to the business and is based on how other categories of risk are discussed and calculated.

So IRM must be integrated into the enterprise risk management framework. As an example, let's look at risk management and innovation in the context of data loss prevention. Many organisations are increasingly using Web-based collaborative tools to facilitate information and knowledge sharing among various user groups in order to improve productivity and eliminate the duplication of efforts.

Often times, the information contained within these environments is very sensitive and can potentially be put at risk if accessed or changed by an unauthorised user. Determining what data is most sensitive or at highest risk and identifying where it resides is the first step in preventing enterprise data loss. But understanding risk becomes important when it's time to implement the controls to prevent data loss. This is the step where security professionals are challenged to establish what level of risk they are willing to accept without stifling the innovation process.

Each organisation must qualitatively and quantitatively answer the following: How does an organisation measure risk? What kinds of controls should be implemented to protect the data? Who should be able to have access or make edits to the document? What kind of actions should be allowed (i.e., can it be printed or saved to external media)? And finally, what kind of action should be taken if the data is inadvertently accessed, changed or an attempt is made to send it (i.e., notification, quarantine, encrypt)? Determining a reasonable risk threshold while avoiding unnecessary disruption to your employees is a delicate balancing act.

**The Time Is Now.** The time is now for security professionals to establish themselves as a "trusted business partner." Security practitioners need to move beyond applying the security technology du jour to meet the latest audit, and instead focus on supporting key business initiatives while meeting compliance objectives.

Security needs to be framed in a business context. Staying ahead of the business and being prepared to promote security as an accelerator rather than an inhibitor will ensure that security has its rightful place at the innovation table.

### ABSTRACT

*While Governance relates to safeguarding the legal rights of all citizens, an equally important aspect is concerned with ensuring equitable access to public services and the benefits of economic growth to all. It also ensures government to be transparent in its dealings, accountable for its activities and faster in its responses as part of good governance. However, this would require the government to change itself – its processes, its outlook, laws, rules and regulations and also its way of interacting with the citizens. It would also require capacity building within the government and creation of general awareness about e-Governance among the citizens. This paper is an attempt to study the initiative taken by Govt. and issues and challenges faced in the successful implementation of its schemes.*

**KEYWORDS:** *Safeguarding, Implementation, Equitable*

### INTRODUCTION

#### CONCEPT

In India, the main thrust for e-Governance was provided by the launching of NICNET in 1987 – the national satellite-based computer network. This was followed by the launch of the District Information System of the National Informatics Centre (DISNIC) programme to computerize all district offices in the country for which free hardware and software was offered to the State Governments. NICNET was extended via the State capitals to all district headquarters by 1990.

In the ensuing years, with ongoing computerization, tele-connectivity and internet connectivity established a large number of e-Governance initiatives, both at the Union and State levels.

### **Types of Government Interaction in E-governance**

- **G2G:** Government to Government.
- **G2C:** Government to Citizen.
- **G2B:** Government to Business.
- **G2E:** Government to Employee

### **Some Initiatives Taken by Government**

- **Computerization of Land Records:** In collaboration with NIC. Ensuring that landowners get computerized copies of ownership, crop and tenancy and updated copies of Records of Rights (RoRs) on demand.
- **Admission to Professional Colleges – Common Entrance Test (CET):** With the rapid growth in the demand as well as supply of professional education, the process of admission to these institutions became a major challenge in the early 1990s. Recourse was then taken to ICT to make the process of admission transparent and objective.
- **Online admission process: Now the Govt. is emphasizing on the making admission process at all levels and courses across universities and professional and technical institutes online making it a transparent and easy for the admission seekers.**
- **MCA 21:** By the Ministry of Corporate Affairs. The project aims at providing easy and secure online access to all registry related services provided by the Union Ministry of Corporate Affairs to corporates and other stakeholders at any time and in a manner that best suits them.
- **E-office:** The Government of India has recognized the need to modernize the Central Government offices through the introduction of Information and Communications Technology. e-Office is aimed at increasing the usage of work flow and rule based file routing, quick search and retrieval of files and office orders, digital signatures for authentication, forms and reporting components.
- **UID:** The unique identification project was conceived as an initiative that would provide identification for each resident across the country and would be used primarily as the basis for efficient delivery of welfare services. It would also act as a tool for effective monitoring of various programs and schemes of the government.
- **Pensions:** The pensions MMP is primarily aimed at making the pension/ retirement related information, services and grievances handling mechanism accessible online to the needy pensioners, through a combination of interactive and non-interactive components, and thus, help bridge the gap between the pensioners and the government.
- **Banking:** The Banking MMP is yet another step towards improving operational efficiency and reducing the delays and efforts involved in handling and settling transactions. The MMP which is being implemented by the banking industry aims at streamlining various e-services

initiatives undertaken by individual banks. Implementation is being done by the banks concerned, with the banking Department providing a broad framework and guidance.

- **Crime and Criminal Tracking Network & Systems:** Crime and Criminal Tracking Network & Systems (CCTNS) MMP aims at creating a comprehensive and integrated system for enhancing the efficiency and effective policing at all levels and especially at the Police Station level through adoption of principles of e-Governance, and creation of a nationwide networked infrastructure for evolution of IT-enabled state-of-the-art tracking system.
- **Public Distribution System:** Computerization of the PDS is envisaged as an end-to-end project covering key functional areas such as supply chain management including allocation and utilization reporting, storage and movement of food grains, grievance redressal and transparency portal, digitization of beneficiary database, Fair Price Shop automation, etc.
- **E-procurement:** Ministry of Commerce & Industry (Department of Commerce) has been nominated as the Nodal Ministry for implementation of e-Government Procurement (e-GP) Mission Mode Projects (MMP). The vision of the e-Procurement MMP is “**To create a national initiative to implement procurement reforms, through the use of electronic Government procurement, so as to make public procurement in all sectors more transparent and efficient**”.
- **E-Courts:** The e-Court Mission Mode Project (MMP) was conceptualized with a vision to transform the Indian judiciary by making use of technology. The project had been developed, following the report submitted by the e-Committee under Supreme Court on national policy & action plan on implementation of information communication tools in Indian judiciary.
- A clear objective – to re-engineer processes and enhance judicial productivity both qualitatively and quantitatively to make the justice delivery system affordable, accessible, cost effective, transparent and accountable.
- **E-Biz:** The e-Biz Mission Mode Project, being executed by Department of Industrial Policy and Promotion (DIPP), Ministry of Commerce and Industry, Government of India, was conceptualized with the vision. Its vision is “**To transform the business environment in the country by providing efficient, convenient, transparent and integrated electronic services to investors, industries and business throughout the business life cycle**”.
- **Common Services Centres:** The CSCs would provide high quality and cost-effective video, voice and data content and services, in the areas of e-governance, education, health, telemedicine, entertainment as well as other private services. A highlight of the CSCs is that it will offer web-enabled e-governance services in rural areas, including application forms, certificates, and utility payments such as electricity, telephone and water bills.
- **Direct Cash transfer:** To facilitate disbursements of Government entitlements like NREGA, Social Security pension, Handicapped Old Age Pension etc. of any Central or State Government bodies, using Aadhaar and authentication thereof as supported by UIDAI.
- **Aadhar Enabled Payment system (AEPS):** AEPS is a bank led model which allows online interoperable financial inclusion transaction through the Business correspondent of any bank using the Aadhaar authentication. This has helped in financial inclusion. The four Aadhaar enabled basic types of banking transactions are as follows:-

- Balance Enquiry
- Cash Withdrawal
- Cash Deposit
- Aadhaar to Aadhaar Funds Transfer
- **Digital India program**
- **Digital Locker for every Indian:** Certificates issued by the government — education, residential, medical records, birth certificates, etc. — are to be stored in individual ‘digital lockers’ and a communication protocol established for government departments to access them without physically having to see the hard copy. The purpose of government is that copies of certificates issued by the government itself not to be carried around by people to government offices for various services.
- **Mobile Seva:** It aims to provide government services to the people through mobile phones and tablets. It has been developed as the core infrastructure for enabling the availability of public services through mobile devices. It enables a government department to integrate both web and mobile based services seamlessly and enhances the access to electronic services tremendously leveraging the very high penetration of mobile phones, especially in rural areas.

The list is endless and Govt. is making all efforts to make the digital India successful and making all the areas to be covered in the electronic area as far as possible.

### WHY E-GOVERNANCE?

Following are some of the main advantages of E-Governance.

- **Speed:** Technology makes communication speedier. Internet, Phones, Cell Phones have reduced the time taken in normal communication.
- **Cost Reduction:** Most of the Government expenditure is appropriated towards the cost of stationary. Paper-based communication needs lots of stationary, printers, computers, etc. which calls for continuous heavy expenditure. Internet and Phones makes communication cheaper saving valuable money for the Government.
- **Transparency:** Use of ICT makes governing process transparent. All the information of the Government would be made available on the internet. The citizens can see the information whenever they want to see. But this is only possible when every piece of information of the Government is uploaded on the internet and is available for the public to peruse. Current governing process leaves many ways to conceal the information from all the people. ICT helps make the information available online eliminating all the possibilities of concealing of information.
- **Accountability:** Once the governing process is made transparent the Government is automatically made accountable. Accountability is answerability of the Government to the people. It is the answerability for the deeds of the Government. An accountable Government is a responsible Government.

- **Convenience:** *E-Government brings public services to citizens on their schedule and their venue.*
- **Improved Customer Service:** *E-Government allows to redeploy resources from back-end processing to the front line of customer service.*
- **Increased access to information:** *E-Government improves the accessibility of government information to citizens allowing it become an important resource in the making the decisions that affect daily life and so it helps in empowerment of citizens*

### **The guiding principle for successful implementation of E-Governance projects**

- Form simplification and field reduction – Forms should be made simple and user friendly and only minimum and necessary information should be collected.
- Online applications and tracking - Online applications and tracking of their status should be provided.
- Online repositories - Use of online repositories e.g. for certificates, educational degrees, identity documents, etc. should be mandated so that citizens are not required to submit these documents in physical form.
- Integration of services and platforms – Integration of services and platforms e.g. Aadhaar platform of Unique Identity Authority of India (UIDAI), payment gateway, Mobile Seva platform, sharing of data through open Application Programming Interfaces (API) and middleware such as National and State Service Delivery Gateways (NSDG/SSDG) should be mandated to facilitate integrated and interoperable service delivery to citizens and businesses.

### ***Challenges before Govt.in successful implementation of e governance***

There are large numbers of potential barriers in the implementation of e-Governance. Some hindrance in the path of implementation, like security, unequal access to the computer technology by the citizen, high initial cost for setting up the e government solutions and resistance to change. Challenges identified as trust, resistance to change, digital divide, cost and privacy and security concerns.

#### **Trust**

Trust can be defined along two dimensions: as an assessment of a current situation, or as an innate personality trait or predisposition. The implementation of public administration functions via e-government requires the presence of two levels of trust. The first is that the user must be confident, comfortable and trusting of the tool or technology with which they will interact. The second dimension of trust pertains to trust of the government].

There has to be a balance between ensuring that a system prevents fraudulent transactions and the burden that extensive checks can take place on people who are honest. Recently, confidential information on military veterans was compromised when a computer containing their personal information was lost. This type of incident can erode trust and user confidence in government systems. Trust, along with financial security, are two critical factors limiting the adoption of e-government services.

**Resistance to change**

The innovation diffusion theory states that over time an innovation will diffuse through a population, and the rate of adoption will vary between those who adopt early, referred to as early adopters and to those who adopt the innovation much later, referred to as —laggards.

The resistant to change phenomenon can explain much of the hesitation that occurs on the part of constituents in moving from a paper based to a Web-based system for interacting with government. Citizens, employees and businesses can all have their biases with respect to how transactions should be processed. However, government entities and public policy administrators cannot ignore the changes that occur as a result of the implementation of information and communication technology (ICT). Education about the value of the new systems is one step toward reducing some of the existing resistance. It can also be particularly useful for a leader or manager, to buy into the new system at an early stage in the adoption process

**Digital Divide**

The digital divide refers to the separation that exists between individuals, communities, and businesses that have access to information technology and those that do not have such access. Social, economic, infrastructural and ethno-linguistic indicators provide explanations for the presence of the digital divide. Economic poverty is closely related to limited information technology resources

An individual living below poverty line does not afford a computer for himself to harness the benefits of e-government and other online services. As the digital divide narrows, broader adoption of e-government in the public domain becomes possible. Economic poverty is not the only cause of digital divide. It can also be caused by the lack of awareness among the people. Even some of the economic stable people don't know about the scope of e -governance. Awareness can only help to bring users to that service delivery channel once. It cannot guarantee sustained use of the system unless the system is also designed in such a way as to deliver satisfactory outcome. Procedures need to be simplified to deliver concrete benefits and clear guidelines provided to encourage their use by the actual end users and reduce user's dependence on middlemen/intermediaries

**Cost**

Cost is one of the most important prohibiting factor that comes in the path of e-governance implementation particularly in the developing countries like India where most of the people living below the poverty line. Elected officers and politician don't seem to be interested in implementing e-governance

**Privacy and Security**

There will be three basic levels of access exists for e-government stakeholders: no access to a Web service; limited access to a Web-service or full-access to a Web service, however when personal sensitive data exists the formation of the security access policy is a much more complex process with legal consideration. With the implementation of e-government projects, effective measures must be taken to protect sensitive personal information. A lack of clear security standards and protocols can limit the development of projects that contain sensitive information such as income, medical history.

## CONCLUSION

We have seen how the concept of e-governance and m-governance has evolved in Indian scenario and how much it is required for transparency and accountability on the part of government and at the same time it is also a toll to increase the participation of people in policy making by empowering them with the right information at right time. The penetration of internet, telecommunication services in India has increased in the last decade and this gives a ray of hope to the citizens of India to fight with the long persisting problems of poverty, corruption, regional disparity and unemployment. But at the same time, due to slow pace of project completion, red-tape and resistance from the side of government employees and citizens too has not given the desired result.

### ABSTRACT

*The effective use of modern pedagogical technologies and interactive methods in the educational process has become one of the core issues in our country. The school teacher uses methods such as brainstorming, small group work, discussion, problem situation, design, role-playing, and practical exercises to open the content of the learning material, aimed at increasing pupils' interest and activity during the lesson. This article focuses on the effectiveness of organizing lessons using interactive methods in the classes of primary schools.*

**KEYWORDS:** *Method, Interactive Method, Pedagogical Technologies, Information And Communication Technologies, Interactivity.*

---

### INTRODUCTION

The word "technology" ("techno" in translation from Greek - skill, "logos" - science, concept) - the science of art and craftsmanship. In the explanatory dictionary of the Russian language defines: "Technology - a set of production methods and processes in the field of production, as well as a scientific description of production methods". The concept of "technology" came to pedagogy from the production environment, where it meant the process of organizing production, which allows you to get a specific part at the output. The technological approach in

pedagogy is associated with the precise definition and description of the goals of education, which allows you to more specifically achieve the intended results with all pupils, objectively assess the achievements and identify the problems of pupils.

The Uzbek dictionary defines the term "interactive" as based on the reception or transmission of information over a computer network. In Wikipedia, interactivity is evaluated as a concept that reveals the nature and level of interaction between objects and is said to be used in the fields of information theory, computer science and programming, telecommunications systems, sociology, industrial design, and so on. In a word, interactivity is the system of organizing the system, it is the parts of the system is to achieve a specific goal by establishing the exchange of information between. The interactive method is aimed at developing personal qualities, activating the acquisition of knowledge by increasing the activity between pupils and the teacher in the educational process. The use of interactive methods helps to increase the effectiveness of the lesson. The main criteria for interactive education are: informal discussions, the ability to freely express and express the learning material, a small number of lectures, but a large number of seminars, opportunities for pupils to take the initiative, small group, large group, assignment to work as a class team, written work and other methods, which have a special role in increasing the effectiveness of educational work.

Currently, one of the main directions in improving teaching methods is the introduction of interactive teaching and learning methods. All science teachers are increasingly using interactive methods in the classroom. As a result of the use of interactive methods, pupils develop the skills of independent thinking, analysis, drawing conclusions, expressing their opinions, defending them on the basis of reason, healthy communication, discussion, debate. In the process of interactive learning, the lesson is based on student interaction. The word interactive was derived from the English word, "Interact", i.e. Inter - means "interaction", "act" - means action, influence, activity. Interactivity is the interaction of two people, that is, the learning process takes place in the form of a dialogue, in the form of dialogue (computer communication) or on the basis of teacher-student interaction. Interactivity - occurs in interaction, movement, sensitivity, student-teacher, student-student (subject-subject) conversations.

The main goal of interactive methods is to create an environment conducive to the student's active, free, creative thinking, to activate his needs, interests, inner potential by creating the most favorable environment for the shooting process. Such lessons take place in such a way that in the process, no student is left out, and has the opportunity to openly express their thoughts on what they have heard, read and seen. Pupils develop a desire to learn, interest in each other, friendly relations are formed. Interactive methods that are considered modern in foreign language teaching methodology have been developed by scientists and have proven to be more effective than traditional methods. Interactive methods significantly increase the cognitive potential of the learning process compared to traditional methods.

The design of new technologies involves the use of methods of a task approach, internal dialogue and imitation games that require the activity of the personal structures of pupils' consciousness. When the activity makes sense, the child's cognitive action also acquires meaning and new, stronger motivation. The meaning of imitation-game situations is the ability, while playing, to solve the proposed tasks and freely express creative forces. This is especially true for primary school pupils, as the need for play remains strong when they arrive at school.

There are many types of interactive lessons, which are selected and prepared according to the characteristics of the subject and the intended purpose. There are specific requirements for the preparation of pupils to participate in interactive lessons, which include the acquisition of knowledge necessary for active participation in the lesson, readiness for communication, collaboration, independent thinking, self-expression and skills of free expression and defense, and so on. Efficient use of time in training is a prerequisite. It is necessary to properly select, prepare the necessary tools and clearly define the trainers and their responsibilities. There are specific differences between interactive methods and traditional teaching methods, and each teacher should compare these differences, their advantages and disadvantages in relation to each other, in choosing the methods of lesson planning and conduct. In this case, the most appropriate interactive for the transfer of new knowledge, the formation, development, consolidation of skills, repetition of knowledge, practical training, as well as for training on each topic, taking into account the specifics of the subject or the correct choice of other techniques. The application of properly selected techniques will ensure that the training is fun and effective.

Taking into account the "biology of attention", it is recommended that primary school teachers structure their lessons in such a way that only 20% to 40% of the study time requires intense attention of pupils. This means that after intensive work, teachers must take care of a break, during which the parts of the brain that were not previously working during the training session are activated. If pupils are continuously mastering new material that requires a high concentration of attention, then there comes a time when they cannot connect the new with the already known, cannot assess it and think over the conclusions. Breaks in the study process are not an empty time, but a necessity. Lessons in primary school need a special rhythm - the oscillation between immersion in a new experience and consolidation of what has been received.

According to the scholars of pedagogy and psychology, if the phase of concentrated learning lasts 10-15 minutes, you need to expect that the processing time of the material will take from 2 to 5 minutes. This period can be organized in different ways. Pupils can discuss their learning experiences with partners in small groups, can reflect on it alone, or completely get drawn out of school by engaging in specially organized activities that promote a balance of mind and body.

On average, children of seven to eight years old can intensively, without interruption, study for 15-20 minutes, no more. Children of nine to twelve years old - within 15-25 minutes, after that there must be a pause. The alternation of unfamiliar, unusual actions and ritual actions is especially important, but, according to psychologists, no more than threefold. Switching attention is necessary, but numerous do not relax, but, on the contrary, tire. It is noted among the moments that prevent the successful course of gaming activity, gaming fatigue. It occurs in the case of a very long game or during repetitive types of games, their uniformity and frequent use. The second case of the appearance of gaming fatigue is associated with a psychological incompatibility between players.

It is important to alternate technologies and observe the limitation in their number. However, the teacher should be aware that, along with attractive features, new gaming technologies may become undesirable for pupils. Pupils may experience negative emotions: fear of the possibility of being incapable of solving game problems, fears about relationships with other players, if the technology is competitive in nature, and worries about possible defeat are added to this. Therefore, it is very important for a teacher to give the student the opportunity to gain positive experience, help some participants to adapt, provide for encouragement, and think over options

for dividing pupils into groups. Newness brings joy, surprise and relieves tension; rituals create a sense of stability and predictability.

### CONCLUSION

The task of a primary school teacher is to build a lesson in such a way as to introduce an element of novelty into classes, to be able to cheer up pupils in time, relieve stress, concentrate attention and help them move from one learning situation to another. If we believe that learning is not only the transfer of knowledge, but also the creative process of human interaction, then by creating an atmosphere of understanding and mutual support in the group, we thereby form a positive attitude towards learning of children. The current stage of development of educational technology is characterized by the widespread use of interactive teaching methods in the educational process. In short, a teacher who aims to ensure the effectiveness of the lesson will achieve his or her goal only if he or she skillfully uses interactive teaching methods in their place.

## COMPARATIVE EVALUATION OF THE APPLICATION OF CALCIUM HYDROXIDE AND MATERIAL ON THE BASIS OF MINERAL TRIOXIDE OF THE BIO-DENT UNIT IN THE TREATMENT OF DEEP CARIES WITH TEMPORARY TEETH WITH LOW INVASIVE METHODS

**Nigora Djuraeva\***

\*Andijan State Medical Institute, Andijan,  
UZBEKISTAN

### ABSTRACT

*The aim of the work was to evaluate the comparative clinical efficacy of the use of a material based on calcium hydroxide, which has successfully proven itself in pediatric dental practice, and the innovative material "Bio-Dent" (DentalsPfarma), the experience of which is limited in the treatment of deep caries of deciduous teeth using minimally invasive methods. Clinical studies were carried out on the basis of the Department of Hospital and Clinical Dentistry at the Children's Regional Dental Clinic in Andijan. The basis for the clinical analysis was the data obtained during the examination and treatment of 52 somatically healthy children 4 - 5 years of age with a compensated form of caries. Summarizing the results of the studies, it was concluded that the use of the "Bio-Dent" material in the teeth of temporary occlusion is the most effective and promising in the treatment of deep caries while maintaining the vitality of the pulp.*

**KEYWORDS:** *Children, Temporary Teeth, Deep Caries, Calcium Hydroxide, "Bio-Dent"*

### INTRODUCTION

At the reception of a pediatric dentist, the diagnosis of deep caries in milk teeth is made with great caution and very rarely. According to T.F. Vinogradova (1987), with an active course of caries, replacement dentin does not have time to form and with deep carious cavities, there are direct pathological changes in the pulp comparable to pulpitis. Thus, in the temporary teeth T. F. Vinogradova and co-authors propose to diagnose deep perforated pulpitis. [6].

Other authors are less categorical regarding the diagnosis of deep caries. They explain this by the fact that during the period of stabilization of the growth of a temporary tooth in a somatically

healthy child, especially when the carious cavity is located on the chewing surface, such a diagnosis is quite justified (Ya.F. Kominek, 1968; A.A. Kolesov et al., 1991) It is known that the structure of hard tissues of milk teeth has certain anatomical and physiological features (smaller volume, wide dentinal tubules, the presence of low-mineralized zones of dentin, which in the form of wide strips of interglobular dentin reach the border of the pulp) contributing to the rapid spread of the infectious process and the development of complications even with a small depth of the carious cavity. Therefore, it is more justified to consider deep caries of a temporary tooth as a subclinical pulpitis, when, in the absence of clinical symptoms, serious morphological changes are observed in the pulp. At the same time, the primary task is to preserve the vitality of the pulp of the temporary tooth with minimal invasive intervention. The key to success in this situation is the selection of the most optimal material as a medical pad.

For many years, calcium hydroxide has been considered the most effective agent used to "heal" the pulp and restore dentin when the pulp is damaged by caries, trauma, or therapeutic intervention. Due to its high pH, calcium hydroxide has pronounced bactericidal properties, neutralizes the acidic products of bacteria, creates good conditions for dentin repair, and also has the ability to mobilize growth factors of the dentin matrix, which causes the formation of new dentin [1]. Recently, new high-tech materials such as mineral trioxide have appeared. unit (MTA®), Trioxident (VladMiVa), Biodentine™ (Septodont), TheraCalLC (BISCODental Products), etc. According to the literature, MTA® stimulates the formation of dentinal bridges, protecting exposed pulp more effectively than calcium hydroxide.

According to various hypotheses, the dentinogenesis caused by it may be associated with its bio-capacity, the ability to maintain marginal integrity and a temporary increase in the pH index [3]. Bio-Dent is a new calcium silicate-based material belonging to the same class as MTA®, similar in characteristics to some Portland cement derivatives. From a biological point of view, it has good compatibility and is capable of causing reparative dentin deposition by stimulating the activity of odontoblasts and cell differentiation, can serve as an artificial dentin substitute and used as a material for direct and indirect pulp capping [2,4].

**Aim of the study.** The purpose of our work was a comparative assessment of the clinical efficacy and feasibility of using a material based on calcium hydroxide, an innovative material "Bio-Dent" (DentalsPfarma) that has proven itself successfully in pediatric dental practice, the experience of which is insufficient in the treatment of deep caries (subclinical pulpitis) of temporary teeth by minimally invasive method of indirect pulp covering.

## **MATERIALS AND METHODS**

Clinical studies were carried out on the basis of the Department of Hospital and Clinical Dentistry in the children's regional dental clinic in Andijan.

The basis for the clinical analysis was the data obtained during the examination and treatment of 48 somatically healthy children 4 - 5 years of age with a compensated form of caries, satisfactory oral hygiene and a clinically established diagnosis: acute deep caries of temporary molars. The diagnosis was established on the basis of anamnesis data, clinical instrumental and X-ray examination. Parents of young patients were familiarized with the treatment plan and gave written consent to participate in the study. Two groups of patients were formed, 26 children in each group, a total of 68 teeth were cured (33 in the first group and 35 in the second group). Before starting treatment, all patients underwent professional oral hygiene and were given

recommendations for oral care. The dissection of the carious cavity was carried out with great care (in most cases, without the use of local anesthesia). With the help of a ball-shaped bur or an enamel knife, the eroded enamel was removed in order to widely open the carious cavity. The softened dentin was removed with an excavator, first from the walls of the carious cavity, controlling the degree of density by probing. At the bottom of the carious cavity, a small amount of light softened dentin was retained and the damaged dentin was considered as the wound surface of the tooth pulp. During instrumental treatment, the carious cavity was irrigated, if possible, with warm (t-37C) sterile saline solution. After isolation, the tooth cavity was dried with a sterile cotton swab without pressure. Then the patients of the first group were placed on the bottom of the cavity with a paste of calcium hydroxide Calcevit (Vladmiva) and a temporary filling made of glass ionomer cement, and in patients from the second group, the entire cavity was filled with Bio-Dent material (The second visit was appointed after 3 weeks. In the absence of complaints and pathological changes on the side of the tooth and on the X-ray, the treatment was completed. In the first group, a temporary filling with a medical bandage was removed, the cavity was irrigated with saline solution, dried, a thinner layer of Calcevit material was applied, an insulating pad made of modified GIC and a permanent filling from a compomer were applied.

In the second group, only the surface layer of the “Bio-Dent” material was removed (up to the enamel-dentin border) and after cleaning the cavity from sawdust, the tooth was restored with a computer. Control examinations were carried out every three months throughout the year. During the examinations, complaints, color and mobility of the tooth, the condition of the gums, clinical symptoms of the state of the pulp (its reaction to stimuli), the condition of the filling (integrity, marginal adhesion) and changes in the radiograph were assessed.

## RESULTS AND DISCUSSIONS

Currently, a pediatric dentist should not only be aware of new filling materials, but also be able to choose the most optimal tactics for treating teeth in children, analyzing existing and new clinical experience.

In practice, we are increasingly using the principle of minimal invasive treatment of dental caries with subsequent clinical and radiological control. With the development of modern dentistry, the absolute removal of all altered and even infected tissues is not necessary to stop the carious process. This is especially important when it comes to temporary teeth. If a healthy child has even a deep carious cavity in a formed milk tooth, there is always hope for the potential of the pulp.

Studies by a number of authors have shown that hermetically sealed cavities with left carious dentin give a small percentage of recurrence and an absolute decrease in the number of microorganisms. Remineralization of the remaining carious dentin was proved by biochemical methods and X-ray observations. In these studies, calcium hydroxide pads were used. [4].

A significant disadvantage of materials based on calcium hydroxide is that it can be destroyed by the dentinal fluid flowing through the underlying dentinal tubules, since a constant current of the dental cerebrospinal fluid can facilitate the diffusion of the components of the paste along the concentration gradient. The unregulated process of dentin formation can lead not only to the formation of conglomerates (denticles) in the tooth cavity, which, mechanically acting on the pulp, can cause its inflammation, but also to complete calcification of the coronal and root pulp and obliteration of the root canals.

The mechanism of action of cements based on calcium silicate, for example, Bio-Dent material, implies the release of calcium hydroxide with a basic pH value at the impermeable boundary of the material and dentin, as well as the resistance of the material to dissolution, eliminating the need for re-intervention. Despite the small amount of clinical data associated with the recent appearance of this material, animal studies convincingly indicate the positive qualities of the Bio-Dent material in terms of preserving the vitality of the pulp, the formation of dentinal bridges and the absence of complications (internal resorption). According to the manufacturer's data, Bio-Dent is compatible with all direct and indirect restorations and with all bonding systems. The remaining "Bio-Dent" can be treated as artificial dentin and remain in the deep cavity.

The research results showed a good therapeutic effect in both the first and second groups of patients. Dentin during the second opening of the tooth cavity using calcium hydroxide can be described as drier, harder and darker.

When using "Bio-Dent" material, the tooth cavity, according to the manufacturer's recommendation, was not re-opened. The condition of the bottom of the carious cavity was assessed radiographically. A month later, the radiographs showed a compaction of the bottom of the cavity in most cases. Clinically and radiographically, it was found that in the first group, out of 33 treated teeth, the carious process was arrested in 26 cases, in the second group - in 31 cases (out of 35 teeth). Thus, the effectiveness of treatment in the first group was 78%, in the second group - 87%. Also, in children of the second group, a smaller number of fillings with impaired marginal adhesion were revealed: 3 cases out of 32 treated teeth. While in the patients of the first group, the loss of the filling and the violation of its integrity was observed in 7 cases out of 33.

Based on our experience, the use of Bio-Dent material is much more convenient compared to the use of calcium hydroxide, does not require an insulating pad and is easier for children to tolerate, since the cavity is not reopened to excavate the treatment pad and replace it.

## CONCLUSION

Summarizing the results of the clinical observations, we can conclude that the use of the Bio-Dent material in the teeth of temporary occlusion is the most effective (in comparison with the widely used calcium hydroxide) and promising in the treatment of deep caries and the preservation of pulp vitality. In addition to the effectiveness of the Bio-Dent material, the advantage of the drug is its ease of use and its budgetary nature, which gives reason to recommend this drug for the treatment of deep caries of deciduous teeth using minimally invasive methods as an alternative to imported drugs of this category.

### ABSTRACT

*This article analyses the migration of harmful substances based on the use of physical methods in the study of environmental problems including the laws of their long-range distribution, the state of the environment in the regions, the presence of excess and foreign elements in soil, water and atmosphere. The results of the artificial environmental problem in the southern regions of Uzbekistan and its impact on the national economy are well documented.*

**KEYWORDS:** *Region, Ecology, Global, Local, Aerosol, Gas Phase, Particulate Matter, Adverse State, Harmful Substances, Heavy Elements, Atoms, Ions, Fluid, Compounds, Migration.*

### INTRODUCTION

Under the influence of anthropogen on the atmosphere in the process of human development in the current conditions, the main source of its pollution is the people. As a result of the global, regional or local environmental problems is arisen there will be problems for humanity again. Pollution of the atmosphere occurs mainly as a result of the release of various wastes of plants and factories into the air. Also, the drastic changes that occur in nature under human influence are also the source of environmental problems. An example of this is the emergence of the ecological problem of the island and the Aral Sea on the basis of unplanned consumption of Amudarya and Sirdarya waters on the basis of the concept of agricultural development in the 60-80 years of the 20th century of the states located in Central Asia. This environmental problem is of a global nature and has led to a sharp increase in the level of pollution of the Earth and the

atmosphere in the regions of many more countries, except for the countries that are currently located in Central Asia.

## **MATERIALS AND METHODS**

If 50-55 cubic km of the volume of water was supplied by the Amudarya and Syrdarya to the Aral Sea every year, the Aral Sea had been preserved. For the last 50 years, the Amudarya and Syrdarya have flowed into the Aral Sea 6-8 cubic km per year. The size of the Aral Sea has now decreased by 70-75% due to the supply of water. As a result, an area of about 5 million grams was separated from the seabed and became a source of ecological environment. The human beings who caused such problems are responsible for preservation. Surkhandarya region, the southernmost part of the Republic of Uzbekistan, has environmental problems of natural and man-made regional scale. Climatic conditions and geographical environment in the northern region of Surkhandarya region are very different from the southern region. There are similar climatic conditions in Shurchi, Altynsay and Uzun districts. Therefore, the region is densely populated. These areas also have their own environmental problems, the solution of which remains a topical issue. The main source of environmental problems that threaten the northern regions is the Tajik aluminum plant[1].

The plant was built only 10 km from the border of the region with Tajikistan, this enterprise is located at an altitude of 500-600 meters above sea level, and the gas aerosol and par-gas poisonous substances separated from it spread all year round to the Surkhondarya region. At present, these toxic substances have been able to poison most of the districts of Sariosia, Uzun, even the most important parts of the districts of Denov, Altinsoy, Shurchi [2]. As a result, there are serious problems in agriculture and animal husbandry. Horticulture and vegetable crops have failed, and some crops have been poisoned. Livestock productivity has fallen sharply and these toxins are having a negative effect on the human race. The incidence of the disease in the population has increased, and these poisonous substances adversely affect the offspring of humans. Among the harmful substances coming out of the plant, the atoms of heavy elements, the combination of toxic hydrogen fluoride with ions, are also dangerous to human health[3-4].

On the basis of the use of physical methods in the study of this environmental problem, the migration of harmful substances, the legality of the distribution of their quantity by distance, was studied. The results obtained with the help of neutron-activation analysis, nuclear gamma resonance spectroscopy and Potentiometric research methods show that the amount of harmful substances coming out of the Tajik aluminum plant exceeds the amount authorized in the northern region of the Surkhandarya region from 4 to 12 times of permission amount (PA), water, it was determined by the composition of the soil and atmosphere. According to the results obtained, it was found that harmful substances spread from 25 km to 60 km. Experiments have shown that the combination of HF has reached all regions of the districts of Sariosia and Uzun. It was found that the combination of HF in the 40-50 area of the denov and Altinsay districts is much more than the amount allowed. Even in the northern part of the Shurchi district, an increase in the amount of HF accumulation was confirmed in experiments. Experiments confirmed an increase in HF in the northern part of Shurchi district. indicates that this toxin affects the development of the national economy in the region. [5]

## RESULTS AND DISCUSSIONS

The experiments also revealed the annual migration of HF compounds and other harmful substances. The results show that the migration of harmful substances is influenced by climatic conditions, meteorological conditions. Wind direction and speed, humidity, precipitation and, most importantly, air temperature have a significant impact on migration. Experiments show that in the warmer months of the year (June-July-August), harmful substances spread over long distances. Considering that the summer temperature in the northern regions of the region is above 35-40, it can be seen that the harmful gases from the Tajik aluminum plant poison many areas in the northern region.

**Figure 1:** Graph of annual distribution of HF compounds in the northern regions of Surkhandarya region (PA-permissible amount)

Also, the harmful substances emitted from this plant include atoms of heavy elements (for example: P<sub>v</sub>) in the Mendeleev periodic table, various heavy ions, as well as aerosol-vapor emissions from the plant, which cause great damage to crops and livestock, as well as the local population. The experiments have shown that it has a strong effect on health. The following table shows the distance distribution of harmful substances emitted from the plant in the aerosol-vapor state in the territory of Surkhandarya region.

**TABLE 1 CONDITION OF HARMFUL SUBSTANCES EMITTED FROM THE TAJIK ALUMINUM PLANT**

№	Place of control	Aerosol phase	Par gas phase
1	Around the factory	65 %	35 <input type="checkbox"/>
2	10 km from the factory	18 <input type="checkbox"/>	82 <input type="checkbox"/>
3	25 km from the plant	15 <input type="checkbox"/>	85 <input type="checkbox"/>
4	40 km from the plant	10,5 <input type="checkbox"/>	89,5 <input type="checkbox"/>
5	55 km from the plant	5,7 <input type="checkbox"/>	94,3 <input type="checkbox"/>

It shows how far and in what condition the harmful substances reach. As a result of studying the environmental problems artificially created by the Tajik aluminum plant, which continues to

poison various regions of Surkhandarya region, including 1.5 million people, regardless of their condition.

### **CONCLUSION**

The restoration of the natural environment in the southern region of Uzbekistan, providing full information about living organisms and the source of this environmental problem affecting nature is the most important information for future generations.

### ABSTRACT

*Conversion circuits and designs of electromagnetic current and voltage converters of monitoring and control systems for quantities and parameters of power supply as new physical and technical effects are used, sets the task of their systematization and selection of parameters of their elements and design. The paper presents the materials for the study of circuits and the design of the transformation of the primary electromagnetic converter of electric current and voltage in power supply systems.*

**KEYWORDS:** *Physical And Technical Effect, Control, Circuit, Control, Current, Voltage, Parameter, Power Supply, Converter, Magnetic Circuit.*

### INTRODUCTION

The values and parameters in the designs of the primary electromagnetic current and voltage converter of electrical energy of power supply systems are distributed in the transformation space, which, depending on the purpose and purpose, have a complex geometric configuration. Given the distribution, heterogeneity, nonlinearity, etc. values, parameters, nature of the environment and space of transformation of electromagnetic converters of primary electric current and voltage of the power supply system, one can imagine that their study and calculation in full is a difficult task even with the widespread use of modern computing systems.

Designs of elements and conversion circuits of primary electromagnetic current and voltage converters, the number of which is continuously increasing as various physical and technical effects are used in them, the problem of their systematization and the choice of rational values and conversion parameters and a design that meets the requirements of modern control and management of quantities and parameters is determined power supply systems.

In the presented graph model, the conversion areas of the primary electromagnetic current and voltage converter are the conversion factors for each phase output voltage  $W_a(x, y, z, t)$ ;  $W_b(x, y, z, t)$  and  $W_c(x, y, z, t)$  is determined based on the following analytical expressions:

$$\begin{aligned} \frac{F_{\mu 11} - F_{\mu 12}}{\Pi_{\mu 11}} + \frac{F_{\mu 11} - F_{\mu 12}}{\Pi 1_{\mu 11}} &= K_{IF_A} I_A \\ \frac{F_{\mu 12} - F_{\mu 11}}{\Pi_{\mu 11}} + \frac{F_{\mu 12} - F_{\mu 22}}{\Pi 1_{\mu 12}} &= -K_{FU_a} U_a \\ \frac{F_{\mu 21} - F_{\mu 11}}{\Pi 1_{\mu 11}} + \frac{F_{\mu 21} - F_{\mu 22}}{\Pi_{\mu 21}} &= K_{IF_B} I_B \\ \frac{F_{\mu 22} - F_{\mu 21}}{\Pi_{\mu 21}} + \frac{F_{\mu 22} - F_{\mu 32}}{\Pi 1_{\mu 22}} &= -K_{FU_b} U_b \\ \frac{F_{\mu 31} - F_{\mu 21}}{\Pi 1_{\mu 21}} + \frac{F_{\mu 31} - F_{\mu 32}}{\Pi_{\mu 31}} &= K_{IF_C} I_C \\ \frac{F_{\mu 32} - F_{\mu 31}}{\Pi_{\mu 31}} + \frac{F_{\mu 32} - F_{\mu 22}}{\Pi 1_{\mu 22}} &= -K_{FU_c} U_c \end{aligned}$$

in the form of a system of equations

$$\begin{aligned} \left( \frac{1}{\Pi_{\mu 11}} + \frac{1}{\Pi 1_{\mu 11}} \right) F_{\mu 11} - \frac{1}{\Pi_{\mu 11}} F_{\mu 12} - \frac{1}{\Pi 1_{\mu 11}} F_{\mu 21} &= K_{IF_A} \cdot I_A \\ -\frac{1}{\Pi_{\mu 11}} F_{\mu 11} + \left( \frac{1}{\Pi_{\mu 11}} + \frac{1}{\Pi 1_{\mu 12}} \right) F_{\mu 12} - \frac{1}{\Pi 1_{\mu 12}} F_{\mu 22} &= -K_{FU_a} U_a \\ -\frac{1}{\Pi 1_{\mu 11}} F_{\mu 11} + \left( \frac{1}{\Pi 1_{\mu 11}} + \frac{1}{\Pi_{\mu 21}} \right) F_{\mu 21} - \frac{1}{\Pi_{\mu 21}} F_{\mu 22} &= K_{IF_B} \cdot I_B \\ -\frac{1}{\Pi_{\mu 21}} F_{\mu 21} + \left( \frac{1}{\Pi_{\mu 21}} + \frac{1}{\Pi 1_{\mu 22}} \right) F_{\mu 22} - \frac{1}{\Pi 1_{\mu 22}} F_{\mu 32} &= -K_{FU_b} U_b \\ -\frac{1}{\Pi 1_{\mu 21}} F_{\mu 21} + \left( \frac{1}{\Pi 1_{\mu 21}} + \frac{1}{\Pi_{\mu 31}} \right) F_{\mu 31} - \frac{1}{\Pi_{\mu 31}} F_{\mu 32} &= K_{IF_C} \cdot I_C \\ -\frac{1}{\Pi_{\mu 31}} F_{\mu 31} + \left( \frac{1}{\Pi_{\mu 31}} + \frac{1}{\Pi 1_{\mu 22}} \right) F_{\mu 32} - \frac{1}{\Pi_{\mu 22}} F_{\mu 22} &= -K_{FU_c} U_c \end{aligned}$$

Where:

$$\begin{aligned}
 A_{11} &= \frac{1}{\Pi_{\mu 11}} + \frac{1}{\Pi 1_{\mu 11}}; A_{12} = -\frac{1}{\Pi_{\mu 11}}; A_{13} = -\frac{1}{\Pi 1_{\mu 11}}; A_{14} = A_{15} = A_{16} = 0; \\
 A_{21} &= -\frac{1}{\Pi_{\mu 11}}; A_{22} = \frac{1}{\Pi_{\mu 11}} + \frac{1}{\Pi 1_{\mu 12}}; A_{23} = 0; A_{24} = -\frac{1}{\Pi 1_{\mu 12}}; A_{25} = A_{26} = 0; \\
 A_{31} &= -\frac{1}{\Pi 1_{\mu 11}}; A_{32} = 0; A_{34} = -\frac{1}{\Pi 1_{\mu 21}}; A_{35} = A_{36} = 0; \\
 A_{41} &= A_{42} = 0; A_{43} = -\frac{1}{\Pi_{\mu 21}}; A_{44} = \frac{1}{\Pi_{\mu 21}} + \frac{1}{\Pi 1_{\mu 22}}; A_{45} = 0; A_{46} = -\frac{1}{\Pi 1_{\mu 22}}; \\
 A_{51} &= A_{52} = 0; A_{53} = -\frac{1}{\Pi 1_{\mu 21}}; A_{54} = 0; A_{55} = \frac{1}{\Pi_{\mu 31}} + \frac{1}{\Pi 1_{\mu 21}}; \\
 A_{61} &= A_{62} = A_{63} = 0; A_{64} = -\frac{1}{\Pi_{\mu 22}}; A_{65} = -\frac{1}{\Pi_{\mu 32}}; A_{66} = \frac{1}{\Pi_{\mu 32}} + \frac{1}{\Pi 1_{\mu 22}};
 \end{aligned}$$

$$\Pi_{\mu 11} \div \Pi_{\mu 31} = \Pi 1_{\mu 11} \div \Pi 1_{\mu 33} = \frac{l_{\mu i}}{\mu_i S_i}$$

$l_{\mu}$  - path length  $i$  – current sections of magnetic flux,  $m$ ;

$\mu_i$  or  $\mu_{0i}$  - magnetic permeability  $i$  – current plots;

$S$  - section plots  $m^2$ ,  $i$  – current sections of the conversion circuit.

The limits are defined as follows:

$$\begin{aligned}
 B_1 &= K_{IF_A} \cdot \overset{\square}{I}_A; B_2 = -K_{FU_a} \cdot \overset{\square}{U}_a; B_3 = K_{IF_B} \cdot \overset{\square}{I}_B; B_4 = -K_{FU_b} \cdot \overset{\square}{U}_b; B_5 = K_{IF_C} \cdot \overset{\square}{I}_C; \\
 B_6 &= -K_{FU_c} \cdot \overset{\square}{U}_c.
 \end{aligned}$$

or in matrix form

$$\begin{bmatrix}
 A_{11} & A_{12} & A_{13} & A_{14} & A_{15} & A_{16} \\
 A_{21} & A_{22} & A_{23} & A_{24} & A_{25} & A_{26} \\
 A_{31} & A_{32} & A_{33} & A_{34} & A_{35} & A_{36} \\

 B_2 \\
 B_3 \\
 B_4 \\
 B_5 \\
 B_6
 \end{bmatrix}.$$

Результаты исследования участков электромагнитного преобразования преобразователя первичного тока представлены на рис.2. а и б).

Fig. 2. Results of the study of areas of magnetic transformation:

a – change in ppm on the number of subdivisions –  $n$ ,

b – change in magnetic flux from the number of sections of the partition –  $n$ .

The graph model of the study of the magnitudes of the electromagnetic conversion of the primary current and voltage transducer for monitoring and controlling the values of the power supply system, makes it possible to analyze the rationality of the choice of both the geometric dimensions of the conversion sections (Figure 2, dimensions  $a = b = 0.01-0.04$ ) and the quantity sections of division  $n$  - allowing to increase the accuracy of the calculation and study of the sections for converting the primary current of electrical energy of power supply systems, is distinguished by clarity and high formalization in the formation of dependencies, which represent the main characteristics in general form. The unified value of the output signal in the form of an electric voltage depends on the rationalized forms and parameters of the sections of the magnetic circuit (the air gap where the sensitive element is installed - a flat measuring winding), which ensure the perpendicularity and uniformity of the intersection of the area of the sensitive element by the magnetic flux created by the primary currents of the electric network of the power supply system.

## MOHLAROYIM NODIRA'S SKILL IN USING A SATELLITE

**Imomaliyeva Musharrafhon Ilhomjon qizi\***

\*Kokand DPI, UZBEKISTAN

Email id: Musharrafimomaliyeva1991@gmail.com

### ABSTRACT

*Mohlaroyim Nodira's rubabiyat, its unique artistic landscape, skillful artistic approach to the use of words and the variety of tones can be understood. Nodira's incomplete Uzbek office is kept in the fund of the Institute of Oriental Studies of the Academy of Sciences of Uzbekistan. The devon includes 109 (or 1704 verses) by Nodira. There are 19 (328 lines) ghazals written under the pseudonym Komila. Today, the free and free-thinking women of our time and, in general, the happy Uzbek people, who have become the masters of their own destiny, remember with respect the noble and selfless poetess, because Nodira's immortal works in Uzbek and Tajik.*

**KEYWORDS:** *Ghazal, Radif, Rhyme, Devon, Rhythmic, Musical, Poetry, Nickname.*

### INTRODUCTION

Nodira is a well-known Uzbek poetess of the first half of the 19th century. Her real name is Mohlaroyim, and her literary pseudonym is Nodira. She also wrote Uzbek poems under the pseudonym Komila. The author of this pen is one of the great poets. He also wrote in Tajik and used the nickname Maknuna in his poems in this language.

During the poet's life, the literary environment of Kokand flourished. Umar Khan was not only his wife, the head of the country, but also a master poet. He wrote poems under the pseudonym Amir. From Nodira to us there are 2 devons. There are 189 ghazals in the Turkish devon. Some of them are in Tajik. Persian poems are concentrated in the Devoni Maknuna. Mohlaroyim's work has reached about 10,000 verses. The main part of the poet's poems is 7-9 bytes.

### MATERIALS AND METHODS

The study of Nodira's life and work began in her time. Hakim Khan Tora's "Muntahab ut-tavorix", Avaz Muhammad Attor's "Tuhafat ut-tavorix", Ishakhon Tora's "History of Fergana", Mushrif's "Enobus- In historical works such as "salotin and tavorihi havoqin", in Uvaysi's epics "The story of Muhammadalikhan" there is information about the talent, activity, creativity of Mohlaroyim.

Nodira's incomplete Uzbek office is kept in the fund of the Institute of Oriental Studies of the Academy of Sciences of Uzbekistan. The devon includes 109 (or 1704 verses) by Nodira. There are 19 (328 lines) ghazals written under the pseudonym Komila. There are 180 poems written under the pseudonym Nodira. 136 of them are in Uzbek, 44 in Tajik. Including 11 muhammas, 2 musaddas, 1 musamman, There is also 1 translator, 1 content and 1 subdivision. There are 333 ghazals written under the pseudonym Maknuna.

There are 156 Turkish gazelles in the poet's "Nodira" divan, of which 97 are radif and 58 are non-radiz.

Radif (Arabic - Radif) - a word or phrase that is repeated in Eastern poetry, including Uzbek poetry, after the rhyme at the end of a line or byte.

A radix can be a single word (short radix) or several words (broad radix). One-word radifs are more common in Nodira's work. According to the technique of the poem, the repetition of a radif is emotionally necessary. serves to ensure sound harmony, gives the poem a musical and rhythmic tone, and is also preserved in the translations of poems. The following words are found in the Turkish poems of the poet:

T/r	The name of the word used as a radix	Meanings given in the "Explanatory dictionary of the Uzbek language" Meanings given in the "Explanatory dictionary of the Uzbek language"
1	Hello	The word "welcome" is in the dictionary: Arabic welcome; 1. Respect means to greet with compliment; 2. Women's names. Welcome, good news, You're a real spit fire Nodira used the first meaning of the word in this byte.
2	Appearance	The word "appear" in the dictionary: 1. To appear, to be created; 2. To come from somewhere, to be present; 3. To appear, to stand out; 4. To be created, to originate; 5. To appear, to reflect. I remembered your face, it appeared late in the morning, Kavokib was on the threshing floor when the city appeared. Nodira used the 4th meaning of the word in this byte.
3	Dud	The word "dud" in the dictionary: 1. Smoke, dry; 2. Dust, dust, complication; 3. Oh, nola; 4. Bitter, angry, furious; 5. Heat taffeta. From noon to dude tonight, Who made the work smoke the sky of love. Mohlaroyim used the 1st meaning of the word in the first

		verse of this verse and the 5th meaning in the second verse. When I wrote the poem "Oh" And then Nodira went to the office. In this verse, the poet uses the 2nd meaning of the word.
4	Abas	The lexical meaning of the word "Abbas": Useless, useless, useless, useless. The effect of the fire of love, if not rare, The pain is excruciating.
5	Fido	The word "Fido" in the dictionary: Arabic - get rid of, get rid of, compensate, exchange. To dedicate oneself to someone or something, to an idea; to dedicate, to sacrifice. Come, O king of the world, sacrifice your country to the world, Step into my heart, sacrifice every step of the way.
6	He didn't come	The word "come" in the dictionary: 1. to take a path, to go 2. Be present. 3. "to begin", "to arrive", "to reach" 4. Indicates that the turn has come (form without -ma) Wow, what happened? I didn't come, All the good ones came from the trip, half did not come.
7	Let's go around	The word "circle" in the dictionary: 1. The verb to circle; 2. Sacrifice and sacrifice; 3. Pampering means respect; Shameless self-promotion for Ballistic Products and a great bargain on a neat little knife for you. Subhidam bodi sabo yanglig 'gulistan aylanay In this verse he used the 1st meaning of the word in the dictionary. I'll be waiting for you whenever you come, Let's start with a hundred years of coincidence. This byte uses the 2nd meaning of the word in the dictionary.
8	Talx	The meaning of the word "talh" in the dictionary: in Persian - bitter, bad. 1. taxir, bitter To me, O Komila, la`lidin ayru, If I eat sugar, it will be bitter.
9	Ajab	The lexical meaning of the word "wonderful": surprising, surprising, surprising, interesting. The words of his grace are wonderful, It is strange that the Sun has declared that it has no interest.
10	As a result	The meaning of the word "consequence" in the dictionary

	<p>is Arabic-end, result, effect, follow-up.</p> <ol style="list-style-type: none"> <li>1. Appreciation, friendship, love and the resulting good attitude;</li> <li>2. The end result;</li> <li>3. After everything (event) happened, the end.</li> </ol> <p>Wasl rebuilt the house, ruined the end of migration, The flood was followed by the destruction of the building. In this byte, Nodira uses the 2nd meaning of the word.</p>
--	---

## RESULT AND DISCUSSION

There are many artists in Uzbek literature who have a special place in their work. In particular, among the artists who have enriched the treasury of our classical literature, there are a number of poets, whose charming poems have already become the property of the people. He is still young and old:

You don't have to worry about it,  
There are no flowers in the flower garden.  
Or,  
Don't go for a walk, don't go for a walk,  
Late in the world, help your imagination.  
A man without love is not a man,  
If you are a man, choose love.

When we hear such verses, we think of the poet Nodirabegim. The warmth of the heart, the expression of tender feelings, the melody that touches the strings of the heart, the delicate glow of pure love give a special mood.

## CONCLUSION

Today, the free and free-thinking women of our time and, in general, the happy Uzbek people, who have become the masters of their own destiny, remember with respect the noble and selfless poetess, because Nodira's immortal works in Uzbek and Tajik. It arouses hatred of oppression, cruelty and inequality, as well as increases our love and devotion to our homeland and society. As the great poet said, "Husho is wise, turn around and build the foundation of goodness." and because of his good service to mankind, his good name, that is, his good name, lives forever in works and prose.

## PEDAGOGICAL AND PSYCHOLOGICAL FEATURES OF THE FORMATION OF THE CREATIVE ACTIVITY OF FUTURE TEACHERS THROUGH PERSONALITY-ORIENTED EDUCATION

**Rakhimova Feruzakhon Mukhammadjonovna\***

\*Teacher of the Department,  
"Preschool education" of the Kokand State Pedagogical Institute named after Muqimiy,  
UZBEKISTAN

### ABSTRACT

*Changes in society, modern requirements for professional knowledge and personal qualities of specialists have created the need to update the content of education in pedagogical universities, innovative forms and methods of teaching, the widespread introduction of modern information technologies into practice. Another important aspect of the process of professional adaptation of future educators is to determine the set of necessary conditions for the acquisition and full implementation of professional knowledge, skills and competencies in these areas.*

**KEYWORDS:** *Professional Adaptation, Pedagogical And Psychological, Innovative Potential, Personality-Oriented Education.*

### INTRODUCTION

When developing strategic plans for the development of the labor market and educational services in the Republic of Uzbekistan, special attention is paid to the formation of the level of professional training and the ability of specialists to adapt to the requirements of the activity. This, in turn, requires solving the following tasks related to increasing the efficiency of the process of professional adaptation of future educators:

- determining the content of professional training of future educators, taking into account modern requirements and proposals of the labor market for the training of educators;
- Identification of pedagogical and psychological factors and conditions that form the innovative potential of high-quality acquisition of professional knowledge, skills and abilities;
- Determination and implementation of pedagogical conditions for professional adaptation on the basis of a creative and collaborative environment based on a systematic approach;

- Development and implementation of new publications, electronic textbooks, teaching materials for independent study of social and pedagogical aspects, theoretical issues and independent training of educators.

## **MATERIALS AND METHODS**

As you know, the professional adaptation of future educators is a purposeful, systemic process. Modern pedagogical and psychological research describes the stages of the process of professional adaptation of future specialists in different ways.

An important condition for ensuring the effectiveness of the tasks set is the substantiation of objective and subjective (external and internal) factors that affect the process of professional adaptation of future educators. Slastin's research on the formation of professional training of future educators shows that high professionalism, that is, the quality of the education received, depends on objective factors in achieving professional maturity and subjective factors that affect the personality's abilities, professional orientation, and effective pedagogical tasks. and an expert approach to decision making.

The socio-theoretical training of students of pedagogical universities is influenced by motivational and social factors, the content of which includes information, knowledge, the foundations of science, which are assimilated in the field of general education.

## **RESULT AND DISCUSSION**

Pedagogical and psychological training of students is based on the principles of the educational process, documents that reveal the content and essence of training, forms, methods and means of training, as well as knowledge of the age and individual characteristics of the student and their psychological state is determined by the level of professional knowledge, skills and abilities in acquisition.

The study showed that the skills of practical adaptation of future educators to professional activities are formed directly on the basis of special methodological training. In this case, the correct construction and implementation of the educational process of the student, the organization and management of the activities of teachers and students, the correct orientation of the educational activities of students, teaching, the degree of mastering the skills of effective use. forms, methods and tools for monitoring and evaluation in science, teaching and subject matter are described as key components.

One of the modern requirements for the process of professional adaptation of future educators is the ability to actively master and implement these innovations.

Innovative training is one of the criteria for professional training, determined by the formation of an axiological, acmeological, creative, reflective approach to pedagogical activity, the creation of an environment for creative cooperation in education, the introduction of innovative technologies into the educational process, active motivation for innovative activities.

Another important aspect of the process of professional adaptation of future educators is to determine the set of necessary conditions for the acquisition and full implementation of professional knowledge, skills and competencies in these areas. Because a comfortable and focused teaching environment makes it easier to achieve the desired result from the process.

The results of the experiment confirmed that the integration of pedagogical and psychological conditions is important for improving the quality of education in the process of training future specialists. It was also found that the practical disclosure of the potential of pedagogical technologies in the educational process, aimed at the professional adaptation of future educators on the basis of a systematic approach, will help to ensure a positive solution to the research problem. Subsequent sections of the case will focus on these issues.

It is known that the process of professional adaptation of future educators is a complex and individual process. In this case, it is advisable to study the individuality of the student's personality, learning conditions, environment and the system of interpersonal relations. In addition, an effective adaptation process contributes to the formation and professional development of future educators, their dedication and value approach to professional activity. This affects the efficiency, effectiveness and longevity of the professional.

### CONCLUSION

1. A feature of the modernization of the educational process in higher educational institutions is not only the formation of general parameters of professional training, but also the development of their creative abilities, the ability to accurately predict the goals and objectives of the process and strive for them. , characterized by the level of development of skills for the development and implementation of optimal ways to successfully organize the pedagogical process.
2. Modern requirements for the professional adaptation of future educators dictate the need for an innovative approach to the organization of the pedagogical process in these educational institutions. This presupposes the identification of pedagogical and psychological factors and necessary conditions that influence the process of professional adaptation in the study.
3. The empirical analysis carried out in this chapter of the study confirmed that the information-content and organizational-methodological factor of the professional adaptation of future educators is one of the main criteria for ensuring the effectiveness of the system.
4. The results of the experiment showed that the development and implementation of methods of professional adaptation based on innovative teaching technologies can give a positive solution to the research problem under study.
5. At the next stages of work, based on the capabilities of innovative technologies, the expediency of developing effective methods that help future educators to adapt to the requirements of pedagogical activity was substantiated.

### ABSTRACT

*This article discusses some aspects of social policy to create conditions for social activity of youth and social activity of youth in our country. In addition, factors influencing the social activity of young people are presented.*

**KEYWORDS:** *Youth, Person, Social Activity, Political Activity, Social Policy, New Conditions, Market Economy, Modern Education, Cognitive, Processes, Harmonious View, A Dynamic Features, Technical Research.*

### INTRODUCTION

Spiritual and moral factors are, in essence, the values created by our ancestors, inherited from them, the mentality, way of life and cultural life of our people and nation. Their connection with different interests and hobbies has formed the categories of "I" and "We" in the spiritual and moral life. "Rituals, traditions, and customs that have been formed and developed in a society over the centuries are also a manifestation of the moral relationship that exists between the individual and society. Based on these, the relationship between the individual "I" and the collective "We" is harmonized [1].

Many literatures emphasize the predominance of "We" in the spiritual and moral imperatives of the East. The fact that this communism has risen to the level of tradition is not a negative, conservative case, of course. But in the development of society, the category of "I" or "We" has never been absolutely dominant, it was impossible to live without harmonizing them. It is natural that there is a contradiction between these categories. Because "the development of the

relationship between the individual and society is not just about commonalities. There will also be contradictions in this relationship;

The basis of these contradictions is the disproportion in the understanding and formation of the relationship between the individual and society. "Creative" means creation. Although creation, creativity is essentially a social reality, in the literature on the psychology and theory of creation it is considered as a private, individual psychological phenomenon. In contrast to this approach, we focus on the social aspect of creative activity.

## **MATERIALS AND METHODS**

The extravagant, that is, the focus on innovative existence of innovative mentality raises a number of scientific and philosophical issues. It is difficult to understand the essence and significance of the subject without having certain theoretical views and assumptions about them. These issues include:

- Through what motives, stimuli or attitudes the creative cognitive reality becomes an extractive reality;
- Whether the harmony of the interests of "I" and "we" is preserved in this process, or whether "we" "swallow" all the processes;
- External deterministic factors activate the internal spiritual-mental mechanisms that motivate creative activity in accordance with which laws;
- Whether the social creative activity of young people is only extroverted, or whether it has an inner moral, spiritual, intravertive character;
- Finally, how the measurement of social creative activity is carried out, according to which criteria it is evaluated.

The transformation of creative cognitive reality into an extractive reality occurs through certain motives, stimuli, and attitudes. Lack of understanding of these psychological factors leads to an unbiased assessment of creative activity; each of them is studied and considered in sociology and psychology as a separate spiritual state of mind. We call them "activating factors" by their common name, because, in our opinion, they are the ones that give direction, importance and necessity to human activity, mobilize all his physical and spiritual strength and motivate him to achieve the set goal [2]. Social creative activity should be recognized first of all as an expression of a person's desire to find his place in society, in existence, in the existing system of relations. This desire is activated when it is actualized in the individual by social life and environment. A.G. Maslow, who studied the problems of creativity and its actualization, writes: "If we really want our children to actualize all the forces which they have, we must bring them up through a single goal, that is, through creativity"[3]. The philosopher and psychologist, thinking about education and preparing young people for life, said that today the world is changing rapidly, new problems are emerging, and in such conditions young people should not lose themselves, stand up to challenges and innovate "with pride and joy." Concludes [4] Again he writes: "We need to be people who don't make the world steady and stable who don't harden it like our ancestors did, who look to the abstract tomorrow with confidence, who look up to future changes and changing lives, who live improvised and adaptable to life. This is a new type of person. If you want, you can call him Heraclitus" [5] here we are talking about the inner state of creative

activity, self-discovery, and even the appearance of "ecstasy" as described by A.G. Maslow. Motives, stimuli and attitudes are rooted in this psychological state. So there are two stages in creativity: the first is the stage at the level of "ecstasy" and the second is the stage at the level of "improvisation and adaptation". Innovation involves or consists of both of them. The first is a person's desire for unique innovation and discovery, and the second is an essentially technical effort to bring the inventions of others into their environment, to install them. The latter is no secret; it can be done even by ordinary minds. Anyone with organizational and technical knowledge, experience in managing technological processes can lead. Countries that have built an industrial society for the first time do so in the process of bringing in foreign scientific and technological discoveries, because they do not yet have the intellectual forces and innovative technology capable of carrying out the scientific and technological revolution. The first stage of innovation is the stage of mobilization of scientific and technical forces in society, making them unique scientific and technical discoveries. The innovative development taking place in Uzbekistan includes both stages, but now we have the advantage of introducing foreign scientific and technical discoveries, through which the modernization of socio-economic life. The relevance of innovative research as culmination, creative activity is associated with these two stages. That is why half of them see innovation as a type of activity related to scientific and technical creativity. Contrary to this view, their social cognitive activity is aimed at introducing foreign technologies. They also associate culminating with this process.

## RESULTS AND DISCUSSION

The "ectase" (A.G. Maslow), intravertive nature of creative activity encourages the study of the interests of "I" and "we". A true creator tends to generalize his "I", preferring to communicate with someone who listens to his opinion or hears it. While this introversion in him is important for creative research, it has to reckon with "us," that is, social interests, especially in the field of scientific and technical creativity. The creation of a nuclear weapon confirms what disasters could befall humanity, which is the result of a failure to take into account the interests of humanity in scientific and technical research. This exemplary example is an important principle for every scientific and technical discovery. Take the internet, for example. Yes, it is a high product of the human mind, an opportunity for everyone to take an active part in world events, to increase their knowledge. But when it falls into destructive, aggressive hands, it can serve evil, inhuman purposes. Therefore, in innovative mentality, we realize that the issue of "I" and "we" is not in vain. Every year in Uzbekistan more than half a million young people who have graduated from schools are ready to take an active part in social relations and find their own way of life. More than 450,000 young people with higher and secondary special education are ready to show themselves, their knowledge and skills in various fields. Innovative changes, the introduction of scientific and technical discoveries do not lead to the creation of new jobs, but save the job vacancy. It is difficult to resolve this conflict with scientific and technical innovations. All areas of human activity, manual labor cannot be replaced by automation and innovative discoveries. This means that the need for manual labor in society remains.

Innovative mentality is nourished by the requirements of social development; it is not "for itself" but for the development of society. Our need for science, technology and innovation even leads to the abandonment of the ego, as A.G. Maslow points out. It is based on a complete devotion to creative pursuits, disregard for the opinions of others, living only with the pain of creation, forgetting that you are divided into two subjects, such as "you observe your own ego

and feel your own ego"[6]. In this case, the question arises as to whether "we" will not completely swallow the creative "I". Yes, there is such a great risk in traditional societies. This risk can be reduced by giving the creative self a social orientation to its creative activity, while acknowledging its propensity for individual exploration. The "I" of the Creator is not antagonistic to the "we" of society, but is ultimately measured by how all inventions have benefited humanity.

Innovative mentality must have a creator "I". It is not harmful for the creator to glorify his "I" or to have egocentric views in it. It is a quality that comes to him from his separation from other creators, from his environment, from his addiction for innovation. If we understand innovation as a kind of true creative activity, we have to support the "I" and endure the conceit and arrogance in it. If we understand innovation as the introduction of imported technical means and methods of work, then there can be no question of true creativity, the "I" of the creator, his stubbornness. These two approaches always follow innovative research, and their beginnings go back to the creator "I". This is why special attention is paid to the training of young professionals who tend to innovative mentality and research. In their scientific and technical mentality, the interests of "I" and "we" do not exaggerate as antagonists, but the true creator, the inventor, does not forget his "I". The dialectical connection between the "I" and the "we" has always been debated, in scientific and technical work, always in favor of the latter. Not only society, socium, but also the individual, the creator, has won from this.

External deterministic factors drive the spiritual mental mechanisms that encourage creative activity according to certain laws. Why is a person engaged in scientific and technical creation, innovative research? What are the mechanisms in the spiritual world of man that motivate him to search restlessly, and even to create scientific and technical innovations in opposition to prohibitions? How does the creator know if he is going the right or wrong way, is it possible to determine that? Admittedly, these questions are difficult to answer. Even experts who have studied the philosophy and psychology of creation have not found answers to these questions. That is why the Russian philosopher N.A Berdyaev, who expressed many interesting views on the philosophy of creation and wrote works, connects the creative process with personalism, divinity and transcendence [7]. Based on the existing social philosophical and scientific views, we believe that the above laws can be determined through contextual, experimental and component research [8]. These directions and methods of scientific research come in different levels and forms in innovative mentality. For example, the contextual method helps to solve a problem in a particular field using a new, technical invention. Automation of the production process, mechanization means the elimination of heavy manual labor, resulting in an increase in the number and quantity of products, saving time spent on them. This method imposes a humanization of labor on scientific and technical discoveries. The humanization of labor, that is, the humanization of social organization in accordance with the interests of man, is a requirement of the laws of management. Or take the experimental method. Its empirical view implies the creation of innovation through special testing. In this regard, we can cite the Decree of the President of the Republic of Uzbekistan dated August 17, 2018 "On a legal experiment to introduce a special regime of governance in Tashkent". It considers the rapid development and modernization of socio-economic sectors in Tashkent, attracting investments, rapid solution of problems in the social sphere and the population, the abandonment of quasi-enterprises and the introduction of a modern, efficient and innovative management system[9]. This experiment

should lead to the identification of methods, ways and technologies to solve existing problems, innovative transformation of urban infrastructure. Its main goal is to create a model of development that is consistent with the innovative development of the country, the formation of a system that increases the welfare of the population. The experiment will help to determine how the country's innovative development can be carried out in accordance with social, political, economic and cultural laws. Experimental creativity does not only lead to positive results, any scientific experiment can be a basis, a model for future experiments, ideas and research. In short, external deterministic factors activate the internal spiritual-mental mechanisms that stimulate creative activity in accordance with the requirements and laws of social development.

## CONCLUSION

This creative activity is the humanization of the social being, the use of the intellectual forces in the individual. Although the social creative activity of young people has an extroverted character, it is not a phenomenon that separates it from the creative person, from his spiritual life. Innovative research, the measurement of creative activity in young people requires special research. Such criteria are different in each type of creative activity. Therefore, experts are in favor of a differential approach to them[10]. In innovative research, such criteria are also determined by how they are approached: is innovation a genuine type of creative activity such as "ecstasy" or the introduction of imported scientific and technical discoveries? The search for criteria is justified only when we find the answer to this methodological question for ourselves.

### ABSTRACT

*This article informs about, the formation and unification of the military team, as well as the fact that each team which has its own characteristics, the great influence of the fighting spirit in the military team, and any difficulties encountered with this fighting mood victory, as well as the factors that determine the socio-psychological environment in the military community.*

**KEYWORDS:** *Military Community, Collective Opinion, Moral Value, Serviceman, Mood, Tradition, Economics, Politics, Ideological Reasons, Spiritual.*

---

### INTRODUCTION

In the process of formation and unification of the community, a common system of spiritual values is created. Spiritual values shape the mindset of the military community. A team opinion is a set of opinions that members have about an issue. Military activity is carried out in a military team, and in the process of this activity, the division of labor between the servicemen is of great importance. The public opinion in the units of the Armed Forces of our country is fully consistent with the public opinion in the whole society. This is a key factor in strong military discipline and high combat readiness. If servicemen have team-specific skills and competencies, interactions, as well as teamwork, will be effective, uninterrupted, and conflict-free. Each team will have its own structure. The position of the members in a certain position, the relationship

between them, forms the structure of the team. In teams with a stable structure, the position of each serviceman is also strong and gives good results.

## **MATERIALS AND METHODS**

A team mood is a set of feelings that a team member has about an event. The mood of the team is very influential and it is the motivation for the behavior and activities of the military. Some types of team mood (passion, confidence in success, high mood) are a factor in its success, while others (bad mood, lack of self-confidence, boredom, sadness and dissatisfaction), on the contrary, reduce the team's chances.

In addition, military teams have their own traditions. It is a tradition to preserve a characteristic of a team over time. Events that occur in society in general, and in the community in particular, in interactions and relationships between people, often take the form of a custom or tradition. The mood in a military unit, its activities and lifestyle, the commander's leadership style, and the specific behaviors of military personnel can also rise to the level of tradition. Traditions are universal, national, regional and collective. They serve as a kind of social "glue" in the team: it is the traditions that keep the team together. At the same time, it gives the team a sense of identity and charm. Traditions are divided into labor, sports, martial arts, and so on.

A unique socio-psychological environment also characterizes the community. Socio-psychological environment (microenvironment, moral environment) is a complex concept, which includes the feelings of each serviceman, the degree of satisfaction of their social needs (communication, mutual respect, friendship, abilities) level of performance, etc.), and the mood of the team. A set of emotions and experiences that occur in all or most members of a team at the same time is called team spirit. If the mood of an individual depends equally on physiological and other social factors, then the mood of the community is primarily the result of the whole system of social relations (economic, political, ideological, and spiritual). Social life is determined by the material and spiritual conditions of human life.

## **RESULT AND DISCUSSION**

Mood is a moving element of psychology and changes very quickly. A person's mood can quickly spread to others and "nourish" them. This is where the socio-psychological law of imitation applies, according to which, along with the positive, the negative also spreads quickly (for example, bad behavior, stupid fashion etc.). Bad moods are common among military personnel. It has no ideological reasons, but psychological reasons. The best way to prevent negative moods is to introduce statutory requirements in the unit, properly organize service, work and rest, as well as provide comprehensive care for military personnel. It is important to regularly inform servicemen about the situation in our country and in the world. First, commanders need to have confidence and alertness in their work. They need to be able to detect and prevent in a timely manner the negative moods that have just emerged in one or more military personnel. The military traditions formed in the teams are a source of positive mood: military oath, military parade, weapons and military equipment inspection, evening visit, enlistment of young soldiers, celebrations, exchange of guards, handing over the battle flag to the military unit tribe

Another factor that determines the socio-psychological environment in a military community is reputation (prestige or prestige), which is a specific form of relationship. Reputation is the

socio-psychological influence of one person (group) on another person (group). For example, the influence of a leader or commander on his subordinates, the teacher on his students, the team on the individual, and the influence of higher organizations on lower organizations. With the emergence of a group, a phenomenon of prestige also emerges and it becomes an integral part of interpersonal communication. The reputation of a unit commander is a key condition for success in strengthening military discipline among servicemen and in training and educating them. It is important to remember that a reputable commander has more influence than a non-reputable commander does.

Nevertheless, a reputation can never be gained through violence. Reputation is the product of existing relationships in the community as well as the positive qualities of the individual. Reputation always reflects respect for that person, confidence in his strengths and abilities. Another important aspect of reputation is that without it, no organizational activity can be carried out in society and in a particular military unit.

Reputation has the power of persuasion. Having it can have a powerful effect on those around you. Confidence in a person of prestige in the team is the unifying factor of this team. Any team can have not one, but several reputable people: a commander, a good specialist, military activists, an athlete, and so on. There are also many such soldiers. The reputation of an ordinary serviceman is a measure of his high position among his colleagues, based on respect, experience, knowledge, skills, moral, psychological and physical qualities. However, it is unfortunate to note that we have become accustomed to understanding the role of adults or commanders in the concept of prestige in life. Such a one-sided view of prestige contradicts the principle of educating servicemen in the community. It is the privileged servicemen among the ordinary soldiers who have a great opportunity to train other members of the team. The presence of a large number of dignitaries in the military unit indicates the richness and diversity of the spiritual life of the community, its wide range of opportunities. It should also be noted that the presence of a large number of people with prestige in a community - a great influence - sometimes leads to the emergence of an unhealthy environment in this community - a small group of opposing parties can also cause. As a result, the team is divided into small groups and weakened.

Discipline is also a specific socio-psychological phenomenon in military units, governed by general military rules and ethics, commands and instructions of commanders, social and public opinion, traditions, and prestige. Law and morality underlie any discipline, including military discipline. General military regulations govern military discipline, the relationship between servicemen, and how to act in certain situations that arise in the course of daily service activities.

The main conditions for a positive socio-psychological environment in the community are:

- Stable team structure;
- Psychological compatibility between personnel;
- Everyone works for the overall result;

## CONCLUSION

Experience has shown that the main reason for military discipline violations is that military personnel are partially or completely unaware of general military regulations. That is why it is so important for soldiers and sergeants to know the military regulations. His methodology plays

an important role in teaching military discipline. Regulation training usually begins with an officer telling a story about them. He tells the young soldiers about the types of military regulations, their purpose, and their importance in combat training. Then it is time to study the individual articles and reinforce them with real-life examples. In addition, some officers go the wrong way in teaching the rules - they require the military to memorize certain articles or rules completely. This attitude leads to indifference to their duties and a weakening of their mental activity.

## THE IMPORTANCE OF PEDAGOGICAL IDEAS IN THE FORMATION OF YOUTH

**Turgunboev Tohirjon Abdugafurovich\***

\*Teacher of the Military Education Faculty of Fergana State University,  
 UZBEKISTAN

### ABSTRACT

*This article informs the importance of family, community and education in educating the young generation in the spirit of military patriotism, as well as the idea that the education of today's youth is one of the most responsible and urgent tasks, and the idea that the Motherland is one. It is about inculcating it in the minds and thinking of the rising generations.*

**KEYWORDS:** *Family, Neighborhood, Education, Youth, Personal Education, Social Education, Homeland, Patriotism.*

### INTRODUCTION

Each science in the same object of study distinguishes its subject of research – one or another form of existence of the objective world, one or another side of the process of development of nature and society. Education as a complex, objectively existing phenomenon is studied by many Sciences. Historical materialism, for example, considers education as a particular moment in the development of society, its productive forces and relations of production; history as a particular moment in the history of class struggle and class politics; psychology - in connection with the study of the formation of the personality of a developing person. The independence of any science is determined, first of all, by the presence of a special, own subject of research, the presence of such a subject that is not specifically studied by any other scientific discipline.

### MATERIALS AND METHODS

In the General system of Sciences, in the General system of "things and knowledge", pedagogy is the only science that has as its subject the education of man.

The study of all science begins with the understanding of such questions: how did this science arise and develop, and what specific problems does it explore?

In fact, each science has its own history and a fairly specific aspect of natural or social phenomena, the study of which it is engaged and the knowledge of which is of great importance for understanding its theoretical foundations.

The isolation and formation of pedagogy as a science were caused by the growing needs of society in creating special educational institutions, in the theoretical understanding and generalization of spontaneously emerging experience of teaching and upbringing of younger generations, special preparation for life. Education and upbringing, thus, became an objective need of society and became the most important prerequisite for its development.

That is why at a certain stage of development of human society and, in particular, in the later period of the slave-owning system, when production and science have reached significant development, education is allocated to a special social function, that is, special educational institutions appear, there are people whose profession has become the education and upbringing of children. This was the case in many ancient countries, but more or less reliable information about schools for boys has come down to us from Egypt, the Middle East and ancient Greece.

I must say that already in the ancient world, many public figures and thinkers were well aware of and pointed out the huge role of education, both in the development of society and in the life of each person. For example, according to the laws of Solon (between 640 and 635-CA. 559 BC), it was assumed that the father must take care of special training of his sons in a particular field of work. As education expanded and became more complex, a special branch of theoretical knowledge related to educational activities began to be developed more intensively. This branch of knowledge, as well as knowledge in other spheres of life and production, was first developed in the depths of philosophy. Already in the works of ancient Greek philosophers-Heraclitus (530-470 BC), Democritus (460-early IV century BC), Socrates (469-399 BC), Plato (427-347 BC), Aristotle (384-322 BC), and others. – contained a lot of deep thoughts on issues of education. The term "pedagogy" also originates from ancient Greece, which has been established as the name of the science of education. How did this happen?

In Ancient Greece, teachers were slaves who were assigned by aristocrats to look after their children, accompany them to and from school, carry school supplies, and take walks with them. The Greek word "paidagogos" (pada – child, Gogo – news) is a "schoolmaster". In the future, teachers were called specially trained people who were engaged in teaching and raising children and for whom teaching was a profession. Hence the special science of education became known as pedagogy.

It should be said that many other pedagogical concepts and terms also originate from Ancient Greece, for example, school, which means "leisure", gymnasium - public school of physical education, and later just a secondary school, etc.

The issues of education also occupied a significant place in the works of ancient Roman philosophers and orators. Interesting pedagogical ideas, for example, were expressed by Lucretius Carus (CA. 99-55 BC), Quintilian (42-118 BC), and others.

In the middle ages, problems of education were developed by philosophers-theologians, whose pedagogical ideas were religious in color and were permeated with Church dogma.

Further development of pedagogical thought was received in the works of thinkers of the Renaissance (XIV-XVI centuries). the most Prominent figures of this era - the Italian humanist

Vittorio da Feltre (1378-1446), the Spanish philosopher and teacher Juan Vives (1442-1540), the Dutch thinker Erasmus of Rotterdam (1465-1536), and others.

They criticized the mechanical rote learning that flourished in education, advocated humane treatment of children, and the liberation of the individual from the shackles of oppression.

Despite the intensive development of educational theory, pedagogy continued to be a part of philosophy. As a special science pedagogy was first isolated from the system of philosophical knowledge at the beginning of the XVII century. Most researchers associate the design of pedagogy as an independent scientific discipline with the name of the great Czech teacher Jan Amos Comenius (1592-1670). The principles, methods, and forms of organization of educational work with children and moral education formulated by him became integral elements of subsequent scientific and pedagogical systems.

The works of such prominent figures as J. J. Rousseau (1712-1778), D. Diderot (1713-1784), K. A. Helvetius (1715-1771) in France, John Locke (1632-1704) in England, Johann Heinrich Pestalozzi (1746-1827) in Switzerland, Friedrich Adolf Wilhelm Diesterweg (1790-1866) and Johann Friedrich Herbart were of inestimable importance for the formation of scientific pedagogy (1776-1841) in Germany.

The founders of revolutionary demographic views in Russian pedagogy were V. G. Belinsky (1811-1848), A. I. Herzen (1812-1870), N. G. Chernyshevsky (1828-1889) and V. A. Dobrolyubov (1836-1861). The works of L. N. Tolstoy (1828-1910) and N. I. Pirogov (1810-1881) had a great influence on the formation of Russian scientific pedagogy. A complete, systematic disclosure of domestic pedagogical ideas was given in the works of K. D. Ushinsky (1824-1870). A great contribution to the development of Soviet pedagogy was made by N. K. Krupskaya (1869-1939), A.V. Lunacharsky (1875-1933), M. I. Kalinin (1875-1946), A. S. Makarenko (1888-1939), V. A. Sukhomlinsky (1918-1970).

## **RESULT AND DISCUSSION**

The fact that pedagogy has put forward such a large number of major teachers is not accidental. The society with its intensive development of production, science and culture required increasing the literacy of the main producers. Without this, it could not develop. Therefore, the number of educational institutions is growing, the network of public schools that provide the necessary training for children is expanding, special educational institutions for teacher training are opening, and pedagogy is being taught as a special scientific discipline. All this gave a great impetus to the development of pedagogical theory.

Having emerged as a science about the education of children and youth, pedagogy, as the boundaries of education and the scope of subjective factors in the life of society expand, increasingly become a science about the General laws of educational influence on people of all ages.

All the period of its development, pedagogy was based primarily on education and training.

## **CONCLUSION**

In turn, education is an educational facet of education, has a scientific-disciplinary and natural essence, representing an integral pedagogical process, during which educational tasks are solved, education and development of students are carried out. This process is primarily two-way. On the

one hand, it serves as a training (teacher), who sets out the program material and manages this process, and on the other – students, for whom this process takes the nature of teaching, mastering the material being studied. Their joint activities are aimed at deep and lasting assimilation of scientific knowledge, development of skills and abilities, their practical application, development of creative abilities, formation of a materialistic worldview and moral and aesthetic views and beliefs.

Training should be available to this class, age, and level of development. And all that is available is based on the knowledge that is available in the child's mind, obtained in the process of education, family education, direct reflection of natural and social phenomena, communication with adults and peers, in reading, television programs, movies.

### ABSTRACT

*The article is devoted the problems of ecological legislation development in the Republic of Karakalpakstan. The Constitution declared land, water, forests, and its bowels to be national wealth [1, 53]. The Constitution was the basis for the environmental legislation of the Republic of Karakalpakstan. These rules unconditionally determine the responsibility of representatives of local khakimiyats for the state of the environment in the region (city), namely, they not only endow them with certain rights in the field of environmental protection, but also increase their responsibility in this regard.*

**KEYWORDS:** *Constitution, Environ mental Legislation, Environ mental Rights Of Citizens, Environmental Information, Environmental Education, Environmental Insurance, Environmental Audit, Ecological Disaster Zones, Compensation For Environmental Damage, Agrochemicals, Environmental Protection.*

### INTRODUCTION

Since gaining independence by the Republic of Uzbekistan, in accordance with generally accepted norms and principles of international environmental law and national environmental legislation, consistent steps have been taken to develop and improve the organizational structure of environmental quality management and rational use of natural resources. In the context of complex structural transformations carried out in the sectors of the country's economy, an increase in the volume of traffic flows and transportation, the intensification of agricultural and industrial production, a significant increase in the urban population, the solution of environmental protection problems, the organization of rational use of natural resources, the

reproduction of natural resources, ensuring the environmental safety of the population and ecological systems are the most important tasks of our state.

## **MATERIALS AND METHODS**

The formation of the environmental legislation of the Republic of Karakalpakstan is associated with the adoption of the Constitution of the Republic of Uzbekistan and, on its basis, the Constitution of the Republic of Karakalpakstan. The Constitution declared land, water, forests, and its bowels to be national wealth [1, 53]. The Constitution was the basis for the environmental legislation of the Republic of Karakalpakstan. The Constitution was adopted in 1993 on April 9 at the XII session of ZhukorgiKenges of the Republic of Karakalpakstan of the 12th convocation. It outlines the main plans of the state's environmental strategy and the main directions of consolidating the environmental legal order.

On the basis of the Constitution of the Republic of Uzbekistan, the Laws of the Republic of Karakalpakstan "On Nature Protection", "On Land", "On Subsoil", "On Forests", "On Water and Water Use", "On Protection of Atmospheric Air", "On Protection and Use of flora ", " On the protection and use of the animal world ", " On waste ", " On specially protected natural areas. " The Constitution of the Republic of Karakalpakstan has defined four articles related to the protection of the natural environment. In particular, Article 48 requires citizens of the Republic of Karakalpakstan to respect the environment. This article appeared for the first time on the basis of the Constitution of Karakalpakstan and is aimed at increasing the responsibility of citizens for the state of the environment, to prevent the ownerless and only in their own interests, the relationship of man to nature. Article 53 of the Constitution reads: "The land, its subsoil, waters, flora and fauna and other natural resources are national wealth, subject to rational use and protected by the state." This article also has environmental and economic content. Article 52 implies: "The use of property must not harm the surrounding reality." The Constitution pays special attention to the role of state bodies in the protection of the natural environment, its protection. Since, with the development of market relations, the rights of private owners have expanded. In such conditions, economics and ecology can contradict each other. The Constitution emphasizes the priority of the environmental interests of society.

Article 90 of the Constitution of the Republic of Karakalpakstan defines the tasks of state bodies and in it special attention is directed to the regulation of environmental protection.

These rules unconditionally determine the responsibility of representatives of local khakimiyats for the state of the environment in the region (city), namely, they not only endow them with certain rights in the field of environmental protection, but also increase their responsibility in this regard. The provisions of the Constitution of the Republic of Karakalpakstan are concretized in other sources of environmental law [2, 112].

At the same time, an analysis of Article 53 of the Constitution of the Republic of Karakalpakstan shows that it deals with natural resources as a nationwide wealth, but they are not considered as a necessary source of life for the present and future generation. Since the health of citizens is in many ways inextricably linked with their right in relation to a comfortable natural environment.

In this regard, we believe that the constitution, which is the main source, both for all other areas and for environmental legislation, should express along with the duties of a citizen a respectful

attitude to the environment, as well as their rights to a comfortable natural environment [3, 212-213].

Modern development of legal regulation of environmental relations makes it possible to draw conclusions about the objective foundations of further improvement of environmental legislation on environmental protection and regulation of relations to ensure environmental safety, rational use and protection of natural resources [4, 91].

## RESULT AND DISCUSSION

The basic principles and mechanism of action of the above legal documents of environmental significance, in general, should be reflected in the main law of our country. Similarly, the Law "On Nature Protection" today cannot cover all environmental and legal relations, nor coordinate the political and legal, socio-economic, organizational and technical mechanisms of the environmental policy of our country. Since it does not sufficiently regulate the issues of social cooperation between state bodies and civil society institutions in resolving environmental problems, the environmental rights of citizens, the mechanism their protection, environmental information, environmental education - upbringing, as well as relations such as environmental insurance, environmental audit, environmental disaster zones, their legal status, compensation for environmental damage, agrochemicals.

This Law is considered complex not only in terms of the content of social relations required by regulation, but also in the form of legal regulation.

This means that the norms of environmental legislation, occupying a central place, but not the only one on the steps of legislation on environmental protection, act together with a set of norms of others - administrative, civil, etc. legal spheres. In particular, the provisions of the law on compensation for damage (Articles 49, 51) were more concretized by the provisions of civil law, etc. Such norms provide a link between environmental legislation and other branches of legislation.

In the Constitution of the Republic of Uzbekistan, the political, socio-economic and spiritual foundations of society are enshrined in independent sections and are defined quite specifically, and the foundations of environmental policy are contained in the norms of various sections and set out in a declarative form.

In order to improve constitutional norms and environmental and legal relations, in our opinion, it would be advisable to combine all environmental norms into an independent chapter - "Fundamentals of Environmental Policy". This chapter should include four articles that establish the foundations of environmental policy: 1) Ownership of natural objects and resources; 2) Basic requirements for the protection of the natural environment; 3) Basic requirements for the use of natural resources; 4) Requirements for ensuring the environmental safety of the population.

The Constitution of our state enshrines the basic environmental rights and obligations, as well as the principles of environmental protection and the use of natural resources. The mechanism for the implementation of these norms is specified in environmental legislation.

## CONCLUSION

In conclusion, it can be noted that the current level of development of environmental legislation, formed in the years of independence, is constantly evolving. It is continuously associated with large-scale economic reforms, privatization processes, democratization of all sectors of society. During this period, the initial important documents were adopted on the formation of environmental legislation in the country. Despite this, in this area, a codification document has not yet been adopted that comprehensively regulates environmental relations. Therefore, the main attention of representatives of lawmaking, scientists engaged in research in this area, should be aimed at creating harmony between man - society - nature, finding a legal solution that meets the requirements of today to regulate relations between them and, finally, to further improve organizational and legal mechanisms in this area. Constitutional environmental provisions are fundamental for the development of the branch of environmental law, aimed at regulating the foundations of environmental relations. In addition, the constitutional foundations should become the basis for the formation of modern environmental legislation.

### ABSTRACT

*The article analyzes the history of the creation of the legal basis for the development of radio and television in the Republic of Karakalpakstan and the radical change in business activity, the expansion of creative opportunities. Most importantly, today the urgent task is to strengthen the role of the media, to protect the professional activities of journalists, to create a radio and television that can penetrate the hearts of the population and critically analyze the existing problems.*

**KEYWORDS:** *Television, Radio, Tv-Journalism, TV-Programme, Editorial Staff.*

### INTRODUCTION

Radio and television, one of the sources of mass communication and information of the twentieth century, have rapidly entered the life of society and become a factor influencing the formation of social and spiritual consciousness. When we think of television and radio interacting with the general public, we mean not just a single-meaning television and viewing event, but an extremely complex, routine, process that affects the worldview of millions of viewers. Basically, television and radio have demonstrated in a very short period of time that they are a very broad, mass, fast, and lively art medium in terms of technical capabilities, the scope of creative research, compared to other art forms. Television and radio have invented new means of expression in the solution of life's problems, in the perfection of the human heart and mind [1].

### MATERIALS AND METHODS

The development of radio and television in the Republic of Karakalpakstan dates back to the years of independence. It was during this period that the development of television and radio

broadcasting became an important direction of the ongoing socio-political and socio-economic reforms in the country. At the state and government level, unprecedented changes and creative developments have begun as a result of the import of modern technical equipment from the most developed countries of the world. For the first time, specialized, private and digital TV channels have been launched. Infrastructure has been created for the sector. Such changes require the study of the development of radio and television and their place in the socio-cultural life of the population in a separate topic. Most importantly, today the urgent task is to strengthen the role of the media, to protect the professional activities of journalists, to create a radio and television that can penetrate the hearts of the population and critically analyze the existing problems.

In order to meet the information needs of the population of the republic, to radically improve the content of television and radio programs, to expand the range of broadcasts and genres, it has been done on the basis of laws and decisions adopted by our government [2].

## RESULT AND DISCUSSION

Decree of the President of the Republic of Uzbekistan No PF-309 of January 7, 1992 “On transformation of the State Committee for Television and Radio Broadcasting of the Republic of Uzbekistan into the State Television and Radio Broadcasting Company of Uzbekistan”, March 28, 1994 “On measures to strengthen the material and technical base of the State Television and Radio Broadcasting Company of Uzbekistan” August 25, 1997 “On complex re-equipment of the system of the Uzbek Television and Radio Company”, November 8, 2005 “On measures to reform and develop independent television and radio broadcasting channels”, December 27, 2005 “The adoption of the Resolution “On measures to improve the activities of the National Television and Radio Company of Uzbekistan” shows that a wide field of action for creative research in the field has been created, all conditions have been created to open new opportunities. [3]

In order to reform and develop the National Television and Radio Company of Uzbekistan and independent television and radio channels, reorganize their activities, and initially improve the regulatory framework, a number of normative acts of the Cabinet of Ministers of the Republic of Uzbekistan were adopted. In particular, on the basis of the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated February 14, 2006 “On measures to organize the activities of territorial divisions of the National Television and Radio Company of Uzbekistan” practical measures were taken to reorganize the Republic of Karakalpakstan and regions [4].

In particular, on the basis of the laws adopted by the Oliy Majlis of the Republic of Uzbekistan, the Jogorku Kenesh of the Republic of Karakalpakstan has adopted several laws related to journalism. In particular, the Law of the Republic of Karakalpakstan of 5 October 2007 “On Mass Media” (as amended), 25 June 1997, the Law “On Protection of Journalism”, 25 June 1997, “Guarantees of access to information and Law on Freedom of Information, August 28, 1999, Law on Advertising, November 12, 2003, Law on Principles and Guarantees of Freedom of Information, Law of August 29, 2007, Law on Copyright and Related Rights For example, the Law on Mass Media has been repeatedly appealed to, a number of amendments and additions have been made to its new editions, censorship has been abolished, and the independent operation of television and radio has been ensured to ensure its economic independence. In general, over the years of independence, more than 40 normative legal acts have been adopted in this area [5].

Karakalpak radio and television cover the socio-political, socio-economic and cultural life of the Republic, other major social events and events taking place here, addressing important issues of socio-economic development of local authorities and self-government, political and social development of citizens. has been developing programs aimed at increasing their social activity and effectively organizing their activities to protect their constitutional rights and freedoms. Development of information-humanitarian, educational, cultural-enlightenment programs taking into account the interests of the multi-ethnic population of the Republic of Karakalpakstan, popularization of modern achievements in the field of world culture, art, music, tourism, cinema, taking into account the interests of the multi-ethnic population and prepares TV viewers, radio listeners and, above all, high-level artistic and entertaining TV and radio listeners who cultivate a sense of beauty and spirituality in young people and children [6].

## CONCLUSION

As a result of reforms in the system during the years of independence, the Karakalpak TV and Radio Company has become the only broadcaster that covers 95-98% of the territory of the Republic in terms of the distribution of its TV and radio channels. During the years of independence, the activities of the Karakalpak TV channel have changed radically. Various shows and TV programs in new genres have been created. Today, the Karakalpak TV channel broadcasts 18 hours a day in analog and digital formats [7].

In April 2013, the TV programs of Karakalpakstan were included in the digital broadcasting network "UZDIGITAL TV". Thanks to the dubbing studio, which opened on June 1, 2013, young viewers have the opportunity to watch cartoons in Karakalpak. In 2014, a second dubbing studio was launched, and the start of dubbing movies into Karakalpak is one of the biggest achievements in the industry [8].

### ABSTRACT

*This article discusses existing approaches to entrepreneurial potential. The term entrepreneurial potential is analyzed by the author, on the basis of which he formulates an integrated definition of the studied concept, takes an attempt to apply a systematic approach to solving the problem.*

**KEYWORDS:** *Entrepreneurship, Entrepreneur, Innovation, Entrepreneurial Potential, Entrepreneurial Activity, Opportunities, Risk, Economic Growth, Business.*

---

### INTRODUCTION

The emergence of various forms of ownership in the economy, development of small business and private entrepreneurship has been identified as a priority of the economic policy of the country since the early days of independence.

The essence of the Decree of the President of the Republic of Uzbekistan “On the Strategy of Action for the Further Development of the Republic of Uzbekistan” also envisages the acceleration of socio-economic development and liberalization of the economy, further development of entrepreneurship[15]. One of the most important objectives of the Strategy is to continue institutional and structural reforms aimed at reducing the government’s involvement in the economy, protecting its private property and strengthening its prestige, and stimulating the development of small business and private entrepreneurship. Entrepreneurship, as a type of activity, implies that entrepreneurs have a certain way of thinking, a special style and type of economic behavior, expressed in a creative attitude to the matter, free manifestation of initiative, a constant desire for innovation, the search for innovative solutions and opportunities, expanding the scope and scope of activities and, which is especially important, constant readiness for risk and finding ways to overcome it.

In economically developed and developing countries, entrepreneurship is recognized as the driving force of the economy, and the degree of its development depends on the formation and implementation of entrepreneurial potential. Being a kind of labor potential, it has specific features, determined both by the nature of a particular type of entrepreneurial activity, and by the characteristics of a particular economic system. Entrepreneurial potential is a complex economic category, the study of which is extremely important in terms of assessing the reserves of entrepreneurship development. The latter, in turn, is the result of the realization of the potential under consideration, a source of economic growth, and the strengthening of the national economic system as a whole.

## LITERATURE REVIEW

Entrepreneurial potential of innovations, role implementation form functions, the final product of economic creativity, etc. At the beginning of the 18th century, R. Cantillon and his followers J. Thünen, G. Mangoldt, and F. Knight singled out risk ability as one of the elements of entrepreneurial potential. J. Schumpeter considered innovation, creativity as the leading ability of an entrepreneur. L. Mises, F. Hayek, I. Kirtsner focused on such individual psychological characteristics of the entrepreneur as managerial abilities, independence in choosing and decision making, the ability to respond to changes in economic and social situation [1]. Leading economists of the country Gulyamov SS [13], HodiyeV.B. Yu., Kasimova MS [14] Other scientific and theoretical works and theoretical and practical aspects of business development were analyzed in detail.

Stepanov A. Ya .. and Ivanov N. V. considering the entrepreneurial potential of the organization, understand it as “the combined capabilities of the enterprise to determine, shape and maximize the needs of consumers in goods and services in the process of optimal interaction with the environment and rational use of resources” [10]. The most comprehensive assessment of entrepreneurial potential is given by P.V. Zhuravlev [6], which includes its structure are elements such as professional knowledge, innate and acquired abilities, innovative potential, as well as extra functional qualifications. To the memory of Cheplyaeva I. E. entrepreneurial potential - an economic category, “representing a socially determined set of opportunities and abilities for organization and implementation entrepreneurial activity by its carriers ” [12].

Tikhonova N.E. and Chepurenko A. Yu. define entrepreneurial potential as “the totality of all individuals ready for occupation entrepreneurial activity” [11]. M.V. Grachev believes that “entrepreneurial potential is a combination of orientation to achieve success, personal and collective responsibility, freedom of expression and creativity” [4]. Thus, the entrepreneurial potential is identified by the authors, first of all, with a person as his carrier. As a result, the interpretation of the concept under consideration is limited, as a rule, to the structural level and subject of disciplinary research. At the same time, the concept under study, as we believe, is much broader. Indeed, the formation and realization of entrepreneurial potential is impossible to inhuman. However, man, existing in a real socio-economic reality cannot realize their entrepreneurial abilities without an appropriate educational level, resource, infrastructural, legal and other support, i.e., without adequate conditions. Moreover, the creation of the latter requires compliance with the principle of consistency, based on them utility levelness of the national economy, and therefore the concept of entrepreneurial potential is multilevel. Therefore, in our opinion, the above definitions need further determination. To this end, we analyze the concepts

of “entrepreneurship” and “potential” and formulate on this basis an integrated definition of entrepreneurial potential.

### ***ANALYSIS AND RESULTS***

The essence and content invested in the concept “entrepreneurship” in the development of economic theory changed and ordered. It is believed that A. Smith was one of those who first became involved in entrepreneurship. However, another ten years before him, these problems seriously R. Cantillon was interested, formulating the thesis according to which the difference between supply and demand in the market makes it possible individual market entities to buy goods cheaper and selling them more expensive. It was he who called these market entities “entrepreneurs, “that is, in translation from French, “intermediaries.”[3] There is no clear definition of entrepreneurship in modern economic literature. As a rule, in most cases, its essence is replaced by the goal of entrepreneurial activity, i.e., maximizing profits. However, as suggested by G. Bagiyev and Asaul A.N., this definition cannot be considered complete. “Most practitioners and researchers focus on making a profit, seeing it as the ultimate goal of entrepreneurship. However, entrepreneurship has as its ultimate goal not so much profit as the continuity of the reproduction process associated with the reproduction of demand and the satisfaction of constantly changing, constantly increasing needs of an individual or a social group, society as a whole. In this regard, entrepreneurship isomer correctly defined as a process of continuous search for changes in needs, end-user demand for products and services, satisfying this need by organizing production, marketing, marketing, logistics, management, focused on the best innovations that bring maximum productivity in each of stages of there production process” [1]. Thus, the authors focus on the consumer and his needs, the satisfaction of which can bring maximum profit. In our opinion, such a definition is most consistent with modern socioeconomic reality, reflecting the principle of the social orientation of market relations. Moreover, this approach does not at all deny the risk, initiative and innovativeness inherent in entrepreneurship.

As StepanovA.Ya.and Ivanov N.V., and does notexist unambiguous definition of the term "potential"[8]. At all, the potential comes from the Latin Potentialis - powerful, literally powerful [11]. In various sources, potential is defined as power, strength[5] or as “means, stocks, sources available and able tobe mobilized, put into action, used to achieve certain goals, implement the plan; solving a problem; the possibilities of an individual, society, state in a certain area ” [2]. In other words, the potential characterizes real (and not theoretical) possibilities that currently cannot be implemented due to various reasons or lack of relevant conditions. For entrepreneurial activity as such conditions favors the business environment. Recall that the latter should be understood as “the prevailing in the country (region, municipality)favorable socio-economic, political, civil law situation that provides economic freedom for capable citizens to engage in entrepreneurial activities aimed at meeting the needs of all subjects of a market economy” [7].

Hence, the business environment, in our opinion, can be represented as a reflection of the totality of the real conditions and opportunities for doing business that are already implemented today. In our opinion, the entrepreneurial potential should be considered as a combination of real business opportunities that can be realized through providing a favorable entrepreneurial climate [8]. Note that by “real” we mean those economic, social, legal and other conditions in which entrepreneurship is currently functioning and developing. In this sense, speaking of entrepreneurial potential, we are talking about the current resource, infrastructural and other support, its more efficient use, real people with relevant personal characteristics, ready to

become subjects of the activity in question, but not able to do it by virtue of financial and other barriers, adverse conditions created [9]. From this, on the one hand, we can conclude that the "entrepreneurial potential" is logically regarded as a concept similar to the concept of "entrepreneurial resource", which means "the ability to efficiently organize economic resources for carrying out economic activities." On the other hand, the entrepreneurial potential, in addition to the efficient use of resources, also includes the totality of opportunities to do this, and therefore we consider this concept more complex and voluminous.

### CONCLUSIONS AND SUGGESTIONS

1. The formation of entrepreneurial potential is the most important factor in the development of the business sphere, and entrepreneurial potential is its key element. Business sphere also includes the entrepreneurial environment as a condition for the realization of entrepreneurial potential and entrepreneurial activity.
2. To determine the nature and structure of entrepreneurial potential, we propose a multi-level approach, according to which entrepreneurial potential is necessary considered as a system with complex hierarchical and socio-economic structures.
3. To date, there is no single methodology, and also scorecards for assessing entrepreneurial potential. we consider it appropriate to use the three-component method assessments involving the inclusion in the system of indicators of such factor variables as a socio-economic state subject, socioeconomic aging of the subject and its economic performance.
4. In order to improve the qualitative and quantitative characteristics human component of entrepreneurial potential, and also ensuring a positive perception of entrepreneurial potential.

So, the analysis allows us to conclude that entrepreneurial potential must be seen as a multi-level system of resources and real business opportunities that can be realized through risky, innovative activities and the organization of favorable business environment in order to ensure socio-economic the effectiveness of the functioning of the business sector.

### ABSTRACT

*This article provides information about the integration of science in improving the teaching of technology in the system of continuing education, focuses on the relevance of science, defines the integration and application of the STEAM method of a new approach to integrated education.*

**KEYWORDS:** *Integration, Technology, Education, STEM, STEAM STREAM Method.*

### INTRODUCTION

The growth rate of economic development of the new Republic of Uzbekistan is highly recognized by the world community. It is also the result of large-scale reforms aimed at the development of science, education reform, and the full support of scientific and innovative activities. The transition to a path of development based on innovation and integration is being accelerated as one of the priorities of the country's economic development.

To do this, the subject (linear) development of curricula for the system of continuing education, the development of certain ideas, concepts, patterns in the minds of students, that is, the prevention of the formation of the form of plates, the integration and study of content-related subjects leads to the effectiveness of educational work[1].

The interactive course of technology education is a system of visual education, which explores the secrets of creating visual skills based on the deepening and expansion of integrative knowledge. The system of visual education is based on different types, forms, methods, objects.

---

## MATERIALS AND METHODS

*Technology is an integrative approach to education* - it involves interdisciplinary connections. The word integration is Latin and means to restore, to fill, to unite parts as a whole. Integrative education is a study that expands, complements and deepens the content, integrates the study of interdisciplinary specialties[2].

It is known that in the system of general secondary education, the use of an integrated approach in the selection of technology educational content and taking into account its main task, comprehensive human development, life and work, career choice and future career secrets. is to prepare for the study. In the system of continuing education, the selection of the content of education for a particular profession (specialty) on the basis of an integrated approach takes into account the field of production. There are different theories in the organization of the integrative approach today, and we think that it is appropriate to take this direction in education as follows[2].

1. Intra-science integration. It is based on theoretical knowledge and practical skills within a single subject.
2. Interdisciplinary integration. It is based on theoretical knowledge and practical skills in several subjects
3. Integration of subject sciences and methods of its teaching. This creates new theories based on previously learned knowledge.

In the study of interdisciplinary issues in the teaching of general secondary subjects of technology education in general secondary schools, in particular, drawing, painting, physics, mathematics, mother tongue, literature, and ecology The presence of cracks was detected.

The development of modern integrative education is aimed at improving the new state educational standards and curricula of general secondary education, as well as the gradual implementation of STEAM methods.

The STEAM integrated education approach is one of the major trends in global education. It covers math, technology, creativity, engineering and the natural sciences.

The integrated learning process allows for the training of required specialists in engineering, design and modeling. STEAM is integrated learning within a scientific and technological concept based on real-life requirements.

The goal of integrated education is to envision education, society, work, and the world as a whole, and to build sustainable relationships between them.

STEAM educational technology is a new method of teaching school students, which is different from traditional teaching methods. It is designed to teach students four subjects at the same time –subject (Science), technology (Technology), engineering (Engineering), Fine Arts, and Mathematics. STEAM is an integrated learning system for subjects, not for science[3].

STEAM education is the application of scientific and technical knowledge in real life through practical training.

## RESULT AND DISCUSSION

### How did this educational approach come about?

STEAM education technology is a combination of theory and practice. The abbreviation STEM was first proposed by the American bacteriologist R. Colwell in the 1990s, but has only been in active use since the 2000s. STEM education is a set of educational activities that contribute to the study of technology and engineering, from pre-school education. Based on STEM (science, technology, engineering, mathematics), new variants of this concept have emerged, the most common of which are STEAM (science, technology, engineering, art and mathematics) and STREAM (science, technology, robotics, engineering, digital 'at and mathematics).

Today, STEAM is one of the main trends in world education. With the rapid development of technology, new professions are emerging. The demand for STEM professionals is growing everywhere. According to various estimates, STEAM knowledge is required in 9 out of 10 majors with high growth rates. In particular, by 2018, the demand for specialties such as chemical engineers, software developers, petroleum engineers, computer systems analysts, mechanical engineers, civil engineers, robotics, nuclear medicine engineers, underwater architects, aerospace engineers is expected to increase. STEAM education prepares students for a technologically advanced world. Technology has grown exponentially over the past 60 years.

Examples include the Internet (1960) and GPS technology (1978) to DNA scanning (1984) and of course the iPod (2001) and others. Today, almost everyone uses smart phones. It is impossible to imagine our world without technology. Technology continues to evolve, and STEM skills are at the heart of that development.

The application of the STEAM method in technological education is carried out in the following stages:

1. Mathematics, physics, technology, etc. are studied;
2. The STEAM method identifies a system of knowledge, skills, and competencies that students can acquire;
3. The interdisciplinary task to be done is defined;
4. Evaluation, testing, improvement. Development of a project for the production of products, evaluation system based on the STEAM method;
5. Giving to students an itemsto make different types of things.

So, they use different methods based on queries and projects to solve the problem.

## THE IMPORTANCE OF INTERACTIVE GAMES IN ENGLISH LANGUAGE TEACHING AND THEIR IMPACT ON THE TEACHING PROCESS

Nosirova Dilfuza Nabievna\*

\*An English Teacher,  
Andijan region law school, UZBEKISTAN

### ABSTRACT

*In this article was given information about the full use of interactive methods in teaching English, peculiarities of the process of pedagogical cooperation, the main basis of pedagogical technology, in English, each lesson, topic, specific technology of the subject, the need to pre-design the teaching process, and how to create a technological map of the lesson in appearance or form.*

**KEYWORDS:** *Interactive Methods, Pedagogical Cooperation, Teaching Process, Technological Map, Information Technology.*

### INTRODUCTION

The interest in the use of interactive methods, innovative technologies, pedagogical and information technologies in the educational process in the educational process is growing day by day. One of the reasons for this is that while traditional education has so far taught students to acquire only ready-made knowledge, modern technology teaches them to search for the knowledge they have acquired, to study and analyze it independently, and even to draw their own conclusions. The educator creates conditions for the development, formation, acquisition and upbringing of the individual in this process, and at the same time performs the function of management, direction. In the learning process, the student becomes the main figure.

Innovative technologies are innovations and changes in the pedagogical process and the activities of teachers and students, the implementation of which is based on the full use of interactive methods.

Interactive methods are called collective thinking, that is, methods of pedagogical influence, which are an integral part of the content of education. The peculiarity of these methods is that they are carried out only through the interaction of educators and students.

The process of such pedagogical cooperation has its own characteristics, which include:

- forcing the student to think independently, to create and to research, not to be indifferent during the lesson;
- Ensuring that students have a constant interest in knowledge in the learning process;
- to strengthen the student's interest in knowledge independently, creatively approaching each issue;
- The organization of constant joint activity of the teacher and the student.

According to teachers, researchers, practitioners studying the problems of pedagogical technology, pedagogical technology is only related to information technology, and improving the effectiveness of teaching that needs to be applied in the teaching process - the use of the teacher's technological tools, computers, distance learning, or a variety of techniques.

We believe that the most basic foundation of pedagogical technology is that it depends on the technology chosen so that the teacher and the student can work together to achieve a guaranteed result from the set goal, that is, in the process of teaching, each educational technology used to achieve a guaranteed result on purpose can form a collaborative activity between the teacher and the student, if both can achieve a positive result, in the learning process, if students can think independently, work creatively, research, analyze, draw their own conclusions, evaluate themselves, the group, the group and them, and the teacher is able to create opportunities and conditions for such activities, which is the basis of the teaching process.

Each lesson, subject has its own technology of the subject, that is, pedagogical technology in the learning process is an individual process, it is a goal-oriented, pre-designed and guaranteed pedagogical process based on the needs of the learner.

## **MATERIALS AND METHODS**

In English, it is up to the teacher and the student to choose what technology to use to achieve the desired result. Because the main goal of both parties is clear: to achieve a result. Depending on the level of knowledge of students, the nature of the group, the technology used, for example, to achieve the result, you will need to work with a computer, but you will need film, handouts, drawings and posters, various literature, information technology. It depends on the teacher and the student.

In addition, it is necessary to design in advance in the teaching of English, in the process of which the teacher considers the specifics of the subject, place and conditions,

Improving the effectiveness of education - the most important thing is to take into account the technological means of the teacher, the ability and needs of the student, as well as the ability to organize collaborative activities.

Only then can the desired guaranteed result be achieved. In short, the student needs to be brought to the center of learning. It is important for the teacher to be able to see each English lesson as a whole and to design the future lesson process in order to visualize it. In this case, the teacher

---

creates a technological map of the future lesson for each subject, the subject taught for each lesson, based on the nature of the subject, the capabilities and needs of students.

Creating such a technological map is not easy. Because for this, the teacher must be aware of pedagogy, psychology, private methodology, pedagogy and information technology, you will also need to know a lot of techniques, methods. The color of each lesson depends on the projected technological map of the lesson, which is carefully thought out in advance. The form or form of the technological map of the lesson depends on the experience, goals and will of the teacher. Whatever the technological map, it should reflect the course process as a whole and clearly reflect the clearly defined purpose, task and guaranteed result, the technology of organization of the course process.

The structure of the technological map saves the teacher from writing an extended syllabus of the lesson, because such a map reflects all aspects of the lesson process.

### **RESULT AND DISCUSSION**

In English, every subject of the subject taught by the teacher of English, the technological map created for each lesson, allows him to imagine and understand his subject as a whole (for one academic year), the beginning of a holistic learning process helps them to see the results to be achieved, starting with the goal. In particular, the technological map can be structured based on the student's ability and needs to bring him or her to the center of learning as an individual. This leads to better and more in-depth teaching of English compared to other subjects.

In the process of teaching English, students are treated as individuals, the use of various pedagogical technologies and modern methods allows them to think independently, freely, to research, creative approach to each issue, a sense of responsibility, conducting research, analysis, effective use of scientific literature, and most importantly, strengthens their interest in reading, science, pedagogue in his chosen profession. Achieving such a result in an English class requires the use of innovative and information technologies in the learning process in practice.

They are very diverse. Modern methods used in the teaching process, or technological trainings that help to increase the effectiveness of teaching, help students to develop logical, intellectual, creative, critical, independent thinking, helps them develop their skills, become competitive, mature professionals, and nurture the professional qualities that professionals need.

### **CONCLUSION**

From the above, it can be said that the use of new pedagogical technologies in teaching English makes the teaching process even more interesting, ensures the interest of students in science and language, as well as the development of mature personnel for the great future of our country.

### ABSTRACT

*In this article discusses the innovative activities of teachers, educational technologies, educational activity in education, the development of creative thinking in students, the formation of skills of critical approach to teaching materials. The period requires the student to become an active participant. This activity, in turn, serves as a basis for the formation of such qualities as conscious attitude, independence, creativity, inquisitiveness. Improving the innovative activity of the teacher depends on many factors, such as the choice of types of pedagogical technology - the knowledge to be formed, methods of action, personal qualities, organizational form of training, applied methods, tools and so on.*

**KEYWORDS:** *Innovation, Activity, Educational Technologies, Methods.*

### INTRODUCTION

At present, more and more problem-based, programmed, exploratory methods are used with students to activate the teaching process, and in practical classes, working and pedagogical games, giving individual assignments has become one of the prerequisites for the implementation of the combination of individual and group activities of students. One of the most important aspects of modern education is the achievement of an innovative nature of pedagogical activity.

The issue of achieving an innovative nature of pedagogical activity in developed countries has been seriously studied since the 60s of the last century.

---

## MATERIALS AND METHODS

Conceptual approach to innovation in science in methodology was described (Yu.V.Gromyko, V.I.Slobodchikov, P.G.Shedrovitsky, etc.); in psychology (L.S.Vygotsky, V.V.Davidov, N.F.Talyzina, etc.); described in general pedagogy (M.V.Klarin, M.M.Potashnik, A.I.Prigojin, N.R.Yusufbekova, K.Angelovsky, Yu.Voglaid, K.Rodgers and others).

In the scientific and pedagogical literature, the experience of preparing teachers for innovative activities is generalized by a number of scientists.

The study of innovation processes in education raises a number of theoretical and methodological issues related to innovation and creative activity of the teacher (criteria for evaluating innovation, traditions and innovations, features of the innovation cycle, the teacher's attitude to innovation, etc.). In their research, scientists often deal with a specific aspect of preparing teachers for innovative activities:

Improving the innovative activity of the teacher depends on many factors, such as the choice of types of pedagogical technology - the knowledge to be formed, methods of action, personal qualities, organizational form of training, applied methods, tools and so on. For example, it is recommended to use binary or integrative lessons, work or role play, heuristic dialogue in the development of creative thinking in students, the formation of skills of critical approach to the teaching material and the organization of productive learning activities. In this case, the teaching methods must be commensurate with the purpose.

Modern educational technologies allow students to search for the knowledge, methods of action and personal qualities they possess, to study independently, to express their opinions. In this process, the teacher performs the functions of management, direction, creating conditions for the formation and development of the learner.

Reasons for focusing on educational technology as a current problem:

- First, the breadth of opportunities for the development of the learner;
- secondly, to provide an opportunity to widely introduce a systemic-functional approach to the pedagogical process;
- Thirdly, it covers the stages from the purpose of the pedagogical process to the teacher to monitor and evaluate the results and, if necessary, to make the necessary adjustments;
- Fourth, because it is based on activation factors, it allows you to get a result close to the intended purpose.

The main requirement for the pedagogical process (educational technology) is to achieve high (quality and efficiency) results without spending excessive (mental and physical) stress, time, money. In this case, the pedagogical process is directly related to the subjects involved in it, regardless of how it is organized and conducted, provides for the following:

- Improving the efficiency and quality of the pedagogical process;
- conscious decision-making and communication between the participants of the pedagogical process;
- Ensuring that students fully master the knowledge, methods of action and personal qualities;

- the formation of students' skills of conscious, active, independent, creative thinking and action;
- creating conditions for students to realize their potential;
- adherence to the ideas of democracy and humanity.

According to the above, "Pedagogical (educational) technology"(s) - in order to optimize the process of education and personal development, taking into account human and technical capabilities and their interaction is a system that combines the stages of design, implementation (implementation), making the necessary adjustments, comparing the results with the goal, which provides for the formation and development of knowledge, methods of action and positive personal qualities in students[1.60]

## **RESULT AND DISCUSSION**

Operating in a market economy requires an environment of direct social competition. This environment, in turn, serves as a basis for conscious activity such as innovation, striving for high quality and efficiency, creativity, inquisitiveness, diligence. Therefore, a conscious attitude towards independent learning in the younger generation arouses a sense of motivation. In the pedagogical process, motivation is considered as a key factor that guarantees its quality and effectiveness. It is natural that the motivation of students to study is important.

The period requires the student to become an active participant. This activity, in turn, serves as a basis for the formation of such qualities as conscious attitude, independence, creativity, inquisitiveness. The upbringing of highly qualified, well-educated young people who are innovative in their thinking, who are successful in a market economy, requires increasing educational activity in education. To do this, first of all, it is necessary to create pedagogical conditions in education. So, one of the most pressing issues today is to increase learning activity in education, to accelerate the innovative activities of teachers.

Today, it is important for educators to have the skills and abilities to innovate. Educators are required to have an innovative approach in order to be able to master the skills of innovative activity. By its very nature, the acquisition of innovative activity skills by educators is based on the decision of an innovative approach.

V.A. Slaven's innovation, as a set of purposeful, focused processes aimed at widespread dissemination and use. According to the author, any innovation aims to meet the needs and aspirations of social actors through new tools[1.97].

The concepts of "new" and "innovation" are important in any innovation. Innovation introduced into various attitudes and processes is manifested in the form of content specific, subjective, local and conditional ideas. Private innovation involves changing, updating, changing one of the elements of an attitude, object, or process. [2.120]

Subjective novelty represents the need to update the self of a particular object. Local innovation serves to describe the practical significance of the innovation being introduced for a particular object.

Conditional novelty, on the other hand, serves to shed light on a set of specific elements that enable a complex, progressive update to take place in an attitude, object, or process.

R.N.Yusufbekova focuses on the pedagogical approach to innovation. In particular, pedagogical innovations in the process of education and upbringing by the author were not previously known, it is emphasized that it is the variable content of the pedagogical event that leads to the unregistered situation or outcome.

According to Russian scientists A.I.Prigogin, B.V.Sazonov, V.S.Tolstoy, N.P.Stepanov and others recognizes that there are two approaches to the study of the innovation process and its components, and the organization of the innovation process:

1) the individual micro level of innovation (according to which some new idea is introduced into practice);

2) micro level, which represents the interaction of individually introduced innovations (in this case, the interaction, unity, competition and replacement of one by another is considered important)[6. 78].

A.I.Prigogin, B.V.Sazonov and V.S.Tolstoy in their research tried to substantiate the systemic concept of innovation. At this point, the authors distinguish the following two important stages of the innovation process:

1. Development of ideas that appear as innovations (m: planning of the development of a particular type of product by the enterprise, organization).

2. Large-scale development of innovation (specific product) [ 7. 87]

## CONCLUSION

In conclusion, we can say that innovative activity is the acquisition of theoretical knowledge, practical skills and abilities on the basis of directing the mental, intellectual, physical strength of the teacher to a specific goal, supplementing practical activities with theoretical knowledge requires the development of cognition, design, communicative speech, and organizational skills. The following are important in preparing a teacher for innovative activities:

- equipping with knowledge of professional ethics;
- To provide knowledge about the traditions of teacher-student;
- to study the problems of formation of spirituality;
- teaching the secrets of enlightenment;
- study and analysis of best practices in pedagogy of foreign countries;
- Development of long-term plans.[5.317]

Also, in essence, the innovative activity of pedagogy is the creation of scientific research, development, experimental work, creation of a new technological process or a new improved product based on the use of scientific and technical achievements.

### ABSTRACT

*In this article given information about the organization of methodological work in vocational colleges, the improvement of the educational process, the deepening of the content and quality of education. The scientific basis of methodological work is the training of well-rounded, qualified specialists as a result of improving the educational process in the system of secondary special, vocational education.*

**KEYWORDS:** *Methodical Work, Education, Teachers, Engineers - Pedagogues.*

### INTRODUCTION

Implementation of the tasks set in the education system today and the issue of training qualified specialists requires the introduction of the most modern forms and methods of educational work in secondary special vocational education institutions and a new approach to the educational process. The effective organization of the educational process in the newly established vocational colleges depends in many respects on methodological work.

## **MATERIALS AND METHODS**

The main purpose of the organization of methodological work is the pedagogical preparation of teachers and engineers-pedagogues for the daily educational process. Methodological work lays the foundation for the successful implementation of daily educational work. It is necessary to provide methodological assistance in teaching modern methods and forms of teaching, best practices and the application of the latest achievements of science in the teaching process, because the main problem in the training of professionals is the rapid change in the requirements for the specialist and the disparity in the fact that the teaching staff is not fully capable of implementing these requirements.

Educational and methodological work in vocational colleges requires the organization in order to improve the educational process, deepen the content and improve the quality of education.

Improving the quality of training is in many respects related to the effective organization of methodological work, scientific and methodological support of the educational process. It follows that teachers, engineers, educators and foremen working in professional colleges, managers need to study the main issues of the content of methodological work and its organization.

Methodological work is based on the achievements of science and advanced pedagogical experience, as well as the development of the creative potential of the teacher, his professional skills, and, ultimately, it is necessary to understand the set of interrelated pedagogical activities that allow to increase the level of education of students. The scientific basis of methodological work is the training of well-rounded, qualified specialists as a result of improving the educational process in the system of secondary special, vocational education,

The methodological work carried out in educational institutions plays an important role in their development into competitive, mature.

One of the issues of scientific and methodological support of the educational process is the issue of improving the content of education. Because the content of education is a curriculum, programs, government documents, and this goal can be achieved as a result of their improvement and full implementation, this issue is the main in methodological work.

## **RESULT AND DISCUSSION**

The activity of engineers-pedagogues of the educational institution is not limited to the provision of theoretical and practical knowledge, ie teaching, individual work with each student in their work, independent work on themselves, working with a group of students, carrying out organizational work on their subject, organizing and equipping classrooms, laboratories, training workshops, working with parents, participating in the work of methodological commissions on subjects, and so on.

Engineer-educators must work tirelessly at all times to work with a group of students, organize their work, and achieve the intended goal, for this it is necessary for them to increase and improve their knowledge. This is because the knowledge they receive in higher education is not enough.

It is based on methodological work, research, creation. Therefore, in organizing their independent work from pedagogical engineers, it is necessary to organize them on a scientific basis.

The structure of methodical work of professional colleges is as follows:

- Improving the ideological, political, pedagogical and professional skills of engineers and teachers of educational institutions;
- Improving the content, form and methods of education and upbringing of students in accordance with the requirements of the times;
- Ensuring and generalizing the unity of education and mutual unity in vocational training;
- study, generalization and application of advanced pedagogical, industrial and scientific-technical achievements to improve the educational process;
- study and implementation of guidelines for the implementation of scientific and methodological work.

The main purpose of such work is to improve the quality and efficiency of the pedagogical process by improving the professional and pedagogical skills of managers, teachers and pedagogical engineers.

The task of methodological work in professional colleges is as follows:

- Organization of educational and methodical work on the basis of state educational standards;
- Improving the spiritual and educational level, pedagogical skills and professionalism of the teaching staff of the educational institution;
- Improving the content, form and methods of education of future professionals on the basis of modern requirements:
- Ensuring the unity of education in the process of teaching students, the interaction between professional training;
- In-depth study, generalization and application of advanced pedagogical and industrial experience, scientific and technical achievements in the educational process;
- providing the educational process with new didactic materials and teaching aids;
- education - improving the professional skills and pedagogical skills of educators, etc.

Scientific-methodical work is an integral part of the activities of engineers and teachers, the implementation of which must be performed by all pedagogical partners of the educational institution.

The organization of pedagogical activity on a scientific basis is a measure of methodological and organizational complexes aimed at improving the working conditions of students, engineers and teachers, the organization and methods of teaching, the application of scientific and technical achievements, increasing the efficiency of the educational process.

## CONCLUSION

In conclusion, it is a fact of life that does not require proof that the performance of the tasks assigned to professional colleges depends directly on the teachers. The rapid development of science and technology, the widespread introduction of advanced production technologies in practice, requires teachers to increase the effectiveness of lessons and extracurricular activities,

rationally using the factors that activate the learning activities of students. This requires the organization of methodological work in professional colleges in an unconventional way on the basis of modern requirements.

Also, the creation of socio-political, legal, psychological and pedagogical conditions for the thorough development of educational and vocational programs, the modernization of the content of vocational education, taking into account the regional characteristics of the labor market, is a key requirement today. One of the main tasks is to connect the system of training and education of junior specialists with the requirements of the ongoing reforms in society, the process of renewal, to raise the level of educational services to this type of education, to improve the knowledge and quality of training.

### ABSTRACT

*This article discusses the concept of the Motherland, its sanctity as a sacred place and the great legacy of our ancestors, the thoughts of our first president and poets about the homeland. A child who loves his parents, their ancestors, their traditions, customs, professions, loves others. He is proud of his nation, people, literature, art, religion and culture, inspired by the nature of the country where he grew up, and understands the value of its sacred land. The king again calmly handed the golden sword to the enemy commander. But the cunning beast was not satisfied. He promised: "You will give a piece of abandoned land in your country where nothing will grow, otherwise we will bleed your country".*

**KEYWORDS:** *Motherland, People, Nostalgia, Umbilical Cord Blood, Our Ancestors.*

*"We consider the work of spirituality and enlightenment to be a work of patriotism, a work of conscience. A person with a conscience and spirituality will definitely love his homeland. Conscience means spirituality - sincere service to the people, the Motherland".*

*Shavkat Mirziyoyev*

## INTRODUCTION

The homeland is the place where a person is born, where his umbilical cord blood is shed, where he spends his childhood and youth, where he is educated, and where he always misses when he travels.

The homeland begins at the threshold, at the place where he was born and raised. That is why it is necessary for a child to grow up in the house where he lives and breathes, and to have eternal love and devotion to his motherland, which is a magnificent and powerful place for him to grow up.

Everyone's love for his homeland is instilled in him through mother's milk, mother's goddess and parental love.

A child who loves his parents, their ancestors, their traditions, customs, professions, loves others. He is proud of his nation, people, literature, art, religion and culture, inspired by the nature of the country where he grew up, and understands the value of its sacred land. After all, no one can find happiness outside the Homeland. A person who does not have a reputation in his own country is not valued in another country.

That is why in our people “Be a shepherd in your own country until you become a sultan in another country”, “It is better to be a beggar in your own country than to be a king in another country”, “When you die, die, be in your homeland!” such translations are not in vain.

## MATERIALS AND METHODS

In ancient times, people wanted to invade a country. But the king of the land was wise and peaceable. To prevent bloodshed, he presented the warlord with a racehorse, a thoroughbred horse. But the enemy did not stop threatening to start a war. The king again calmly handed the golden sword to the enemy commander. But the cunning beast was not satisfied. He promised: “You will give a piece of abandoned land in your country where nothing will grow, otherwise we will bleed your country”. The king was so determined that he commanded his army: “O brave sons of my country, go and fight! The cunning beast is looking at our sacred soil. We will not give an inch of the land inherited from our ancestors to the enemy”, he said.

Everyone who travels and lives in another country knows the value of their home, their home, their homeland.

The great thinker AlisherNavoi, Babur Mirzo, Furkat and other ancestors lived far away from their homeland, with a strong longing for the homeland, smelling the soil of the motherland and the fruits grown in it. , it is clear to everyone that they have suffered at the hands of the country.

Their spiritual experiences are the condition of a true patriot. A true patriot will not leave the Motherland, no matter where he lives, in good or bad days, he will be with him.

Our first President Islam Karimov said with great love about our Motherland:

“A person who considers his native land, where his umbilical cord blood was shed and where his ancestors lay, to be an unequal, holy Motherland in the world, has clear goals, pride and high pride”. “Of course, the world is wide, there are many countries in the world, but in this world, our unique homeland, Uzbekistan, is unique. This is a beautiful country; this holy land is only for us”.

Our great enlightened ancestor Abdullah Avloni said about the homeland:

"Everyone's hometown and country is called their homeland. Everyone loves the place where they were born and raised. Even animals have this sense of homeland. If an animal loses its homeland, it will not live as happily as it did on its own land, its life will be bitter, and the love of its homeland will always be in the corner of its heart".

Our ancestors also expressed these ideas in a poetic way. Note the following lines of the famous poet and enlightener SiddikiKhandayliki:

*What is it Motherland? Where I was born, where I live,*

*The place of rowing up, playing and laughing ...*

*My soul is my homeland, my body is my homeland, my eyes are my homeland,*

*Forget about seeing about it, where I saw it*

Depriving a person of his homeland is the greatest sin.

Everyone's home is his inviolable homeland. So, according to the custom of our people, if you suddenly have to go to someone's house, the landlord apologizes. Our ancestors considered it a sin to deprive not only man but all living beings of their homeland. AlisherNavoi got up from a meeting and hurried home.

His friends then asked him why. AlisherNavoi replied: "On the way, an ant came with me, clinging to my clothes. I wanted to take him home because he had lost his homeland. That's why I was in such a hurry".

They do not love the country only because of its unique riches, beautiful nature and favorable conditions. The climate of the motherland, regardless of its nature, is a sacred place for a person, which cannot be exchanged for anything, where his soul and spirit can rest.

There are evil forces in the world that will destroy all nations.

For example, the pre-independence Soviet government expelled the Crimean Tatars and deported them to other countries, including ours.

## **RESULT AND DISCUSSION**

As a result, they lost their homeland for almost half a century. It was only after the collapse of the Soviet empire that they returned to their homeland, the Crimean peninsula. Our people remained faithful to the traditions of our ancestors, sympathized with them in the most difficult days and gave them a place in their hearts.

During the Second World War, our people provided food, clothing, shelter, and shelter to about 1 million people of different nationalities who had been evacuated from the Nazi-occupied territories of the USSR. 200,000 of them were children. In Tashkent alone, 2,323 orphans have been adopted by our compatriots. Thanks to the kindness of our people, they have a lifelong childhood love for Uzbekistan. These people saw our country as their true homeland.

Such kindness of our people is a testimony to the great happiness of living in the homeland, the deep tragedy of statelessness.

**CONCLUSION**

In short, the homeland is the place of ancestors, the country, the people who have grown up, whose language, history, culture, customs and values are truly formed, is the ground on which to grow and mature. It is the childhood duty of each of us to take care of him. Understanding the homeland is a lifelong process for a person.

Our great Khorezm scholar NajmiddinKubro was very old when the Mongol army led by our ancestor Genghis Khan invaded.

Enemies, given his prestige, allowed him to leave the besieged city of Old Urgench. But our brave and wise ancestor will not accept this condition of the enemy.

He and his countrymen died heroically defending their homeland. It is our highest duty to love our dear Motherland, which our ancestors have cherished for thousands of years, and to cherish every inch of its soil like the apple of our eye. Not loving one's country is the greatest loss of human happiness and emotion. Ignoring the fate of the motherland is tantamount to leaving it in the hands of others.

A real child loves the Motherland with all his being, devotes all his energy and abilities to its preservation and development.

## STRENGTHENING THE ROLE OF GERMAN IN EDUCATIONAL LANGUAGE SKILLS

**Kakhorova Zabarjad\***

\*Student,  
Karshi State University,  
UZBEKISTAN

### ABSTRACT

*In this article we can see to what extent the role of language skills is in German. The article discusses the strengthening of the German language among other languages of instruction and the use of innovative methods for teaching German at schools and universities. It also focuses on the special role of language skills in language learning, with an emphasis on the role of language skills in German and their teaching Learner lies.*

**KEYWORDS:** *Language Skills, Educational Language Skills, Language Skills, Communication Difficulties, Reading Fluency, Conference Of Ministers Of Education, Qualification Profile.*

### INTRODUCTION

Educational language skills in the German language are the essential prerequisite for all pupils to learn and to succeed in school. They are therefore of paramount importance in improving equality of opportunity and equity in education. Educational language finds expression in oral and written language use and includes the areas of competence reading, writing (including spelling), listening and speaking. These educational language skills are available individually. They are developed and strengthened through language education and language support.

Language competence describes the ability or the degree of proficiency of (foreign) language learners to apply their knowledge of a language and their skills in a language.

### RESULT AND DISCUSSION

Language is the key to communication, understanding and discourse and therefore essential for a successful degree, regardless of the subject. Competencies in several languages are a prerequisite for mastering an (international) degree and a multiple advantage for students. Without targeted promotion of language skills, neither academic communication nor international careers are

possible. The English language skills of the students and the lecturers must be at a level that guarantees academic language skills that allow a degree without provoking linguistically justified dropouts or dropouts.

As a rule, it is extremely beneficial for cooperation if lecturers are able to act in both languages in an academic context. Linguistic errors will occur, but they should not interfere with communication; in the event of communication difficulties, they can be compensated by switching to the other language. These compensatory languages can also be the source languages of the students. Concepts of language education and language promotion are not limited to teaching in the subjects German and German as a second language or target language, but also focus on specialist teaching and corresponding all-day offers. By linking technical and linguistic action, the students acquire educational and technical language skills in an authentic context.

Language-conscious teaching in all subjects, learning areas and learning fields enables or facilitates the receptive and productive handling of subject and learning content. In particular, in German lessons as the main subject for language education and support, the respective sub-skills are developed systematically and in small steps. Exercises on writing and reading fluency and the conscious use of writing and reading strategies in all subjects, learning areas and learning fields beyond primary level contribute significantly to the development and expansion of the central competence areas of reading and writing. This complex and demanding task to strengthen educational language skills can only be successfully mastered in close coordination and cooperation of all those involved in school education. Successful teaching and learning processes depend to a large extent on a common understanding of the teachers for the importance of language education, diagnostics, language promotion and multilingualism from. The awareness of school administrators and teachers of the relevance of the educational language German in teaching and learning processes in all subjects, learning areas and learning fields should be strengthened. Linguistic education and language promotion are therefore an indispensable component in all phases of teacher training. As part of the university education (1st phase), in the teacher training course at a university or college of education, the aim is to enable prospective teachers to acquire the basics of language education and language promotion. The preparatory service (2nd phase) builds on the knowledge and skills acquired during the course for language education and language promotion. By linking theory and practice, it prepares the teachers for the activities that arise on the basis of the curriculum and education plans and thus “language education as a continuous task of teaching as a standard task for all school types and levels” (intercultural education and education in schools – reports from the federal states on the implementation of the 2017 resolution). Teachers of all types of school should, if possible, be trained in the 3rd phase with regard to strengthening the educational language sub-competencies. The contents of the competences to be taught build on each other systematically and are to be coordinated accordingly between the educational institutions. The cooperation of educators with teachers in the area of “strengthening linguistic competences” during the transition from elementary to primary is of crucial importance, as language education and language promotion can be all the more successful, the earlier this begins in the children’s educational career. The conveyance of concepts of language education and language promotion is already part of the training of educators, based on the requirements of the resolution of the Conference of Ministers of Education “Competence-oriented qualification profile for the training of educators at technical schools and technical academies”.

## CONCLUSION

After all, I believe that every foreign language learned has its own set of rules and abilities. This is particularly reflected in the German language. The above services demonstrate the language skills of the German learners. It is surprising that learners can barely communicate despite good knowledge of German and cannot bring up the expected success. For this, the students practice more, hear a lot, read aloud and memorize texts is particularly important. Only then can the learner see the expected result. That would be all I want to write.

## EDUCATION REFORMS AND ITS EFFECTIVENESS

**Z.A. Zulfikorova\***; **Yu. R. Jurayeva\*\***

<sup>1,2</sup>Department of "Foreign Languages",  
Karshi Engineering and Economics institute,  
UZBEKISTAN

### ABSTRACT

*This article reforms and nature and decrees and decrees and decrees of the industry and its effectiveness is analyzed in detail in education. The peculiarity of this is that in traditional education, students are taught only to acquire ready-made knowledge, while the use of modern technology teaches them to search for their knowledge, study and think independently, analyze, and even draw their own conclusions. Due to the specificity of the foreign language studied in the process of teaching foreign languages, the way of life, cultural creativity of the Uzbek nation and its rich historical heritage are studied in harmony.*

**KEYWORDS:** *Pedagogy, Education, Reform, Decrees, Methods, Pedagogical Technologies, Modernization, Innovation, Higher Education, Foreign Languages.*

### INTRODUCTION

Today, our country has large-scale positive changes in improving the quality and effectiveness of education.

The question of the quality and effectiveness of education is primarily priorities for the quality and effectiveness of the education system, which increases the intellectual potential of today's youth of the current Uzbek youth is one of the priorities.

Achievements in science, technologies, manufacturing and technologies have been created by all possibilities, conditions for all modern modern, innovative approaches, young people in educational institutions working at all stages of the Institute for Continuing Education.

In particular, it is no secret that a number of decisions and decrees were adopted and the growth of reforms in the education system in recent years, and special attention is paid to the preparation of reforms in the education system.

In particular, the Presentation of the President of the Republic of Uzbekistan № 3955-PP dated September 30, 2018 "On the goal of improving the management of the preschool education system" is to strengthen the technical base, ensure the quality of highly educated, highly qualified teaching staff, high-tech personnel arc, aesthetic and physical development of children, as a key goal was identified to radically increase their level of school readiness.

Also, the Law of the Republic of Uzbekistan "On Education" №-637 URL, adopted on September 23, 2020, recognizes the priority of education as a basic principle, freedom of choice of education, non-discrimination in education, equal opportunities for education, The inculcation of national and universal values in education and upbringing, the humane, democratic nature of education and upbringing, the continuity and consistency of education, openness and transparency in the field of education have been strengthened.

In order to identify priorities for systemic reform of higher education in the Republic of Uzbekistan, to raise the process of training highly qualified independent thinking to a qualitatively new level, to modernize higher education, to develop social and economic sectors based on advanced educational technologies The Concept for the Development of the Higher Education System of the Republic of Uzbekistan until 2030, approved by Decree No. 5847, is the basis for new reforms in this area.

It is clear from the above-mentioned legal and regulatory documents that the reforms in the education system are being carried out in a comprehensive, systematic manner.

The intelligence of children in the pre-school education system, which is the first link in the education system, the mastery of information technology requires further improvement of educational programs in preschool education on the basis of advanced foreign experience. According to the President's decree, the program of large-scale comprehensive measures for 2017-2021 envisages radical improvement of the quality of school readiness, introduction of modern approaches to the educational process, creation of all conditions for intellectual, moral, aesthetic and physical development of children

According to the program, it is planned to strengthen the material and technical base of 2,200 preschools, rebuild preschools in rural areas, provide the necessary inventory, equipment, teaching aids and multimedia tools.

It should be noted that in preschool institutions, children have the initial skills to learn a language through various interactive methods, while in schools, systematic work has been done to ensure that children master foreign languages. Children are interested in the introduction of a system of teaching foreign languages based on the age characteristics of students on the basis of new state educational standards and new textbooks in this area. In addition, modern textbooks have been developed for students in grades 1-4, and students and teachers are provided with textbooks one hundred percent free of charge.

In order to increase the effectiveness of foreign language teaching, schools have been provided with all the necessary equipment and inventory, and the textbook "Kids' English" is based on a single conceptual methodology and principles for primary school.

As of 2017, 4th graders who have been educated in accordance with the new state education standards in foreign languages will continue to study in 5th grade, and in connection with this process, existing English, French and German textbooks will also meet the new requirements, it

was redesigned and introduced into the education system as a logical continuation of foreign language textbooks for grades 1-4.

In order to meet the demand for foreign language teachers in 2013-2016, 6,133 graduates of higher education institutions studying in this area were employed in secondary schools. In the 2017-2018 academic year, 1,421 graduates of 18 higher education institutions training foreign language teachers were hired. According to 2017 data, over the past three years, 652 entrants were admitted to foreign languages in 47 districts of the Republic of Karakalpakstan, Kashkadarya, Navoi, Namangan, Samarkand, Syrdarya, Surkhandarya, Fergana and Tashkent regions. recorded.

Significantly, new, unique approaches to teaching a foreign language to schoolchildren have been chosen. In particular, along with language learning, the children got acquainted with the culture of the people whose language is being studied in comparison with our national values and traditions. The textbooks also include examples of Uzbek and world literature, which serve to form a culture of reading in children.

The introduction of advanced pedagogical and new information technologies in education not only increases the effectiveness of teaching, but also plays an important role in educating an independent and logical thinking, well-rounded, mature, highly spiritual person through the practical application of scientific achievements.

Today, there is a growing interest in the use of interactive methods and information technology in education, in the learning process, in the study of foreign languages, in the classroom. The peculiarity of this is that in traditional education, students are taught only to acquire ready-made knowledge, while the use of modern technology teaches them to search for their knowledge, study and think independently, analyze, and even draw their own conclusions. In this process, the teacher creates conditions for the development, formation, acquisition and upbringing of the individual, and at the same time performs the function of management, direction.

In particular, "Brainstorming", "Thought Attack", "Networks" method, "Syncway", "BBB", "Fifth plus", "6x6x6", "Debate", "Role play", FSMU, "In small groups modern interactive methods such as "work", "Step by step", "Zigzag", "Saw", "Give me a word", "Wheel" are used effectively.

In the education system, foreign language teaching focuses on teaching students to think, understand the opinions of others and express them orally and in writing, and the development of an independent-minded, well-educated literate person plays a key role. Due to the specificity of the foreign language studied in the process of teaching foreign languages, the way of life, cultural creativity of the Uzbek nation and its rich historical heritage are studied in harmony.

So, the large-scale reforms being carried out at all stages of the education system in our country, the creation of conditions to enrich the quality of education, broaden the horizons of students, master the achievements of modern science and technology, the use of educational technologies, national, universal values. creates the basis for the formation of In turn, the state provides teachers with sufficient benefits and conditions, and provides effective use of the experience of developed countries.

Advanced pedagogical and new information technologies are effectively used in the learning process, in the acquisition of foreign languages.

### TOWARDS CREATING A TECHNOLOGY-ENHANCED LANGUAGE CLASSROOM: SOME PEDAGOGIC CONSIDERATION FROM THE PERSPECTIVE OF BANGLADESH

Mizanur Rahman Jewel\*; Sheikh Alauddin\*\*

\*Senior lecturer,  
Bangladesh International School and College,  
BANGLADESH  
Email id: mizanbd781@gmail.com

\*\*Assistant Professor and Head in Charge,  
BANGLADESH  
Email id: alauddinbu1957@gmail.com

#### ABSTRACT

*The present paper aims at illustrating the significance of using technology in the language learning classroom. It basically and in general focuses on some of the current practices of Bangladeshi educational institutions in line with the global way-forward. Technology-enhanced language learning is a common phenomenon now-a-days all over the world. Technology aids in the process of language learning in the classroom. The paper focuses on the application of the technology in foreign language learning scenario. At the same time, it brings into light the current scenario of technology uses in the language learning set-up of Bangladesh. It, at the same time, intends to disseminate the information on global and regional foreign language learning set-up.*

**KEYWORDS:** *Technology, Computer-Assisted Language Learning (CALL), Pedagogy, Learners, Foreign Language.*

#### INTRODUCTION

##### Preamble

The challenge Bangladesh faces is how to become a learning society and to ensure that its citizens are equipped with the knowledge, skills and qualifications on information and communication technology (ICT) they will need in the next century. ICT revolution imposes particular challenges on education systems in Bangladesh. These challenges reduce to three

broad areas. The first has to do with participation in the information society, the second considers how ICT impacts on access, cost effectiveness and quality of education, while the third is to do with the way that ICT changes the education process. However, ICT is contributing to ever-increasing inequalities in Bangladesh through the so-called “digital divide” that splits the Bangladesh between those who are “ICT-literate” and the majority who are not and most of the women have no access to a computer and the Internet. A series of factors, including literacy and education, language, time, cost, geographical location of facilities, social and cultural norms, and women's computer and information search and dissemination skills constrain women's access to information technology.

### **Importance of Technology in Contemporary World**

The goals of using technology in the foreign language classroom are the same as in any foreign language classroom: to provide students with opportunities to engage the target language through reading, writing, speaking, and listening comprehension. In fact, using technology, and computers in particular, can only help to give students opportunities to encounter the culture of the target language more authentically.

In the past, it was believed (during the audio-lingual days) that structured drills and repetition were all that were needed to make students more proficient in a language, and this is what “language labs” were mainly used for. Now, research in applied linguistics has shown that meaningful exposure to a language is the most important factor in language learning. The Internet, CD-Roms, recording software, and audio files all provide these opportunities for students to be exposed to the target language in a meaningful way.

The authentic language that students encounter when conducting web-quests or reading on-line versions of newspapers, magazines, and catalogs (store Web sites) is more engaging for students and also provides opportunities for cultural awareness and empathy.

Regardless of the type of technology that a teacher uses, it is important to keep in mind that the meaningful exposure to the target language is the most important factor. Many technology-based activities do not look like traditional classroom exercises, but this is not a bad thing. When students are engaged in an activity that forces them to make meaning of the language that they encounter, they are gaining in proficiency.

### **Why Use Technology in the Language Classroom**

There are many benefits to using technology in the language classroom:

- Multimodal practice with feedback
- Individualization in a large class
- Pair & small group work on projects
- Fun factor
- Variety in resources available & learning styles used
- Real-life skill-building in computer use

There are many different ways to integrate technology into your teaching and the students' learning. These are just a few of those:

---

- Collaborative projects
- Peer editing of compositions
- Email
- Reinforcement of classroom material
- Games and simulations
- Blogging and podcasts
- Web Quests
- Authentic language learning opportunities
- As a resource for multimedia (images, audio, video, etc.)
- As a resource for activity and lesson plans

### **Educational (ICT) Policy of Bangladesh**

Bangladesh faces the challenge of becoming a learning society, and ensuring that its citizens are equipped with knowledge of ICT, skills and qualifications they will need in this century. Application of computers in industry, business, communication, and education and in every other sphere of life demands the extensive introduction of computer education from primary to post-graduate level, and career-oriented professional ICT training provided by NGOs like the Dhaka Ahsania Mission or a training centre like Bangladesh Computer Council. Formal education in computers was first started in 1984 with the foundation of Computer Science and Engineering Department in Bangladesh University of Engineering and Technology. ICT education thereafter gradually extended to the bachelor's degree, higher secondary and secondary school levels. In Bangladesh, there are about 83,796 primary level institutions, 5,694 and 15,748 junior and secondary level institutions respectively, 2,339 higher secondary and degree colleges and more than 1,000 ICT training centers. This section describes the introduction and status of ICT education in primary and junior secondary, secondary and higher secondary, diploma, undergraduate and post-graduate levels, and career-oriented professional ICT training.

### **History: From audio-lingual to multi-media.**

The language laboratory with which most Americans are familiar was a creation of the boom in education and technology after World War II. The audio-lingual method of the 50's and 60's demanded a great deal of repetition and creation of language within established patterns such as the person-number substitution drill. During the height of this method in the 60's and 70's, schools and universities often had several large rooms dedicated to carrels in which students would sit, either by themselves or in a class, and answer questions posed to them on audiotape, or repeat utterances for the purpose of checking their own pronunciations or grammar. From an instructional point of view, it was not unusual to devote a full day of class (one-fifth to one-fourth of the entire course) to taking the class as a whole to the lab. As audiotape technology became more inexpensive and widespread, students began to listen to their tapes at home. Language labs made available high-speed copiers so that students could make a personal copy of the lesson to listen to at home. Publishers were made aware of this trend, and began to bundle individual audiotapes with the textbooks. The ease of personal access to audiotape technology had two immediate consequences. First, attendance at language labs began to drop as it became

unnecessary for students to sit in carrels to do their homework. Second, anecdotal evidence began to mount that students were simply not getting the same benefit from listening to tapes at home. Professors complained that students were not listening to the tapes properly, if at all. They would rarely repeat a tape until they got the answers right, and they were not checking their answers properly. Students, who by the 80's were accustomed to being entertained at home via television, Nintendo, and personal computers, complained that the tapes were just too boring to be believed, and they were simply unwilling to spend the time repeating drills the way their parents had. The final nail in the coffin of the audio lab was the death of the audio-lingual method itself. New research noted that it was not necessary to bore students with repetitive drills in order for them to learn language, but it was important to engage the students in the language as often as possible.

As early as the 60's and 70's, foreign language methodologists began to experiment with computer-assisted language instruction. The early efforts, dependent entirely upon the access one had to the computer (usually a line-by-line terminal attached to a mainframe), were little more than electronic workbooks. The student would be asked a question, type in an answer, and be given immediate feedback whether the answer was wrong or right. Some programmers favored the game model, in which one played simple games like "Hangman" in the second language. Some students, those particularly interested in language or computers, were inspired to learn in this way, but for most, the experience turned out to be as unpleasant as the audio lab: one had to go to a public place, sit in a carrel, and do repetitious work. Only this time the students had to contend with unfamiliar technology, user interfaces that varied greatly from machine to machine (especially in the approach to foreign characters), and, as with their experience listening to tapes at home, little to no supervision. At the same time that MTV was revolutionizing the visual vocabulary of a generation, computer screens full of text or excruciatingly amateurish graphics.

It wasn't until the 90's that the possibilities of computer-assisted language learning (CALL, for short) really opened up. On the hardware side, personal computers finally got fast and big enough to run sophisticated programs, and networking began to make technology available for collective endeavors such as education. With larger machines came multimedia capabilities: CD-Rom, Midi ports, and the like. On the software side, the success of the Windows operating system meant that PC users could finally learn the benefits of a standard user interface that Macintosh users had known for years: learn one interface, run any program using the same key-stroke commands. Of course, the software also kept up with the growing capabilities of the hardware, and it became extremely easy to run complicated software on CD or link to the Internet with a double click. The market soon discovered the interest in foreign language instruction, especially for business, and responded with several language "methods" for the most profitable language. (It should be noted that these CDs offer little more than conversational language methods. They can teach phrases and vocabulary and some grammar, but they are hardly the same as a full language course.) Even more important than the commercial offerings was the explosion in the World Wide Web across the world. In an hour in front of a computer, a student can now visit a variety of sites in the countries in which their target languages are spoken and see "authentic language," that is, language written by native speakers for native speakers. At the same time, they learn about the culture both directly and indirectly, through pictures, audio, videoclips, discussion groups, e-mail resources, and the like. Language teachers always knew that to learn a language one had to "go there." Now, it appeared that "there" was able to come

her. Since the web was available from both Macintosh and Windows platforms, even the perennial problem of hardware differences appears to have been overcome.

Programs that had hesitated to jump on the technology bandwagon when all it offered were simple programs (like the modern language program at Trinity) realized that the time had come to take advantage of the hardware and software at hand. Since the audio-lingual lab was essentially dead anyway, and since the entire campus, including the residence halls, was wired for the campus network during the summer of 1996, we could only improve current instruction by seeing what could be done to create what we optimistically called the "virtual language laboratory."

### **Basic Assumptions**

If students won't come to the lab, then the lab can go to the students. The faculty at Trinity has by no means given up on the value of a language lab. Research has shown that language proficiency is a direct function of time spent dealing with the language. The "virtual language lab" was not meant to replace any of the tools of the past. Students would still be expected to use textbooks, audiotapes, and workbooks for drill and practice. The technology is intended to enhance the traditional classroom language acquisition experience. Because this is a kind of lab, it is expected that students will use it on their own time, that they will learn language because they are dealing with it, either by reading web pages in the target language, or by participating in student-oriented discussion groups or e-mail exchanges, or by listening to RealAudio or shortwave broadcasts, or by doing activities similar to those found in their workbooks, but adapted to take advantage of the multimedia technology.

This rationale has a number of assumptions behind it. First, on the side of language learning and instruction, it is assumed:

1. that students do not necessarily need only structured drills in order to learn, that language acquisition takes place any time the student is dealing with the target language (one might make the pedagogical leap and assume that the more students are engaged with a target literature or culture the more they will learn about those as well);
2. that information that students discover on their own has greater impact than information they are told or that they gain through memorization;
3. that "authentic language" is more engaging and useful (although occasionally problematic) than created pedagogical language, and that, as a result, students will be interested in accessing authentic language web pages in their target language, perhaps enough so to click on a few links of their own and go exploring, thus spending more time with the language and culture;
4. that websites and other software appropriate to a language lesson can occasionally be brought into class, thus giving the students a common "lab" experience;
5. that culture, which has been recognized as essential to full comprehension of another language, is easier to comprehend from real-life web pages than from the distilled cultural overviews usually written into textbooks;

6. that language, literature, and culture are intertwined so that one cannot really know one without knowing something of the others and that one always learns something about the others by studying one of them; and
7. that professors are willing to adapt their materials to include Internet materials and accommodate the unexpected, such as when a student brings a previously unknown site to the attention of the class;

### **Online Activities**

The following is a list of the most popular kinds of activities multimedia technology offers to students:

- e-mail, discussion, chat, and lists
- web page creation
- games, including web hunts
- current events: news, sports, leisure activities
- information retrieval; research
- authentic language through personal web pages
- images and maps available to supplement readings
- analyze texts electronically
- online audio and video

### **Using technology for different areas of language study**

While technology has had a major influence on the teaching and learning of languages, a lot of disagreement surrounds areas such as the teaching of grammar, vocabulary, language skills and testing.

#### **Grammar**

The increase in the number of interactive exercises on CD-ROM and the web has undoubtedly benefitted the analytical learner. Students can practise 24/7 and receive instant feedback. However, many teachers and material writers would argue that this kind of practice is based on an outdated, stimulus-response methodology. These grammar exercises 'skewer' the language, so on-line practice focuses on 'crisp' areas of language at the expense of 'fuzzy' areas. Here's a good example of this distinction:

Crisp: Is 'I went there': (a) Simple past? (b) Present perfect?

Fuzzy: What's the difference between (a) 'I did it' and (b) 'I've done it'?

#### **Vocabulary**

Arguments are currently raging about the use of electronic translators. These provide many benefits, allowing students to cross-check between bi-lingual dictionaries and mono-lingual dictionaries, and encouraging them to review language. Yet, when used for production, they seem to encourage the selection of the wrong word in English, and teachers can quite easily spot

an essay written with the help of one of these small machines. They also inhibit fluency if students take them out in discussion classes – which they frequently do.

### Skills

In the area of the receptive skills, listening and reading, the effect of technology has been huge. The Internet has provided a vast range of material, offering many more opportunities for exposure to authentic materials, both audio and text. At the same time, much of this material is clearly unsuitable for language learners. The debate continues as to how useful YouTube is and to what extent is technology ‘responsible’ for the rise in plagiarism in EAP (English for academic purposes).

The influence of technology on the productive skills of speaking and writing is, arguably, less. If you wish to improve fluency, many students would argue that nothing is better than a face-to-face language lesson, a discussion class with the teacher. Can the same be said about taking a fluency class using Skype, a web-based program such as Illuminate or a class in the virtual world, Second Life? What value does ‘Voice recognition’ have? Wikis enable students to compose an essay together at a distance, making them a suitable medium for collaborative writing. However, not all learners wish to learn from each other, and prefer only the teacher to correct their work, rather than a peer.

### Testing

There has been an explosion of on-line testing in the last few years. Such test materials use the same formats as multimedia materials: gap-fill, multiple choice etc. Is this a match made in heaven? Some would argue that on-line tests actually favour students who use computers, and ignore the assessment of ‘affective factors’ such as personality and learner type.

### Theory vs Practice

This is a world which is driven by technology. The innovators innovate, and later, pedagogy plays catch-up, as teachers try things out. The world of theory (of evidence and research) is, arguably, lagging behind what is happening in the classrooms. In other words, if you wait for a case study to justify whether or not Twitter has value, you may be waiting a long time, and the technology will have moved on by the time the research has been done.

### Technology readiness for the educational institutions of Bangladesh

Bangladesh has a relatively long experience in the use of computers - the first "second generation" computer was installed in 1964 at Dhaka and very soon some of the large banks and industrial concerns started using computers, mainly for accounting and payroll applications. The utility companies (e.g. gas, electricity) also started using the bureau facilities of these installations for their customer billing. Unfortunately, the financial crisis that the country faced immediately after its independence in 1971 did not permit the sustenance of this early lead and lack of maintenance forced the closure of most of these installations.

Although the possibility of export of data entry services and software from Bangladesh has been discussed for over a decade, only a few companies were successful in getting some work from outside. In June 1997, the Government of Bangladesh appointed a Committee (with the author of this article as its Convenor) to look into the problems and prospects of export of software from Bangladesh. The Committee submitted its report in September, 1997. It contained 45 recommendations, both short term and medium term; some of these recommendations have

already been implemented and the government has asked different concerned ministries to go ahead with implementing the other recommendations.

Although not properly exploited yet, Bangladesh does have quite a few inherent strengths which can be used as the launching pad for making this country a potential offshore source of Software and Data Processing Services. Some of these advantages are :

A substantial number of educated unemployed youth force, with ability to read and write English, exists in the country. They can be trained in the required skill (particularly in Data Processing Services) within a short time. Quite a few Bangladeshi skilled professionals have been working abroad. They can be encouraged to return to the country and/or collaborate with Bangladeshi entrepreneurs, provided proper environment is created. Universities in Bangladesh are turning out an increasing number of graduates in Computer related subjects every year, although the number is much less than the requirement. A large number of Bangladeshi students are studying overseas in Computer related subjects. A wide range of Hardware platforms, from Mainframe to

The government has taken a decision recently (June, 1998) to withdraw all import duties and VAT from all computer hardware and software. This has brought the prices of computers down to a level affordable by middle income households and sales of PCs have soared during the last few months. A 80-90% annual growth in the number of PCs sold is expected this year.

An Information Technology village is going to be set up very close to Dhaka. The government has already made 18 acres of land available for setting up this IT village. This would be similar to the Software Technology Parks in India. All the infrastructure, including high-speed telecommunication facilities (2 Mbps link) would be provided. These would enable the small companies to move into buildings with readily available facilities. Since this is going to take at least two years, a decision has been taken to initially set it up in an existing building in Dhaka.

In June, 1996 the government decided to allow private companies to act as Internet Services Providers (ISPs) using VSATs. At present, there are about 22,000 account holders with the ISPs (8 in Dhaka and 2 in Chittagong) and the total number of users would be around 100,000. The slow speed of access provided by VSATs ( max. 128.8 kbps) is a major constraint. A number of Cybercafes providing e-mail and Internet browsing facilities have been opened in Dhaka city; these are quite popular among the young generation. Public kiosks with internet facilities are also being planned.

BTTB has already established a network for providing Internet connectivity and plans to start commercial service very soon. The proposed tariff rate should make Internet connection affordable to a larger cross-section of public. BTTB is also establishing a fibre optic backbone in the country. They also plan to offer ISDN service very soon using the facilities of the already installed digital exchanges in Dhaka and Chittagong cities.

In order to enable the young entrepreneurs in the IT field, a special fund has been created by the government to provide working capital loan without any collaterals. A venture capital fund is also being set up. The banking procedures are also being amended and simplified to reflect the different nature of software transactions.

Experience of other countries shows that it is very difficult to achieve success in exporting software unless there is a big domestic market. The government ministries and departments are

being asked to computerise their activities. A domestic price preference of 15% would be given to suppliers of locally developed software.

Some of the local firms have already succeeded in exporting software, although the total amount is not very large. One firm has been producing CDs with searchable database for US and Latin American clients. CAD conversion work and web-page design work are also being undertaken. Taking advantage of the considerable number of COBOL programmers who were trained in the sixties and seventies, a number of firms are doing work related to the Y2K problem. ERP software is being developed by a local firm in partnership with Microsoft.

The government has placed top most priority to human resource development in the IT field. At present, the annual output of graduates in the IT field would be around 500. The target is to produce 10,000 programmers annually by the year 2001. There are about 24 Universities offering undergraduate degree programmes in IT-related fields. All the four BITs (at Rajshahi, Chittagong, Khulna and Gazipur) are also planning to offer undergraduate degree programmes in computer science and engineering from next year. The 20 Polytechnics are also introducing 3-year diploma programmes in Computer Technology. In addition, a large number of educational and training institutes, many of them with linkage with foreign institutions, are also offering training courses. One of the major problems faced by these institutions is the shortage of trainers. Recognizing this problem, the GOB Committee (referred to earlier) recommended that BCC should take up a crash programme to train at least 1000 high-level trainers by the end of 1999. Moreover, the absence of adequate physical resources (e.g. computer hardware and software) and weakness in course contents in the training institutions will adversely affect the quality of output from these institutions. An accreditation system is planned to be introduced by the government soon.

BUET was the first institution to offer post-graduate degrees (M.Sc. and Ph.D.) in Computer Science and Engineering. Some other institutions have also initiated research programmes in IT related fields. These include Machine Learning, Pattern Recognition, Speech Recognition, Automatic Translation, Computational Algorithm, VLSI and 3-D Vision. Considerable research work has been done in the use of Bangla in computers. Unfortunately like R&D in other fields of science and technology, there is very little interaction between academia and industry.

Efforts were initiated about 13 years back to introduce computers in schools and colleges. 'Computer Studies' has been introduced as an optional subject both in SSC and HSC examinations. The lack of adequate physical facilities, computers and qualified teachers has resulted in very few students opting for these courses. Experience of other countries shows that teaching of computer programming by incompetent teachers may do more harm than good. Therefore, teacher training is one of the priority actions to be taken.

In order to co-ordinate the computerisation activities of government and semi-government agencies a National Computer Committee was set up in 1983. This was transformed into the National Computer Board in 1988 and the Bangladesh Computer Council was set up in 1989 by an Act of Parliament. It had some initial problems and faced a lot of criticism from the IT community when it became more of a regulatory body, rather than a promotional body as originally envisaged. It is planned to strengthen BCC by inducting more IT professionals, so that it can play a bigger role in IT development in the public sector, particularly in human resource development.

A large number of Bangladeshis are now working in the IT field in different companies in USA and are gradually moving up the organizational hierarchy. The government is trying to get the assistance of these non-resident Bangladeshis (NRBs) in IT development, particularly by giving them incentives to set up software companies in Bangladesh.

Although the banking sector had been among the pioneers in computerization in Bangladesh, the present level of computer usage in banks is very low. The foreign banks operating in Bangladesh have taken a lead in computerizing their front office operations. It is only during the last 4/5 years that some of the Bangladeshi banks have started gradually computerising their front office activities and very soon a network of automatic teller machines (ATMs) using VSATs would be set up by the private banks throughout the major towns.

At present, Internet access is available only in a few Universities. The University Grants Commission is setting up BERNET (Bangladesh Educational and Research Network) establishing linkage among the Universities and providing access to the Internet.

The present government has recognized IT as one of the priority sectors and is providing all support to the private sector to enable them to enter the export market for software and data processing services. Recognizing the bright future of IT, a large number of students, young professionals and businessmen are taking keen interest in acquiring knowledge about computers and its applications. This is reflected in the tremendous enthusiasm generated in the on-going International Computer Show organized by Bangladesh Computer Samity. It is expected that within the next 3 to 4 years, IT applications in Bangladesh would not only spread to various private and public sector offices and industrial units, but Bangladesh would emerge as a regional hub for software development.

### **Using Video in the F/SL Classroom**

What are the practical implications of using video in the classroom? At the most basic level of instruction, video is a form of communication and it can be achieved without the help of language, since we often interact by gesture, eye contact and facial expression to convey a message. Video provides visual stimuli such as the environment and this can lead to and generate prediction, speculation and a chance to activate background schemata when viewing a visual scene reenacted. It can be argued that language found in videos could help nonnative speakers understand stress patterns. Videos allow the learner to see body rhythm and speech rhythm in second language discourse through the use of authentic language and speed of speech in various situations. Videos allow contextual clues to be offered. In addition, video can stimulate and motivate student interest. The use of visuals overall can help learners to predict information, infer ideas and analyze the world that is brought into the classroom via the use of video instruction. In a teaching or testing situation video can help enhance clarity and give meaning to an auditory text; it can create a solid link between the materials being learned and the practical application of it in a testing situation; the video can act as a stimulus or catalyst to help integrate materials or aspects of the language; videos can help manipulate language and at the same time be open to a variety of interpretations.

Arthur (1999) claims that:

"Video can give students realistic models to imitate for role-play; can increase awareness of other cultures by teaching appropriateness and suitability; can strengthen audio/visual linguistic

perceptions simultaneously; can widen the classroom repertoire and range of activities; can help utilize the latest technology to facilitate language learning; can teach direct observation of the paralinguistic features found in association with the target language; can be used to help when training students in ESP related scenarios and language; can offer a visual reinforcement of the target language and can lower anxiety when practicing the skill of listening."

Video used in a classroom should be interpretive and to the point. The visual should show reasonable judgment and enhance comprehension, heighten sensory acuteness, and illustrate the target language being used. Practitioners should avoid the use of distracters, over-crowded or violent stimuli. Visuals are ineffective in the learning process when the visual is too small; when the visual or video uses stereotypes; when the visual or video is a poor reproduction; when the picture is too far away from the text illustration; when the video has irrelevant captioning; when the video or visual offers too much information related or unrelated to the picture; when the video or visual is poorly scaled; and when the picture is not esthetically meaningful. A visual cue may be accompanied by a written cue to focus on a lexical item being furnished. Videos can make the task, situation or language more authentic. More importantly, video can be used to help distinguish items on a listening comprehension test, aid in the role of recall, help to sequence events, as well as be adapted, edited or changed in order to meet the needs of the language learner (Canning, 1998).

### **Key Consideration for Using Video in the Classroom with Nonnative Speakers**

Although video may be a popular tool to use with students, as F/SL educators we must not lose sight of the educational purpose it has in the language classroom. It is suggested that language teachers should ask themselves the following questions before implementing a video lesson with F/SL learners:

- How will the language learner benefit from the use of video in the classroom?
- How will the visual component enhance the auditory component?
- Who will select the video? Is it the class, the teacher or the curriculum developers?
- Who decides which language should be exploited from the video? Is it the class, teacher or curriculum developers?
- How do you plan to exploit the 1-10 minute segment of the video? What are the alternative methods of exploiting the clip for further reinforcement in the classroom?
- Whose responsibility is it to select key vocabulary and structures from the video?
- Who decides how many times the video is played?
- How can students and teachers develop academic listening and conversational listening activities based on the video?
- How is the video used in a classroom context?
- How does video support the curriculum?
- Can the comprehension of the video be measured without visual support?
- Can the comprehension of the video be measured without auditory support?

- How will you assess the comprehension of the video by the language learners?
- How practical is the video to improve a learner's academic listening and/or conversational listening skills?
- What is the educational purpose for showing the video? How will you later assess its effectiveness with the learners ability to comprehend information?

### **Using Computer in language classroom**

For some tasks, computers can provide distinct advantages over more traditional approaches. The use of a computer for listening exercises often provides not only sound, but also visual input providing students with more contextual clues. Students interacting with a computer are also using motor skills as well, which can have a strong reinforcing effect on the learning process by connecting physical actions (clicking, typing) with desired results. Students are also allowed more control over their own learning process as they make the decisions when to repeat questions, exercises and sequences based on their own progress.

Probably the strongest argument for the use of the computer in the classroom environment is that of student self-pacing. Especially in the field of pronunciation, students can employ a computer to record themselves to compare their pronunciation to a target pronunciation. This can be repeated endlessly until a student is satisfied with his/her result. These pronunciation exercises are often combined with visual aids (such as intonation graphs) to help the student recognise how his/her pronunciation compares to the target pronunciation. Common tools such as spell checking can also provide the student with valuable self-analysis instruction.

Finally, with the aid of the Internet and CD-Rom based materials, teachers can quickly access documents addressing individual student needs. This is especially effective when teaching English for Specific Purposes such as Business English. An example would be white papers put up on a company web-site discussing certain technologies in English that students are currently employing. Another example is glossaries provided for specific business sectors (port, banking, insurance, etc.). Using these materials, the teacher can often provide content addressing specific student needs, thereby improving motivation and effectiveness.

### **Making the student comfortable with the technology**

Admittedly, the computer can be an overwhelming and imposing instrument to students and teachers. The complexity of the computer - not to mention the overwhelming choice of possibilities - can put students and teachers off as they lose time grappling with how to use the computer. There are a few basic principles that should be followed in order to help the student (and teacher) feel more at home using the computer.

- The computer should always be turned on, booted, and the program loaded (preferably the exercise chosen) before the class begins. In this manner, students focus on doing the task at hand rather than getting to the point where they can do the task.
- Students who are not comfortable using computers should be placed with students who are. These students should not be forced to use the mouse or type at the keyboard. As they become more familiar with the technology, they will often begin to play a more active role - even if they don't, the ability to use the computer is not the issue.

- Students more comfortable with the computer should be strongly discouraged from using other resources available in the program itself, or in other programs. These students should be encouraged to explore these resources on their own by taking advantage of self-access programs.
- Use of the computer should be phased in; instead of introducing a complex series of exercises to be done for a lesson, teachers should begin by doing a limited amount of work with the computer (i.e. one listening exercise followed by an interactive quiz).

### **Computer-assisted language learning (CALL)**

Computer-assisted language learning (CALL) is a form of computer-based learning which carries two important features: individualized learning and bidirectional learning. It is not a method. CALL materials are materials for learning. The focus of CALL is learning, and not teaching. CALL materials are used in teaching to facilitate the language learning process. It is a form of student-centered learning materials, which promote self-paced accelerated learning. CALL is not a software application, but rather courseware that is designed specifically for language learning for a specific group of learners.

CALL originates from CAI and was invented in 1960s. Computer-Assisted Instruction was first viewed as an aid for teachers. The philosophy of CALL puts a strong emphasis on student-centered lessons that allow the learners to learn on their own using structured and/or unstructured interactive lessons. These lessons carry 2 important features: bidirectional (interactive) learning and individualized learning. It is a tool that helps teachers to facilitate language learning process. CALL can be used to reinforce what has been learned in the classrooms. It can also be used as remedial to help learners with limited language proficiency.

The design of CALL lessons generally takes into consideration principles of language pedagogy, which may be derived from learning theories (behaviorist, cognitive, and constructivist) and second language learning such as Krashen's Monitor Theory.

Others may see CALL as an approach to teaching and learning foreign languages whereby the computer and computer-based resources such as the Internet are used to present, reinforce and assess material to be learned. CALL can be made independent of the Internet. It can stand alone for example in a CDROM format. Depending on its design and objectives, it may include a substantial interactive element especially when CALL is integrated in web-based format. It is in the area of industrialization of teaching that is reigning now. The traditional face-to-face teaching which is based on interpersonal communication between the teacher and student is gone. However, the industrialized teaching is able to offer teachers with the opportunity of sourcing from the computer internet rather than being faced with the problem of materials. It may include the search for and the investigation of applications in language teaching and learning. Except for self-study software, CALL is meant to supplement face-to-face language instruction, not replace it.

Computers have been used for language teaching ever since the 1960s. This 40-year period can be divided into three main stages: behaviorist CALL, communicative CALL, and integrative CALL. Each stage corresponds to a certain level of technology and certain pedagogical theories. The reasons for using Computer-assisted Language Learning include: (a) experiential learning, (b) motivation, (c) enhance student achievement, (d) authentic materials for study, (e) greater

interaction, (f) individualization, (g) independence from a single source of information, and (h) global understanding. The barriers inhibiting the practice of Computer-assisted Language Learning can be classified in the following common categories: (a) financial barriers, (b) availability of computer hardware and software, (c) technical and theoretical knowledge, and (d) acceptance of the technology.

In multimedia programs, listening is combined with seeing, just like in the real world. Students also control the pace and the path of the interaction. Interaction is in the foreground but many CALL programs also provide links to explanations simultaneously. An example of this is Dustin's simulation of a foreign student's arrival in the USA. Programs like this led also to what is called explorative CALL.

More recent research in CALL has favored a learner-centered explorative approach, where students are encouraged to try different possible solutions to a problem, for example the use of concordance programs. This approach is also described as data-driven learning (DDL), a term coined by Tim Johns.

### **Theoretical basis for CALL instruction design**

Computers have become so widespread in schools and homes and their uses have expanded so dramatically that the majority of language teachers now think about the implications. Technology can bring about changes in the teaching methodologies of foreign language beyond simply automating fill-in-the-gap exercises. The use of the computer in and of itself does not constitute a teaching method, but rather the computer forces pedagogy to develop in new ways that exploit the computer's benefits and that work around its limitations. To exploit the computers' potential, we need language teaching specialists who can promote a complementary relationship between computer technology and appropriate pedagogic programs.

A number of pedagogical approaches have developed in the computer age, including the communicative and integrative/experimentative approaches outlined above in the History of CALL. Others include constructivism, whole language theory and sociocultural theory although they are not exclusively theories of language learning. With constructivism, students are active participants in a task in which they "construct" new knowledge based on experience in order to incorporate new ideas into their already-established schema of knowledge. Whole language theory postulates that language learning (either native or second language) moves from the whole to the part; rather than building sub-skills like grammar to lead toward higher abilities like reading comprehension, whole language insists the opposite is the way we really learn to use language. Students learn grammar and other sub-skills by making intelligent guesses bases on the input they have experienced. It also promotes that the four skills (reading, writing, listening and speaking) are interrelated. Sociocultural theory states that learning is a process of becoming part of a desired community and learning that community's rules of behavior.

What most of these approaches have in common is taking the central focus away from the teacher as a conveyor of knowledge to giving students learning experiences that are as realistic as possible, and where they play a central role. Also, these approaches tend to emphasize fluency over accuracy to allow students to take risks in using more student-centered activities, and to cooperate, rather than compete. The computer provides opportunity for students to be less dependent on a teacher and have more freedom to experiment on their own with natural language in natural or semi-natural settings.

---

### **Use of CALL for the four skills**

A number of studies have been done concerning how the use of CALL affects the development of language learners' four skills (listening, speaking, reading and writing). Most report significant gains in reading and listening and most CALL programs are geared toward these receptive skills because of the current state of computer technology. However, most reading and listening software is based on drills. Gains in writing skills have not been as impressive as computers cannot assess this well.

However, using current CALL technology, even with its current limitations, for the development of speaking abilities has gained much attention. There has been some success in using CALL, in particular computer-mediated communication, to help speaking skills closely linked to "communicative competence" (ability to engage in meaningful conversation in the target language) and provide controlled interactive speaking practice outside the classroom. Using chat has been shown to help students routinize certain often-used expressions to promote the development of automatic structure that help develop speaking skills. This is true even if the chat is purely textual. The use of videoconferencing give not only immediacy when communicating with a real person but also visual cues, such as facial expressions, making such communication more authentic.

However, when it comes to using the computer not as a medium of communication (with other people) but as something to interact with verbally in a direct manner, the current computer technology's limitations are at their clearest. Right now, there are two fairly successful applications of automatic speech recognition (ASR) (or speech processing technology) where the computer "understands" the spoken words of the learner. The first is pronunciation training. Learners read sentences on the screen and the computer gives feedback as to the accuracy of the utterance, usually in the form of visual sound waves. The second is software where the learner speaks commands for the computer to do. However, speakers in these programs are limited to predetermined texts so that the computer will "understand" them.

Self access language learning centers or independent learning centres have emerged partially independently, and partially in response to these issues. In self-access learning, the focus is on developing learner autonomy through varying degrees of self-directed learning, as opposed to (or as a complement to) classroom learning. In most centres, learners access materials and manage their learning independently, but have access to staff for help. Many self-access centres are heavy users of technology and an increasing number of them are now offering online self-access learning opportunities. Some centres have developed novel ways of supporting language learning outside the context of the language classroom (also called 'language support') by developing software to monitor students' self-directed learning and by offering online support from teachers.

Center managers and support staff need to have new roles defined for them to support students' efforts at self-directed learning. In fact, a new job description has emerged recently, that of a "language advisor".

### **CONCLUSION:**

Foreign language learning especially English language is a dominant aspect for the present world. The tradition of technology based language learning is growing and spreading around the globe with the global changing scenario. Bangladesh is also trying to cope up with global

prospective. If, some improvements, on certain aspect can be made the country would be able to flourish the shifting trend in a more better and comprehensive manner.

### ABSTRACT

*It is known that in the conditions of the irrigated soils of our country, the cultivation of secondary crops allows the cultivation of additional crops from each hectare of land. When legumes are used as a secondary crop, not only the grains of these crops, but also their soybeans and other waste products are used as feed rich in whey protein for livestock, which is more "healthy" for livestock than wheat straw. This article discusses the relevance of using legumes and provides scientific advice in this regard. At the same time, the introduction of innovative technologies in the use of leguminous crops is being studied.*

**KEYWORDS:** *Legumes, Soil, Crops, Irrigation Technology, Mineral Fertilizers, Protein, Nitrogen.*

### INTRODUCTION

A number of decisions, orders adopted on more efficient use of land and water in agriculture in Uzbekistan since 2016, the introduction of best practices into the new farming system, the revision of foreign agricultural technologies, irrigation and fertilization in each region, the introduction of significant innovations in the placement of agricultural crops has served to increase the volume export and quality improvement.

The growing increase in humanity has made human needs the main criterion - the provision of food in the country and the task of increasing productivity from year to year. In recent years, the sown area under cotton and winter wheat has reached 2.2 million hectares, and the sowing of legumes such as moss, beans, soybeans, peas, on land freed from winter crops, prevented the

deterioration of the soil cover, for the development of animal husbandry, mixed sowing of peas, vinyas, vetch, beans with corn, sowing corn for grain, the extraction of oil and protein from soybeans also improve the quality of feed.

### **Main part**

Planting plants in the spring to meet the world's protein demand, such as soybeans, peas and moss, will also help meet the protein demand. Currently, according to FAO, a person's protein requirement should be 90-100 g per day.

Protein deficiency in humans leads to physiological functional retardation of growth and development, rapid fatigue, especially mental fatigue.

Protein demand from legumes, alfalfa, alfalfa, legumes, green manures and catch crops is radically improved by meeting the demand for animal protein, which is important for improving human health. Protein from legumes is easier and better absorbed (before March 3), and animals also rank higher than other grains. Vegetable protein is the cheapest and most digestible. This means that legumes store several times more nitrogen than other plants, which makes the soil more fertile. Nitrogen, on the other hand, enriches the soil with substances that are constantly needed in the biotic world, as well as phosphorus, potassium, molybdenum, manganese, zinc.

To obtain a high and high-quality yield from leguminous crops, i.e. the use of the maximum amount of nitrogen in the air; a) depending on the pH of the soil or soil solution, lupine is good at pH -5.0, excellent at pH 6.0, good at pH -7.5, soybeans and beans - 6.5-7; 2 - conditional water regime (75 - 80%) - norm; Condition 3 should be aeration, ie, aerobic aerobics; Condition 4 If legumes have not previously been planted in the ground, the seeds should be moistened with nitrogen 3-4 hours before sowing in a cool (protected from the sun) place, otherwise the crop will not form.

5<sup>th</sup> condition is in the fertilization system should be sprayed with seeds that consume 1 kg / ha of elements containing trace elements, spraying with molybdenum on acidic soils gives good results. Nitrogen fertilizers are applied to the young phase before sowing, phosphorus and potassium are added at 100–80 kg /ha before plowing.

### **DISCUSSION**

In the eighteenth and nineteenth centuries, European scientists noted the effect of natural nitrogen, phosphorus and potassium on the growth of natural nitrogen, phosphorus and potassium in soil. For example, one of the founders of agrochemistry, the German chemist J.Libih (1847), in his book "Chemistry in Agriculture and Physiology" said that the plant receives ammonia from the air, but in 1856 it was even believed that the plant receives nitrogen through the roots in the form nitrate. Since then, many researchers have proven that plants need macro, micro and ultra micro nutrients.

Today, there are several microorganisms that accumulate nitrogen in the soil, including ammonifiers, nitrogen fixers, nitrifiers and denitrifiers. Scientific research has solved the problem of bacteria that bind proteins, nucleic acids, molecular nitrogen and convert ammonia to nitrate.

19 substances in the plant are elements S, N, O, N, P, S, K, Ca, Mg, Fe, Mn, Cu, Zn, Mo, B, Cl, Na, Si, CO, which are important. ; of which C, H, O, N are organogen, 95% of the body, the rest

are P, S, K, Ca, Mg, Fe, Al, Na, Si, etc. 5%. 0.001% by weight of the plant, but the substances necessary for growth and development are called ultra-trace elements Mn, Cu, Ca, Mo, B, Co.

**Fig.1. The structure of Root nodules in beans.**

The results showed that in the initial periods of ontogenesis (10-12 days) in this and non-fed variants of fertilization of beans and peas little differs from the plant, the accumulation of the biomass of photosynthesis per day increased significantly due to the activation of growth from the beginning of branching.

It was found (determined) that in both plants chlorophylls "a" and "v" on the leaves were 4.2-4.8 mg per 1 dm<sup>2</sup> of surface (beans) -2.90-3.15 mg when applied with nitrogen and phosphorus-potassium fertilizers. In addition, the accumulation of chlorophyll in the world flow is most intense in the morning (9-11), slows down at 13-16 hours of the day and increases again in the evening (Table 1).

**TABLE 1. THE AMOUNT OF CHLOROPHYLL IN THE LEAF IN THE EXPERIMENTAL VARIANTS (ON AVERAGE FOR 2017-2018)**

Options	3-5 true leaves		Buddingphase		Flowering (blossom) phase		Whenthe 2-3 beans are ripe	
	"a"	"b"	"a"	"b"	"a"	"b"	"a"	"b"
1.	7,5	1,8	7,5	1,8	8,0	1,10	7,4	0,82
2.	8,6	2,1	9,2	2,1	9,6	1,80	5,8	0,91
3.	7,9	2,3	9,3	2,0	11,3	1,84	6,0	1,10
4.	6,9	2,0	11,3	1,95	12,3	2,0	6,1	1,12
5.	7,4	2,1	11,4	2,1	12,0	2,3	6,3	1,13
6.	7,3	1,2	12,3	2,1	11,1	2,2	6,2	1,12
7.	8,3	2,3	13,6	2,4	12,4	2,3	7,2	1,14

Based on the above, since 2017, stationary experiments have been carried out to determine the effect of different levels of nitrogen on peas, soybeans, beans in the humid regions of the

Chimgan hills of the Fergana region, we research mainly on the number, weight, life expectancy of branched bacteria in beans, pea root.

*Fig. 2. The structure of the Root nodules of the pea plant.*

In experiments carried out on pie endogenous bacteria, the seeds were treated with 137 nitrogen preparations when sowing cotton after wheat in 2016. In the second year, they were transplanted in the spring without nitrogen, in the summer 3 more times. At the same time, starting from 2017, soybeans were planted with the Nasaf variety. In 2017, 2018 and 2019, before sowing half of 30,60,90,120 kg of nitrogen per hectare, the rest was watered with cultivator fertilizers to a depth of 15-16 cm. All agrotechnical work was carried out in accordance with the recommendations of N.N. Ataboeva, Sh. Khudoikulov (2018) in "Plant growing" ("Botany").

## **DEVELOPING SMALL BUSINESS AND ENTREPRENEURSHIP THROUGH THE TRANSITION TO THE DIGITAL ECONOMY**

**Obidjon Azizov\***

\*Independent Researcher,  
 Department of economic theory of the Socio-Economic Faculty,  
 Fergana State University, UZBEKISTAN

### **ABSTRACT**

*Today, new digital technologies, innovative business models occupy all spheres of economic life of society and affect the essence of the economy, which in turn shapes the qualitative structural changes in the economy. As a result, the digital economy is emerging as a subsystem of the traditional economy, characterized by the active use of digital technologies and the circulation of specific electronic goods. The level of development of the digital economy is closely linked to national competitiveness, which requires special attention to the development of the state and business. This article provides an overview of the development of the digital economy in the world and in Uzbekistan, an overview of the development of the digital economy, as well as various threats and some suggestions for their elimination.*

**KEYWORDS:** *Digital Economy, Small Business, E-Commerce, Innovation, Sustainable Development, Economic Growth, Government Regulation Of The Economy, Threats And Risks To Scientific And Technological Progress*

### **INTRODUCTION**

Many researchers rightfully link medium-term trends in the development of society and the economy with their digitalization. Today, new digital technologies and innovative business models are penetrating all areas of the economic life of society, influencing the essence of the economy and forming qualitative structural changes in it.

It can be said that humanity has entered a new era of global change due to digitalization and other technological developments being put forward by many researchers today.

It is no exaggeration to say that by the 21st century, e-economy has already moved beyond economic processes. Now that digitalization is being applied to the social processes of society,

the successful lives of people are also increasingly dependent on the digitalization process. Indeed, the activities of all government agencies and their structures are also being evaluated through the widespread introduction of digital technologies. The development of the digital economy on a global scale has led our country to pay great attention to this trend. Admittedly, at the moment, Uzbekistan has not yet achieved a leading position in the world in the digital economy. However, in the group of countries that follow the leaders, it can be said that the rapid development of digitization on economic growth and the promotion of reforms in this area are considered as one of the countries on the agenda, and thus improving its position in this direction year by year.

### **MAIN PART**

The joint activities of the government and business are important for the rapid development of the digital economy in any country.

It is worth noting that the digital economy is now widely accepted as the solution to almost all existing rapid development problems.

In support of our view, we see this reflected in socio-economic and humanitarian studies, including statements and official documents of influential politicians and government officials, as well as a sharp increase in interest in digital issues among the public.

However, it must be acknowledged that just as not all diseases are claimed, the self-digital economy does not serve as the primary means of eliminating all elements of the global economy. The development of artificial intelligence and, as a result, modern technological changes, the digitization of society and the economy and all social structures closely related to them will go hand in hand with direct economic digitization, as all aspects of life are inextricably linked with the economy.

### **An overview of the development of the digital economy.**

Since the second half of the 20th century, information technology has become increasingly important in the economic development of many countries around the world.

At the present stage due to scientific and technological progress the single information economic space is achieving economic growth and labor productivity, creating innovative jobs and digital assets, expanding the rights and opportunities of citizens, as well as access to global markets and enhancing the competitiveness of enterprises, thereby improving the quality of public services.

Chronologically, in 1995, the American scientist N. Negroponte introduced the concept of “digital economy” in connection with the use of modern information technology in digital economic processes and their management. According to him, the advantages of the digital economy include the elimination of the complexity of product delivery, size of the data, low prices, resources for the production of electronic goods, the relatively small size of the product, as well as the almost instantaneous movement of goods via the Internet

The digital economy has become a key factor in the development of various international organizations. In particular, the Organization for Economic Co-operation and Development (OECD) has described the digital economy as a combination of several common goals achieved by people through the Internet and related technologies.

The digital economy is unequally distributed around the world, and there is an uneven distribution in the development of this industry even between the North Pole and the South Pole. For example, the United States itself has an advantage in the development of the digital economy network in the North Pole, with a quarter of the pole in that state. Today, the geography of the digital economy is gaining momentum in the economies of two countries, China and the United States. Currently, the U.S. and China account for 75% of blockchain technology authorship and 90% of the market capitalization of the 70 largest digital platforms in the world.

Looking at the recent past of digital economy development, business digitalization began with domestic and corporate projects and gradually gained global coverage, and soon major digital business participants took first place in the world in digitalizing economic development. In this regard, it is necessary to recognize the development of the world's largest companies in terms of market capitalization, such as Apple, Alphabet, Microsoft, Amazon and Facebook in the field of digital business.

Another major company on this list is Alibaba Group, an internet retailer. In addition, examples of “digital ecosystems” can be found in a variety of other industries and companies today.

In short, the digital economy can be described as a new type of economic relations that already exists and is actively developing in all sectors of the world market.

It is no exaggeration to say that the digital economy may soon become a leading segment of the growth and development of the economic system, a driver of rapid industry management. A single example of this is the fact that the digital economy has some advantages over material commodity exchanges, such as the speed of delivery of goods or the actions taken in practice to provide services almost instantly. Another advantage of the digital economy is that it is associated with lower production and transaction costs.

### **Development of digital economy in Uzbekistan**

Today, in the process of large-scale reforms in our country, comprehensive measures are being taken to actively develop the digital economy, the widespread introduction of modern information and communication technologies in all sectors and industries, especially in public administration, education, health and agriculture.

A number of measures aimed at accelerating the development of the digital economy in the country with the broad involvement of information technology are being set by the head of our state. It should be noted that adoption of the Decree of the President of the Republic of Uzbekistan dated October 5, 2020 No PF-6079 on approval of the strategy “Digital Uzbekistan – 2030” and measures for its effective implementation was an important program aimed at accelerating the development of digital industry in the country .

This Decree provides for the introduction of more than 400 information systems, electronic services and other software products in various areas of socio-economic development of the regions in the framework of digital transformation of regions and industries in 2020-2022, automation of management, production and logistics processes in enterprises in the real sector. More than 280 information systems and software products have been identified for development. Another important role of this decree in the implementation of the digital economy strategy is the addition of appropriate higher education institutions to improve the digital literacy and skills of governors, government agencies and organizations in the regions, training them in information

technology and information security, with their 12,000 employees being trained in IT too. This, in turn, will help reduce poverty through the widespread implementation of local information, the introduction of e-government services for the development of small businesses and private entrepreneurship, which play an important role in the socio-economic life of the country through the digitalization of the economy in remote areas.

The Decree also provides for the practice of hearing monthly reports of the heads of government agencies and organizations on the implementation of planned projects and measures for the development of the digital economy and e-government, as well as consideration of their responsibilities. Based on continuous monitoring of the widespread implementation of the digital economy in the country, it is planned to take measures to further improvement of e-government services in business, optimization of functional processes and procedures in state bodies and organizations.

Another important reform envisaged in the decree was the introduction of the formation of a personal account for the establishment of electronic interaction with government agencies and organizations in the issuance of an ID card to an individual under the complex program "Digital Tashkent". Today this system has been put into practice, which allows even more accelerating and optimizing the stages of documentation and registration process when starting a small business. In addition, the Open Data Portal of the Republic of Uzbekistan envisaged by the Decree provides for the online posting of public statistics by government agencies and organizations, registration of patents, medicines and medical devices, public transport, land use and other public statistics. Significant benefits will be achieved in the development of entrepreneurship in the field of large business. This will allow entrepreneurs to obtain the necessary information from the open data portal, preventing them from obtaining documents of various permits, applying to the competent authorities for the first step to start a business.

In addition, it should be noted that the ability of individuals and legal entities to pay all established state duties, fees, fines and other mandatory payments online using electronic payment systems will create a wide range of benefits for small businesses.

Another important aspect is that the Decree stipulates that by January 1, 2022, the digital transformation of commercial banks will be completed by providing a wide range of online services, including the sale of remote credit products, opening deposits and accounts.

It is also planned to open digital technology training centers for the general population, especially for young people and women, on the basis of existing infrastructure facilities in each district and city. This is aimed at ensuring the broad penetration of public administration into the community and through it, improving the skills of citizens to live in step with the development of the digital economy.

The scope of the reforms includes the organization of paperless electronic document exchange and office work, digitization of all administrative procedures and operational processes, ensuring openness and transparency of activities and the use of public services in settlements, automation of interdepartmental electronic cooperation. provides e-government services to the subjects without human factor.

In short, the “Digital Uzbekistan – 2030” Strategy sets out the strategic goals, priorities as well as medium- and long-term prospects for the development of the digital economy and e-government in Uzbekistan.

It should be noted that today in our country the transition to the digital economy is widespread in all areas. In particular, work has begun on the introduction of the "Electronic Polyclinic" in the health sector, which is expected to reduce the number of documents in medical institutions by 40% and waiting times by 60%. Currently, only in the capital, information systems for electronic medical records, hospitals and ambulances are being introduced in this area. Starting next year, it is planned to launch software in this area in the regions of the country.

It should be noted that in order to ensure the rapid development of the digital economy and to cover all areas in this regard, 2020 has been declared in Uzbekistan “Year of Science, Education and Digital Economy”. On the accelerated development of this sector, the President of Uzbekistan signed another Decree “On measures to widely introduce the digital economy and e-government”. This Decree provides for a doubling of the share of the digital economy in the country's GDP by 2023, including the introduction of a set of information systems in production management, the widespread use of software in reporting in the field of financial and economic activities, as well as the task of its rapid formation through the automation of technological processes.

## CONCLUSIONS AND SUGGESTIONS

In the context of globalization, the digitization of the economy as an important factor of development will bypass the electronic front of any country. Digitalization requires a balanced development not only in the economy, but also in all spheres of life, as well as in social and spiritual life. At the same time, it should be taken into account that lagging behind in one sector will lead to failures in other sectors. As a single example, it is natural that the electronicization of documents in the field of construction lags behind, which in turn delays the registration of the business. As a result, it is necessary to recognize that the start of entrepreneurship and the acceleration of positive results will be slowed down.

Another important factor is the optimization of procedures for providing public services to entrepreneurs, reducing the number of required information and documents, the transfer of all processes related to the issuance of licenses and permits for business activities in electronic form in real time primarily serves the development of small business.

The development of digital technologies in the economy will provide management through the automation of all stages of small business, thereby reducing logistics and procurement costs, robotization of production processes, as well as the introduction of artificial intelligence technologies will enable the development of entrepreneurship in any country.

Therefore, it is expedient to put forward a number of proposals for the development of the digital economy in the transition period. In particular, as a prelude to the rapid development of this sector, there is a need to improve the existing regulatory framework in our country for the introduction of innovative automated control systems and software products.

Accelerating the creation of industry databases in the form of mutual electronic exchange of information between government agencies, the formation of an open registry of information

needed for business, by expanding existing information systems of competent state bodies and organizations to assess the level of digitalization.

In this regard, the implementation of the adopted regulations in this area by the relevant structures is significantly lagging behind. It should also be noted that the lack of awareness of local executives on the content of reforms in the sector leads to the fact that the development of information and digitalization lags behind global economic development.

Today, in many countries around the world, including Uzbekistan, portals for the provision of public services to the population, as well as payment platforms have been developed. In the field of reporting and exchange of information in the field of entrepreneurship, tax authorities are also moving to electronic reception, work on the widespread use of plastic cards for social payments is underway.

The widespread introduction of the digital economy requires, first of all, informatization and technological development. This, in turn, generates the need to increase the number of training of specialists in the field of information, the formation of inter-branch, regional and interstate systems of cyber security, including the improvement of legislation to combat cybercrime, the creation of security units in law enforcement agencies. However, it should be borne in mind that information security should not hinder the growth and development of technology, and it is desirable to strengthen the interstate exchange of information in the field of cyber security, along with the development of the digital economy.

## PROGRESSIVE DEVELOPMENT OF ENIGMATIC TEXTS IN LINGUISTICS

**Yakubova Nodirakhon Davlatbay kizi\***

\*Doctorant of Kokand state pedagogical Institute,  
 Kokand, UZBEKISTAN

### ABSTRACT

*This article is devoted to the study of enigmatic texts as a special type of text. It deals with the origin of enigmatic texts, their distribution in different forms in different countries, the first collections of "riddles" and their authors. The article reflects attempts to explore puzzles not only as an object of folklore but also as a linguistic object.*

**KEYWORDS:** *Text, Enigmatic Text, Riddle, Puzzle, Conundrum, Linguistic Phenomenon.*

### INTRODUCTION

Nowadays, linguistics is concerned with the study of phenomena related to human linguistic thinking and its communicative activity. The creative potential of language can be seen obviously in the phenomenon of human speech. This creativity is reflected in the text, which is the product of the phenomenon of verbal communication. As a result of the integration of scientific ideas around the world, new directions are emerging and forming within the boundaries of various scientific fields. In particular, the direction of textual linguistics has gone through a number of stages of its development. In this field, the text is recognized as an object of linguistic research.

The most characteristic feature of the text, emphasized by various authors, is that in it, on the basis of relevance and purposefulness, the ideas under the general theme, along with providing information, also have a semantic sequence. Not all authors dwell on this feature of the text, as the idea that the semantic completeness of the text must have certain limits is disputed.

Recently, in the process of text analysis, the communicative character has come to the fore. All the diversity that exists in our language today arises only from the manifestation of images and systems of images that are stored in our memory and can be reflected in the human mind. Images that contain additional ethical or aesthetic content have a symbolic meaning in the minds of

native speakers, i.e., speakers of that language. That is why the text is considered as a socio-communicative unit.

The development of the field of textual linguistics requires researchers to focus on less studied areas, in particular the study of different game-related types of texts. Although literature, especially folklore, was originally the subject of study, riddles and other related genres, such as chiston and crossword puzzles, were used as a type of puzzle to create a special mode of communicative collaboration in the form of dialogue. and not only allows us to understand the various forms of the vernacular from new positions, but also demonstrates the inexhaustible potential of oral creativity, the formation of an aesthetic worldview, the elucidation of original considerations and ideas.

In this sense, we have found it necessary to study enigmatic texts in world linguistics - puzzles, crossword puzzles and logical questions as a special type of text. We consider it expedient to analyze the philological stage of the process of studying enigmatic texts, in particular, the development of the field of "riddles" in two main directions: the first is the process of reciting, collecting and compiling riddles from different strata of the people's representatives orally; that is, the practical phase and the second is a theoretical process aimed at the linguistic study of these collected materials. If we look at the history of the development of riddles, the most common form of enigmatic texts in the first stage, we see that the oldest riddles contained mythical symbols, poetic texts here served partly to describe and partly to explain natural and environmental phenomena. Over time, this meaning of the puzzles disappeared, only the figurative-allegorical description remained, and people began to look at the puzzles as a simple exercise of the mind.

From ancient times the riddles had a special mysterious meaning, and in folk epics they also acquired a special divinity. That is, there were also beliefs that guessing the riddles would help the desires to be answered, to get rid of the danger. Puzzles can also be included as a plot element in fairy tales and adventure tales, which served as one of the forms of testing the protagonist[1]. Saying a riddle and finding its answer, puzzle competitions are a very common motif of this folk epic and the fiction created under its influence. This special question-and-answer tour covers all nations and eras, including the Edda, which depicts ancient Germanic and Scandinavian mythology, the Kalevala, an ancient Finnish song, and Indian poetry[2].

Ancient Russian and Slavic songs consisting of riddles usually follow a cycle of legends about the "wise girl"[3]. According to their content, when the bride and groom are compared, the idea that the bride is not so stupid is also highlighted.

However, among the ancient Greeks, riddles were associated with words and were mainly expressed in hexameters (poetic measurements). In Greek, riddles were also used for didactic purposes. Poets, on the other hand, added puzzle-shaped words to their works[2].

In later periods of Christianity, under the influence of reading the books of the Scriptures, many puzzles began to emerge in places where puzzles were considered important, with biblical themes or the origin of everything that exists. In the seventeenth century, interest in riddles was revived: in France Fenelon, Bualo, Jean-Jacques Rousseau were known as puzzle writers, while in Germany Schiller spoke with his poetic riddles. In Russian literature, V.A.Zhukovsky created wonderful examples of poetic riddles.

Such texts exist in all nations, and in this sense, we must first turn our attention to collections based on riddles. In particular, the first collection of German riddles in Western Europe was published in Strasbourg in 1505 (later published in 1875), and in France by Abbot Koton in 1646, the collection "Recueil des énigmes de ce temps"[2]. From English literature, Archer Taylor's "English Riddles from the Oral Tradition" (published in 1951), Exeter Book (published in 1961)[4], and F.J.Childe's "English and Scottish ballads" are unique sources, including the oldest Anglo-Saxon riddles.

We can see that the collection and study of Russian folk riddles on a scientific basis began in the 60s of the XIX century. According to I.M. Kolesnitskaya, the scientific collection of Russian folk riddles was originally compiled by I.A. Khudyakov and published in 1861 with a brief introduction[5]. Also from Russian literature D.N.Sadovnikov's "Russian folk riddles" ("Zagadki russkogo naroda") (1876), M.A.Rybnikova's "Puzzles" ("Zagadki") (1931) and V.V.Mitrofanova's collections such as "Zagadki" (1968) are the first examples of such sources. Most of these collections have a unique thematic structure.

Ўзбек халқ топишмоқларини тўплаш ва қисман бўлса ҳам текшириш ишлари ҳам XIX асрнинг 2-ярмидан бошланган[6]. It is not known whether there were any collections of Uzbek riddles until the nineteenth century, with the exception of a few Turkic riddles in "Codex comanicus"[7] a few muammos found in some manuscripts, question-and-answer riddles, and chistons[6]. However, over time, the first collections of Uzbek riddles, although translated into Russian, were published. The collection published in 1895 "Proverbs and riddles of Sartov" by N.Ostroumov [8] and A.Vasilev's article "Sartovskie zagadki"[9] was prepared for publication in 1909. Thus, the number of people interested in collecting these samples of Uzbek folklore has increased. However, not all of them were analyzed because they did not meet scientific requirements.

Riddles, which have been the masterpieces of folk wisdom for many years, are not only a joyful game of the mind, a means of spiritual relaxation, which develops human perception, observation, poetic imagination, but also a key role in understanding the spiritual world and historical past of our ancestors. They are invaluable documents of historical culture. In this regard, A.N.Tolstoy wrote: "It is a mistake to think that oral literature is only the fruit of popular entertainment. He filled the stable spiritual image and historical memory of the people, the activities, nature and customs of their ancestors, and the whole life flowing in accordance with them with deep meaning[10].

## CONCLUSION

The culture of the ancient and talented people has flourished on Uzbek soil. All sections of the population were involved in the collection of folklore works. Scientists such as B.Karimov, M.Afzalov, Z.Khusainova made a significant contribution to the study of Uzbek riddles. The archive fund of the Institute of Literature of the Academy of Sciences of Uzbekistan has accumulated a huge amount of material on Uzbek riddles [11]. It is among these materials that one can find a number of riddles in the oral poetry of the Uzbek people, created on the basis of the laws of national poetics. In Uzbek folklore, as in other nations, the main manifestations of artistic speech, such as comparison, allegory, animation, adjective, are subject to one goal - poetic perception, poetic description of reality. Uzbek riddles reflect the Uzbek reality, the Uzbek nature. That is why folk riddles are small examples of folk art.

Therefore, one of the important tasks of modern Uzbek theoretical linguistics is to talk about such poetic works based on concealment, that is, the language, structure, semantic and pragmatic features of enigmatic texts.

## KOKTURK WRITING AND DIFFERENT IDEAS IN ITS STUDY

**Dilorom Mirzaeva\***

\*Student,  
 Fergana State University,  
 Fergana city, UZBEKISTAN

---

### ABSTRACT

*This article discusses the peculiarities of the Kopturk alphabet, which existed in the early Middle Ages and was one of the main writings of the Turkish Khanate, and its importance in cultural life at that time. Although there are some sources on the use of writing in the Hunnic period, we do not know the exact meaning of this writing. therefore, the first known alphabet used by the Turks was the one widely used during the Kopturk period. So what is the blue alphabet? What are its features? The Kopturk alphabet, used by the ancient Turkic people, was later used by the Huns and Kyrgyz.*

**KEYWORDS:** *Kopturk Alphabet, Orkhon-Enasay Inscriptions, V.Tomsen, N.Yadrinsev, Turkic Peoples, Inscriptions.*

---

### INTRODUCTION

Our culture, which has been influenced by many civilizations throughout history, is also influenced by language. Over time, the use of the alphabet began to change according to the geography in which it was located. The Kopturk alphabet, known as the first alphabet used by the Turks, is similar in origin, although it is very different from the modern alphabet. So what is the blue alphabet? What are its features? The Kopturk alphabet, used by the ancient Turkic people, was later used by the Huns and Kyrgyz. Research has also shown that it was used by Turks who immigrated to Europe and by a group called Sekeller in 16th century Hungary.

### METHODS

The Kopturk alphabet and its origins are being studied. It is believed that pictures were used in the formation of this alphabet. This script is also very important for our culture because it was the main writing system used by the Turks.

This first Turkish alphabet, which was widespread during the Turkish Khanate, was used not only in writing but also in manuscripts. The so-called "East Turkestan Manuscripts" prove this. Apparently, this alphabet was used for some time during the Uyghur period, which came after the Kokturks. The Shine-Usu inscription, dated 759–760, and the Taryat inscription, discovered in recent years, illustrate this point. The Kokturk alphabet was also used by the Bulgarians, Khazars, Pechenegs, and Sekels with some modifications, and thus spread from Central Asia to the interior of Europe.

The emergence of the Turks as a political entity on the stage of history dates back to the centuries BC, the Hiungnu period. Although there are some sources on the use of writing in the Hunnic period, we do not know the exact meaning of this writing. therefore, the first known alphabet used by the Turks was the one widely used during the Kokturk period. In recent years, a two-line text written in the Kokturk alphabet found in a fortress near Issyk-Kul dates back to the 5th-4th centuries BC. Therefore, it must be acknowledged that the first Turkish inscription belonging to the Kokturks was found centuries before the establishment of the Turkish Khanate.

The Orkhon-Enasay inscriptions were first reported in the early 18th century by the Russian scientist S. Remezov, later by the Swedish scientist F. Stralenberg and the German scientist D. Messerschmidt. The fact that these inscriptions belonged to the Turkic peoples was first proved by the French scientist J. Abelremyza, and then by the Russian scientist N. Yadrinsev. In 1890, as a result of archeological expeditions along the Orkhon River under the leadership of N. Yadrinsev and V. Radlov, 2 atlases were published in 1892. The first Orkhon-Enasay inscriptions published in these atlases were read in November 1893 by the Danish linguist W. Thomsen. After Thomsen, Radlov compiled a transliteration and transcription of a text on a huge stone written in the eighth century in memory of the Turkish prince Kultegin and translated it into German. This material formed the first idea of the structure, phonetics, morphology and lexicon of the ancient Turkic language.

## RESULTS

There is no consensus among scholars on the origin of the Orkhon-Enasay inscription. It is widely believed that the inscription is derived from the Sogdian and Pahlavi scripts of the Aramaic script. The place and time of the appearance of the Orkhon-Enasay inscription are still unresolved. Due to some graphic features related to the place and time of its appearance, it has the options of orkhon, talas, yenisey. The oldest of these is the Orkhon version. These inscriptions are in harmony with the Turkic languages, are more perfect, and are somewhat easier to write and read than the Arabic script, after the Arab conquest of Central Asia, Kazakhstan, and many other places inhabited by the Turkic peoples. Arabic script is widespread in the countries.

Because the characters used in the alphabet were similar to the characters in the old Scandinavian script called Runic, they were considered runic characters and it was speculated that they may be related to this alphabet. However, Russian scholars such as Aristov have suggested that the symbols may have been derived from old Turkish brands. Jevat Emre suggested that the Kokturk script had the same roots as the Sumerian script. This is what can be said in the midst of various and even contradictory arguments, and in scientific circles Thomsen's opinion is considered widespread and well-founded. There are 38 letters in the alphabet, 4 of which are vowels. Stamps in the alphabet represent sounds. The sounds "ae", "i-1", "ou", "ö-ü" are also used in the alphabet without separating them from each other. When writing

text in this alphabet, spelling is done from right to left or from top to bottom without attachment. The text uses two dots to separate words.

## DISCUSSION

The Yenisei writing system contains more than 150 characters of the Orkhon alphabet, using a total of 38 letters of the Kokturk alphabet. The deleted characters are 38 in the Orkhon alphabet. Of the fourth, 34 are consonants. The main reason for the large number of consonants in the alphabet is that some letters are represented by two characters. Other features of the alphabet are:

- ❖ Each has two letters that give the sounds “y, t, s, r, n, l, g, d, b” depending on whether the vowel next to it is thin or thick.
- ❖ Double sounds have a pair of consonants. They can be used as "yn, nch, ik".
- ❖ Flours are used inseparably. It is written and read according to the harmony of the vowels.
- ❖ As in the Latin alphabet, non-adjacent blue letters are used separately.
- ❖ There is a big pause between the words. No more punctuation.
- ❖ The text is usually read from the right.
- ❖ Flours are not used much. If there are vowels, they are included in the first syllable. Subsequent vowels are not used when they are the same. Only the last letter is written with a vowel.
- ❖ There is no confusion in consonants. Thin and thick consonants can be used interchangeably.

The works written in the Kokturk alphabet cover the Uyghur and Kokturk periods. The inscriptions are usually tombstones, and the remains of the Uighur Turks are mostly considered to belong to the Mani and Buddhist religions.

The inscriptions are also called bengü stones, and these stones were erected to build a monument after the death of the recipients of the state message and the khagans. Inscriptions from the Kokturk period:

- Kokturk inscriptions
- Monument to the Nightingale
- Kultegin monument
- Bilga Hakan monument

It is known that the technique of printing the book was used in the Uyghur period. There are many stories about the period. The Kokunch Theater is one of them. In general, the excitement and national consciousness in the works of the Kokturk period are not reflected in the writings of this period. The inscriptions are usually found in the form of tombstones.

Groups of the Orkhon-Enasay inscription such as Lena Baikal, Yenisei, Mongol, Altai, East Turkestan, Central Asia, and Eastern Europe have been identified. Russian and European scholars such as V. Thomsen, V.V. Radlov, P.M. Melioransky, A.A. Polovtsev, G. Geikel, S.E. Malov, L.N. Gumilyov, D. Nemet have made a great contribution to the study of the Orkhon-Enasoy inscription. Academicians G.Abdurahmanov and A.Rustamov and professor

N.Rakhmonov from Uzbek scholars also studied the Orkhon-Enasay script and carried out certain researches. The study of these monuments continues to this day.

## CONCLUSION

In short, some lexical units and grammatical forms of the Orkhon-Enasay script are found in modern Uzbek, Uyghur, Azerbaijani, Kyrgyz, Kazakh, Turkmen, Karakalpak, Tatar, Bashkir, Karachay, Bulgarian and other Turkic languages. The Orkhon-Enasay script is a valuable source for studying the history, culture, ethnography, language and history of Turkic languages.

### ABSTRACT

*This article to the analysis of credit system introduction to the education process, it's futures and perspectives in educational system of the Republic of Uzbekistan, especially in TUIT is devoted. This article the fundamental position in the modern assessment system in the field of education. The introduction of a credit system raises the need to compare similar modernization steps in the experience of other countries are describes. The introduction of the credit system in Uzbekistan requires a comprehensive analysis of the optimal approach in the process of its implementation. This the article reflects the educational practice in countries with economies in transition regarding the introduction of a credit system for assessing knowledge gained on the basis of experimental work.*

**KEYWORDS:** *Credit Education System, Credits, Educational Process.*

### 1. INTRODUCTION

Social and economic development of the Republic of Uzbekistan was a prerequisite Root of Perfection I Higher Education. The priority issue was the training of personnel, the creation of conditions for the retraining of higher education specialists at the level of international standards.

Based on the modern requirements of social life and the economy, one of the main tasks of modernizing the higher education system is the introduction of modern forms and technologies into education based on the study of international experience.

Decree of the President of the Republic of Uzbekistan dated February 19, 2018 "On measures to further improve information technology and communications" and the Cabinet of Ministers of the Republic of Uzbekistan "On measures to radically improve and enhance information

technology" The effectiveness of the training system at the Fergana Polytechnic Institute "will radically improve and increase the efficiency of training at this institute.

An important step in the ongoing system of innovations is the introduction from the 2018-2019 academic year of a credit training system for training personnel in the field of information technology and communications in order to ensure the university's entry into the list of the most prestigious universities in the world. [1]

## 2. LITERATURE REVIEW

Currently, the most widespread and mature credit systems are the United States Credit System (USCS), which has been in use since the end of the 20th century, and the European Credit Transfer System (ECTS), which began to form in the mid-1980s. biennium and since 1997 has been adopted by the European Commission as a unified system for comparing learning outcomes in the educational space of the EU countries. Since June 1999, after the European countries signed the Bologna Declaration (where the introduction of a credit system of education is the main criterion for the country's entry into the Single European Educational Space), these processes began to spread more and more intensively. [4]

The analysis of the literature made it possible to state that the credit system is an asynchronous (as opposed to the traditional - "linear") model of the organization of the educational process. It includes all the mechanisms that support it, including credit accounting technology, a system for selecting training courses, principles of grading, a set of criteria for obtaining a diploma, rules for transferring from course to course, rules for converting credits received when transferring to another university, etc.

At the same time, a loan is understood as a unified unit of measurement of the volume of a student's / teacher's academic work, corresponding to 45 academic hours of total labor intensity for any academic period in a bachelor's program, 60 academic hours in a magistracy and 75 academic hours in doctoral studies. Therefore, a credit based system (CBS) is a subject-based educational model based on the requirement to complete the volume of academic work, expressed in credits, in order to obtain a professional qualification or degree.

Comparative analysis of traditional and CBS shows significant differences between them in a number of signs: the duration of the academic year, vacations, semesters, sessions, in the forms and methods of monitoring and assessing the quality of education, the movement of students from university to university, the trajectory of training, the electivity of courses and disciplines, mobility and etc.

The comparison of the credit system and the traditional (linear) education system allows us to say that it is the credit system that has the ability to prepare students for professional activity in the conditions of a modern information (post-industrial) society and, with the correct organization and construction of the educational process, can become a guarantee of high quality education. [2]

According to the Rules for organizing the educational process on CBS, every 15 academic hours of classroom work is accompanied by 30 hours of students' independent work. It is independent work that is the main advantage of the credit system. The free choice of subjects, teachers, schedules gives students the opportunity to be independent, active, mobile, plan and carry out their educational activities as they please. Other advantages of the credit system include: a high

degree of academic freedom; the independent nature of the educational activities of students; developing style of teaching activities of the teacher; independent search educational activity of students; innovative content of educational programs; expanding the volume of the university component of educational programs; an increase in the proportion of active, problem-stimulating, interactive teaching methods; predominance of practical forms of conducting classes; systematic, step-by-step control of students' academic work; productive, research level of knowledge assimilation; diversification of the content and terms of mastering educational programs; compatibility with any national educational system; the possibility of international credit transfer. [11]

It should be emphasized that the advantages of the credit system relate primarily to three interacting parties - students, teachers and the educational institution. And each side benefits from this in its own way. For students, the benefits are: free choice of subjects, teachers and timetables; cumulative rating system, i.e. the ability to assess your knowledge during the learning process, and not after it; enhanced communication capabilities, skills of quick adaptation to a new environment, communication and exchange of information; confidentiality of the student's information about his grades, the number of credits collected, provided by the assignment of an identification number. [13]

Teachers also benefit a lot from the credit system: students' interest in the subject makes the teacher's job much easier; a clearly graded grading system allows for a fair and transparent assessment of student progress; the opportunity to receive grades from students, opinions and recommendations on the subject.

As for the institution itself, the introduction of a credit system adds a significant amount of flexibility and adaptability to its policies. Unlike a traditional university, where the curriculum could remain constant for 10-15 years, a university of a new model has the ability to change the composition of the taught disciplines quite quickly, focusing on the demand for a particular specialty in the labor market, given its relevance given the existing market and social trends.

### **3. Research Method**

The education credit system is based on a trend of transparency and student-centered selection and transfer of test units. This system is considered accumulative, that is, it provides for the growth of loans accumulated earlier at all stages of education.

Its importance lies in the fact that academic programs will be tailored to the requirements of the labor market. 50 percent of the subjects of the curriculum are selective and will be introduced into the information systems of the educational process. Individualization and differentiation of the education system is based on adaptation to changes in socio-economic conditions and educational and program documents.

Under the credit system, classes are conducted in an interactive form. During the week, the student performs independent work, after which the teacher gets acquainted with the results of the work and the weekly rating of students. A student at a university can observe the growth and decline of his rating in his chosen direction. If a student receives a low score or does not prepare for one lesson, then his average grade will decrease. If he does not attend lectures, does not participate in seminars, he is not allowed to take exams. Thus, this form of training necessitates constantly improving the knowledge of teachers and the work of students on themselves. [16]

Credit technology enables the student to choose a subject that is included in the working curriculum. Also, students have the opportunity to choose teachers. Taking into account the fact that first-year students do not yet know all the teachers, for the convenience and objectivity of the choice of teachers, the teachers of the disciplines are developing curricula (syllabus) of subjects. Having familiarized themselves with the curriculum, students will have an idea of the discipline and the requirements for each teacher individually. It is also necessary to note the factor that students, having the opportunity to choose a teacher, do not always choose teachers objectively. Demanding, strict, highly qualified teachers can be left without a student. But this is a matter of time; subsequently, students will choose just such mentors in order to achieve their goal - to gain in-depth knowledge in the chosen direction.

It should be noted that the education system should meet the modern requirements of a dynamic of increasing globalization and informatization development process, in order to prepare highly qualified personnel having high demand in the job market. And for this reason, the importance of introducing a credit system into training for the formation of specialists is so that they can find and process the necessary information, analyze and effectively use it in their future work.

The use of information technologies at the Tashkent University and its operating branches of the credit education system will provide an opportunity to prepare highly qualified specialists who are competitive in the current unstable international labor market, as well as to ensure a high rating of an educational institution among 1000 universities in the world. [6]

In accordance with the government decree "On measures to radically improve and increase the efficiency of the training system at the Tashkent University of Information Technologies named after Muhammad al-Khwarizmi" at the Tashkent University of Information Technologies named after Muhammad al-Khwarizmi and its branches, starting from the 2018-2019 academic year, a credit education system for training personnel in the field of information and communication technologies was introduced. The main goal is to ensure the entry of the university into a number of prestigious universities in the world by introducing a credit education system.

The main advantages of the credit education system:

- Academic mobility - the possibility of continuing the student's studies in foreign educational institutions;
- High level of quality of education - attracting highly qualified industry specialists from foreign educational institutions and leading enterprises to the training;
- Development of curricula, based on the experience of foreign higher educational institutions, in order to ensure the intensification of the learning process;
- Possibility of students' choice of disciplines, etc. [13]

It should be noted that under a credit education system, the level of a student's mastering of a certain course depends on the accumulation of a certain number of credits based on various criteria. The total number of credits earned by a student is determined on the basis of the student's active participation in the classroom, the results of tests during the course, the results of scientific research, oral and written examinations, and practice. The introduction of the credit system of education in the educational process of the university will radically improve the system of training highly qualified specialists who are competitive in the changing international

market, and TUIT will also enter the TOP 1000 prestigious universities in the world. directions for its further development were developed. [7]

Academic Credit System is standards assessment systems, which determines the effectiveness of student learning in higher education. In some cases, only admitted students must first complete a special course in the credit system.

The evaluation criteria are similar to the evaluation criteria of the previous system, but they have their own specifics. Typically, the teacher gives the grade, taking into account student attendance, test results, research and final written work. Also, credit scores differ depending on the composition and complexity of the courses, as well as on how well it fits in the chosen direction. For example, a course that requires a lot of research work has the highest score. It should also be noted that the final control tests are conducted by a special department, which determines the transparency and objectivity of the assessment of students' knowledge. [6]

#### 4. Results

In the Republic of Uzbekistan, the introduction of the credit system in the educational process is due to the desire to improve the level of education, and the desire to comply with world requirements. The introduction into the educational process of the credit system, which is widespread in many higher educational institutions of the world, will allow our educational institutions to become one of the most prestigious universities in the world.

The implemented system has a number of advantages for students:

First, the credit scores collected do not change, they can be transferred when transferring to study at another, more suitable university.

Secondly, the student has the opportunity to choose any subject at will. Of course, there are subjects, the study of which is necessary, but he can choose other disciplines on his own.

Education is determined according to different levels of mastering the course by the student, which depends on the amount of credit. [13]

At the stage of implementation of the credit system, the concept was formed that this system is something completely new. In fact, for, for a student, there is nothing new. If we look in more detail, the following aspects can be identified:

-Visit. Attendance in the educational process has always been a mandatory criterion, which has remained in the credit system. If in the old system 72 hours of passes was the limit, then in the credit system each item is counted separately (7 items \* 5 passes = 35 passes or 70 hours).

-Tasks. In this criterion, too, little has changed, only strict time frames have been set. If in the old system a student could not complete tasks until the end of the student and only by the end of the semester take assignments at a time, then in the credit system, for each assignment, a due date is set after which the student is not given the opportunity to retake. This will make it necessary for students to submit assignments on time and free teachers from the need to accept assignments in large numbers in a short period of time.

-Scholarship. In this aspect, little has changed either, if in the old system scholarships were deprived of arrears and later expelled, then in the credit system a student can be a debtor for up to 7 years.

#### 4. CONCLUSION

In conclusion, it should be noted that the introduction of the credit system into the education process will make it possible to raise the level of education to a new qualitative level, through the effectiveness of training and student mobility - the possibility of recognizing the loans acquired in other educational institutions, as well as to eradicate the shortcomings that existed in the old system.

### ABSTRACT

*It is no secret that the weight of anthropogenic factors increases from year to year, depending on the level of human civilization, types and amounts of various waste elements in the environment, and the impact on nature is increasing day by day. However, it should be noted that before the rapid development of science and technology in the past, they did not feel the influence of environmental problems. This is because the waste from the Earth's environment undergoes natural self-cleaning processes. As a result, ecological harmony and balance in nature are not very disturbed. Basically, this was the case until the 19th century, when a "scientific and technological revolution" was observed in the development of human life and production. This article scientifically investigates the environmental and economic aspects of solving the waste problem.*

**KEYWORDS:** *Ecology, Nature, Waste, Technology, Ecological Problem, Environmental Protection, Natural Resource.*

### INTRODUCTION

Nature is a complex system that people and societies are its product. It exists and develops in exchange for nature. Man satisfies his needs at the expense of nature. It takes air, water, food, minerals and fuel from nature and influences nature throughout its life. As a result, new memorable objects for nature are being created. These include towns and villages, factories, roads, mines, reservoirs, agricultural land, and more. Such man-made landscapes, created by human intelligence and labor, have an impact on the environment. The rapid growth of the world population, the rapid development of science and technology, the uneven distribution of natural

resources on the territory of countries require the maximum use of available natural resources and thereby accelerate the development of society. As a result, the laws between nature and humanity are destroyed. Violation of these laws will sooner or later lead to an ecological crisis.

### **Main part**

Today, many people around the world are concerned about the state of the environment. An ecological catastrophe is taking place before our eyes. The issues of environmental protection and efficient use of available natural resources remain relevant. It became clear that man is the cause of the current ecological crisis and the one who can save him from this crisis with his own intellect. Protection of the environment from pollution and the use of natural resources largely depends on the level of environmental literacy and environmental culture of people, regardless of the society in which they live. Improving the environmental awareness of the population is one of the priority directions for solving environmental problems in our independent republic. It is especially important to teach the subject "Fundamentals of Ecology and Environmental Protection" at all stages of the education system.

Due to anthropogenic factors, especially at the later stages of the development of society, the quality and quantity of all living resources in the environment and on Earth change. Due to the growth in the production of semi-finished products, frozen and canned foods, they have recently been sold in special boxes, boxes, special containers, paper and cellophane bags. The packaging consists mainly of paper, glass, metal, cellophane and plastic. Most importantly, they cannot be reused. The population disposes of this waste in public landfills, especially in some areas where there are densely populated apartment buildings. This increases the amount of household waste. It is necessary to develop measures to correct this negative situation and change it for the better.

In this regard, the Decree of the President of the Republic of Uzbekistan dated April 21, 2017 No. PP 2916 "On measures to radically improve and develop the system for performing work related to household waste in 2017-2021." This decision is aimed at improving the sanitary and epidemiological situation in the regions and cities of the country, cardinal improvement and further development of the waste management system in 2017-2021.

### **DISCUSSION**

According to experts, the world's population consumes 1 ton of industrial and household waste per capita per year. In the Tashkent region, this figure is twice as high. Currently, the Almalyk Chemical Combine alone has accumulated over 60 million tons of waste. Of these, only 1% is spent on processing.

#### **Solid waste formation in Uzbekistan**

- Up to 10 - 12 thousand. tons of solid waste per day, 4.4 million tons per year.
- No. 45 - formed in Tashkent, Fergana and Samarkand regions.
- It is predicted that an additional 100 million tons will be formed in 2015-2030, which will reach 7 million tons per year by 2030.

#### **Recycling solid waste**

- ▶ There are 235 businesses. Capacity - 500.0 thousand tons per year. (11.2%)
- ▶ Processing of 88 polymers - 155.2 thousand tons.

- ▶ Processing 96 waste paper - 141.6 thousand tons.
- ▶ Recycling of 8 windows - 200.9 thousand tons.
- ▶ Processing of 23 tires - 0.9 thousand tons.
- ▶ 20 other waste

The Law of the Republic of Uzbekistan "On Waste" In the field of waste management on the territory of the Republic of Uzbekistan, prevention of harmful effects of waste on the life and health of citizens, the environment, waste generation and their rational use in economic activities.

The introduction of waste-free technological processes is a socio-economic problem, especially in chemical technology. This requires the selection and manufacture of the most optimal technological process available.

It is known that each household consumes different food items and a certain amount of waste (husks, seeds, etc.) is released from them. In rural areas, especially in households where pets (animals, birds, etc.) are kept, this waste is not disposed of, i.e. are passed on to pets for food. This, firstly, will save the environment, secondly, it will take care of pets, and thirdly, it will create additional funds in the family budget.

Unfortunately, in some areas where there are densely populated apartment buildings, the population dumps this waste in public landfills. In addition, the following measures can be taken to improve and reverse this negative situation in high-density areas. If we take the example of a single housing company, then about 20 apartment buildings will be connected to it. If each house has an average of 40 to 60 apartments, then the company will have 800-1200 apartments. Each household has an average of 3 people. A family consumes on average 2 kg of potatoes, 2 kg of carrots, 1 kg of onions and other products (melons, fruits, etc.) per week. Although these products produce an average of 0.5 kg of animal feed, it would be prudent to develop livestock farming as a subsidiary farm under the Homeowners' Association for efficient waste management. To do this, the homeowner's association will have to submit a business plan to the bank with which it has an account. A business plan may include the purchase of 10 or 20 head of cattle, the construction of buildings for their feeding and care, as well as the purchase of the necessary equipment, their distribution and distribution of various handouts. The Homeowners Association can take out a loan or loan based on this business plan and use the funds for their intended purpose. The Homeowners Association encourages each family and its members to actively participate in the implementation of the business plan.

If 0.5 kg of feed waste per household is 400 kg or 600 kg per week (0.5x800 or 1200), this feed waste is fed to livestock on a ration basis. Food waste is packed in special plastic containers, which the company distributes to each family and sends it to the Food Waste Collection Center. The representative of this center regularly organizes the collection of food waste. At the same time, as an additional feed, the enterprise can allocate the necessary land, plant alfalfa and corn, collect a certain amount of hay and grass. This event will contribute to the life and health of all types of waste, improve the environment, prevent waste generation, use it wisely in economic activities, achieve economic efficiency and, most importantly, further improve the spiritual, economic and environmental education of our people.

It was determined that for every 1000 kg of solid waste, thermal combustion is generated, which is generated by burning 250 kg of fuel oil. In terms of thermal capacity, 10.5 tons of municipal solid waste is equivalent to 1 ton of oil. Extraction of aluminum from recycled material saves only 5% of energy costs, 4 tons of bauxite ore from 1 ton of aluminum, saves 700 kg of coking coal, less than 35 kg of waste is emitted into the air, glass products from residues save 1.2 tons of primary product, energy savings 2,5%.

The main purpose of waste management is to increase the responsibility of producers and consumers. In this regard, the experts explained the role of waste management: "The production and disposal of waste should be regulated in such a way that they do not harm human health and do not restrict ecological products that are acceptable for use." It is based on preventive principles of environmental protection.

### CONCLUSION

All waste that affects the environment and entails economic costs must be recycled or disposed of. The more important it is to conserve resources through health and environmental protection and recycling, the higher the demand for its quality. Disposal of untreated waste is the lowest cost. This can have a significant impact later on.

In order to preserve the environment, toxic gases and emissions must be reduced and eliminated through the use of environmental protection measures and methods, rather than their generation.

### ABSTRACT

*In today's globalization process, a state of rapprochement between different ideas and cultures around the world has emerged, resulting in the displacement of some cultures and customs from others, leading to the emergence of a single culture and ritual for humanity. The diversity in the culture of the world's population is disappearing and a single mass culture is emerging. This will negatively affect the future of countries with national and religious values in the world. In particular, attacks on Islamic culture and its manifestations have a serious impact on the lives and activities of Muslims. Therefore, the issues raised in the work of Nasiruddin Samarkandi "al-Fiqh an-nofe" play an important role in educating Muslim youth in the spirit of national and religious values, solving social problems in their lives.*

**KEYWORDS:** *Globalization, Social Issue, Samarkandi, Al-Fiqh An-Nofe, Source, Popular Culture, Moral Depravity, Dress Code.*

### INTRODUCTION

Every nation in the world has its own traditions, customs and national values. The spiritual values that have sprouted in a certain land, formed and refined for hundreds of years, are the priceless wealth of this nation, this people. In the rapidly evolving techniques and technologies of globalization, a deeper understanding of the nature of such wealth is essential.

At the same time, in the process of globalization, there is a proliferation of different ideas and views around the world. This process is especially active among young people and is reflected in their behavior. In particular, “Popular Culture” and its various manifestations are examples of

this. Spiritual and moral depravity, moral depravity, violence, individualism, egocentrism, indifference to national and spiritual values and the dangers of subverting them, the perception of immorality as a culture, disregard for original spiritual values, indifference to national and spiritual values in young people showing its negative impact on young people. These include virtual (computer) games, movies made in some foreign and private studios, low-level songs, the Internet and social networks, mobile phones, the yellow press, the urbanization process, false information, radio and television.

It is no coincidence that the problem of moral depravity has come to the fore in these manifestations of "popular culture". The analysis of these concepts leads to the following conclusions:

Moral depravity is the lowest human activity, gradually rising from the stage of "free love" to "same-sex marriage". He morally corrupted the youth and introduced adultery instead of the love that had been cherished for thousands of years. For example, "Today, 30 percent of women in the United States have at least two abortions before marriage, and girls are raised in the same spirit. The majority of voters will vote against any policy that interferes with such a lifestyle"[2]. In general, moral depravity first affects the family, and then it harms the purity of the offspring. However, in the East, the issue of family sanctity, generational purity is an important value. Regarding all kinds of immorality, the hadith states: "A believer does not have two qualities in common: one is greed and the other is malice" [1].

The content of violence is the transfer of one's domination over another. Violence violates the rights of the individual and embodies animal feelings and characteristics in his or her mind [7]. He said that today movies are promoted through computer games and various guides on the internet.

Individualism is a moral principle that expresses the individuality of human life, the absoluteness and autonomy of individual rights [3]. According to this idea, a person puts his own interests above the interests of others. The person must be an individualist. However, there is also a norm of individuality. Individualism is a contradictory form of community, which brings up the individual in a spirit of alienation from society, neighborliness, kinship, and community in general.

Egocentrism is the prioritization of the human self. The most troubling aspect of this is that such a person always considers himself to be right, to look down on others, to know that his actions are absolutely right, which is the main sign of egocentrism.

Another of the main manifestations of popular culture is that this person puts himself in non-human forms, changes his body parts, and completely denies the culture of dress.

### **The main part**

Although Nasiruddin Samarkandi's "al-Fiqh an-nofe" was written almost nine centuries ago, the social issues outlined in the book have not lost their relevance. In particular, the 23rd chapter (book) of the work is called "Production" - the book "Approved Works", which deals with the problems that arise in today's social life and their solutions. In particular, this section details the culture of dress, men's and women's clothing, and jewelry. In particular, this section emphasizes that it is not permissible for men to wear clothes made of silk, on the contrary, it is possible for women to wear clothes made of silk, which is an adornment for them [4: 887]. This is evidenced

by the hadith of the Prophet (peace and blessings of Allah be upon him): “It is haram for the men of my ummah to wear clothes made of silk and gold, and it is halal for the women of my ummah”.

He then goes on to describe the views of the sectarians on the use of the silk pillow. While Abu Hanifa allowed the use of silk pillows, his disciples Abu Yusuf and Imam Muhammad considered it makrooh for a man to use silk pillows [4: 888]. Abu Hanifa gave two reasons for allowing a man to use a silk pillow, the first being that there was no sign of clothing on the pillow, and the second being verse 32 of Surat al-A'raf: Say: proved.

Also in the next issue, Abu Yusuf and Imam Muhammad agreed that men's tight armor could be worn inside during the war on a tight garment made of silk - kimkhob (Kimkhob is a thick garment worn during war. It is worn inside an armor that protects the human chest and front body from bullets). Abu Hanifa, on the other hand, said that it was makruh [4: 888].

Based on the above considerations, it can be said that a man was advised to avoid clothes made of silk when wearing clothes. Because it is so gentle, it is intended to take men out of masculine qualities and negatively affect their character. It is emphasized that the dresses made of silk are suitable for the delicate nature of women and give them elegance and splendor.

Today, unfortunately, among young people who follow the "popular culture", there is a growing tendency to ignore national traditions in the choice of clothing, and to resort to Western-style clothing. This has led to the spread of inappropriate dress culture among members of the community as well as Western traditions. Therefore, educating the younger generation in the spirit of national and religious values is one of the important tasks facing society.

Another aspect of ‘popular culture’ is the wearing of jewelry of various shapes and forms. Their prevalence among men is contrary to national and religious values.

In “al-Fiqh an-nofe”, Samarkandiy mentions this, noting that men are forbidden to wear gold and silver jewelry, and women are allowed to do so [4: 889]. Also, men were only allowed to have a silver ring, belt (belt) and sword handle made of silver.

Wearing wedding rings made of gold, which is common in wedding ceremonies today, is also one of the cultures that has come from the west. In national and religious values, men are not allowed to wear gold rings. There was no such custom in marriage ceremonies either. But the custom of giving women gold and silver jewelry as dowry has been around for centuries, and scholars have allowed it.

During “Nofe”, Samarkand said that it was makruh for boys to wear silk clothes and gold jewelry, even when they were babies [4: 890]. In this way, the scientist meant that children should be brought up properly from an early age, and a child who has been brought up beautifully from an early age should not go astray even when he grows up.

But nowadays, among the young and old, such vices as adornment, luxury, and luxury are becoming more and more common in daily life and ceremonies. This is the result of their departure from national values and their blind imitation of other cultures.

This is also reflected in household items, guest utensils, and wedding utensils. According to religious values, doing so is a waste. It was returned from waste. Nasiruddin Samarkandi also mentions this in his book, saying that "It is not permissible for men and women to eat, drink,

smell and use utensils made of silver and gold" [4: 890]. This is evidenced by the words of the Prophet (peace and blessings of Allah be upon him) narrated by al-Bukhari and Imam Muslim: He also noted that it is permissible to use glassware, crystal and polished stoneware in Samarkand household items.

However, it can be used if the saddle and similar frequently used items are given a silver color. However, the scholar stated that it is makruh to pour gold and silver water on the mushaf of the Qur'an, and to cover the mushaf with gold or silver. To this, Abdullah ibn Mas'ud said, "Cleanse the Qur'an (from all kinds of gold and silver ornaments and sheaths). Do not clothe him with the clothes you wear".

This means that Samarkand not only forbids household items used by people, but also the Qur'an from being made of gold. Because all this is, firstly, a waste, and secondly, people can be proud of such things in front of others and lead to arrogance. Pride, on the other hand, leads people to evil.

During the topic, it was pointed out that it is permissible to use golden water to decorate mosques and draw various patterns on their walls, which would be to glorify the mosques, but it would be preferable to leave this work [4: 891-892].

Even today, the construction of mosques and their over-decoration is in full swing. But it is even more important to think about the actions in it and the upbringing of the people who pray in it. For this reason, mosques should be clean, tidy, light, free from useless hashams and patterns.

It is also a good deed to improve educational institutions or health care facilities and create appropriate conditions for people in them. In this regard, the ongoing beautification work in the country is an example of solving the most important tasks.

Nasiruddin Samarkandi in his book "Production" also mentions the use of animals. There is no harm in cutting animals so that they do not give birth. But he says that it is makruh to use them in service [4: 892].

In the age of modern medical science, scientists are conducting research on artificial insemination to improve animal reproduction. Livestock on many modern farms are being bred through artificial insemination. This was allowed by Islamic scholars. Only this process is required to occur in animals of the same sex. It has also been stated that it is not possible to inseminate an animal of the same sex naturally or artificially with an animal of the same sex.

One of the socio-economic issues raised in "al-Fiqh an-nofe" is the issue of "Ihtikar" - Monopoly. It is makruh for people to buy food on a daily basis, sell it at any price, or keep it at any price, and then artificially raise the price. The words of the Prophet (peace and blessings of Allah be upon him) narrated by Imam al-Hakim as evidence of this are cited as evidence:

Samarkandi said: "If the sultan (head of state) does this for the sake of the people, it is permissible" [4: 899]. Hence, it is permissible by the state or the head of state to control the sale of foodstuffs necessary for the daily needs of the people, to take measures not to artificially increase their prices in the interests of the majority of the people.

One of the approved trade practices in the work is the issue of selling fruit juices. The scientist noted that it is possible to sell fruit juices, that this work will replace intoxicating drinks, discourage people from consuming such drinks and quench their thirst [4: 901].

Also, at present, the trade in fruit trees is developing, and their sale is carried out internationally. In this case, traders have to pre-order the gardeners and buy a certain part of the ripening crop in advance.

This issue is mentioned in a separate book of "al-Fiqh an-nofe", "Musaqat - on the rent or purchase of a certain part of the fruit" [5: 1303]. Abu Hanifa said, "Musaqat is the renting of a part of the fruit of a tree, and it is void." Abu Yusuf and Imam Muhammad, on the other hand, said that it is permissible if its duration and amount of harvest are clearly defined. It's like likening to renting fruit. The musaqat says that it is permissible to use trees, grapes, dates and vegetables, and that if the harvest is more than the cut amount, it can be purchased. It is stated that if the conciliation agreement is terminated, then the party who terminated it will compensate the damage.

"Al-Fiqh an-Nofe"'s "Book on Hunting and Slaughter" describes the conditions and circumstances of the slaughter of animals that are consumed by humans, one of the social and domestic issues [4: 960]. In particular, Samarkandiy says that if he deliberately abandons the "tasmiiyah" during the slaughter, it is not permissible to eat what he has slaughtered. In this regard, the scholar cites verse 121 of Surat al-An'am: "Do not eat that which does not mention the name of Allah". Imam Shafi'i says that it is permissible to eat. This is evidenced by verse 3 of Surat al-Ma'ida. At the same time, Samarkandi says that if the butcher forgets to say the tasmiiyah at the slaughter, it can be eaten according to the union of scholars. When 'Abdullah ibn Mas'ud was asked about this, he was quoted as saying, "The name of Allah is in the heart of every Muslim." So, for the meat of a slaughtered animal to be halal, it must have been slaughtered in honor of Allah and in His name. In order for it to be correct to say "Bismillah" at slaughter, the following four conditions must be met:

The one who kills "Bismillah" himself;

Saying "Bismillah" with the intention of slaughtering;

Saying "Bismillah" or words in its meaning that glorify Allah, and refraining from uttering words with other meanings;

He must assign the Bismillah to the animal being slaughtered.

This section also mentions animals that can and cannot be eaten. It is makruh to eat zobb and lizard meat. Because the hyena is a beast. Imam Shafi'i said that it is not makruh to eat zob meat. This is evidenced by the fact that the Prophet (peace and blessings of Allah be upon him) ate zobb on his table. In addition to the Samarkand theme, he also considers the consumption of insects to be makrooh and quotes verse 157 of Surat al-A'raf.

Regarding the consumption of horse meat, it is narrated that Abu Hanifa said that it is makruh, and that his disciples Abu Yusuf and Imam Muhammad are not makruh. Samarkandi agrees that it is not makruh to eat horse meat here.

It is also said that there is no impediment to eating rabbit meat, but it is not permissible to eat the meat of humans and pigs (pigs). Of the aquatic animals, only fish and animals of this species can be eaten. The Prophet (peace and blessings of Allah be upon him) said: "We were given two deadly bodies and two bloods. Two dead fish and a locust, two blood livers and a blackbird". The variety of seafood dishes and their sale is expanding in the existing modern restaurants. This

leads people to ask questions on this issue. The issues outlined above play an important role in answering these questions and preventing misunderstandings.

Today, some misguided groups visit graves and forbid the people of the graves from reciting the Qur'an. They claim that such acts are heresy and do not reward the pilgrimage and recitation of the deceased. Nasiruddin Samarkandi has touched upon this issue in his work "al-Multaqot". The scholar said, "It is permissible to visit graves. Once a week the graves are visited with the aim of blessing them. When he enters the cemetery, he greets the people of the grave. He prays for them by asking Allah for goodness, forgiveness and mercy" [6:52]. The scholars of Ahlas-Sunnah unanimously allowed visiting the graves [6:62]. In particular, reports of visiting graves on Friday or the day before or the day after were mentioned. It is also makruh to sleep in the grave and pray there. sitting on the grave is forbidden from climbing on it. During a visit to the grave, he is said to have walked around it.

The Hanafi scholars have stated that it is not makruh to recite the Qur'an at the grave [6: 448]. At the same time, hadiths have been narrated during the pilgrimage to recite Surahs "Ayatul Kursi", "Ikhlas" and "Fatiha". This has been proven to benefit and benefit the people of the grave.

## CONCLUSION

The social issues mentioned in Samarkandi's "al-Fiqh an-nofe" and other works of jurisprudence are a source of special attention not only for their time, but also for finding solutions to some of the problems that exist today and preventing conflicts and heresies. One of the main tasks of the research is to reveal the role of "al-Fiqh an-nofe" in finding answers to social problems that arise in society today. Issues such as "men's and women's dress code", "use of silk fabric", "use of gold and silver jewelry, utensils", "decoration of mosques", "decoration of the Qur'an with gold water" described in the book "Istehsan" And its negative impact on the education of young people and their prevention in the book "On hunting and slaughter "Animal consumption" plays an important role in answering the questions that arise in social life.

### INTRODUCTION

A compressor is an industrial equipment that is designed to compress gases, increase pressure and further supply compressed gas to the consumption of technological processes. The tasks in this case can be different from meeting the need for high-pressure compressed air to increasing the pressure in order to separate (dehumidify) the gas. Industrial compressors are used in many

industries and in various technological processes. Because the compressor is a rather complex and expensive equipment, with a large consumption of electrical energy [1].

Modern compressors are built mainly by their computer-based automatic control systems that meet modern energy-saving requirements. But many industrial enterprises use compressor machines built according to the projects of the 90s, which did not have computer control. Computer controls ensuring the safety of the equipment operation creates the conditions for saving energy.

Replacing these compressors with a new automated one requires a large financial cost. Therefore, the modernization of compressors based on elements of modern computer automation is relevant. We have developed modern automated control systems for compressor units based on multi-level automation systems built on the basis of industrial controllers, operator panels and operator workstations[2,3].

The constructed system is a two-level system consisting of a first-level system implemented on microprocessor-based meters-regulators, remote access modules, and a second-level system implemented on an industrial computer.

The first-level system includes:

- Subsystem for collecting, displaying and converting information; implementations of control actions.

The first of the subsystems performs: - collection, conversion of analog and discrete signals from the object; control of the reliability of the input analog information; - generates discrete signals (signs) of channel malfunction; measurement of input signals and output beyond the limits of the specified parameters.

- blocking the operation of the compressor according to certain parameters.

The second subsystem of the first level performs the calculation, checks for restrictions and implements the calculated control actions on the executive mechanisms of regulatory bodies.

The second-level system includes:

- subsystem for collecting and processing and storing information;

- subsystem for diagnostics of the state of the main equipment and situational control of the technical process;

- subsystem for adapting the coefficients of regulators and filtration coefficients;

The second-level information collection and processing subsystem collects analog and discrete information from the ADC and DAC modules, as well as information entered by the operator from the keyboard, filters and checks the reliability of the input information.

The subsystem of diagnostics of the state of the main equipment and situational control of the technological process of the second level is designed to recognize with a certain degree of confidence situations of shutdown of the main equipment and the state of the technological process with the issuance of recommendations on the virtual structure of the control circuits.

The subsystem of adjustment of coefficients of regulators on the basis of the analysis of dynamics of transients on channels:" the regulated variable - the position of the regulating body "

carries out adjustment of tuning coefficients of regulators, and on the basis of the analysis of behavior of current values of analog parameters, carries out adjustment of coefficients of filtration.

The information representation subsystem is designed to implement a set of functions of the driver-operator dialogue with a personal computer. Information exchange between subsystems should be carried out through a system-wide information base. The operating mode of the system is continuous, three-shift.

The developed system is implemented for the modernization of the compressor 2VM2 .5-12/9.

**Fig 1. Compressor 2VM2, 5-12 / 9**

The compressor 2VM2. 5-12 / 9 is a horizontal, crosshead, piston compressor of two-stage compression, made on the opposite base M2, 5.

Complete set of the compressor 2VM2, 5-12/9 2VM-2,5-12/9 - all compressors are supplied with 2VM2. 5-12 / 9 electric motors, intermediate and end refrigerators.

Intermediate gas coolers are located above the compressor cylinders. The end gas cooler is installed on the foundation near the compressor. The 2VM air piston compressor with cylinder and oil seal lubrication is used in almost all industries where compressed air is not subject to strict cleanliness requirements. They are designed for the supply of compressed air as an energy carrier in construction works, coal and ore mining, tunneling, transportation of bulk products, in the drives of automation systems, pneumatic machines and equipment, etc.

Modular reciprocating air compressor units 2VM are mounted on a single supporting frame in factory readiness. The compressor 2VM2. 5-12 / 9 is driven by an asynchronous electric motor.

Technical characteristics of the compressor:

Compressible gas	Air	
Motor shaft speed, rpm	750	375
Capacity,	27	13,5
according to the suction conditions, m <sup>3</sup> / min Initial	Atmospheric pressure	
pressure, atm Final	9	
pressure, atm	130	130
Flow rate ohl. water without end cooler (inlet +15°C), l / min Oil	96	
Amount of oil to be poured into the compressor frame, l	100	

Compressor	
weight, kg	3920
Type	A2K 85/24-8/16 УХЛ4
Power, kW	160/75
Voltage, V Installation	380
weight in the scope of delivery, kg	5000
Overall dimensions of the installation, mm	3000×1485×2100

The newly developed automated control system "Compressor" has special mnemonic circuits that control and control the operation of the compressor[4]:

## CONCLUSION

We have developed a system that reduces the human impact on the operation of the compressor and optimizes the operation. The implementation of the system is achieved by saving electrical energy by 20 %.

The upper level of the automated control system "Compressor" is developed on the instrumental software package Trace Mode and is universal for use in other types of compressors.

## THEORY AND PROBLEMS OF RUSSIAN LANGUAGE TRANSLATION IN THE FIELD OF TECHNOLOGY

**Parpieva Makhsudakhon Makhmudjonovna\***

\*Senior Lecturer

Department of Uzbek Language and Literature,  
Fergana Polytechnic Institute,  
UZBEKISTAN

### ABSTRACT

*Due to the rapid development of modern technologies, the translation of scientific and technical terminology is particularly relevant in recent years. Today, scientific and technical translation is not only a type of translation activity, but also a separate applied discipline. And the main task of scientific and technical translation is a brief and accurate presentation of the information and the absence of errors. without any emotional coloring. Moreover, one of the goals is also to create an electronic dictionary that would be able to include multi-component terminology that is applicable in narrower, less studied areas of knowledge. A separate item examines the features of automated translation programs, the selection and analysis of four-component terms, and the frequency of their use. Use in the studied texts, as well as their verification for the presence of a pro -7 message in the text.*

**KEYWORDS:** *Search For An Algorithm, Dictionary, Research Materials, Methods, Structure, Multicomponent Terms, Vocabulary.*

### INTRODUCTION

A distinctive feature of scientific and technical texts is the abundance of terms and various phrases, formulas, graphs, the translation of which can cause a number of difficulties. And the main task of scientific and technical translation is a brief and accurate presentation of the information and the absence of errors. without any emotional coloring. Due to the rapid development of technology, new terms (neologisms) are constantly appearing in the scientific language, which even the latest dictionary does not have time to fix, which also presents great difficulties in translation.

Thus, the relevance of our work is determined by the lack of knowledge of the translation of terminology from Russian into English, especially on the material of such narrow areas of knowledge as opt informatics. The relevance of our research work is also due to the increasing role of the importance of adequate translation of scientific terminology.

The object of the research is scientific and technical terminology and multicomponent terms. The subject of the research is the peculiarities and difficulties of translation of scientific and technical texts in general, and terminology in particular.

As for the purpose of this work, it can be defined as the identification of difficulties encountered in the translation of scientific and technical terminology. Moreover, one of the goals is also to create an electronic dictionary that would be able to include multi-component terminology that is applicable in narrower, less studied areas of knowledge. In accordance with the purpose of the work, the following 5 tasks were formulated, the solution of which is aimed at a comprehensive disclosure of the topic and achieving the goal:

1. Introduction to the basic concepts of the scientific and technical field
2. Selection of materials and tools for analysis and research
3. Extraction of multicomponent terms for further research
4. Search for an algorithm and build a translation hypothesis for translation
5. Creating a dictionary

The theoretical significance of my work is due to the importance of research and study of the specifics of the translation of scientific and technical terminology.

As for the practical significance, it consists in the fact that sometimes a translator has to deal with scientific and technical terms, and at the same time with the difficulties of technical translation, without the knowledge of which you can make many mistakes, even if you are proficient in a foreign language. In this regard, this research paper can be a good guide to the translation of terms of varying degrees of complexity.

Russian – Russian and Russian – English terminological technical dictionaries, as well as scientific and technical texts, were used as research materials. In the practical part, the body of the text is considered, which includes annotations to articles of a scientific and technical nature, and in particular, opt informatics.

To perform all the tasks of my work, the following methods were used:

1. Structural analysis;
2. Statistical Analysis;
3. Identification of technical terminology features;
4. Comparative translation method.

The scientific novelty of my thesis is that due to technological progress, more and more terms in various fields of knowledge appear every day, and the need to develop a clear algorithm for translating scientific terminology is growing.

Moreover, multicomponent terms have not previously been considered in the texts of scientific and technical literature in such detail, which once again confirms the need to develop a clear algorithm for their translation.

Our research work is aimed at identifying the difficulties in translation of scientific and technical terminology from Russian into English.

The structure of this thesis is presented as follows: table of contents, introduction, theoretical and practical research, conclusion, bibliography, and appendix. The list of references contains 30 sources.

In the first chapter, we consider the main concepts related to translation, the style of the text, especially of a scientific and technical nature, as well as the difficulties that may arise when translating them. Special attention is paid to such concepts as term and terminology, which are key to our work. Further, various classifications of scientific and technical terms and resources used by the specialist in the translation of terminology are considered.

The second chapter is aimed at proving the relevance of the problems of translating scientific and technical terminology based on opt informatics, since the chosen field of knowledge is important for research due to its lack of knowledge and, accordingly, the problems that arise for the translator with terminology of this nature. The next section examines the body of text from which multicomponent terms are extracted. A separate item examines the features of automated translation programs, the selection and analysis of four-component terms, and the frequency of their use. Use in the studied texts, as well as their verification for the presence of a pro -7 message in the text. An important section is the introduction to the translation algorithm of multicomponent terms, which can be a good helper for students and translators in specialized fields of knowledge.

In this paper, we are dealing with the translation of texts of scientific and technical style. In this regard, it is necessary to find out what the style is, what the texts of this topic are and what features they have.

A language style is a collection of language tools. The style of scientific and technical literature, in turn, is distinguished by the presence of special characteristics.

First, it's the vocabulary. In scientific and technical texts, special terms are used, which are selected in accordance with the field of knowledge to which a particular text belongs in order to accurately convey the idea.

As for grammar, scientific and technical texts abound in the use of passive, impersonal, and vaguely personal constructions.

Most of the sentences are compound and compound sentences. Consequently, the language of scientific and technical style is widely used conjunctions, compound prepositions, and various phrases. In addition, it is worth noting that the author of the text, trying to convey information and explain those or other facts, discoveries, processes, avoids the personal forms of the verb, replacing them with the 10 passive voice. In this regard, it becomes obvious that all the processes and phenomena in the text act as subjects, while overshadowing the author of the text.

The style of presentation of information. The main feature of the scientific and technical text is the brevity of the presentation of the material and the clarity of the wording.

---

Zhidkov A.V., in turn, identifies the following features of the style of scientific and technical translation: strict consistency and consistency of all components of the idea presented by the author, the content of the text, the availability of a specialist in a particular field in terms of understanding the information presented, as well as the statement of scientific fact.

Having found out what the style of scientific and technical texts is, we should proceed to the definition of scientific and technical translation.

In this paper, the problems of translation of scientific and technical terms were considered, among which the problems of translation of multicomponent terminology were of particular interest.

To date, issues related to the translation of scientific and technical literature are of great interest to specialists.

The first chapter is completely devoted to the consideration of such concepts as translation, scientific and technical translation, terminology and terminology. We paid special attention to the peculiarities of scientific and technical texts in terms of vocabulary, grammar and style of presentation of information.

**ABSTRACT**

*In this article, a number of methodological recommendations and proposals on the activities of the Centers of activity developed on the basis of the state requirements for the development of children of primary and preschool age, the state program "first step" and the features of the development of children for age are presented. During the 4th week of January with the children of a large group of MTT, on the basis of the theme "Alphabet of sobriety", the methodical recommendations and conclusions that gave positive results in the test of practical experience on language and Speech, Art, construction, constructivism and Mathematics, Science and nature, Games and staging centers, didactic games and their use in the process.*

**KEYWORDS:** *Development, Knowledge, Skills, Qualifications, Didactic Play, Creative Side-Play, Geometrical Figures, Methodology, Methodological Recommendation.*

**INTRODUCTION**

While we live in a civilized age of Science and technology, the indicators of Child Development and mental growth are also growing day by day. All developed countries want young people to take an active part in the life of society and the country and open the doors to all the necessary opportunities for this. In particular, in our state, all the necessary conditions are created for the growth of the younger generation. In the decree of our President SH.Mirziyoyev "on the strategy of Action for the further development of the Republic of Uzbekistan" "to educate young people who are healthy, spiritually and mentally developed, think independently, are loyal to the motherland, have a firm life outlook" the fact that it is defined as an important task means that the problem of youth education is one of the most priority issues of the country's policy. New technologies and innovations, a number of methods and tools are being developed in each area

every day and hour. In particular, in the field of pre-school education, radical reforms are carried out in recent years. The establishment of the Ministry of pre-school education, the development of the state program “first step”, the introduction of a number of new legislation into the education system show positive indicators of quality efficiency in every sphere.

Creation of new methodical and educational tools, introduction of modern technologies, we also achieve achievements in education and training through the development of new pedagogical technologies and techniques that will be used in creative, didactic, staged and building-building games. These bring a number of convenience to educators and educators. Due to their pedagogical skills and individual characteristics of children, the issue of co-operation, the need to develop new methods of training are entrusted to them. 2-th principle of the Convention on the rights of the child- it is necessary for children to develop their abilities more broadly. That is, the laws of obtaining knowledge, entertainment, recreation, cultural activities, information are laws. After all, with reasonable use of all created opportunities and conditions, the education and upbringing of worthy heirs to ancestors depends on educators.

In this regard, I would also like to pass my methodological recommendations for the kata group Educators of the organization conducting research on the topic “Alphabet of sobriety” on the 4th week of January, which received a positive result, based on the state requirements and the requirements of the state program “first step”.

Age group: large group.

Month: January.

Moon blue: the joy of winter.

4 Week theme: Alphabet of sobriety.

The general purpose of the activities of the centers: to create an understanding and imagination about the fertility of the winter season itself, Entertainment and the charm of the holidays.

To teach politeness, decency, culture of treatment, non-application of words, listening in the process of communication, synthesis of analysis of words, Statement of perceived thought in the literary language in accordance with the culture of speech. To be cultured in communicating with the surrounding people, to form independent thinking skills on the basis of integrated education. Within the framework of the activities of each center “to form knowledge, skills and skills pertaining to” sobriety.

### **Language and Speech Center**

The purpose of the center: to increase the vocabulary of educators, to create the skills of communication on the basis of literary language norms, to develop skills of cultural listening and recounting.

Necessary equipment: prepared in advance for the Center, ”sweet word sister”, ”the boy with decency” poem passage.

The activity of the center begins with a story telling:

“Sweet word sister”

Since there are gardens with many amenities, beautiful apart from the resort, which has gone from the wisdom of the drag that the carefree and independent mother Uzbekistan. Among such kindergartens there is a 23-th kindergarten, which is distinguished from other kindergartens by its children with wrists, whims and decency. The children here are distinguished from other kindergarten children by their own conversational manners, culture of dressing, exemplary behavior. Among the children in this kindergarten there are sisters named Shahrizoda and Bibifotima. The sisters are very polite, wash their hands away when they wake up early, to their parents “Assalomu - alaykum” as long as the girls say. Speaking of parents, “Labbay replied that”, “Hop is”.

One day a neighbor named Kadirjon, who does not want to go to their house to the kindergarten, when adults say, “No, no, no, no”, does not want to say hello, does not want to listen to his mother's words, came to the guest. The sisters met him as a welcome Kadirjon with a good mood and invited him to dinner at the table. As soon as Kadirjon sat down at the table, he stretched out his hand to eat. Then Shahrizoda: Kadirjon to eat first an adult hand stretches, and then after they give permission, we begin to eat. We washed our hands, you did not wash. He said that we should wash our hands before and after eating. Sisters learned in kindergarten after having had dinner “the poem “ boy with decency:

Kattalarga hurmatda,  
Kichiklarga izzatda.  
Odobli bola har gal,  
Assalom: der albatta.  
Do'stlariga qadirton,  
Jonvorlarga mehribon.  
Tovuqlarga berar don,  
Odob-ahloqli bola.  
Xonalari ozoda,  
Kiyimlari top-toza,  
Charchamas o'qib- yoza,  
Odob ahloqli bola.  
Erta tong turar barvaqt,  
O'ynar telefonmas shahmat.  
Ota-onangga rahmat,  
Odob-ahloqli bola.  
Sport bo'lsin yo'ldoshing,  
Kitob esa sirdoshing,  
Fahrlantir yurtboshing,

Odob-ahloqli bola.

deb aytib berishibdi.

Having heard the poem, Kadirjon was born of his masculine and evil spirit, which greatly upset his mother. He wants to throw out his bad habits. When he returned home to his mother: tomorrow I will also go to the kindergarten sister Shahrizoda and Bibifotima DEC said beautiful words, I rejoice you, ask his mother to forgive me. Kadirjon was very pleased with the fact that his mother changed her son, and gave him a gift from the book of fairy tales kata.

Expected result: to teach the educators the words that denote the positive feelings involved in the story and in the poem. Children's interpersonal and free-thinking skills to find content. To achieve the effectiveness of educator and Parent cooperation.

### The curse Center

The goal of the center: to shape the drawing skills of Educators, based on their own interests and abilities, tactfully imagining a good mood. Distinguish colors that represent a bright excellent mood, delight them on the basis of drawings on the basis of drawings. Develop fine hand matting movement.

Necessary equipment: White Paper of A4 size, black and colored pencils, various smileys, watercolor paints, a picture depicting a water vessel, a moose pencil and a smiling sun.

Activities of the center: the educator first creates an imagination in the educators on the subject of sobriety. Laugh, be polite, tidy will tell the children the pleasant aspects. Exercise doskasigi using the image of the sun, they depict a picture of the sun, which came out of their imagination and laughed, sad and crying. the educator gives the children the right training in the use of colors, they monitor their activities and help the children. From smileys, which represent a different mood in the process of drawing children they use it.

All children's drawings are analyzed at the end of the activity and children are encouraged positively.

Recommendations: “through smileys on the basis of the theme of” sobriety “laughing”, “upset”, “pumpkin pals”, “angry”, “crying”, setting up a corner representing the mood in general. Form the skill of drawing on the basis of imagination. Smileys that express the mood

### Center for construction, construction and mathematics

The purpose of the center: to teach educators to make a paravoz on the basis of geometric figures ( circle, square, rectangle, triangle, oval). Make accurate and reverse counting skills up to 1-9. In children, by playing our cheerful paravoz ' didactic game, correctly correlate their creativeness regarding how to construct them.

Necessary equipment: scissors, glue, colored cardboard paper, black and colored pencils, „a colorful picture with a cheerful image.

Activities of the center: at the beginning of the activity, the educator mentions the use of careful equipment. Repeating the name of each of the geometrical figures, they make a cheerful paravoz of the group with their participation. Picked up the paravoz from different colored cartons, wheels, relays, 9 carriages , eyes, eyebrows and mouth after clapping, the image of” cheerful paravoz " is combined on the basis of a worn image. In the process of this activity, the educator supervises and assists the children. After that, our cheerful paravoz” plays didactic game.

Bizning quvnoq paravoz ,

Unda bor 9 xona.

Barchaga yo'l ko'rsatar,

Boshqaruvchi yagona.

Vagon sanash qiyin ish,

Bir, ikki, uch, to'rt, besh,

Olti, yetti, sakkiz, to'qqiz,

Charchadim endi so'zsiz.

Keling endi siz sanang,

Jo'r ovozda hamohang..... (bolalar sanaydilar)

Biroz muddat dam oling,

Paravozga chiqa qoling.

Methodological recommendation: to repeat the subject-based concepts, to find the right and reverse counting skills through didactic gameplay content from 1 to 9. To teach simple methods of making a parachute using geometrical figures. It is very effective to play the didactic game in minutes, in addition to activity.

### Center for science and nature

The purpose of the center: to provide educators with information about the changes in nature, the exchange of seasons, the pleasure of winter in the snow. Creating concepts about the state of snow in children by clearing the corridor of the kindergarten playground from the snow, observing the transformation of the winter into water at a hot temperature, and ice in the cold, and from a heap of snow "make an enchanted ice kindergarten".

The activity begins with providing educators with information about the useful properties of snow. The fact that each of the snowflakes falling from the sky has a repeating shape, the more it rains, the more it will saturate the earth with water and get a plentiful harvest in the fields, saying: children wear warm clothes and wear gloves because : we clean the corridor of the playground of our kindergarten from snow piles and from collected snowflakes, we Over the kindergarten, which is made of snow piles, pour cold water and magically freeze. The educator will tell about the changes that are happening in the composition of the snow.

After returning to the training room, in one breath, quick remarks are made:

-Erta tong otdi, qo'lda qor qotdi.

-Gilam qoqsa osmondan, par to'kilar har yondan.

-Qor yaxshi, o'ynashga qorbo'ron yaxshi.

Remarkable aspect: participation of all children in the process of activity is controlled. Active educators are encouraged. In them, consciousness and imagination are formed about the states of the snow.

### **Center for Sujet-role playing and staging**

The purpose of the center: to assist children to carry out their activities in harmony with their interests and talents on the basis of creative support. To teach to adhere to the culture of speech and to perform roles. achieve the sounds and voices of circus animals, by imitating them to express their actions and circumstances, enrich their imagination about circus performances, stage a live circus performance

Necessary equipment: posters depicting circus performances, videos from circus performances, deployments depicting circus heroes (masquerade, buratino, watch animals), their stage clothes, a lion cage (made of yellow yarn as a rectangle) and small balls on the floor, balloons.

Activities of the center: circus performances begin with watching short videos depicting. Educators are given information about the animals of the spectacle, the culture of the spectator. After that, a mysterious circus performance begins. Before you into the viewing area will come into the circus manager. Then visit The Masquerade, buratino and one after another circus animals: puppies, horses, elephants, monkeys, rabbits and lions. Children perform the actions of circus heroes, their voices entering the role. In the distribution of roles, the educator should take into account the interests and performance skills of children.

Recommendation: create a live circus performance environment. Educators are taught to distinguish circus animals, by imitating sounds and voices, to express their states of movement through roles.

To give information about audience culture. “During the summer recovery”, bring the children to the live circus performances. Help them to feel the mysterious pleasure in the circus.

### **INTRODUCTION**

From the early years of independence of our country, the training of competitive personnel has become the need for competitive personnel using the education system and using the achievements of developed countries.

Providing various areas of the state and society with intellectual, educated personnel was considered as one of the priorities. In turn, specialists in this area have been borne by the presentation of the literature in the fields of the field, the introduction of innovation and education technologies in the educational process, in terms of the Identity of the Independence.

In this regard, President Shavkat Mirziyoyev stresses: "Another issue is crucial: this is the professional level of teachers and professors, their special knowledge. It is necessary to create an

environment that actively supports the process of education, spiritual, enlightenment maturity and the formation of real values. "

Stations defining the quality of education related to the learning process, encourages problem lectures, interesting in the form of questions, questions, and to think of advanced pedagogical technologies, and think of students, and to think freely, to think freely, to think freely, to think freely. There are many technologies that attract problem situations, solve problems, to freely communicate, in scientific research, find solutions to the problem.

Today, the development of young people cannot be imagined without innovative ideas. Education, science, production is an independent worldview, determines well-made young people with high knowledge and thinking, which has an independent worldview. In this case, the education system requires best practices, creativity from any teachers working in the education system.

From the early years of independence of the country's independence, reforms in the education system were voluntary and applied. In 1992 and in 1997, the Law on Education and the 1997 National Training Program and gradual changes in the education system were updated. Wide reforms have been carried out in recent years, in order to be held for the sustainable development of the Republic of Uzbekistan for 2017-2021, in particular, practical measures, updates, a number of decisions and decrees, the education system. Lifting to the top, reforming all links of the education system, developed countries, are the main task of training highly qualified personnel and young people, which are independent worldview, intellectual motorism.

This, in turn, is relevant than ever to work with all the coaches, pedagogues working in the system of continuing education, the effective use of information technology, effective use of information technology, effective use of interactive and innovative technologies.

Life itself proves that life itself is not sufficient in the early second-friendly age. Science, technology and innovative technologies in production cover the education system, as well as other industries. These are modern pedagogical technologies, innovative technologies, interactive methods, methods of non-traditional classes, etc.

Innovation (Innovation) - innovation, is news. Innovative technologies are a pedagogical process and the activities of teachers and student, in mainly interexive techniques are used to fully in it. Today, both traditional and non-traditional models of organizing the lesson of education are used by our teachers.

A non-traditional lesson is aimed at the student's personality, and it is also known as the student in the center. It should be noted that the non-traditional models of organization of the lesson have a number of achievements. In this way, teaching requires great skills from our teachers. Non-traditional forms of education include:

1. Oodelized lesson;
2. Heavial learning lesson;
3. Incidental lesson;

1. Modeled class and society are a set of methods in the classroom and the model of the processes in the community and the methods of studying students in their personal participation and education.
2. The joint study is a set of methods that provide educational in exchange for working in independent groups.
3. The study research model is a set of methods that provide for a specific problem.

Apparently, the lesson in all three models encourages students of student-educational students, creative research, to work together. The non-traditional lesson has a number of advantages in the following areas:

- leads to good development of the content of the course, freestyle observation;
- Insurance of timely re-communications;
- Creation of conditions for applying concepts in practice;
- offer of various teaching methods;
- to be a high level of motivation;
- well recollection of past materials;
- Improving the development of communication;
- increase in self-assessment;
- Formation of positive attitude of students in the field of the topic;
- Development of critical and logical thinking;
- Students form knowledge, skills, skills such as the formation of problems solving skills.

It is a great opportunity for students to have knowledge, skills and skills, such as improving the content of the learning, entering the contents of science, developing self-assessment, critical, critical, critical, and logical thinking of students. This, in turn, requires an innovative technological approach to education. A particular project of each lesson is prepared and determined what results will be achieved on the basis of this projector basis. In the context of a market economy, one of the most effective ways to train national ideas in the field of education is to use the most effective forms of educational in organizing the lesson.

In the use of joint training, sending students to students in advance, each small group, demonstrating the assignment provided in the next lesson, using the methods of presentation, using presentations. The formation of the skills to work in the team and to find the problem solving in the team will serve to develop skills between students, solving solutions to the problem, and innovative approach.

So, of the following ways, of course, in the learning of foreign languages In particular, the fields of foreign languages in particular is a national tradition, the formation of skills, the formation of skills, national pride and pride, the country He hurts the groundwork for the formation of qualities such as involved in development and independence, as perfect and competitive personnel.

 UZBEKISTAN

### ABSTRACT

*This article is generalized the information about the maturity of the person and its characteristics. As well as the theory of education as a part of pedagogical science analyzes the content, form, methods, tools and techniques, the importance of the spiritual heritage of Eastern thinkers of the educational process today.*

**KEYWORDS:** *Pedagogy, Education, Education, Theory, Methodology, Spiritual, Heritage, Values, Decrees, Manners, Means, Culture*

### INTRODUCTION

The future and development of any nation depends on the spiritual maturity, worldview, intellectual potential of young people. In particular, raising the spiritual qualities in the minds and hearts of young people, strengthening solidarity in families and communities, strengthening ideological immunity against ideological and information attacks, spiritual and moral criteria, the priority of national and universal values, regular study of geopolitical and ideological processes, terrorism, extremism, ideology. Understanding the essence of such issues as effective ideological fight against human trafficking, drug trafficking and other dangerous threats, dedication to the development of our developing country, honest work, and thorough mastery of the secrets of modern science are among the most pressing tasks today.

Indeed, the Resolution of the President of the Republic of Uzbekistan dated March 26, 2021 "On measures to radically improve the system of spiritual and educational work" provides for fundamental, practical and innovative research in spiritual education and social sciences, increasing the effectiveness of spiritual and educational work in all sectors of education. The basis of education is the organization, implementation, study of the heritage of our great

ancestors, who contributed to the development of world science, a deep understanding of the rich spiritual heritage left by them, the formation of highly spiritual, competitive personnel through the effective application of modern technologies in education.

Education and its theoretical foundations are an integral part of pedagogical sciences, studies the content, shape, methods, tools, tools, tools, tools, tools, and techniques, as well as the problems of the educational process.

Currently, as well as in educational institutions, teacher educators pay special attention to the formation of young people as spiritually, mature person. In this regard, President Shavkat Mirziyoyev emphasizes: "Another issue is crucial: this is the professional level of teachers and professors, their special knowledge. It is necessary to create an environment that actively supports the process of education, spiritual, enlightenment maturity and the formation of real values".

In this regard, if we think about the goals and objectives of education, education is a process of comprehensive development of the younger generation on the basis of a specific, clear goal and socio-historical experience, the formation of its consciousness, behavior and worldview. In different times and places, social education has been expressed in essence differently, and its content is based on social goals.

The purpose of education is determined by social order. From the simplest action to the most comprehensive state program, education is always goal-oriented. Without a purpose, there can be no upbringing that does not express a particular idea. Based on the purpose of education, based on its content, the methods and techniques that serve to achieve the goal are identified. The problem of the purpose of education is one of the most pressing issues of pedagogy.

The purpose of education can be general and individual in nature. Advanced pedagogy demonstrates the unity and harmony of general and individual goals. The goal is aimed at the positive solution of the general social goal of education and manifests itself as a system of specific tasks. Hence, the purpose of education is a system of tasks to be solved on the basis of the organization of the educational process. Educational goals are grouped into general and specific tasks according to their nature and scope.

Human qualities such as spiritual and moral purity, faith, honesty, piety, honor, kindness, and respect for the elderly, which play an important role in the spirituality of society and the maturity of the individual, do not form spontaneously. At the heart of all this is the content, ideological direction and effectiveness of education for the younger generation in the family, general secondary, secondary special, vocational and higher education.

An important component of social education - a new approach to the organization of mental, spiritual, moral, physical, labor, aesthetic, legal, environmental, economic education for the formation of the younger generation as a modern, harmoniously developed person, to develop their effective ways. The output is particularly relevant. These are the most important tasks in education.

In this regard, in recent years, large-scale reforms have been carried out and implemented in our country. First of all, not only in our country not only in our country not only in our country is extremely important in the upbringing of the younger generation of the younger generation growing.

According to the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated July 6, 2020 № 422 "On measures for the gradual implementation of the subject" Education "in general secondary education", there are noble goals, such as deepening the values and high spirituality, educating them in the spirit of patriotism and humanity, the organization of spiritual and educational work in general secondary education on a new basis.

Also, the introduction of a single subject "Education" in general secondary education, combining the disciplines "Ethics", "Sense of Motherland", "The idea of national independence and the foundations of spirituality" and "History of world religions" has great educational value for students, serves to enrich their knowledge, to raise their spiritual maturity.

Today's issue of education of modern globalized, modern technical technology is a factor in the developed period - every nation is a factor in which the future is the future.

In particular, the XXI century entered as a computer age in human history. However, it is necessary to work, based on how effective and the technique is developing and increasing an important place in the life of the society, raising a person in public life, based on nationality of Central Asian thinkers, leading options of Central Asian thinkers, and the leading views of Central Asian thinking.

In the upbringing of young people in a harmonious man, the valuable spiritual heritage of Eastern will be as an important program. Such as the Muhammad al-Khwarizmi, Abu Nasr Farabi, Abu Ali ibn Sina, Abu Rayhon Beruni, Ahmad Al-Farghani, Imam Ismail al-Bukhari, Ahmad Yassavi, Bahouddin Naqshband, Amir Temur, Mirzo Ulugbek, Alisher Navoi and Zakhtaliddin Muhammad Babur. The social, political and philosophical views of popular scientists play an important role in all-time.

From no one, a person who does not know his past's cultural heritage did not study and honor his ancient descendants, he or she does not know his life.

The study of the cultural heritage of the past is a complex process. Sampling for cultural heritage and the absorption of the noble ideas in the age of-generation should be carried out continuous, consistent, systematically, and purposeful.

In particular, the President of the country noted the following statements at the solemn ceremony dedicated to the 29 th anniversary of the independence of the Republic of Uzbekistan: The first Renaissance of Uzbekistan, fell to the second-philosan stone and Temur and the Temurids. It was not only Movaraunnahr, but the whole of the Central Asian countries increased to a new level of development. It was also noted that during this period, the development of science, culture and arts was manifested and the rise of contemplations was manifested.

In this speech of the head of our state, the word "The glorious power of our people is still being created in Uzbekistan - the period of a new renewal - the third of Renesans".

In fact, the rise processing process in our lives in growing rapidly is displayed in all areas. In the early years of independence, it was tried to reveal the original essence of our national identity, rich historical, spiritual and scientific heritage. It should be noted that our people have joined the idea of "national revenue - the national construction" in steadfast.

So, it is difficult to enrich the minds of youth and worldview today, on the basis of historical principles in educational system, on the basis of historical role in all stages of the education system.

**ABSTRACT**

*This article analyzes the influence of spiritual and moral factors in the formation of scientific and technical thinking in young people. The role of scientific and technical literacy in the formation of innovative thinking of young people in modern times has been scientifically discussed.*

**KEYWORDS:** *Spiritual And Moral Factors, Innovation, Creation, Creativity, Superior, Modern Education, Cognitive, Processes, Harmonious View, A Dynamic Features, Technical Research.*

**INTRODUCTION**

The scientific and technological revolution, the processes of modernization taking place in society will inevitably affect people's lives, spiritual and moral factors. The scientific and technological revolution has been studied since the new era (16th century). This would greatly expand the scope of our subject and lead us to deal with the history of science and technology. Therefore we are limited mainly to a brief look at the changes that have taken place since the second half of the twentieth century to the present. Doctor of Philosophy, Professor N. Shermuhamedova, who has observed the history of epistemological research, writes: "In the middle of the 18th century, the number of scientists in the world did not exceed 10,000, but by the end of the 19th century, the number of scientists had reached 100,000," she said. By the end of the 16th century, most of the "scholars" were clergymen with religious knowledge. In the 19th century, science and technology became an independent branch of social labor, and it was practiced by "secular" professional scientists who had graduated from special faculties of

universities and institutes. In 1850, about a thousand scientific journals were published in the world, and by 1950 their number exceeded 10,000. In 1825, the German chemist Yu. Libix established a scientific laboratory, which began to bring the scientist a large amount of income. By the end of the 19th century, the number of such laboratories was increasing. Science is beginning to attract more and more attention of traders and entrepreneurs.

## **MATERIALS AND METHODS**

They will start to finance the work of scientists, which is of industrial and significant producing.[1]. During this period, science and technical thinking differed from religious clerical views, scientists were interested in real-life problems, especially the improvement of the means of production, the discovery of the mysteries of the universe and its service to human interests. The struggle between the clergy, the church and the owners of science and technical mentality had led to many tragedies. Here we can remember the fate of Galileo, Copernicus, Spinoza, Bacon, Acosta. The second half of the twentieth century is a new stage in science and technical mentality . It was a postclassical period when a revolution took place in science and technical thinking. "After the Second World War, the achievements of science and technology in economically developed countries will be put into practice on an unprecedented scale in industry, agriculture, healthcare and everyday life. Science is making huge changes, especially in energy (nuclear power stations), transport (automotive, aviation), electronics (television, telephony, computers)."The development of science will be a key factor in the creation of the latest military equipment, and the escalating arms race in the condition of the post-war confrontation between the two camps will force major powers to invest heavily in scientific and technological research"[2]. During this period, science and technical thinking differed from irrational inheritance, and it was preferable to rely on common sense, to abandon sophisticated approaches and to devote to scientific research in accordance with the science of logic. During this period, about 60 research institutes and the Academy of Sciences of Uzbekistan, the Academy of Agricultural Sciences, the Academy of Medical Sciences were established in Uzbekistan alone. For the development of rational mentality, a new system of education, dreamed of by our jadid ancestors, will be created; all areas will be managed by highly qualified personnel. The information technological revolution of the late twentieth century has radically changed people's worldview and perception of the universe. Today, about 6 million scientists work in this great science. During the years of independence, the Khorezm Mamun Academy, branches of the Academy of Sciences of the Republic of Karakalpakstan and Samarkand, Andijan, Namangan, Bukhara, Surkhandarya, Kashkadarya and Fergana branches were opened in Uzbekistan. These research centers serve to develop intellectual mentality, enrich the life of society with the results of innovative research. The former "Chinese wall" between science and religion is being removed. The establishment of the Tashkent Islamic Institute for the Study of Islamic Culture and Mentality, 10 Islamic secondary special educational institutions, the Tashkent Islamic University under the Cabinet of Ministers, and the International Scientific Research Center named after Imam Bukhari leads to a harmony between religious and secular knowledge. These young people are bound to be influenced by their spiritual and moral views. Because today in these scientific institutions have a main goal which the formation of young people who have a great love for the rich heritage of Islam, full of high spirituality and enlightenment, actively participating in the processes of modernization and innovative development in our society,

mastering modern knowledge and information technologies, ready to fight religious extremism and terrorism[3].

## RESULTS AND DISCUSSION

The main goal is to form young people who will be able to hold their ceremonies in accordance with modern requirements. The impact of scientific and technical thinking and innovation on the formation of modern spiritual and moral factors in young people can be seen in the following:

- when it is considered that the intellect as a modern sign, an indicator of human perfection;
- in the tendency to modernize social life on the basis of modern knowledge, scientific worldview;
- when evaluating the achievements of innovation and modernization in terms of high moral and ethical values;
- while acting as a supporter of scientific and technical discoveries, humanization of technological processes, humanization;
- while enriching their spiritual world with high ideals, exemplary experiences and modern altruistic views based on a combination of secular and religious knowledge;

Although the view of the intellect as an important indicator of human perfection has existed since the time of our great ancestors, such as Abu Nasr al-Farabi, Abu Rayhan al-Biruni and Ibn Sina, it was not until the twentieth century that it became a special quality of man. (Farabi). The newly established schools were based on the paradigm that everyone, regardless of human origin, nationality, gender, has intellect, everyone can discover, create, show their intellectual abilities.

Sexual and social restrictions on the upbringing of young people have been halted. It was essentially a novelty, an innovative change. Today, it has become a tradition to turn intelligence into natural intelligence and artificial intelligence. This is primarily due to cybernetics, computerization. "The emergence of computer systems, which began to be called intelligent systems (IS), and the development of a direction called artificial intelligence (SI) have given rise to a new approach to a number of traditional theoretical cognitive problems. This, in turn, has helped to find new ways of research, to focus on many aspects of cognitive activity that no one has previously remembered, to understand new cognitive mechanisms and outcomes" [4]. This scientific innovation gave rise to the theory of "computer mentality". At the same time, the practical mastery of the computer has become a common reality. For example, today in Uzbekistan about 7 million people use the Internet. About a third (32 percent) of our respondents considers computer technology to be the most effective means of intellectual growth. According to them, the computer plays the same role as books and scientific heritage in human development. Even the computer is superior to any other means with its responsiveness, richness of information and quick interaction, communication. The maturity of young people depends on the adequate dissemination of scientific, spiritual and vital heuristic information. The lack of this information, the lack of ability to use it, has a negative impact on the intellectual development of young people. At the same time, artificial intelligence, computerization also raised the issue of spiritual and moral development of man, as a result of which the term "computer ethics" appeared. According to scientists, "we cannot replace a person with computers in areas related to

interpersonal relationships, mutual understanding and affection, for example, replacing a psychiatrist or judge with a computer is immoral. According to J. Moore, computer ethics is a dynamic and complex field of research that studies the relationship of ever-changing computer technology to the language of facts, conceptualization, politics, and values. Computer ethics does not consist of a list of rules to hang on the wall or even ethical principles that are automatically applied to computer technology. Although computer ethics links technology to and depends on ethics, it represents the goal of understanding computer technology and implementing policies in this regard"[5]. Hence, the debate over the connection of intellectual pursuits with spiritual moral values continues, which is one of the immanent laws of contemplation. But technocratic ideas and proposals are also likely to open up new topics and directions for innovative research. The desire to modernize social life on the basis of modern knowledge and worldviews is the result of maximalism in youth. True, most of them cannot imagine exactly what modernization, what reforms will lead to. Living with high spiritual and moral ideals, seeking them from secular and religious values and experiences is a characteristic feature of Uzbek youth. They are well aware of the negative attitudes towards Islam and religious values during the Soviet era. At this point, the impact of the education system is obvious. In the Soviet era, it was impossible to write or talk about Islamic thought, because in Islam, ideas and views based on common sense, rationality, and life experience were contrary to communist ideology.

## CONCLUSION

In fact, the development and thinking of the world cannot be imagined without the Islamic phenomenon and culture. Under the influence of Islam, such spiritual and moral factors were formed in the East and the legacy of such thinkers was formed, without which it is difficult to turn today's development, innovative changes into a reality. It is true that Islam has influenced these spiritual and moral factors and the legacy of thinkers in different ways, while religious fanatics have opposed scientific research and did not want them to be included in public life. For example, M. Khatami, who specifically studied Islamic thought, reveals that he formed different philosophical, scientific, political and moral ideas at different times. Some ideas (e.g., Farabi's political-philosophical legacy) have been completely forgotten [6]. Islamic mentality was a paradigmatic phenomenon that influenced secular views and knowledge, which could not be erased from the hearts of the people, the nation. Forty-three percent of our respondents say that scholars who have left a deep mark on Islam and thought are a school of life ideals, their spiritual and moral qualities, and 37 percent say that religious values, especially Islamic moral traditions, influence the formation of secular views. They believe that changes in society will strengthen Eastern and Islamic values, giving a national spiritual outlook to the modernization process. Underlying this optimism lies confidence in the Islamic heritage and modern renewal.

### ABSTRACT

*Educational systems around the world are under increasing pressure to use the new technologies to teach students the knowledge and skills they need in the 21st century. Education is at the confluence of powerful and rapidly shifting educational, technological and political forces that will shape the structure of educational systems across the globe for the remainder of this century. Many countries are engaged in a number of efforts to effect changes in the teaching/learning process to prepare students for an information and technology based society. Multimedia provide an array of powerful tools that may help in transforming the present isolated, teacher-centred and text-bound classrooms into rich, student-focused, interactive knowledge environments. The schools must embrace the new technologies and appropriate multimedia approach for learning. They must also move toward the goal of transforming the traditional paradigm of learning. Teacher education institutions may either assume a leadership role in the transformation of education or be left behind in the swirl of rapid technological change. For education to reap the full benefits of multimedia in learning, it is essential that pre-service and in-service teachers have basic skills and competencies required for using multimedia. This paper, therefore, explores the latent benefit of using multimedia tools particularly in professional teacher education. The paper also discusses why pre-service teachers need to use multimedia technologies within the context of students' familiar, technology-rich living spaces to develop their own teaching skills and the technology skills of their students. In addition, the author also explains the role of multimedia in enhancing the 21st century skills.*

## INTRODUCTION

Multimedia offers the lecturer many benefits including: satisfying educational objectives, increasing pupils understanding, demonstrating events, showing places, conducting experiments which would otherwise be impossible. Sharing of multimedia outputs is done carefully such that it will not disturb other learners working in the same classroom! Not only may a number of pupils be performing similar activities at the same time on a network, the lecturer must decide whether to control the activities via the media of the computer. The use of multi-party desktop conferencing with the lecturer chairing the running of the conferencing session, showing selected parts of a video is a case in point.

Giving pupils an opportunity to produce multimedia documents of their own provides several educational advantages. Pupils work with the same information from four perspectives: 1) as researcher, they must locate and select the information needed to understand the chosen topic; 2) as authors, they must consider their intended audience and decide what amount of information is needed to give their readers an understanding of the topic; 3) as designers, they must select the appropriate media to share the concepts selected; and 4) as writers, they must find a way to fit the information to the container including the manner of linking the information for others to retrieve.

Some of the advantages that can be listed for the use of multimedia, according to the authors of the above report, are as follows:

Multimedia can:

- enhance learning in different locations and institutions of diverse quality;
- present opportunities to pupils working at different rates and levels;
- provide (tirelessly, without holding up other pupils) repetition when repetition is warranted to reinforce skills and learning;
- compensate, in the short term, for high pupil populations and limited numbers of trained and experienced teachers – in combination with robust teacher development initiatives and improvements in teachers' working conditions.

Updates to content ware can ensure that teachers and pupils encounter and have the chance to work with current and authentic sources. Such encounters tie learning to the most important events of our time and underscore the general idea that knowledge itself is not fixed and finalized, that there is a universe of discoveries and a library of analyses that can be available to pupils.”

To what extent these advantages of multimedia are relevant to language teaching and learning will be discussed later in this section.

Teachers have chosen a variety of technologies to help in educating ESL pupils. In some instances the older technologies of audiotapes, language masters, televisions, and videotapes are still utilized. Audiotapes are used in listening centers, and in some cases with home projects. Language masters are still used as listening and speaking centers in some classrooms. The common technologies of television and videotapes are valuable learning tools, when used

appropriately. With previewing, viewing, and post-viewing activities included, a wide array of activities can be used with video and television that provide both auditory and visual language experiences.

The emerging technologies of computers and multimedia provide opportunities for even more learning experiences for EFL pupils. Word processing, e-mail, computer software, the Internet, and the World Wide Web are all sources of more and different learning activities. The interactive nature of multimedia provides new ways to enhance the learning experience of EFL pupils.

Teachers use multimedia with EFL pupils for a variety of reasons. The text, graphics, video, and audio encourage immersion in language. The nonjudgmental aspect of technology is comforting for these pupils. The individualization, instant feedback, and assessment components of many software packages are all positive factors. Pupils are motivated when using technology, especially the new emerging technologies. They feel empowered and often content is more accessible to them.

Many factors need to be considered when evaluating multimedia. It should be easy to use and to navigate. It should be consistent with the knowledge we have about EFL pupils' learning needs. Software should be appealing and, of course, it should have a purpose.

Technology is a valuable part of all pupils' learning and education. It can be an integral factor in the EFL pupil's learning. Not only can technology, and particularly the emerging technologies, assist in the acquisition of language skills, but also technology can aid in the all-important task of aiding pupils in the mastering of curriculum content in English. When appropriate preparation and activities are utilized, technology can assist teachers in meeting the special language and learning need of EFL pupils.

One of the major concerns of many countries today is that there is a mismatch between graduates' skills, acquired from higher education institutions and the skill sets needed in industry. Many of the current graduates are found to be lacking in creativity, communications skills, analytical and critical thinking, and problem-solving skills.<sup>1</sup> As such, there is much need for institutions of higher education to focus on training future graduates to be more adaptable to the needs of the industry.

Currently, many institutions are moving towards problem-based learning as a solution to producing graduates who are creative and can think critically, analytically, and solve problems. Since knowledge is no longer an end but a means to creating better problem solvers and encourages lifelong learning, problem-based learning is becoming increasingly popular in educational institutions as a tool to address the inadequacies of traditional teaching. Since these traditional approaches "do not encourage pupils to question what they have learnt or to associate with previously acquired knowledge" problem-based learning is seen as an innovative measure to encourage pupils to "learn how to learn" via "real-life" problems.

We would like to extend this contention further by using multimedia technologies to create a multimedia-oriented project. By doing so, we hope to further develop the pupils' ability to become creative and critical thinkers and analyzers, as well as problem-solvers, within this multimedia-mediated problem-based learning (PBL) environment. This learning mode is constructivist in approach whereby the pupils participate actively in their own learning process and construct their own knowledge.

The move towards using problem-based learning in many educational institutions has resulted in a shift in the curriculum model. The focus is moving from content towards problems to provide a more realistic approach to learning and to create an educational methodology which “emphasizes real world challenges, higher order thinking skills, multi-disciplinary learning, independent learning, teamwork and communication skills” via a problem-based learning environment. However, this model can be further strengthened with the inclusion of multimedia technology into this problem-based learning environment to enhance the pupils’ learning experience.

With the use of multimedia projects, pupils can utilize the knowledge presented to them by the teacher, and represent them in a more meaningful way, using different media elements. These media elements can be converted into digital form and modified and customized for the final project. By incorporating digital media elements into the project, the pupils are able to learn better since they use multiple sensory modalities, which would make them more motivated to pay more attention to the information presented and better retain the information.

On the other hand, there are also some disadvantages of multimedia and its use in teaching. I can consider the price of the tool as the first problem, because as everyone knows multimedia tools are expensive and not all people or teachers can afford it for themselves. Every teacher wants to use it but, as they do not have enough money to have its tools they mostly try to avoid of using it.

The next disadvantage is that it is not always to configure, I mean not all teachers can use it easily. Because it is difficult to use it people who are not aware of this kind of program as it requires special hardware. Even sometimes teacher take a readymade material it is difficult them to use it because of lack of knowledge in that sphere.

Creating multimedia projects is both challenging and exciting. Fortunately, there are many multimedia technologies that are available for developers to create these innovative and interactive multimedia applications. These technologies include Adobe Photoshop and Premier to create and edit graphics and video files respectively, Sound Forge and 3D Studio Max to create or edit sound and animation files, respectively. They can also use an authoring tool such as Macromedia Director or Author ware to integrate and synchronize all these media elements into one final application, add interactive features, and package the application into a distributable format for the end-user. Another advantage of creating multimedia projects in the classroom setting is that when pupils create multimedia projects, they tend to do this in a group environment. By working in a group, the pupils will have to learn to work cooperatively and collaboratively, using their group skills and a variety of activities to accomplish the project’s overall objectives.

As stated by Agnew : “Pupil-created multimedia projects are beneficial, in addition, because they often involve substantial work, open-ended assignments, theme-based activities, and knowledge and experiences that the pupils draw from a wide variety of sources.” Multimedia-oriented projects are “a way for pupils to achieve high self-esteem, to increase their ability to function as self-directed learners, to learn to think effectively, and to practice problem-solving and decision-making”.<sup>2</sup> Therefore, using multimedia in the teaching and learning environment enables pupils to become critical thinkers, problem-solvers, more apt to seek information, and more motivated in their learning processes. Multimedia is slowly gaining ground as a way for pupils to represent the knowledge that they acquire in class and to construct their own interpretation of the

information acquired. It also fosters collaborative and cooperative learning between and among pupils, thus better preparing them with a skill set for real-life work situations.

Having analyzed the theme of my research work, having studied several resources on the given topic and having seen the works of other scholars about the multimedia and its use in education and especially in teaching EFL and ESL I came to the conclusions below:

1) The term Multimedia is said to date back to 1965 and was used to describe a show by the Exploding Plastic Inevitable. The show included a performance that integrated music, cinema, special lighting, and human performance. In the 1993 first edition of McGraw-Hill's *Multimedia: Making It Work*, Tay Vaughan declared, "Multimedia is any combination of text, graphic art, sound, animation, and video that is delivered by computer. When you allow the user – the viewer of the project – to control what and when these elements are delivered, it is interactive multimedia. When you provide a structure of linked elements through which the user can navigate, interactive multimedia becomes hypermedia."

2) The use of multimedia in education has been extensive, as it has been effective in increasing productivity and retention rates, where research has shown that people remember 20% of what they see, 40% of what they see and hear, but about 75% of what they see and hear and do simultaneously. It is now permeating the educational system as a tool for effective teaching and learning. With multimedia, the communication of the information can be done in a more effective manner and it can be an effective instructional medium for delivering information. A multi-sensory experience can be created for the audience, which, in turn, elicits positive attitudes toward the application. Multimedia has also been shown to elicit the highest rate of information retention and result in shorter learning time.

1. Most teacher advocates of audiovisual aids have made similar observations on the primary and secondary level as well. An effective teacher knows the secret of AV instruction is to utilize the unique capability of each medium. This can only be accomplished if the teacher is willing to put in the necessary planning and effort. The rewards can be considerable. Once a technique is mastered, its use can free the teacher for the many classroom activities in which human interaction is still, and always will be, vital.

Pupils respond to information differently. Thus, it is often to our advantage as teachers to use many different formats and modes to teach the subject matter of a lesson. This is why teachers normally use some combination of lecture, text and hands-on laboratory for conveying information. With the advent of the Internet and the multiple formats that can be communicated over the World Wide Web, we now have several new and exciting ways to present information. The Web allows the incorporation of animation, moving pictures, and sound into lessons, which extends our abilities to present materials that encourage pupil interaction with the subject matter. Pictures and animations help bring to life scientific principles, and multimedia allows pupils to take a more active role in learning: they can watch experiments in action, see microorganisms up close, and use a mouse or keyboard to navigate images, simulations and interactive material. One of the advantages of using multimedia is to convey information quickly and effectively to all pupils – and keep them interested in learning.

2. Multimedia materials in the teaching of foreign culture are of inestimable value. I have discovered that these aids are extremely effective; especially at a time when the visual media seems to dominate all our lives and, as such, that this visual conditioning communicates to us

with greater sharpness and impression. It must be kept in mind that multimedia materials serve the teacher only as supports to his lectures and the assigned required readings; Pupil evaluations both essay and objective, of the multimedia used in the course attest to the effectiveness of their use in the classroom.

So, as we are living in the 21<sup>st</sup> century we must use all opportunities that we are given. Teachers of this century have the opportunity to engage pupils like never before. Multimedia resources, such as interactive online games, video clips, pod casts and sets allow them to address a range of learning styles and meet the needs of every pupil.

## CONCLUSION

To summarize the theme we have taken under discussion we can state that Teaching Reading, speaking, writing and listening with the help of authentic materials have profound advantages:

- it helps pupils form the experience of English text reading
- it supports the pupils enlarge vocabulary
- it helps pupils be aware of the history, social life and culture of people whose native language they are learning as a second or foreign language.
- it helps the pupils to develop reading, writing, listening, and speaking techniques; to improve their observational skills, to obtain analytical methods and make stylistic interpretation analysis.
- It improves the pupil's abilities of any authentic and compulsory material.
- It forms the pupils' fluency in the English language
- It provides the pupils' effective communication
- It develops pupils' critical thinking and creative approach abilities
- It helps the pupils to gain much knowledge, form the outlook.
- More over Teaching reading, writing, listening, and speaking for using authentic materials implements professional aim as to develop pedagogical – professional practice in pupils.

**THE DEPENDENCE OF THE RESISTANCE OF ESTRADIOL ON THE INFLUENCE OF THE MUTANT HENA OF THE ALLEL A WITH JUVENILE DYSMENORRHEA**

**Yakubova Oltinoy\***

\*Andijan Medical Institute,  
UZBEKISTAN

**ABSTRACT**

*Girls were examined with YUD (n = 64) compared with the control group (n = 50). For the release of DNA, venous blood was served from the elbow vein, with the detection of estradiol-alpha receptor genes and serum estradiol (E2). The data obtained during genetic studies are consistent with the indicators obtained during the study of the level of estradiol, in the blood of girls with primary dysmenorrhea, depending on the presence of CTD criteria. It was revealed that the presence of a mutant allele A, as well as the G2014A genotype in the ESR1 G2014A genotype in women, can affect the level of estradiol levels in the blood, which was confirmed by genetic analysis, which revealed that the intelligence of the mutant allele of the estrogen receptor - alpha (one-deactive replacement of Guanin On adenine in RS2228480), 1.9 times higher in the group of girls with YUD with CTD than in the YUD group without CTD ( $\chi^2 = 4.515$ ;  $p = 0.03$ ).*

**KEYWORDS:** *Juvenile Dysmenorrhea, Connective Tissue Dysplasia, Estradiol.*

**INTRODUCTION**

Around the world, one of the factors that worsen the quality of life of girls and teenage girls is considered painful syndrome accompanying the physiological process - menstruation. According to WHO, the prevalence of menstrual pain syndrome in the structure of teenage gynecological pathology is extremely high, while about 15% of them characterize menstrual pains as painful. Juvenile Dysmenorrhea (YUD) - painful menstruation in girls under 18, in the absence of pelvic pathology, are general and often depleting gynecological suffering regardless of age or nationality. Despite the high prevalence, the primary dysmenorrhea among girls is often poorly diagnosed and is even ignored by medical workers and the girls themselves and

their mothers who can take painful menstruation as a normal part of the menstrual cycle. If the pathological situation occurs in the body of the growing female body, the formation of pathological states of organs and tissues in the form of dysplastic manifestations from the connecting tissue is occurred. A large variety of clinical criteria for the severity of undifferentiated connective tissue dysplasia (CTD), but the features of the metabolism of the connective tissue are still unclear. To date, it has been established that human endometrium undergoes cyclic waves of proliferation, differentiation, apoptosis and regeneration, depending on the increase and decrease in the levels of estradiol synthesized in the ovaries and progesterone. The synthesis of specific proteins of estrogen alpha-receptors was determined by the ER $\alpha$  genome (ESR1). This gene is located on chromosome 6Q25. It consists of 8 exons, 7 intron and occupies more than 140 kilobes. Molecular mechanisms, thanks to which these polymorphisms affect the activity of receptors, remain intact. RFLP is found in the intron, i.e. The almost non-functional region of the gene, and since they are separated by 50 pairs of bases, are presumably in a strong linear clutch.

**THE PURPOSE OF THE STUDY IS:** to establish the role of molecular genetic mechanisms of violation of endometrial regulation on the basis of a survey of single polymorphisms of genuine receptor genes of genital steroids, regulation of angiogenesis, in patients with dysmenorrhea.

**MATERIAL AND METHODS OF RESEARCH:** We examined girls with YUD (n = 64) compared with the control group (n = 50). For the release of DNA, venous blood was served from the elbow vein, with the detection of estradiol-alpha receptor genes, polymerase chain reaction (PCR), which was carried out using specific primers (NPF Litech, Russia) in the automatic amplifier "Rotor Geene 6000". The concentration of serum and estradiol (E2) was determined by the IFA methods on the AT-858 analyzer (ShangheiAntaiDiagnostics CO, LTD) using the ELISA test system sets - Austria. The data obtained in the study was subjected to statistical processing on the Pentium-IV personal computer using the Microsoft Office Excel-2012 software package, including the use of built-in statistical functions.

### THE RESULTS OBTAINED AND THEIR DISCUSSION.

Analysis of the distribution of allelic variants of the ESR1 G2014A gene, according to Table 1, showed that the frequency of occurrence of a mutant allele (a) in a group of patients with YUD, accompanied by CTD reliably higher compared to the control group of practically healthy persons ( $\chi^2 = 3,999$ ,  $p < 0.04$ ,  $OR \geq 1.92$ ). A reliable increase in the homozygous genotype with the participation of risky alleles AA also met significantly more often compared to the control group, with the indicators  $\chi^2 = 3.716$ ,  $p = 0.053$ . This gives grounds for assumption that YUD in girls with CTDs may have a genetically deterministic origin.

**TABLE 1 DISTRIBUTION OF FREQUENCIES OF ALLELES AND GENOTYPES OF THE ESR1 G2014A GENE IN GIRLS WITH PRIMARY DYSMENORRHEAL WITH CTD COMPARED TO THE CONTROL GROUP OF PRACTICALLY HEALTHY FACES**

Genetic type	YUD + CTDn=64	YUD + CTD %	Genetic type	control, n=68	control, %	OR	$\chi^2$	P
G	99	77,34	G	118	86,76	0,52	3,999	0,04
A	29	22,66	A	18	13,24	1,92		
GG	44	68,75	GG	53	77,94	0,62	1,429	0,23

GA	11	17,19	GA	12	17,65	0,97	0,005	1
AA	9	14,06	AA	3	4,41	3,54	3,716	0,053

In the study of the distribution of allele variants of the ESR1 G2014A gene in the group of patients with YUD, accompanied by CTD (n = 64) compared with a group of girls with YUD without CTD (N = 54), showed that the frequency of the mutant allele (a) in the patient group YUD with CTD is reliably higher compared to the control group of girls with YUD without CTD ( $\chi^2 = 4.515$ ,  $p < 0.033$ ,  $OR \geq 2.14$ ). Homozygous risky genotype with the participation of alleles AA, also met significantly more often compared to a group of girls with YUD without CTD ( $\chi^2 = 3.718$ ,  $p = 0.05$ ,  $OR \geq 4.25$ ) (TAB. 2).

**TABLE 2 DISTRIBUTION OF FREQUENCIES OF ALLELES AND GENOTYPES OF THE ESR1 G2014A GENE IN GIRLS WITH YUD WITH CTD COMPARED TO THE CONTROL GROUP AND FROM YUD WITHOUT CTD**

Genetic type	YUD + CTD, n=64	YUD + CTD, %	Genetic type	YUD + Without CTD, n=54	YUD + Without CTD, %	OR	$\chi^2$	P
G	99	77,34	G	95	87,96	0,47	4,515	0,033
A	29	22,66	A	13	12,04	2,14		
GG	44	68,75	GG	43	79,63	0,56	1,79	0,2
GA	11	17,19	GA	9	16,67	1,04	0,006	1
AA	9	14,06	AA	2	3,70	4,25	3,718	0,05

At the next stage, it was decided to analyze the distribution of frequencies of the occurrence of allele variants and ESR1 G2014A genotypes in the group of girls with YUD without CTD compared with almost healthy persons in population control.

**TABLE 3 THE DISTRIBUTION OF THE FREQUENCIES OF ALLELES AND GENOTYPES OF THE ESR1 G2014A GENE IN GIRLS WITH YUD WITHOUT CTD COMPARED TO THE CONTROL GROUP OF PRACTICALLY HEALTHY FACES.**

Genetic type	YUD + Without CTD, n=54	YUD + Without CTD, %	Genetic type	controle, n=68	controle, %	OR	$\chi^2$	P
G	95	87,96	G	118	86,76	1,11	0,078	0,78
A	13	12,04	A	18	13,24	0,90		
GG	43	79,63	GG	53	77,94	1,11	0,051	0,8
GA	9	16,67	GA	12	17,65	0,93	0,02	0,8
AA	2	3,70	AA	3	4,41	0,83	0,038	0,8

As can be seen from Table 3 during the analysis of these groups, there were no reliable markers.

The indicators obtained during the study of the level of estradiol in the blood of girls with primary dysmenorrhea, depending on the presence of CTD criteria are given in Table. four.

**TABLE 4 ESTRADIOL CONTENT IN BLOOD SERUM (NMOL / L)**

Group	estradiol
Practically healthy, n=25	0,9±0,12
YUD + Without CTD	

Light, n=10	0,85±0,06
Average, n=31	0,85±0,04
Heavy, n=15	0,85±0,04
YUD with CTD	
Light, n=24	0,56±0,16 <sup>a,6</sup>
Average, n=100	0,52±0,06 <sup>a,6</sup>
Heavy, n=50	0,47±0,12 <sup>a,6</sup>

Note: A - Differences regarding these groups of healthy girls are significant, B - differences regarding these groups of girls with YUD without CTD meaning ( $P < 0.05$ ).

In the group of girls with a might of a light degree without the presence of criteria, the estradiol content in serum has only a tendency to reduce the values of practically healthy girls and amounted to  $0.85 \pm 0.06$  nmol / l. These values corresponded to the norms of the norm in the 2nd phase of the cycle. In the group of girls with an average and heavy degree of dismenoria, the preservation of the regulatory quantities of estradiol was revealed. In girls with the presence of criteria for CTD, with a light severity of the severity, the separation of estradiol in serum was significantly reduced in 1.6 ( $p < 0.001$ ) times compared with the indicators of a group of practically healthy girls, in 1.51 ( $p < 0.05$ ) times Regarding the values of a group of girls with YUD without manifestation of CTD. As can be seen from the given data, the level of estradiol in the blood serum decreased more pronounced. As the pathological process progresses the content of estradiol even more decreased, especially with a severe degree of dismenoria. Thus, the level of estradiol in the blood serum of girls with an average degree of primary dismenoria decreased in 1.73 ( $p < 0.001$ ) and 1.63 ( $p < 0.05$ ) times, relative to the values of a group of girls with YUD without manifestation of CTD and practically healthy girls. That is, patients with CTD, at YUD, there was a hypooestroy. In the group of girls, the Estradiol in serum in the Signs of the CTD is 1.9 ( $p < 0.001$ ) and 1.8 ( $p < 0.05$ ) times, relative to the values of a group of girls with YUD without manifestation of CTD and practically healthy girls . A strong reverse correlation was noted between the severity of dysmenorrhea and the content of estradiol ( $R = -0.92 \pm 0.1$ ,  $p < 0.01$ ), and the presence of the manifestation of the Girls from the YUD is exacerbated by hypoethroemia.

It is interesting to note that the data obtained during genetic studies are consistent with the indicators obtained during the study of estradiol levels in the blood of girls with primary dysmenorrhea, depending on the presence of CTD criteria (Table 4).

Conclusions: 1. The presence of a mutant allele A, as well as a homozygous genotype AA in the ESR1 G2014A genotype in women, can affect the level of estradiol levels in the blood.

2. Genetic analysis revealed the intelligence of a mutant allele of the estrogen receptor gene - alpha (single-meter replacement of guanin on adenine in RS2228480) 1.9 times higher in the group of girls with YUD with CTD than in the YUD group without CTD ( $\chi^2 = 4,515$ ;  $p = 0.03$ ).

**ABSTRACT**

*This article contains ideas about the relationship between language and culture, their linguistic interpretation, interdependence. Some languages are spoken by tens or even hundreds of millions of people, while others are spoken by thousands, hundreds, or even countless people. For example, Congolese speak 500 languages, Indonesians 250, and Sudanese 117. Language and culture can be seen as a relative asymmetry. The reason for this can be explained by the fact that the representatives of many countries around the world carry out the process of communication in a single language.*

**KEYWORDS:** *Linguoculturology, language, culture, linguistic world, scale, specific language, linguistic feature, mentality, ancient, ethnic, national identity, ontogenesis, phylogeny, communication, ethnoculture.*

**INTRODUCTION**

In linguoculturology, the subject of comparison of language and culture has a special significance. According to Russian linguists E.M. Vereshchagin and V.G. Kostomarov, language and culture are closely interrelated concepts. [1.] In fact, such notions go back to ancient times. They agreed that there was no doubt that the spiritual dimension of language came from the world. Undoubtedly, the sphere of influence of language on culture has its own power. This means that language and culture cannot be imagined in isolation”.

The problem of the commonality of the concepts of “people” and “language” in the Indo-European, Finno-Ugric, Turkic, and African language families has been in the constant focus of scholars since ancient times.

Because, if we look at history, when we say people, we mean a group of people who speak several languages, but when we say language, we mean the language that exists in the consumption of the people. A particular language is a means of distinguishing the national characteristics of one nation from another. It is important that the ethnic and linguistic characteristics of the population are interrelated. These similar features in them are remarkable in that they were more clearly manifested in primitive times.

## **MATERIALS AND METHODS**

Gradually, as tribal units evolved from large to small and, conversely, from small to large communities, the ethnic and linguistic characteristics of the communities changed accordingly. In contrast to the growing state of human society, the process of convergence of languages was slow. Often, we see representatives of the same people speaking different languages, and in some peoples, we observe their communication in a single language.

For example, while the state language of the Uzbek people is Uzbek, representatives of more than 130 nationalities speak mainly Uzbek, Russian, Tajik, Tatar, Korean, Azerbaijani, Turkmen, Kyrgyz, and Turkish. Switzerland, on the other hand, is a Swedish nation, with a population mainly speaking Romanian, German, Italian and French.

Language and culture can be seen as a relative asymmetry. The reason for this can be explained by the fact that the representatives of many countries around the world carry out the process of communication in a single language. For example, German-speaking Germans and Austrians, Portuguese-speaking Portuguese, Brazilians and 5 other African countries, Spanish-speaking Spanish and 20 citizens of Latin America, English-speaking Americans as well as Americans, Canadians, Australians and again used by a large proportion of South African countries. In addition, citizens of 19 countries in Africa also officially speak English. Also, the Indian people also speak mainly English after their mother tongue.

According to experts, it has been found that there are more languages than there are peoples on Earth.

According to the Uzbek linguist, Professor BR Mengliev, "there are more than 3,000 languages in the world, and according to some sources, there are about 7,000 languages. The UN has officially announced that there are 2,976 languages.

## **RESULT AND DISCUSSION**

Some languages are spoken by tens or even hundreds of millions of people, while others are spoken by thousands, hundreds, or even countless people. For example, Congolese speak 500 languages, Indonesians 250, and Sudanese 117. Chinese is spoken by about a billion people around the world, while Chukot and Vele are spoken by only a few hundred thousand people. Or that there are more than a million people in Dagestan who speak about 40 languages. According to a 2012 census in Russia, 40 people in Dagestan speak Baghula, 12 people speak Chamala, and five people speak Kaitags. In New Guinea, almost every village has its own language".

It can be said that language cannot be the main factor in the emergence of national identity. There is a factor of religious affiliation between the sense of national identity and the relationship of language, and the belief in a particular religion can also determine the national characteristics of a particular nation. However, it should not be forgotten that Japanese Shinto,

which is practiced by members of one nation, in contrast to the Armenian-Gregorian churches, The Shari'a rules of Islam bring together the sense of identity of people of different nationalities who are not brothers. The most virtuous qualities peculiar to a Muslim, if necessary, constitute the criteria of national spirituality.

In particular, concepts such as humanity, justice, honesty, tolerance are one of the highest values that affect not only the national identity of the Uzbek people, but also its spiritual foundations.

According to N.B.Mechkovskaya, in the context of the comparison of language and culture, we think that they should talk about interdependent determinism. That is, language and culture are interrelated as follows:

1. in the communicative process
2. ontogenesis (in the process of formation of speech ability)
3. in phylogeny (formation of a social person).

In his article, the Uzbek linguist A.Nurmonov commented on the theories of linguistic relativity and linguistic determinism, as well as the relationship between language and culture.

He acknowledges the ideas of the founders of the theory of linguistic relativity, B. Wharf and E. Sepir, that language and thought are forms of culture, and at the same time dwells on the commonality of languages: "Every language not only reflects the spirit of the people, the national culture, the way of seeing and perceiving the world, but also has such commonalities in the creation of images between languages that are the product of universal thinking".

A.Nurmanov divided the scholars into 3 groups: "The first group is connected with the names of V.Humboldt, E.Sepir and B.Worf, who considered language as a unifying force in the relations of language and thinking, language and culture", concludes and interprets this idea as a one-sided view.

The Uzbek linguist notes that in understanding the center of the image on which the nomination is based, it is impossible to ignore the general aspects of different languages. This suggests that the conclusion of the theory of linguistic relativity about the primacy of language in the perception of the world is one-sided.

A.Nurmonov [2] points out that the scientists of the group in their views completely denied the connection between language and culture. According to him, the third group of scholars synthesizes these views and states that "language and culture are interrelated and at the same time different phenomena.

The role of language in the relationship of language and culture is great. The ethnoculture of each nation finds its own expression through its own language. But because of the existence of this ethnoculture in the objective being, it also manifests itself through language.

Linguistic mentality, in contrast to consciousness, not only reflects the realities of the external world in the individual, but also connects these perceptions with cognitive space, and this conceptual content is relevant to the specific national-lingual (linguistic) community in each particular moment of time. occurs through.

## CONCLUSION

In understanding the essence of mentality, we must not overlook the interdependence of concepts such as language, culture, ethnos. We observe an isomorphism in the structure of language and culture in the system of signs of generality and specificity of language and culture.

In particular, the concept of speech culture refers not only to the norms of the Uzbek literary language, but also to the norms of the national language, [3.]

These norms include specific norms of dialects. Therefore, approaching the above concept of isomorphism, N.I.Tolstoy establishes the following classification:

- a) elite culture;
- b) folk culture;
- c) intermediate culture;
- g) traditional-professional culture.

So, instead of concluding, we can say that there is a mutually conditioned duality between language and culture. Language, as a linguoculturological phenomenon, embodies cultural riches, and the development of any national culture, at the same time, depends on the specific nature of a particular language. At the same time, language can express the whole world by itself, it can embrace a multifaceted culture, a diverse society from a lexical-semantic point of view.

## THE ENLIGHTENMENT ACTIVITY OF BEHBUDI

**N.Urinbaev\***

\*Associate Professor, Senior Lecturer,  
Candidate of Philosophical Sciences,  
Institute of Advanced Training under the Fergana Regional Department of Public Education,  
UZBEKISTAN

### ABSTRACT

*This article describes Behbudi's enlightenment activities, Jadid schools in Turkestan, the education system and the idea of its reform, views on the national education system, the work done by the Jadids in this direction and the specific problems. The author, for example, in recent chapters has cited the views of world and Turkestan scientists on the formation of the earth, and has given insights into geographical objects and terms such as maps, globes.*

**KEYWORDS:** *Turkestan, Jadid, Reform, Local, Enlightenment, School, National Liberation, Tsar, Administration, New Method, Geography, Russia, Children's Book, Islam, History, Globe, Scientific, Practical, Censorship, Exam, Manual, Policy.*

### INTRODUCTION

The emergence of Jadid schools in Turkestan dates back to the end of the XIX - beginning of the XX century. According to experts, the idea of reforming the education system came to Turkestan fifteen to twenty years later than in Crimea, Kazan and Azerbaijan. The main reason for this was the policy of the Governor-General of Turkestan aimed at consciously keeping the local population away from enlightenment. The fact that an enlightened people could fight for their rights, for freedom from colonial oppression, and for national liberation, forced Tsarist Russia and its administration in Turkestan to remain vigilant.

### MATERIALS AND METHODS

The secret service of the governor-general's office, the Tsarist Okhranka, closely monitored every step taken by the local intelligentsia to reform the education system. Even at the end of the 19th century, when new methodological schools began to open, a special commission was formed for the Turkestan educational district. The commission decided to put an end to the unauthorized construction of new schools. The resolution contained the following articles:

1. Local schools are opened with the special permission of the tsarist administration.
2. The opening and teaching of local schools is allowed only to Russian citizens who are politically credible.
3. Only books published with the permission of Russian censorship are taught in local schools.
4. Persons who open a school without a special permit are deprived of the right to open a school and teach for life ...

Despite such barriers in front of the new schools, the selfless children of the people, including Behbudi, who at the beginning of the last century set out to open “usul savtiya” (sound method) schools. One of the first “usul savtiya” schools opened in Samarkand was opened in 1903 in the village of Rajabamin, Jambay district, in the yard of the famous enlightener Abdukadir Shakuri.

Behbudi contributed to the establishment and operation of this school. But Behbudi moved him to his backyard because there were not many commuters from the city among the schoolchildren and it was difficult for them to attend Rajabamin village. During these years, he taught the students of this school “Muntahabi Geography” (“Brief General Geography”), “Madhali Geography Umrani” (“Introduction to Population Geography”), “Brief Geography of Russia” (“Brief Geography of Russia”), he created textbooks and manuals such as “Kitabat ul-Atfol” (“Children’s Book”), “A Brief History of Islam” (“A Brief History of Islam”).

This in itself tests to the fact that Behbudi was an enlightener who set himself the task of imparting both religious and secular knowledge to his students.

Behbudi's Selected Works (1999), published by Ma'naviyat, gives us a clear idea of his two textbooks and manuals. One of them is Kitab ul-Atfol. Behbudi gave examples of types of letters, giving students an idea of the conditions of writing and the skills of writing in it, as they could not learn the skills of writing, despite the fact that they studied in ancient schools for four or five years.

Excerpts from the book “General Geography” give information about the meaning of the word “geography”, when did the science of geography, the importance of studying this science, as well as about the countries of the world. In addition, the textbook includes chapters “Old and new sages”, “Sages of Turkestan”.

The author, for example, in recent chapters has cited the views of world and Turkestan scientists on the formation of the earth, and has given insights into geographical objects and terms such as maps, globes. These books, which were of great scientific and educational importance in their time, have long served as textbooks and manuals in other schools in Samarkand.

In his article "On the examination of the Samarkand method Jadid school" Behbudi wrote that these textbooks and manuals were taught at the Shakuri school and students took the exam on their basis: In our book Madhali Geography of Umrani and Brief Geography of Russia, we describe the distance (measurement) of Russian countries in Europe, Asia, Africa, America and Australia, as well as the number and time of each country and government, and the distribution of Russia. They described in detail and memorized the old and new continents of the population, the territories and seas, and the number of Muslims, Christians, Jews, and Magians on earth [ 1. ].

In addition to educators, Likoshin and Vyatkin, on behalf of the local government, as well as bailiffs, merchants and shopkeepers, took part in the examination described in the article. The exam, which lasted two days from 10 a.m. to 6 p.m., left a good impression on them. Most of them praised the students' knowledge, while some even cried out of excitement.

“Haji Mavlonbek”, writes Behbudi, “stood for six hours, weeping over the children's answers to the questions of religion and knowledge, and gave the teacher a gift of 15 soums”. [2].

The knowledge and examination held on the basis of Behbudi's textbooks and manuals at the Shakuri school raised the prestige of the Jadid schools in the eyes of the public, in which Behbudi's services were not insignificant.

## RESULT AND DISCUSSION

This ardent propagandist of science not only opened a school and wrote textbooks and manuals, but as one of the great public figures of Turkestan region in 1907 sent to the Muslim faction of the 3rd State Duma of Russia to consider the project “Cultural Autonomy of Turkestan”. Unfortunately, the 3rd State Duma ignored this project developed by Behbudiy. However, if approved, the project would have a significant impact on the social life of Turkestan.

Our compatriot, who found this historical document in foreign archives, wrote the following about Doctor Temir Khoja ugli: “... if this text is carefully studied, it is clear that Behbudi wanted autonomy for Turkestans living in Turkestan under Tsarist Russia (excluding the Emirate of Bukhara and the Khiva Khanate), which was more courageous than its time and demanded broad rights. One of the two most important topics in the draft is the privatization of schools (Article 18) and the other is that the Russian State Duma should not interfere in the internal affairs of Turkestan [1].

Behbudi also presented a section entitled "General Schools" in the "Draft" presented to the Muslim faction of the 3rd State Duma, in which the following issues were asked to have legal force:

17. “Let the question and article of general education in Russia make Turkestan an equal (inclusive) community.

18. Turkestan schools and madrassas should be free from government control.

19. To appoint a commission from Muslims for general higher and secondary school.

The Russian alphabet should not be used in Islamic schools.

20. There are Muslims in various enterprises, prisons and military bases, and a Muslim priest should be appointed” [2].

These articles of the draft testify to the fact that Behbudi took a bold step from the Enlightenment to the independence movement as early as 1907.

Behbudi later founded Oyna magazine, which published articles encouraging young people to acquire religious and secular knowledge and to master not two but four languages. Writing a series of articles based on various travel impressions, he provides convincing evidence that the scientific and cultural progress taking place in the East and especially in the West is the result of the great attention paid to science in those countries.

**CONCLUSION**

There is also information that one of the leaders of the National Awakening Movement in those years acknowledged Behbudi's views that the reform of the education system alone was not enough to achieve the "cultural autonomy of Turkestan". In conclusion, it can be said that he and the true children of a nation like his will never tire of fighting for the happiness, future, prospects and independence of their people.

They will always faithfully serve the Motherland and its people. They can always, at any time, in any field be an example and role model for the younger generation.

### ABSTRACT

*This article reveals the trends in the formation of tourist complexes in historical cities and protected areas rich in historical and cultural monuments; to study their impact on the formation of master plans and the preservation of historical monuments in the cities included in the tourism system, the types and categories of service enterprises, their location, as well as their high socio-economic efficiency. Recommendations have been developed for the preservation and rational use and preservation of architectural, historical and cultural monuments.*

**KEYWORDS:** *Architecture, History, Tourism, Monuments, Territory, Heritage, Tourism, Development, Development, Resources, Architecture.*

### INTRODUCTION

The problem of preserving and using the architectural reserves of historically formed cities of Uzbekistan reflects the general level of urban planning ideas, including the attitude of the Uzbek people to the heritage and care for its future. They are witnessing significant qualitative changes in the process of changing the historical parts of the cities of Uzbekistan.

In terms of its tourism resources, Uzbekistan is one of the leaders in Central Asia and one of the 10-15 countries in the world with unique potential in this area. In ancient times, the cities along the Great Silk Road, which connected China with European countries, have many architectural monuments of historical periods, which are undoubtedly of great interest to tourists.<sup>1</sup>

Decree of the President of the Republic of Uzbekistan "On measures to restore the Great Silk Road and strengthen the participation of the Republic of Uzbekistan in the development of international tourism in the Republic of Uzbekistan" of June 1995, Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated 30.06.1999 The Law of the Republic of

Uzbekistan "On Tourism", adopted on 20.08.1999, provides for the development of schemes for the development of promising tourism for the historical cities of Uzbekistan.

The volume of tourism in Uzbekistan is constantly growing. In the list of enterprises of the Central Council for Tourism and Excursions of Uzbekistan alone, the total volume of tourism in 1990 was 31.4 million people, and in 1991 - 33.4 million people, including tourists and amateurs on weekends, tourists and other categories. The growth rate of domestic and foreign tourism, on the one hand, due to the increase in leisure time of workers, the growth of material prosperity, the growth of the cultural level of the population and, on the other hand, the trend of active recreation, reaches about 5% of annual flow.<sup>2</sup>

The variety of tour itineraries, the opportunity to get acquainted with the historical past and modern life of the protected area or city, as well as the most favorable conditions for a study tour, along with the rest of the historical nature. Therefore, the range of issues that need to be addressed has become much wider, and as a result, we have come to develop in all respects all the key aspects of tourism development in the project area.

1 picture. Samarkand .2018.

Tourist organizations do not spend money on additional services for tourists and do not receive adequate income from them. This, of course, not only reduces economic efficiency, but also has a significant impact on the tradition of introducing tourists to the traditions of the destination area. The developed system of additional service enterprises - the production and trade of art monuments, national cuisine, the demonstration of folk traditions in wonderful traditions, etc. - all this not only helps to expand the flow, but also the rich history and culture of tourism.

It should be borne in mind that tourism has a significant impact on the development of urban planning. Preservation and rational use of architectural, historical and cultural monuments; reconstruction of old ones and beautification of new cities; transport, road construction; utilities; local industry and trade - it is expedient to plan all this, taking into account the prospects for the development of tourism, the share of capital investment in the development of these areas of activity.

## **MATERIALS AND METHODS**

The great place allocated to the tourism economy is determined, first of all, by the fact that we see a real economic basis for the preservation and rational use of monuments in tourism, the creation of conditions that have been preserved for many years, occupying a worthy place in architecture. - Spatial structure of cities. This approach stems from the Law of the Republic of Uzbekistan "On the Protection and Use of Cultural Heritage" adopted by the OliyMajlis.<sup>3</sup>

The law itself already represents the unity of beings and ways to solve the problem. Taking into account the different techniques and methods of including tourism in the structure of the ancient city, we can simultaneously find the optimal way to use the architectural monuments in search of the optimal functional organization of tourism, to find new ways to adapt them.

## RESULT AND DISCUSSION

Based on the above, we emphasize that the systematic design of tourism should probably be the basis for the planning, construction and operation of tourist complexes - as highly efficient state-owned enterprises. Tourism is able to actively influence the development of related sectors of the economy and, first of all, one of the most difficult problems of modern architecture and urban planning - the preservation of the historical appearance and architectural monuments of the rich cities of our republic.

The existing structure of the ancient city, the preservation of all the architectural monuments and valuable houses in their environment, the ethnographic zones that meet the national and climatic features and national characteristics, and the living environment - a functional environment. Consists of identification.

## CONCLUSION

Provision of the territory with engineering facilities, organization of tourist zones and reconstruction of handicraft and trade streets. Formation of a buffer zone between the "Old and New" city and administrative territories; development of a single-storey residential building or residential complex. to satisfy the conditions of development in the historical zone, to create places for the use of the labor force, taking into account the peculiarities of the historical zones.

**ABSTRACT**

*This article is a comparative analysis of the problems faced by specialists in the formation of the foundations of national statehood, the process of reforms to address public policy in the formation of a new system of specialists in public administration of independent Uzbekistan.*

**KEYWORDS:** *Independence, State, Society, Administration, Leading Experts, New Generation, Mental Centre, Institute, Soft Power, Brand.*

**INTRODUCTION**

The Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, developed on the initiative of the President of the Republic of Uzbekistan Shavkat Mirziyoyev, pays special attention to public administration reform, development of an organizational and legal framework of public service. In this strategy is given the main purposes that the successful implementation of radical changes and reforms in the life of the state and society, first of all, the growing demand for young and enterprising professionals with solid knowledge in a market economy, able to understand and analyze the current foreign and domestic policy of Uzbekistan. What is the reason for this? Has not a new generation of specialists been formed for the independent state of Uzbekistan over the past 30 years? If so, why is there a need for a new generation of specialists for today's renewed Uzbekistan? We will try to answer such questions in our analysis.

## **MATERIALS AND METHODS**

### **Complications of the past**

Achieving political independence of Uzbekistan has allowed the formation of a new system of leaders and management specialists in public administration. This is a unique period which required the work to be done, the most important of which is the radical renewal of the system of leaders and managers formed during the former socialist regime, the training and retraining of leaders and managers to meet the requirements of a new political system and state and society building. This is "... the consistent continuation of the policy that has completely changed the image of our country and the meaning of our lives and the achievement of our goals, to become one of the developed democracies" [1], as well as "specialists who are able to solve large-scale, complex and broad tasks", "it is about training specialists who have a deep sense of responsibility for the fate of their homeland, its present and future, who think independently and innovatively" [2].

As the First President of the Republic of Uzbekistan I.A. Karimov noted in the early years of independence and he began to look at the life philosophy: "The fate of reforms, their effectiveness, impact on our lives depends, first of all, on the qualifications of specialists, their mastery, patriotism and dedication."

This is reflected in the following aspects:

The task of gradually forming a new generation of leaders and management specialists to strengthen and preserve independence in Uzbekistan has been identified as one of the most important tasks of the transition period. To solve this problem:

First, the lack of trained leadership professionals who understand independence and new market relations;

Second, the need for new thinking for existing managers and management professionals;

Third, the new system of specialists required the training of leaders and management specialists, taking into account such aspects as the formation of their political, management-related political thinking on the basis of the national idea.

Why? This is because the system of training leaders and management specialists of the "Soviet Party School", which existed in Uzbekistan during the former totalitarian system, was not abolished.

Therefore, the main achievement of the national interests of our country is that due to independence, Uzbekistan has moved to the foundations of a new system of leaders and management specialists, free from the single communist ideology, unique and appropriate, meeting the principles and requirements of national and democratic development.

To this end, the First President of Uzbekistan Islam Karimov identified the transition from administrative-command to democratic methods of governance in the country, the study of the role and place of leaders and management specialists in regulating all aspects of social relations.

Due to independence, the single-party system in the country was abolished. In place of the class-party, ideological principles of training, new human interests, the priority of freedom have been introduced. This led to the formation of a new political thinking in leaders and management

professionals. As a result, the Constitution of the Republic of Uzbekistan states that “social life in the Republic of Uzbekistan develops on the basis of diversity of political institutions, ideologies and opinions. No ideology can be established as a state ideology.

This set a new political pillar for the formation of a new system of leaders and management specialists in the country.

Based on this, we divide the stages of formation of the system of specialists in the development of independent Uzbekistan into the following periods:

The first stage: the first stage, which includes the first reforms and changes related to "... the transition period and the formation of the foundations of national statehood", the transition period 1991-2000, which left a huge mark on the life of our country and people;

The second phase, covering the period from 2001 to 2007, was a period of active democratic renewal and modernization of the country, which played an important role in ensuring the sustainable development of our economy, political life, the legislative, judicial and social humanitarian spheres. These reforms are inextricably linked with changes in the political thinking of public administration leaders and management professionals in the transition period. Each stage is characterized by significant practical achievements in the field.

The third phase covers the years 2010 to 2016. This period was a period of public administration reform, decentralization of public administration and development of civil society institutions in our country. Each of these periods is inextricably linked with its own reforms.

## RESULT AND DISCUSSION

### **"The greatest danger is in the level, knowledge, science and dedication of specialists"**

Shavkat Mirziyoyev's coming to power as President of the Republic of Uzbekistan is the fourth stage of the country's development, and from the first days the most painful point for our country was the dissatisfaction of specialists, their level and knowledge do not meet today's requirements. In particular, there is a need to attract about 1,000 foreign scientists and experts to develop various fields in Uzbekistan. This was stated by President ShavkatMirziyoyev on December 18, 2018, at a meeting on the need for modern specialists, the involvement of educated youth in strategic areas: In the current process of structural change, it has become clear that most professionals are not ready for this, and their knowledge, skills and abilities do not meet modern requirements. For example, the initial need for doctoral and master's degree training, advanced training and internships abroad are more than 3.5 thousand. Our country needs more than 600 compatriots with international scientific and practical experience. There is a need to attract about 1,000 foreign scientists and experts. That is, today the urgent need for ordinary scientific and scientific-pedagogical specialists is more than 5,000. If we take into account the demand for production, this figure will increase at least 50-100 times," he said.

Of course, there is a good reason for the head of state to tell such a sad truth. It is not in vain that these important statements are being made today to ensure the future of our country and its national interests. It is clear that if we do not pay serious attention to the issue of modern specialists, it will have a negative impact on the fate of the country.

In due course, it is useful to recall the words of the American statesman and military leader George Marshall: "A state that does not define its interests will work against its own people." [4]

While man's great creative potential directly serves to preserve the integrity of the universe, it binds his relationship of stability between nature, society, and man. In our country, too, the image of man, raising his dignity in all spheres of public life has risen as a top priority of our state policy. Nations and all religions and denominations have equal rights. After all, as the First President of Uzbekistan said, "... if any nation and people at a difficult turning point in history do not maintain their unity and solidarity, stand firmly in the pursuit of their national interests, there is no doubt that they will lose their independence and freedom, lose responsibility and vigilance, which are their greatest and unequal wealth" [6].

Today in our country it is directly related to the process of selection, training and placement of specialists. There will be no qualitative change in public administration without the creation of an effective system for the selection and training of innovative and independent-minded, responsible, enterprising, well-trained, patriotic, honest professionals [7]. So, our young people are provided with employment with a free, wide use of the desired professional skills in practice.

Researcher Jim Collins writes in his book *From Good to Greatness*: "The leaders of great companies began the process of reorganization by getting the right people for their team and getting rid of the unnecessary ones. After that, they chose which way to swim. The basic idea is that everything is decided by experts and the word "who" is more important than the word "what". Because experts are the strategy, they are the organizational structure, they are the tactic. Companies today need to build their foundations to move to a new level of quality. In my opinion, the fundamental answer to this question is the question of experts [8]. In short, these views of Jim Collins are consistent with the statement that the quality of professional training today should be commensurate with the quality of education. To do this, it is necessary to train highly qualified specialists who are able to carry out innovative activities in educational institutions. It is also impossible to succeed in any field without carefully training and appreciating professionals. In this regard, it should be noted that the state should consistently pursue a policy of specialists, including the effective use of the institution of rotation, which is one of its key elements - the analysis of global trends in the effective use of potential, training and placement of specialists, the development of conclusions are important [9].

It is no coincidence that the El-Yurt Umidi Fund under the Cabinet of Ministers of the Republic of Uzbekistan has been established to train highly qualified specialists to ensure the above-mentioned national interests in domestic and foreign policy. Because, for the country, "we need quality, not quantity. To achieve this, it is necessary to thoroughly study foreign experience. The state that pays special attention to the training of specialists wins. Our most important task is to establish a system of training specialists on the basis of science-based experience, " the head of state said. [10]

Today, in order to fulfill one of these tasks and to select qualified specialists, the State Testing Center under the Cabinet of Ministers together with the Ministry of Public Education, the Ministry of Information Technologies and Communications and the Agency "Uzstandard" until March 1, 2021, to certify teachers of "Computer Science and Information Technology" as an example, work is underway to introduce a national system.

Another example is the establishment of the State Institution "Scientific and Educational Center" (Scientific Center) under the State Testing Center on the basis of the decision of the Cabinet of Ministers "On additional measures to improve the testing system." The purpose of the centre is to

organize testology and pedagogical measurements, foreign language training courses, training of qualified specialists, candidates of science and cooperation with leading international organizations in the field, to establish a regional scientific school of testology in Central Asia.

### **"Intellectual centres– the idea and the creative force of the state"**

It is of great importance for the developed countries of the world to study and analyze the issue of comprehensive development of the country on the basis of objective conditions. Probably, for this reason, these tasks are performed by "mental centres/institutions" on a planetary scale. "In the 1990s, there were about a hundred think tanks in Washington alone." After 2000, there was an increase in the need for analytical activities in the world as a whole. As an example, we can see that the total number of think tanks reached 4.5 thousand [12], and by the end of 2009, their number was 5.5 thousand [13].

Their scope of activities, sources of funding and responsibilities vary. Some specialize in specific areas of both domestic and foreign policy, while others specialize in studying the problems of a particular region. The activities of the well-known US "think tanks" are funded in two ways - privately and through government agencies [14].

Commenting on the response to the emergence of think tanks, American professor Donald Eibelson said that as the United States becomes a hegemon in a bipolar world, he argued that mental centres developed because Washington's top leadership feels highly responsible and needs the intuition and competence of think tanks to help develop holistic and well-founded national security policies [15].

For this reason, many international organizations and think tanks have set up a system for studying and analyzing the development of the world's countries and identifying their activities. These include the National Defense Research Institute (RAND, USA) [16], the Stockholm International Peace Research Institute (SIPRI, Sweden) [17], the Oslo Institute for Peace Studies (PRIO, Norway) [18], and other think tanks and organizations. It was these international institutions that developed the study and analysis of global problems after the Second World War. What is the reason?

In international relations today, the countries of the world are conditionally divided into countries that train scientists and suppliers (donor countries) and countries that use them (recruiting countries). The conditionality of this division is that, for example, Western European countries are considered donor countries for the United States if they are recruiting countries for Asian and African countries. Therefore, the departure of scholars is not a problem for them, as the United States and Canada are included in the list of recruiting countries in the absolute sense. Therefore, an analysis of the US policy on intellectual security, which is an integral part of the national security system today, shows that, unlike other developed countries, it pursues a policy of "retaining" science, advanced technology or qualified personnel.

The reason is that the United States sees the above-mentioned common security strategy and doctrine as one of the intellectual potential and vital interests of its citizens. The implementation phase of this process allows for the direct implementation of intellectual security in the U.S. national security system in two phases.

**The first stage** is to attract scientists who contribute to world science during the re-establishment of the CIA under the President of the United States in the process of redistribution of the world

after the Second World War and as a result of their search, scientists were able to settle in the United States and continue to use their intellectual potential to this day.

**The second stage**, as a result of the radical economic changes that took place in world politics after the collapse of a great state like the Soviet Union, also had a serious impact on the scientific and technological potential of the CIS countries. This is due to the fact that the funds allocated for scientific research have been sharply reduced, and in some areas even suspended.

In addition, at that time, some countries even abandoned the system of organizing science through the Academy of Sciences. These circumstances have greatly narrowed the opportunities for talented young people to engage in science.

This, in turn, has led scientists to lose their high status and prestige in society as before. Consequently, in such circumstances, the rank of scientist has lost its appeal to young people. The younger and middle generation of existing research institutions has abandoned scientific activity. They tried to adapt to the demands of the market system: some hit themselves on commercial, some on simple technical personnel activities. Unable to adapt to the conditions in scientific research institutions, the most talented scientists turned their attention to Europe and the United States, and many of them were forced to leave their homelands.

Based on this, we can see that the break-up of the former Soviet Union had a positive impact on the flourishing of intellectual potential in the United States today. For example, 70 to 80 per cent of world-renowned mathematicians and more than 50 per cent of theoretical physicists emigrated from Russia to the United States in the 1990s, according to the U.S. National Science Foundation. The fact is that more than half of the country's specialists in the field of science have left the CIS countries) is proof of the above.

## CONCLUSION

In conclusion, from the first years of independence, Uzbekistan, along with the developed countries of the world, has established bilateral relations with the United States. This is especially true in the field of education. For example, as a result of the Umid Foundation's training of young people in the United States or developed countries, the role of intelligence in the labour market is growing, as well as the importance of foreign experience in ensuring intellectual security. The implementation of positive achievements in the interests of our country in this direction has become a topical issue on the agenda, as the state depends on the youth.

If we use the term "soft power", which has recently attracted the attention of the scientific and political community, it is through this that Uzbekistan has achieved social stability at the level of demand in our country.

Indeed, every sovereign state in the world is judged by the contribution of a particular society to world stability. Uzbekistan has come up with such a practice that in some sense it is not a mistake to call it the "brand" or "soft power" of our state.

### ABSTRACT

*Information Communication Technology [ICT] concentrates on these three aspects - Information, Communication and Technology. The paper is based on a study which covered various aspects of the Users of ICT Gadgets, in terms of their socio-economic profile, pattern of utilization of ICT tools, purpose for which the ICT tools used and also the constraints experienced by SC and ST women in Use of ICT tools. The micro level study was undertaken in two villages of Kollam district in Kerala. These two villages are identified based on the concentration of SC and ST population in the Kollam district, Anchal Block and Two Villages - Kulathupuzha and Thinkalkarikakom are identified and purposively chosen for the study. The researcher has used a structured interview schedule, and also Focus Group Discussion with women. In this paper, outcome of the Focus Group Discussion and Case studies are presented and discussed.*

**KEYWORDS:** *Access, Employment, Information, Technology, Utilization, Enabling*

### INTRODUCTION

In the 2000s, India is emerging as a role model for Information Technology infused development, from e-governance to ICT-D. India's importance in this area is partially explained by the symbolic success of its export-oriented Information Technology (IT) industry, often represented as an "engine of growth" for the wider national economy<sup>1</sup>. It means that technology

is playing a pivotal role in the development process and paving way for multiplier effect with the use of technology by the people.

The Information Communication Technology [ICT] has three dimensions - Information, Communication and Technology; to promote information via communication with the help of technology. The Communication is a process that promotes the forces of transformation and survival of communities<sup>2</sup>. The ICT is providing Information as a resource that can affect the life of the people in a given area. It needs to be understood that as the technology enables the transaction of information as a resource.

Any amount access to Information, Communication and Technology (ICT) creates new opportunities to enhance the women skills, knowledge particularly in increasing the productivity of the existing livelihoods and move towards the knowledge and economic empowerment<sup>3</sup>. It reads that ICT is enabling factor and also opening up the opportunities for livelihood in the society.

Higher education system in India is undergoing a dynamic change. Good education is always seen as promoting factor for high career<sup>4</sup>. Bhattacharya and Sharma observed that development of Information Communication and Technology (ICT) has brought a shift in the current education system in India<sup>5</sup>. It implies that ICT influence the delivery of content and same accessed by many at the end point. Therefore, the learning opportunities have widen due to the ICT intervention in the education system.

Whereas in contrast Balit<sup>6</sup> argued that isolated and marginalized sections of the society, in particularly those who are in rural-remote groups face acute constraints with regard to access to information and communication. Thus, they have limited participation and voice in the public sphere and in decision-making process affecting their lives and thus risk further marginalization, politically, socially and economically. It underlines the possible influence of the ICT among the socially excluded and their participation in the public life.

Anita Gurumurthy, Nandini Chami, (2014), the gender gap in income and education levels are key contributors to the gender gap in ICT access<sup>7</sup>. Odambe et al, (2002) argue that in rural areas, women are more likely to be information- and resource-poor, isolated, and less educated compared to men<sup>8</sup>. It implies that these factors play significant role in access to ICT in the rural areas with given level of endowments.

Stauffacher and Kleinwacher, (2005) have observed that information has the ability to improve standards of living for everyone by enhancing all aspects of our lives, from trade to telemedicine, from education to environmental protection<sup>9</sup>. It means that ICT is capable of influencing the ability of the people which lead to development.

According to Minakshi Ramji, (2006), women and SCs can face problems that may prevent them from free access. Social and cultural norms may also mean that women due to their multiple responsibilities or SCs who are mostly daily labourers have less time to access ICTs. Illiteracy is greater among women and SCs and as such this can pose a problem for access. Lastly, poverty may restrict these groups from owning ICTs<sup>10</sup>.

Dalal (2006) argues that while there is recognition of the potential of ICT as a tool for the promotion of gender equality and the empowerment of women, a gender divide' has also been identified reflected in the lower numbers of women accessing and using ICT compared with

men. Unless this gender divide is specifically addressed, there is a risk that ICT may exacerbate existing inequalities between women and men and create new forms of inequality<sup>11</sup>.

Patil (2007) observed that, in India the utilization of ICT for women empowerment is in the take-off stage and obviously there are many field and technical problems. The key constraints are insufficient regional specific information, inadequate internet connectivity and electricity, inadequate support from facilitator, lack of Infrastructure facility, lack of construction of content in local language, limited duration of projects, problem of monitoring and evaluation, lack of operators knowledge, lack of the involvement of other ICT channels, lack of marketing management and development skills<sup>12</sup>. Patil et.al (2009), the main barriers to women's use of ICT continue to be lack of proper training especially among the rural and deprived women. In this context Schools, Panchayat offices and Women Self-Help Groups (SHGs) should impart ICT training<sup>13</sup>.

Mehta (2013) study revealed that 69 percent of India's population lives in rural areas; the majority of India functions with substantial barriers to education attainment and social mobility, and work in an unorganized, casual labor market which yields very little income. The rural population is at an inherent disadvantage in India as they lack the pre-requisites to participating in their country's economic growth in the tertiary, modern services sector<sup>14</sup>. Jewan Singh et al (2010) study found that ICT enhances community participation, community empowerment and improve the socio-economic condition of the community<sup>15</sup>. Han Ei Chew et al (2010) found that the impact of information and communication technologies, especially landline and mobile phones, computers, and Internet cafés in facilitating economic growth in the developing world<sup>16</sup>.

The available literature on the ICT and its accessibility indicates that ICT is capable of influencing the process of development in the society. The process is also subjected to the many factors that work as enabling and also disabling factors for the application of ICT by people in the grassroots level. Hence, the authors have interacted at the field level with Schedule Caste Community households to understand their level of access to various ICTs; and their influence on their decision relating to their socio-economic and political life. The study would be relevant in the context of empowerment of the Schedule Caste households and access through modern technology.

### **1. Focus of the Paper**

The UN Resolution in October 2015 has resolved [Item No. 5 b] and focused on "enhance the use of enabling technology, particularly Information and Communication Technology, to promote the empowerment....". In this context, it significant to understand the level of access to various Information and Communication Technology [ICT] in terms of use of Mobile Phone, Use of Television, Access to Radio, Access to Computer and Internet facilities in the rural areas.

This paper is based on a micro-level study covering aspects on how far the ICT tools are owned and used by Schedule Caste and Schedule Tribes Women; aspects on which the women are getting information or exchange information. The paper is based on a study which covered various aspects of the Users of ICT Gadgets, in terms of their socio-economic profile, pattern of utilization of ICT tools, purpose for which the ICT tools used and also the Constraints experienced by SC and ST women in Use of ICT tools.

The micro level study was undertaken in two villages of Kollam district in Kerala. These two villages are identified based on the concentration of SC and ST population in the Kollam district, Anchal Block and Two Villages - Kulathupuzha and Thinkalkarikakom are identified and purposively chosen for the study.

The SC women is found to be more in the Kulathupuzha and ST women are more in the Thinkalkarikakom in the Anchal Block. From village each sample village, 75 women was targeted as sample respondents, and totally 150 respondents is base for the study. But, due to ground level problems and non-availability of the respondents at the time of field visit, the researcher was able to meet and interact with a sample of 88 ST women and 62 SC women, thus reaching a total of 150 women respondents. The researcher has used a structured interview schedule, and also Focus Group Discussion with women.

Initially, there was challenge for the researcher in terms of non-cooperation by the women and demonstrated lot of resistance in answering the questions asked by the researcher. Because, most of these ICT Gadgets are costly and when questioned about its ownership, SC and ST women have found different and also difficult to answer them. They are bothered as the Researcher is taking stock of the facilities owned by the SC and ST women in the village. Later, with persistent efforts made by the researcher, the women could come-out of their shell and provided information.

## 2. Output of Focus Group Discussions and Case Studies

The researchers focused to bring out the influence of ICT gadgets on women Users and their family. It is a complex process of assessment of effects, that involves use of information received through the ICT gadgets and measuring its effects on the Users and on their living condition. Hence, the researcher has used the Case Study methodology to bring out the positive effects and influence of the ICT gadgets on the living condition of the women Users.

Based on the preliminary observations made in the Focus Group Discussions, the researcher has identified cases for further investigation so as to document the effects of the utilization of ICT gadgets on the Women Users and their way of living. This chapter presents the output of the discussions and Case Studies on the effect and impact.

## 3. Output of Focus Group Discussion

The Focus Group Discussions was conducted in the study villages. About 15 tribal girl student and 15 women from different age groups have participated in the discussions **.It is to get a clearer picture of the women's perception and using towards ICT. In this focus group discussion it was possible to effectively assess the use of accessing ICT in the everyday lives of rural women and the development needs of the rural tribal communities.**

The Focus group discussion was conducted in a Prematric hostel for tribal girls in Kulathupuzha situated in Villumala.13-18 years old tribal girls were participated in the two day discussion .These students need to travel 3-4 km to school from their home .since it is a forest area the fright of elephants would set hurdles on their way. Most of their parents are labors and working far away from their place .so the school authority provided a prematric hostel near the school, for the sake of students safety and make their studies easy. Students are comfortable in the hostel .All of them are under BPL category .each of them owned 50 cent to 1 acre .They are leading nuclear families. T.V and mobile phone are the most familiar devices used by tribal girl's \ students in

ICT gadget list. Telephone is very rare .they is not that aware of internet, though it is a part of their school studies but as a beginner they have some knowledge about internet.

### **3.1 Pattern Mobile and Telephone Utilization**

Everyday students in the tribal hostel are allowed to use mobile phone for 5-10 minutes. That is only for calling their parents. In home, the girls used call friends and other uses are taking photos, listening music and videos, calculations etc. Android phones are very rare in them.

One girls experiences sharing in the group discussion ....During time of excursion she was deviated from the group and become alone; at that time mobile phone helped her to get the right way and she reached safely in to the group.

A girl came to know her SSLC results through the phone. Another girl came to know the results of Intermediate Board Examination .Other one has been listening music in mobile phone after coming from work in the plantation. It makes her more relaxed.

One girl explained a situation in which the mobile has helped her very much in a difficult situation. She could participate in Student Police Cadet when her teacher gave information to be present in the school at the right time. Mobile phone helped her to contact the teacher who provided the information. It created an opportunity for the girl.

In many cases, the women labour were informed about the MGNREGS work in advance, through SMS from the Mobile Phone.

### **3.2 Pattern of Radio Use**

Very few Tribal women are familiar with Radio. Even if it is in the mobile phone due to the range [signal] problem they could not get it all the time.

Radio is very informative and communicate device for women. Many women heard the speech of Prime Minister from the programme *Manki Bath*. There was a connectivity problem some time, so could not listen to full speech.

Veena [SC woman] They are use to listen to Radio daily for during the last 6 years. Now due to range problem they could not hear it properly. Otherwise many used to listen news, speeches (especially Prime Minister Narendra modi speech manki bath), weather report, film, songs, etc.

One girl explained a situation in which the radio has helped her very much in a difficult situation .she faced a general knowledge questions [mostly related to name and position of few leaders] from her teacher in class. She could answer well, because she had listen those topic in Radio.

Vidya, housewife used to listen radio every day. She regularly listen news, music; comedy etc. It has helped to improve the general knowledge and develop interest in the music. Mostly useful to relax in the evening.

### **3.3 Pattern of Television Use**

Television is the most familiar device to all. Most of the women are aware about the positive aspects of it.

Saranya: she is one of the higher secondary students; she regularly watch news, weather, music, serial, documentary, educational programmes. She is one of the regular viewers of the documentary programme safari.

Majority of the housewives using cable Television. They used to see educational programmes in Amrita Channel, Victors and local news in Manorama, Reporter, Amrita, Mangalam, Surya, Asianet The problems in use of Television are - there is no adequate signal during the rainy season, eye problem, power cut and not able to watch. The type of information, they are getting through Television is related - agricultural news, Horoscope, Cookery shows, Yoga and meditational programme, Music and Exam results

Deepthi [worker] “we can make new dishes from the cookery show. we used to try new items by seeing cookery show. we used to see agricultural programmes like kissan, krishi deepam..

Shalini [working with book shop]: For her *kodiswaran* programme in Asianet is very informative. We can increase our G.K level by watching that programme. Doctor’s phone in programme inspired us .now I have set my ambition to become a doctor.

### 3.4 Computer and Internet usage Pattern

Among the women, mostly students are using computer for the purpose of drawing, playing games, animation, coloring and typing. They are totally unaware of internet. Most of them replayed they are in the Beginner level of computer and internet literacy.

Most useful to learn new skills - Using the Internet, Reading books, Watching TV generally Reading newspapers, Using computers, Watching educational TV (eg documentaries/Learning Zone and also Listening to the radio

The output of the Discussion is indicating that women are aware of the ICT gadgets. But still they are not reached remote villages on large scale. However, whoever is aware and own the ICT gadgets are putting the same into maximum usage. In this discussion they gave some suggestions for their betterment.

1. There is no range all the time, tower is necessary.
2. Lack of awareness internet and computer so training programmes are needed.
3. Internet café is necessary
4. Computer centre is necessary
5. Government have to provide computer
6. Make them aware about government schemes
7. Solve the range problems
8. Increase the efficiency of akshaya centre

### 4. Case Studies:

An attempt has been made to discuss with some individuals to document the perception and attitude of the women on the ICT gadgets.

**Case - 1: Mrs. Ajitha.S** [36 years old] she is residing at Villumala, Thingalkarikakom village. She has studied up to 10<sup>th</sup> standard. Her husband is also completed only school level of education. Her family is a nuclear family. She has used to collect information about the world through mobile phones, news papers, and TV. Usually she receives both internal and external [personal and public] news through mobile from her friends and relatives.

The programmes of her choice in the Television includes watching yoga, agricultural programmes, news, sports, cooking, health programmes, music channels, films, serials, etc. It helps her to update information on day to day affairs. By watching agricultural programmes; she is accustomed with gardening and earns money by selling organic vegetables. She practices yoga everyday from the Television which helps her to cure all the problems of mind and body. Music programmes help her to rejuvenate her mind to do the house hold activities in a more relaxed way.

Knowledge - providing quiz programmes like *kodeeswaran* updates her general knowledge. She enjoys the entertainment programmes like *kuttipattalam* with her family. She considers Television as an inevitable thing in her family life.

**Case -2: Ms. Sujitha. K** [26 years old] she is residing at villumala, Thingalkarikakom village. She is a graduate and unemployed too. So she is preparing and appearing for competitive exams. Her family consist of four members and the entire family is living with her father's meager income. Mobile applications, Television programmes and Newspaper provides the information about world and day to day affairs which helps in her preparations for examinations. Apart from this, now-a-days government propagates mobile apps by informing about qualified exams through personal messages. She is also make use of the famous schemes of the Prime Minister KAUSHAL VIKAS YOJANA [PMKVY] through the mobile phone. It provides required technical training for her to get a better job. She has trained in computer training.

**Case-3: Ms. Reshma** [21 years old] she residing at **Villumala, Thingalkarikakom** village. She has studied up to degree level. Now she is studying in St. Johns College Anchal. She used to collect information about the world through mobile phone, news paper, and Television. Usually, she receives messages about home events and other general news through mobile from my friends and relatives. Mobile phones plays a vital role in my life to collect and gather information's to communicate. Moreover, Television also supports much to get more information.

Through mobile phones she has able to get information's and download project regarding works. She has been watching Television programmes on educational, entertainment programmes and takes notes on it to make use of it in my daily works. So, she has much benefited by real progress. Thus, she collect information that improve her knowledge and help the needy in time.

**Case-4: Ms. Vanaja** [41 years old] and residing at **Villumala, Thingalkarikakom** village she has completed her secondary education and now working as a sales assistant in a showroom. She is also working in MGNREGA which help in managing and running her family. She is married and living with her two sons. She makes use of mobile to contact her showroom many times. Also she uses internet in the mobile to search online customers and for replying necessary enquiries of theirs. Mobile enables her to make a good coverage for her business transactions. She can access the organizations special classes on new products through mobile and also get information about launching new products through mobile. She has been helped and enabled by the Mobile phone in her occupation.

**Case -5: Ms. Archana** [40 years old] and she is residing at **Villumala, Kulathupuzha** village she has studied up to higher secondary level. She is living with two daughters and struggling to run her family as a widow. She is compelled to manage the expenses of daughters' education as well as family maintenance with her meager wages.

She is working as a Chairperson of SHG Federation. She is more depended on computer and mobile for her daily routine and office work. She got computer training in the Akshaya programme that helped her to do her works more fruitfully. Mobile is helpful for her as she can contact her fellow workers for enquiring about the closing of accounts, meetings and daily activities. Apart from this she can acknowledge the latest up-comings through computer and mobile. Now, she has carrying work on the effective steps to be taken in SHG through computer. In this task, Internet helped her a lot in this regard. She is also using mobile phone daily and computer. Now, mobile phone and computer are playing an essential role in her life.

**Case -6: Ms.Vinita** [35 years old] she residing at **villumala, kulathupuzha** village. She is a spinster and running a tailoring shop. Mobile helps her lot in her works through mobile application and internet. She can update latest designs in dress patterns and also new stitching styles will be explained in detail. With this new technology, she got a lot of customers who are interested in her works. Now, she has a plan to open a new boutique. For this she has made contact with resellers through Phone and she can buy materials through online. She hopes she will get online customers through *face-book* and *whats app*.

**Summing up:** The case studies indicate that the ICT gadgets are part of their life and they have enabled to do their work effectively and efficiently. The information is a resource that becomes knowledge when it is delivered / accessed and applied properly. The ICT gadgets are channels to deliver the Information and Knowledge to women that in turn used by them to take decisions. So, the ICT gadgets are enabling technology for rural women, particularly to SC and ST women.

## **ISSUES OF FURTHER IMPROVEMENT OF WATER CADASTRE LEGISLATION OF UZBEKISTAN**

**Toshboeva Robiya Sobirovna\***

\*Acting Associate Professor of the Department of Environmental Law,  
Candidate of Legal Sciences, Tashkent State Law University,  
UZBEKISTAN

### **ABSTRACT**

*The article analyzes the legal basis for maintaining the state water cadaster of Uzbekistan as one of the mechanisms for ensuring water safety reveals the essence and goals of maintaining the state water cadaster, summarizes the latest trends in improving the legal and technological foundations for the formation of water cadaster information. The author presents some scientific and practical problems related to the formation of water cadaster information, the solution of which would contribute to ensuring the transparency of water information and its reliability, and studies foreign experience in this area. Based on the analysis of the current water legislation, special legal literature, as well as foreign experience, the author substantiates proposals for further improvement of water cadaster legislation and develops three draft normative legal acts aimed at legal regulation of water cadaster management.*

**KEYWORDS:** *State Water Cadaster, Water Monitoring, Unified Information System, Water Cadaster Information, Surface Water, Underground Water, Water Use, Information And Communication Technologies, "Smart Water", And Digitization*

### **INTRODUCTION**

#### **Relevance of the topic**

Water is a precious and essential resource for the maintenance of life on Earth. As the foundation of life, water, through its diverse uses, continues to play a major role in addressing a broader range of challenges to achieve food security, reduce poverty and improve the quality of life in the world. That's why we need to have complete and reliable information that answers questions like: How much water do we have? What is its quality? How long will it last? What is the cost of water resources?

As global environmental crises escalate, water security, which means the ability of the population to have sustainable access to an adequate amount of acceptable water quality to support human livelihoods, well-being and socio-economic development, is an integral part of a country's environmental security.[1] Water security promotes environmental protection and social justice by resolving conflicts and disputes that arise over shared water resources. And to ensure this very safety, we must first of all be provided with reliable statistics on the state of the waters.

Today, in Uzbekistan, in the conditions of water scarcity, the issue of ensuring water security will be even more relevant. In our opinion, the following problems in the field of water resources management are relevant to this issue:

1. Reduction of water resources as a result of climate change,
2. Increased demand for water due to population and economic growth,
3. further degradation of water quality.

The main problem of today's water use is the lack of reliable and transparent statistics on water and water bodies, which are concentrated in the State water cadastre (hereinafter referred to as the water cadastre). The information available in Uzbekistan on the state of water resources is far from complete and "stale" due to the lack of modern technologies in the process of collecting, processing and storing information that allow for systematic updating of water monitoring data ( we outlined the use of the latest information and communication technologies in the process of collecting, processing and storing water-cadastre information only last year!!!), its outdated methodological basis (the Regulations on the procedure for developing and maintaining the State water Cadastre of the Republic of Uzbekistan were adopted already in 1998!!!) and incomplete coverage of the quality indicators of water resources ( for example, the water cadastre does not contain information about wastewater flowing into large water bodies of the country and affecting its quality). For Uzbekistan, which is moving to a digital economy, the importance of reliable statistics and figures in the life of the state and society is paramount. Even in the last century, the famous Russian writer G. I. Ouspensky, speaking about the meaning of statistics, noted: "And yet it is only in these thick, boring books that the 'real' truth of our life is told in figures, about which we have completely lost the habit of speaking in human language, and it is only necessary once to get interested in these fractions, zeros, zeros, in this generally digital grain with which statistical books and tables are littered, so all of them, all this grain of numbers, will begin to take human images and it will begin to receive the meaning not of dead and boring signs, but, on the contrary, the meaning of the most versatile image of life." [2] In addition to this metaphor, I would like to add that this "digital grain" should be justified and updated, then it will have an important practical significance in environmental protection.

### **The degree of scientific knowledge of the topic**

Existing research in the field of legal regulation of water cadaster management in domestic environmental science addresses the issue of water cadaster management from the point of view of water fund management and is reflected in the works of such domestic scientists of environmental lawyers as Fayzieva Sh. Kh. [3], Usmonov B. M. [4], Salokhiddinova A. R.[5], Chembarisov E. I. and Rakhimova N. M.[6] , etc. Part of the national research in the field of water use is devoted to the problem of the use of transboundary water resources, in particular, the

works of Kholmuminov Zh. T. [7], Skripnikova N. K. [8], as a new trend of modern domestic water legislation, O. Narzullaev considered the issue of water use of biological resources in the context of the COVID-19 pandemic [9], etc.

Directly the issues of legal regulation of water cadaster management, the ratio of water monitoring, accounting and cadaster are reflected in the works of such scientists of the CIS countries as Bogolyubova S. A. [10], Kolbasova O. S. [11], Sivakova D. O. [12], Krasova O. I. [13], Budaragina L. V. and Tishchenko S. V. [14], V. A. Dukhovny, N. N. Mirzaev, A. I. Tuchin [15], Bekisheva S. D. [16], Petrakova S. V. [17], etc.

The relationship between the water cadaster and water management stability is revealed by Philip P. Miklin, a professor at Western Michigan University. [18]

#### Analysis of legislation

The regulatory framework for maintaining the water cadaster consists of: the Law "On Water and Water Use", Resolution of the Cabinet of Ministers of the Republic of Uzbekistan "On Approval of the Regulations on the procedure for Developing and maintaining the State Water Cadaster of the Republic of Uzbekistan" dated January 7, 1998 No. 11, Resolution of the Cabinet of Ministers of the Republic of Uzbekistan "On measures for further streamlining activities in the field of underground water use" dated June 27, 2017 No. 430, Decrees of the President of the Republic of Uzbekistan "On measures for the effective use of land and water resources in agriculture" of June 17, 2019, No. UP-5742 and "On approval of the concept of water management development of the Republic of Uzbekistan for 2020-2030" of July 10, 2020, No. UP-6024, etc.

In accordance with article 109 of the law "On Water and Water Use", the water cadaster includes data on water accounting for quantitative and qualitative indicators, registration of water use, as well as data on water use accounting.

The main task of the water cadaster is to obtain and maintain reliable information about water resources and water bodies at the current level with minimal costs by constantly improving the technology of collecting, summarizing, storing and providing information.

The water cadaster consists of the following sections:

- 1) Surface water
- 2) Underground water
- 3) Water use

The water cadaster is maintained by three bodies:

1. The Center of Hydro meteorological Service under the Ministry of Emergency Situations of the Republic of Uzbekistan-under the section "Surface waters»;
2. The State Committee of the Republic of Uzbekistan on Geology and Mineral Resources-under the section "Underground waters;
3. The Ministry of Water Resources of the Republic of Uzbekistan-under the section "Water use".

In accordance with the Concept of Water Management Development of the Republic of Uzbekistan for 2020 — 2030, it is planned to improve the system of forecasting, accounting and forming a database of water resources and ensure its transparency, which is implemented through the following measures:

- a) Step-by-step equipping of hydrological posts located on large and medium-sized rivers and says with automatic equipment based on digital technologies, expansion of the network of hydrological posts;
- b) Improving the control and accounting of water in all water bodies on the basis of digital technologies, creating a transparent information system on water resources;
- c) Implementation of the following measures for water resources forecasting, water accounting and data processing:
  - 1) Implementation of the geoinformation system in forecasting water resources, conducting operational monitoring of water resources and improving the reliability of forecast data;
  - 2) Standardization of data for water accounting at all water bodies;
  - 3) Improvement of information systems for collecting and processing information about water bodies based on information and communication technologies;
  - 4) Step-by-step implementation of water monitoring in water bodies using digital technologies, creation of a unified information system for all sources and water resources;
- h) Improving the water cadaster and database management system with the help of information and communication technologies and ensuring their transparency.

In addition, this act provides for the creation of an Integrated National System of Accounting, Planning and Management of water Resources linked to the National Cadastral Database, which will ensure the openness and accessibility of data on water resources.

At the same time, the introduction of "Smart Water" technology in water use and water consumption accounting is also an important step in the further improvement of the water cadaster.

It should be emphasized that the next cadaster of natural resources after the land cadaster in the field of its digitalization is just the same water cadaster.

### **Practical problems of water cadaster management**

1. Lack of a mechanism for economic assessment of water resources. In Uzbekistan, the procedure for assessing water resources is legally established, which means systematic accounting for quantitative and qualitative indicators both during the year and in a multi-year context through measurements with standard hydrometric devices, analysis of the reliability of the data obtained, their processing by standard methods and generalization by various territorial and temporary units, while the development of new criteria for the economic mechanism of water use, in particular, determination of the procedure for reimbursement by water consumers of state expenses for the delivery of water.

But we do not regulate the concept of "economic assessment of water resources", which includes the monetary form of the public utility of natural resources through production and consumption.

In the foreign legal literature, there are several concepts of economic assessment of natural resources, including water resources.

In particular, S. G. Strumming proposes to evaluate all natural resources by their costs for their development, the main criterion of which is net income and differential rent. [19]T. S. Khachaturov suggests estimating natural resources from the costs that we spend to get the effect of the resource used.[20]

A mixture of these two theories can be observed in the example of the Republic of Kazakhstan, where the base price of water resources is set from the ratio of the cost of protection and reproduction of water resources to the total intake from water sources.[21] At the same time, water quality is not taken into account in prices, which gives rise to a one-sided attitude to setting prices.

In the domestic environmental legislation, there is an economic mechanism for nature protection, which provides for the collection of fees for special use of natural resources, for pollution of the environment (including waste disposal) and other types of harmful effects on it; tax, credit and other benefits provided to enterprises, institutions and organizations, as well as individuals when implementing low-waste and resource-saving technologies, carrying out activities that give environmental and natural restoration effect; obtaining licenses (permits) for the right to release, discharge substances polluting the environment or to carry out other environmentally harmful activities, etc.

We support the position of the International Institute of Water Resources Management, according to which the economic assessment of water resources should be carried out in several stages in order of increasing complexity. A multi-stage

The main issues of the mechanism of economic assessment of water resources, in our opinion, should be:

1. Definition of the main criteria for economic assessment
2. Identification of the competent authorities involved in the assessment.

We propose to take the quantity and quality of water resources, the availability of irrigation structures, as well as the size of the differential rent for water use as the evaluation criteria. Note that this system of criteria is conditional, has a general character and can be updated depending on the individual properties of water resources and the powers of the competent authorities.

Recognizing that Uzbekistan's water resources and facilities are diverse in terms of water volume, background pollution, climate, geographical and landscape conditions, the development of common criteria for conducting an economic assessment of water resources is a very complex process. But at the same time, in the conditions of increasing scarcity of water resources for the purpose of rational use of the remaining resources, the regulation of the economic assessment of a natural resource is one of the main tasks of the natural resource cadastral system in the context of the transition to a "green economy".

2. There is no procedure for providing water cadaster information to interested individuals and legal entities, which prevents the full exercise of the constitutional right to receive information. In accordance with Article 17 of the Law "On State Cadastres", information from state cadastres is provided to state authorities free of charge, and to other legal entities and individuals in

accordance with the established procedure, for a fee, while the very concept of "established procedure" is not disclosed by law. The law "On Water and Water Use" and the Regulation on the Procedure for Developing and Maintaining the State Water Cadastre of the Republic of Uzbekistan do not disclose the procedure for providing water-cadastral information, which is a serious gap in the water-cadastre legislation. Article 29 of the Constitution of the Republic of Uzbekistan reads as follows: "Everyone has the right to seek, receive and disseminate any information, with the exception of information directed against the existing constitutional order and other restrictions provided for by law." If we proceed from this norm, then the lack of a mechanism for providing water-cadastre information is an obstacle to the implementation of this constitutional norm.

### **3. Insufficient validity and unreliability of information on the quality of water resources.**

This primarily concerns information on wastewater (in particular, information on wastewater entering the Chirchik, Akhangaran, and Bozsuv rivers), which reflects the discharge of specific harmful substances into reservoirs and assesses the actual pollution of natural waters. These rivers are polluted by wastewater from many industrial enterprises, municipal and collector-drainage runoff from irrigated fields. Of particular concern are the unaccounted-for wastewater that is not provided for in the design of treatment facilities and the rules for the acceptance of wastewater and is a concentrated discharge. And with the growth of urbanization, this problem is even more urgent

**4. In the water cadastre, there is no information reflecting the socio-economic and environmental efficiency of water resources, we evaluate only its raw materials.** The time has come when it is necessary to evaluate water not as a natural good, but as a natural capital that should be multiplied.

**5. The low level of the scientific basis of the water cadastre and practical developments.** It should be noted that the modern domestic water legislation does not fully and clearly regulate water relations. And scientific research in the field of legal regulation of water cadastre management in Uzbekistan is completely absent. The legal scientific works of Russian scientists contain only references to the function of accounting for water bodies and their condition in the framework of research on the protection of water and water bodies, as well as control and supervision of the activities of citizens and legal entities in the process of water use. Some of the research is devoted to the study of transboundary waters, while the legal problems of maintaining a water cadastre are still unexplored, which in turn is a serious gap. Recent trends in the improvement of water legislation are more focused on the introduction of new technologies in the process of collecting, processing and storing water cadastral information, which is also important. At the same time, we should not forget about its scientific and methodological components

**Foreign experience.** After analyzing the legislative basis for maintaining the water cadastre of the **Russian Federation**[22], **Kazakhstan**[23], the Republic of **Belarus** [24], **Turkmenistan**[25], we came to the conclusion that the content of the water cadastre of these countries practically repeats each other, while the system of bodies that conduct it is diverse.

If the water legislation of the post-Soviet countries still revolves around automated water cadastre systems, the proposals of scientists from the United States, Europe and Asia to improve

the formation, collection, processing and storage of water cadastre information at the current stage of development are based on the use of the latest nano-technologies.

In particular, in the collective work of American scientists, special attention is paid to the state of such a water body as a water reservoir and it is proposed to widely use satellite systems in tracking the quality of water resources, referring to the fact that a complete database on water resources in all countries does not yet exist. Since sensor data is not available worldwide, US scientists suggest using NASA's new satellite mission, ICESat-2, to obtain information on water quality, which they believe will be an important component of any global inventory of reservoir levels and will provide new insights into how reservoir management responds to climate variability and rising human demand.[26]

In the collective work of English scientists, it is proposed to use the new mobile infrastructure of eco-accounting as the basis of natural resource inventories, including the water cadastre, consisting of four modules: eco-consumer account, eco-shopping, eco-processing and eco-incentives.[27]

In the next collective work of American scientists, it is proposed to use remote sensing to catalog lakes in order to characterize the morphology and build a typology using cluster analysis. This method can be used to identify environmental research needs, adapt water monitoring and management programs, customize environmental programs, and use the conservation of available water resources more effectively to achieve large-scale management goals.[28]

The collective work of Mexican scientists examines the mapping and monitoring of fresh (surface) waters in the largest mountain range of Mexico-the Sierra Madre Occidental (SMO), covering the states of Chihuahua, Sonora, Sinaloa, Durango, Nayarit, Zacatecas and Jalisco, which are of great importance for understanding hydrological processes and water management. In this study, 120 Sentinel-2 satellite images were used. [29]

The problem of insufficient data and the need for a more reliable data inventory is also raised in the work of the Tunisian scientist BeljamAzhoubi. It proposes to develop and build scientific capacity through regional and international partnerships, as well as to implement rational water resources management for sustainable development based on gis technologies and the GALDIT index system. [30]

In the joint work of Argentine and Colombian scientists, the issue of delineation of water bodies is raised, which is not a clearly solved problem, as a result of which it is proposed to develop a conceptual model of water bodies of the LLO type with dynamic boundaries, based on the legal definitions of coastal boundaries in the future 4D LLO. [31]

In the collective work of Chinese scientists, water-saving technologies have long been seen as an effective method of reducing irrigation water use and alleviating regional water scarcity. However, the growing number of reports of more severe water shortages and the increasing use of water-saving technologies around the world have required a reassessment of water-saving practices in agriculture. This study develops a simple method based on satellite ET partitions to estimate water intake, consumption, and backflow from the 1980s to the 2010s, and quantifies water savings across the world and four hot irrigated areas at both field and regional scales based on a water accounting system. [32]

Summarizing foreign experience, I would like to note that Uzbekistan has something to borrow to further improve the mechanism for generating reliable information about water resources and providing it to potential consumers by deepening liberal reforms in the field of water resources management.

In particular, Uzbekistan has already taken the first steps to implement public-private partnership in the field of water management, consolidating the system of outsourcing in the use of water bodies. The next stage of this process, in our opinion, should be the participation of business entities in the formation of water-cadastre information on the basis of an investment agreement, which would allow updating the technological basis of water-cadastre activities and improving the quality of the information provided.

### **Proposals for the improvement of water cadastre legislation.**

Based on the above, in order to further improve the water cadastre legislation, we consider it appropriate:

first, to introduce a separate chapter on the state water cadastre in the draft Water Code, which, in our opinion, should look something like this:

#### **"Article X. State Water Cadastre"**

The State Water Cadastre is a geoinformation database on surface and underground water resources, consisting of several independent subsystems, intended for fiscal, legal, informational and administrative purposes, including qualitative and quantitative indicators, economic assessment, information on the geographical and legal status of water resources, as well as water users and water consumers.

#### **Article X. Bodies that maintain the state water cadastre**

The State Water Cadastre is maintained by:

Center of Hydrometeorological Service under the Cabinet of Ministers of the Republic of Uzbekistan - on the division of surface waters;

State Committee of the Republic of Uzbekistan on Geology and Mineral Resources - on the division of underground waters;

Ministry of Water Resources of the Republic of Uzbekistan-under the section of water use.

The data of the state water cadastre are provided by the Ministry of Water Resources of the Republic of Uzbekistan to the Cadastre Agency under the Tax Committee of the Republic of Uzbekistan for its further integration into the National Geographic Information System of the Republic of Uzbekistan.

#### **Article X. Financing and procedure for maintaining the State water cadastre**

The State water cadastre is financed from the State budget and other sources not prohibited by law.

The procedure for maintaining the State water cadastre is determined in accordance with the Regulations on the Procedure for Maintaining the State Water Cadastre.

---

**Article X. Water and cadastral information**

Water-cadastral information includes data on rivers, channels connecting various water systems that serve for territorial redistribution of runoff or irrigation; lakes and reservoirs; glaciers; underground waters (basins, aquifers, deposits) as well as hydroelectric facilities and reservoirs; structures for taking water from water bodies (channels, pumping installations, production wells, etc.); channels that serve for territorial redistribution of runoff; structures for the discharge of used and mine water into water bodies (collectors, drainage and drainage channels, tubular water outlets, etc.); structures for the treatment of used water.

Water cadastre information is intended to provide state authorities and management bodies, interested legal entities and individuals with the necessary data on water bodies, water resources, water regime, quality and use, as well as on water users and the contract for outsourcing of water bodies

**Article X. Provision of water-cadastral information.**

The provision of water cadastre information to state authorities and management bodies is carried out free of charge through the E-Government platform.

The provision of water cadastre information to interested individuals and legal entities is carried out on a paid basis through the territorial divisions of the State Services Agency.

**Article X. Liability for violation of water cadastre legislation.**

Officials and citizens who are guilty of violating the water cadastre legislation are liable in accordance with the established procedure»;

**secondly**, we propose to develop a Regulation on the procedure for providing water cadastre information to interested individuals and legal entities, which provides for:

**Section 1.** General provisions. This section should regulate the grounds for providing cadastral information in one place, the types of water-cadastral information, and the principles of forming water-cadastral information.;

**Section 2.** Types, forms and sources of formation of water-cadastral information. This section should regulate the sources of formation of water-cadastral information, the composition of water-cadastral information, the powers of the competent authorities to maintain the water cadastre when providing water-cadastral information;

**Section 3.** Conditions for the provision of cadastral information to interested individuals and legal entities. This section should regulate such issues as the procedure, conditions and terms of providing information to the appeals of interested individuals and legal entities, the payment procedure, the grounds for refusing to provide water-cadastral information, the procedure for reviewing appeals;

**Section 4.** Responsibility of officials for violation of the order of submission of information. This section should address the issues of holding officials accountable for violations of the procedure and deadlines for providing information to individuals and legal entities. "

Third, we propose to develop a Regulation on the economic assessment of water resources, which provides for:

**Section 1.** General provisions: This section should regulate the definition of the concept of economic assessment of water resources, objects of water resources assessment, subjects of water bodies assessment, environmental damage caused to water resources, risk factors for water resources assessment, criteria for economic assessment, etc.

**Section 2.** The procedure and conditions for conducting an economic assessment. This section should address such issues as the differentiation of water resources assessment based on water quality, criteria for determining the degradation of water bodies as a result of anthropogenic impact on them, the assessment of complex water resources and objects, etc.

**Section 3.** Assessment of water resources at the national level. This section should address the issues of determining the system of central bodies that carry out the assessment, the powers of central bodies that carry out the assessment, the amount of differential rent, etc.

**Section 4.** Assessment of water resources at the territorial level. This section should address the issues of determining the system of territorial bodies that carry out the assessment, the powers of territorial bodies that carry out the assessment, etc.”

fourth, in order to strengthen the scientific and legal development of common problems of water resources use and protection, we propose: to intensify scientific activities in the field of legal regulation of water-legal relations by providing various types of incentives for participation in international projects; to improve the methodological basis of water-cadastre research by ordering the appropriate literature; to open master's courses in law higher educational institutions in the specialty " Water law” .

In conclusion, I would like to note that water is one of the main elements of the universe, which is located inside every earthly substance. Therefore, the lack of water has devastating consequences for people, animals and plants and negatively affects the development of the economy. The existing water problems resulting from global environmental crises and human economic activity are getting worse day by day, and the forecast of the state of water resources is disappointing. At the same time, the need for it is growing every day. Therefore, in order to build the right tactics for the rational use of available water resources and their protection, we must always have complete and reliable water cadastre information at hand.

**THE ROLE OF CHESS IN THE DEVELOPMENT OF INTELLECTUAL  
 ABILITIES OF SECONDARY SCHOOL STUDENTS (BASED ON  
 COMPUTER TECHNOLOGY)**

**Toshev Murodjon Halilovich\***

\*Base Doctoral Student of Bukhara State University,  
 UZBEKISTAN

**ABSTRACT**

*The article provides some comments on the importance of chess (based on computer technology) in the development of intellectual abilities of secondary school students. **Basic terms:** N.N.Moiseev, N.M.Verzilin, E.I.Perovsky, D.O.Lordkipanidze, computer technologies, didactic principle, method, oral, visual, practice, observation.*

**KEYWORDS:** *N.N. Moiseev, N.M. Verzilin, E.I. Perovsky, D.O. Lordkipanidze, Computer Technologies, Didactic Principles, Method, Verbal, Visual, Practice, Observation.*

**INTRODUCTION**

About 60% of the population of the Republic of Uzbekistan are young people. Teaching them to care for our Motherland is one of the highest tasks of all educational institutions. Especially in the development of society, the education of mature young people is very important. In this case, the use of various tools, including games, in the development of intellectual abilities of students from the primary grades of schools is very effective. Today, our young people are regularly involved in games such as football, volleyball, wrestling, chess and checkers. Among them, the introduction of chess as a subject in a number of schools of our country is becoming important in educating young people mentally and spiritually.

Experiments have shown that students who play chess have a 40 percent higher response to intellectual influences. In the words of academician NN Moiseev, intellect is, first of all, the pursuit of a goal, an estimate of it, the planning of resources to achieve a goal. These are the algorithms of the game of chess. Chess gives joy and pleasure to students, enriches their spiritual worldview.

In order to use the intellectual abilities of secondary school students and the great potential of the game of chess in their development, firstly, it is necessary to pay attention to the correct choice

of didactic principles and methods, and secondly, to use didactic principles and methods. Ensuring the connection (combination) of theory and practice from the didactic principles, the systematic formation of skills and competencies, as well as the provision of visual aids are very effective in education. Source-based learning methods have been categorized by scholars such as N.M.Verzilin, E.I.Perovsky, D.O.Lordkipanidze into 3 groups (oral, visual and practical).

According to the classification of these scientists, resource-based learning methods are selected in the development of students' intellectual abilities (Figure 1).

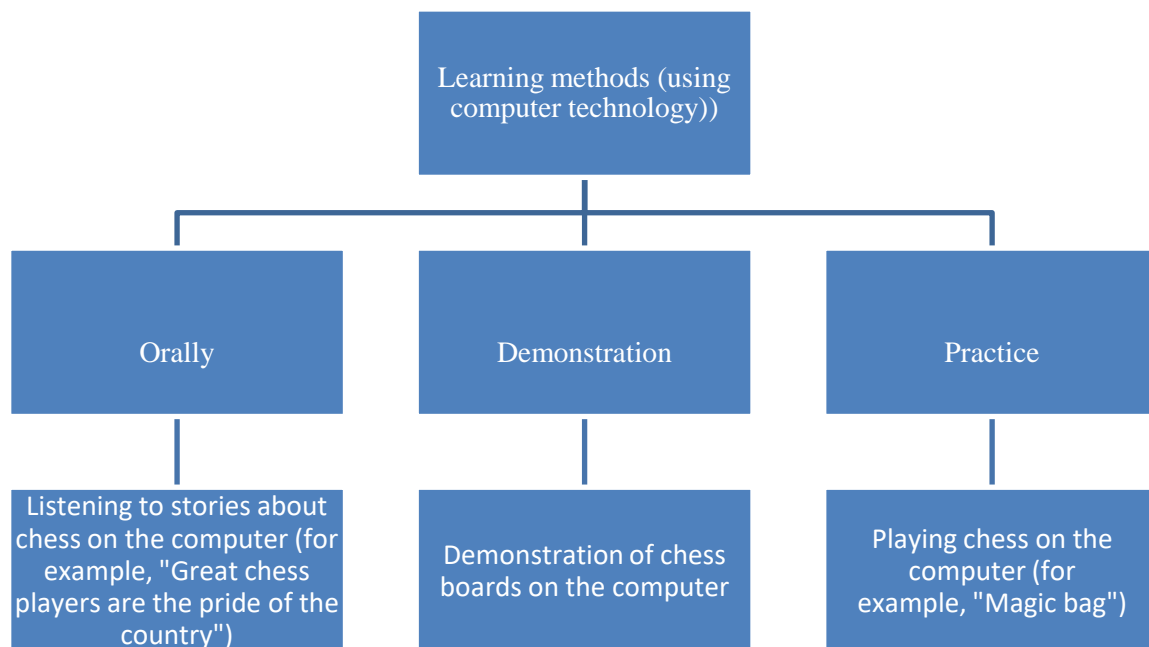

Figure 1. Use of computer technology in the use of resource-based learning methods Listening to the story from the above methods, observation, playing chess with the help of a computer is very important. Through the method of observation, students' behavior during lessons and games, attitude to the opponent (peer), mood, personal qualities are studied.

The above qualities of students can also be studied using the survey method (test form). The form of taking tests from students is especially popular.

1. Which game do you like?

A. I love football. I love chess

2. Are you bored playing chess?

A. for me the game of chess is boring V. i don't get bored of playing chess

3. Do you play chess at home?

A. Yes, we play chess at home. No, we don't play chess at home

4. Have you ever played chess on a computer?

A. I played chess on the computer. I didn't play chess on the computer

5. Is it good to play chess on the computer?

A. Ha V. No.

6. What do you do if your opponent swallows in chess?

A. Congratulations to my opponent on the victory. I am saddened by his victory.

Bukhara city No. 1 Children and Youth Sports School "Chess" circle students Kholmurodaliyev Abdulkakor Bukhara city 21 - secondary school student "Football" 5 other people interested in the game; Bakhtiyorova Robiya, Tohirova Umida, Zoyirov Muhammadziyo, Rakhmonova Shakhlokhon 1st grade and 3rd Shirinov Begzodlar Tests taken from 8th grade students of Bukhara city will be checked and their attitude to chess will be analyzed. The attitude of students who chose 10-40 percent of chess is unsatisfactory, 41-50 percent are partially satisfactory, 51-70 percent are satisfactory, and 71-100 percent are exemplary.

After this method, work will be organized to increase students' interest in the game of chess.

### ABSTRACT

*Today, the teacher requires the use of advanced pedagogical and new information technologies in the educational process. The introduction of advanced pedagogical and new information technologies in education not only increases the effectiveness of training, but also plays an important role in the upbringing of an independent and logical thinking, comprehensively high spiritual person by applying the achievements of Science in practice. This article describes the ways of teaching and learning using interactive techniques in the lessons.*

**KEYWORDS:** *Pedagogical Technology, Intellectual Attack, Technique, Grosses Intellectual Attack.*

### INTRODUCTION

The state standard of education is called upon to create equal opportunities for each of the students in their education, to encourage each of them to achieve a higher result and thereby ensure that the educational - cognitive process is organized differently. The production of state educational standards in the field of Science, Education on the basis of choice of educational disciplines implies the modernization of educational methodological complexes, including the teaching of mathematics in primary classes. The implementation of arithmetic in primary classes on the basis of the principle of linking and coordination of knowledge serves to ensure the internal linkage of Educational Sciences and Inter-interdependence of Educational Sciences. The Fulfillment by the students of the requirements for the performance of arithmetic operations in the primary classes helps them to acquire the necessary knowledge, skills and conics.

a) Adaptation of pupils to the surrounding natural environment.

- b) Acquisition of Educational Labor, communication of various types of activity.
- c) Self-control and assessment training.
- d) Definition General natural-a defined level of scientific knowledge is a description of its further development.

Thus, the process of performing arithmetic in the primary classes provides not only knowledge, conics and competency in teaching mathematics to the educational-cognitive process, but also the formation of qualities corresponding to the specific set of basic activities of the individual - labor training, communicative-moral and physical - perfection.

Theoretical basis of the methodology of teaching students to perform arithmetic operations. As stated in the "National Program of Personnel Training" in the law on development of Education" on the changes taking place in the system of public and economic relations, public education" each class student is assigned an important task. These tasks also allow to specific joints for primary education, since these joints can form a network in a variety of educational science programs, curricula, textbooks on the introduction of education, as well as in the methodological system.

The state educational standards open up wide opportunities for the creation of educational and methodological complexes (programs, curricula, courses, as well as provide for the connection of educational disciplines and the connection of educational disciplines on the basis of the principle of knowledge achievement. In the new course of mathematics, similar to the previous one, arithmetic plays a key role. In the new program of classes I-IV, the content of arithmetic materials has not changed much: the theory of arithmetic (the change of properties, results of actions and the results of actions when one of the components changes) is less illuminated, the theory is more strengthened by the connection of practical issues (counting, measurements, calculations, solving issues): the formation of concepts (number, counting, system, arithmetic Also the initial learning style of arithmetic has been perfected. It is included in the new science-based method and methodological school program aimed at Timely summarizing the facts and observations that are based on the activation of their recovery activities from all stages of the teaching of junior students, the appointment of a reciprocal link between certain issues, the emergence of independent performance studies in children. In the distribution of the study material by the academic years, it is planned to gradually increase the area of the studied numbers.

Numbers from 1-th grade I to 20.

Numbers from 2-th grade I to 100.

Numbers from 3-th grade I to 1000.

Numbers from Grade 4 to 1000000.

And, that is, multi-digit numbers are studied. The material for arithmetic operations is studied as concentrates. In total, there are five concentrates: decimal, second decimal, hundred, thousand, multi-digit numbers.

Each concert reflects in its content the main issues of the systematic arithmetic, for shimming, students learn the steps on the numbers within these or that limits, creating an idea of the essence

of arithmetic in general. Each time repeatedly resorting to the implementation of actions on the basis of a new finite material allows deepening and expanding the content of the most important arithmetic concepts. In addition, the gradual formation of solid learning and skills ( in counting, measurements, oral and written nomenclature, calculation, etc.k is provided, because the methods of performing these actions are gradually complicated by maintaining the generality. Thus, the study of nomenclature and arithmetic operations in each previous center is considered to be a preparatory work for further study of the corresponding issues, while in each subsequent Center the previously studied material is summarized and consolidated.

The methodology of teaching elementary mathematics is closely related to several disciplines. 1) With mathematics as the basis of teaching; 2) pedagogy; 3) Psychology; 4) with other teaching methods (native language, labor ...). The course of Primary Mathematics Education has become a subject of study. Functions of teaching methodology in elementary mathematics teaching:

1) to be able to carry out educational and practical tasks, 2) to enlighten the learning process of the system of theoretical knowledge; 3) to be able to teach the ways of forming the worldview of students;

4) Humanization of Education; 5) in the process of teaching mathematics shows the love of human labor, the upbringing of such qualities as self-esteem, hormones of each other; 6) teaching methodology shows the connection with the content of mathematics of the V–VI class, which is a continuation of mathematics of the I–IV classes.

The task of the elementary mathematics course is to help the school solve such tasks as “the use of new technology in providing students with thorough knowledge of the basics of science, giving them the current socio-economic knowledge, directing them to marriage, profession, training them to make a conscious choice”. Today, a number of developed countries have accumulated considerable experience in the application of pedagogical technologies that increase the educational and creative activity of students and guarantee the effectiveness of the educational process, and the methods that form the basis of this experience are called interactive methods. Below we will talk about the essence and use of several of the interactive techniques that are used in their practice.

#### The” thought attack» method

This method serves to ensure the activity of students in the process of training, to encourage them to think freely, to release from the inertia of the same thinking, to gather colorful ideas on a particular subject, as well as to learn to overcome the thoughts that arise at the initial stage of the process of solving creative tasks. Method” intellectual attack "A.F.Recommended by Osborn, his basic principle and condition is an expression from the absolute prohibition of criticism, stimulation of all kinds of bites and Jokes In relation to the thought that is being put forward by each participant of the exercise. The aim of this study is to provide free participation of students in the training process. The use of this method in the educational process will depend on the breadth of the pedagogical skills and scope of thought of the teacher.During the use of the” thought attack" method, it is desirable that the number of readers does not exceed 15 people. Training based on this method can be organized up to one hour.

The method of " gross intellectual attack”

This method is J.Developed by Donald Phillips, it can be used in classes consisting of several dozen (20-60) students. The method serves to create conditions for the expulsion of new ideas by students. Each group of 5 or 6 students must be positively addressed within 15 minutes after the different tasks or creative tasks are positively addressed within the specified time period, one of the members of the group will be informed about this. The information given by the group (assignment or solution of the creative task) is discussed and evaluated by the teacher and members of other groups. At the end of the training, the teacher announces the answers that are found to be the best and specific among the solutions of the given task or creative tasks. In the process of training, the activities of the members of the groups are evaluated according to the level of their participation.

The essence of the method is as follows: - assistance in the realization of the personal capabilities of each student performing certain tasks among the team; - the ability of students to put forward an idea against the idea expressed by a particular team. The training, based on the use of the method of "severe attack of thoughts", is organized in the following stages: 1-stage: the formation of small groups of students who are mentally close to each other, which are attached to themselves and are numerically equal; 2-stage: the identification of goals arising from the essence of the task or tasks assigned to the solution); Step 4: discuss the solutions of tasks, divide them into categories according to the correct solution; Step 5: reclassification of the solutions of tasks, that is, their correctness, the time spent on finding a solution, evaluation based on such criteria as a clear and clear description of the solutions; Step 6: discuss specific critical comments expressed on the solutions of tasks in the initial stages.

### ABSTRACT

*Decisions of the homogeneous and non-uniform equation of a bend orthotropic on mechanical properties of the rectangular plate, received are described by a recurrently-operational method. For an illustration of algorithm of the decision of problems the recurrently-operational method results numerical results of test problems for the non-uniform equation, satisfying to initial and boundary conditions.*

**KEYWORDS:** *Electronic Equipment, Orthotropic Plate, Lamé Equation, Recurrent Operator Method.*

### INTRODUCTION

In modern conditions, electronic equipment, in addition to meeting the main set of technical characteristics, is subject to a number of strict requirements aimed at improving the design of electronic equipment that is resistant to mechanical and thermal disturbances [1].

In the monograph [2], discrete models of devices are considered without taking into account the anisotropy of electronic boards. However, when placing individual electronic devices on the

boards, some structural anisotropy of mechanical and thermal properties is created. Therefore, when placing individual elements in an electronic circuit, it is desirable to ensure the regularity of the structure so that the board can be considered as an orthotropic plate.

This article deals with the problem of mechanical vibrations of an orthotropic plate.

As is known, the problem of the eigenvalues of an orthotropic plate is reduced to solving the differential equation of plate deflections [3, 4, and 5]

$$L(w) \equiv \left( b_0 \frac{\partial^4}{\partial x^4} + b_1 \frac{\partial^4}{\partial x^2 \partial y^2} + b_2 \frac{\partial^4}{\partial y^4} + \frac{\partial^2}{\partial t^2} \right) w = 0, \quad (1)$$

Satisfying the initial and boundary conditions. Here

$$b_0 = \frac{1}{\rho} D_1; \quad b_1 = \frac{2}{\rho} D_3; \quad b_2 = \frac{1}{\rho} D_2; \quad f = \frac{1}{\rho} f_q; \quad \rho = \frac{h_0 \gamma}{g};$$

$$D_1 = \frac{E_1 h_0^3}{12(1 - \nu_1 \nu_2)}; \quad D_2 = \frac{E_2 h_0^3}{12(1 - \nu_1 \nu_2)}; \quad D_3 = D_1 \nu_2 + 2D_k; \quad D_k = \frac{G h_0^3}{12},$$

$h_0$  – Plate thickness;  $\gamma$  – specific gravity of the plate material;  $E_1, E_2, \nu_1, \nu_2, G$  – Young's modules, Poisson's coefficients, and the shear modulus for the principal directions;  $D_1, D_2$  – cylindrical stiffness;  $\lambda, \mu$  – Lamé constants,  $w(x, y, t)$  – deflections of the median surface of the plate.

#### Problem statement

Find deflections  $w(x, y, t)$  the median surface of an orthotropic articulated plate satisfying equation (1) and the following boundary and initial conditions:

$$w \Big|_{\substack{x=0,a \\ y=0,b}} = \frac{\partial^2 w}{\partial x^2} \Big|_{x=0,a} = \frac{\partial^2 w}{\partial y^2} \Big|_{y=0,b} = 0 \quad (2)$$

$$w \Big|_{t=0} = 0, \quad \frac{\partial w}{\partial t} \Big|_{t=0} = f(x, y). \quad (3)$$

To solve the problem (1) - (3), we apply the recurrent operator method [6,7].

Following the recurrent-operator method, the solution of the homogeneous equation (1) is sought in the form

$$w_r[g_r(x, y)] = \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} Q_{i,j} \frac{\partial^{2i+2j}}{\partial x^{2i} \partial y^{2j}} g_r(x, y) \frac{t^{i+j+r}}{(i+j+r)!}, \quad r = 0, 1. \quad (4)$$

Where  $g_r(x, y)$  – An arbitrary analytical function.

$Q_{i,j}$  – The constant coefficients determined from equation (1)

Substituting (4) in (1), we get,

$$\begin{aligned}
& b_0 \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} Q_{i,j} \frac{\partial^{2(i+j+2)}}{\partial x^{2(i+2)} \partial y^{2j}} g(x,y) \frac{t^{i+j+r}}{(i+j+r)!} + \\
& + b_1 \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} Q_{i,j} \frac{\partial^{2(i+j+2)}}{\partial x^{2(i+1)} \partial y^{2(j+1)}} g(x,y) \frac{t^{i+j+r}}{(i+j+r)!} \\
& + b_2 \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} Q_{i,j} \frac{\partial^{2(i+j+2)}}{\partial x^{2i} \partial y^{2(j+2)}} g(x,y) \frac{t^{i+j+r}}{(i+j+r)!} + \\
& + \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} Q_{i,j} \frac{\partial^{2(i+j)}}{\partial x^{2i} \partial y^{2j}} g(x,y) \frac{t^{i+j+r-2}}{(i+j+r-2)!} = 0
\end{aligned}$$

Replacing the index  $i$  in the first double sum with  $i-2$ , in the second  $i$ -with  $i-1$ ,  $j$ -with  $j-1$  and in the third sum  $j$ -with  $j-2$ , and after combining all the sums into one, we get

$$\sum_{i=0}^{\infty} \sum_{j=0}^{\infty} [b_0 Q_{i-2,j} + b_1 Q_{i-1,j-1} + b_2 Q_{i-1,j-1} + Q_{i,j}] \frac{\partial^{2(i+j)}}{\partial x^{2i} \partial y^{2j}} g(x,y) \frac{t^{i+j-2}}{(i+j-2)!} = 0$$

In order for this equality to hold for all values of the common factor, the expression in square brackets must be set to zero. As a result, the problem is reduced to solving the following numerical recurrence relation

$$Q_{i,j} = -(b_0 Q_{i-2,j} + b_1 Q_{i-1,j-1} + b_2 Q_{i,j-2}) \quad (5)$$

Under initial conditions

$$Q_{i,j} = 0 \text{ By } i < 0 \text{ or } j < 0; \quad Q_{0,0} = 1. \quad (6)$$

Here are the first few coefficients  $Q_{i,j}$ :

$$\begin{aligned}
& Q_{0,0} = 1, \quad Q_{0,1} = 0, \quad Q_{0,2} = -b_2, \quad Q_{0,3} = 0, \dots \\
& Q_{1,0} = 0, \quad Q_{1,1} = -b_1, \quad Q_{1,2} = 0, \quad Q_{1,3} = 2b_1 b_2, \dots \\
& Q_{2,0} = -b_0, \quad Q_{2,1} = 0, \quad Q_{2,2} = 2b_0 b_2 + b_1^2, \quad Q_{2,3} = 0, \dots \\
& Q_{3,0} = 0, \quad Q_{3,1} = 2b_0 b_1, \quad Q_{3,2} = 0, \quad Q_{3,3} = -4b_0 b_1 b_2 - b_1(2b_0 b_2 + b_1^2), \dots \\
& \dots
\end{aligned}$$

By the method of complete mathematical induction, we can show the validity of the expressions

$$Q_{2i,2j} = (-1)^{i+j} \sum_{s=0}^i \frac{(i+j)!}{s!(2i-2s)!(j-i+s)!} b_0^s b_1^{2(i-s)} b_2^{j-i+s},$$

$$Q_{2i+1,2j+1} = (-1)^{i+j+1} \sum_{s=0}^i \frac{(i+j+1)!}{s!(2i-2s+1)!(j-i+s)!} b_0^s b_1^{2(i-s)+1} b_2^{j-i+s}; \quad (7)$$

In this case, the terms with negative powers at  $b_2$  should be considered equal to zero.

Note that the sum of all the coefficients is  $Q_{i,j}$ , for which  $i + j = 2k$ ,

$$(-1)^k (b_0 + b_1 + b_2).$$

In the isotropic case, i.e., when the coefficients in equation (1) are equal  $b_0 = b_2 = b^2$ ,  $b_1 = 2b^2$ , we get  $Q_{i,j} = 0$  при  $i + j$  odd and

$$Q_{i,j} = (-1)^{\frac{i+j}{2}} \frac{(i+j)!}{i!j!} b^{i+j} \text{ при } i + j \text{ even-numbered.}$$

By directly using the recurrent relation (5), taking into account (6), we can make sure that the coefficients  $Q_{i,j}$  with an odd sum of the indices  $i$  and  $j$  are zero.

Changing the order of summation, we present (4) as:

$$w = \sum_{i=0}^{\infty} \left( \sum_{j=0}^i Q_{i-j,j} \partial_x^{2(i-j)} \partial_y^{2j} (g) \right) \frac{t^{i+r}}{(i+r)!}.$$

Substituting (7) into this expression and collapsing the internal sum, we get the solution of equation (1) in the following operator form:

$$w = \sum_{i=0}^{\infty} (-1)^i \Delta_{xy}^{2i} (g) \frac{t^{2i+r}}{(2i+r)!}, \quad (8)$$

Where  $\Delta_{xy}^{2i} (\cdot) \equiv (b_0 \partial_x^4 + b_1 \partial_x^2 \partial_y^2 + b_2 \partial_y^4)^i (\cdot)$ .

For function (4), the following differentiation formulas are true:

$$\begin{aligned} \frac{\partial}{\partial x} w_r(g) &= w_r \left( \frac{\partial}{\partial x} g \right), \quad \frac{\partial}{\partial y} w_r(g) = w_r \left( \frac{\partial}{\partial y} g \right), \quad \frac{\partial}{\partial t} w_1(g) = w_0(g), \\ \frac{\partial}{\partial t} w_0(g) &= \frac{\partial}{\partial t} g + \left[ b_0 w_1 \left( \frac{\partial^4}{\partial x^4} g \right) + b_1 w_1 \left( \frac{\partial^4}{\partial x^2 \partial y^2} g \right) + b_2 w_1 \left( \frac{\partial^4}{\partial y^4} g \right) \right]. \end{aligned} \quad (9)$$

We find a solution to the Cauchy problem for equation (1) under the initial conditions

$$w \Big|_{t=0} = \phi_0(x, y), \quad \frac{\partial w}{\partial t} \Big|_{t=0} = \phi_1(x, y) \quad (10)$$

We will look for a solution to the problem (1), (9) in the form

$$w = w_0(g_0) + w_1(g_1). \quad (11)$$

Substituting (11) into (10), using the differentiation formulas (9) and considering that  $w_0(g) \Big|_{t=0} = g$ ,  $w_1(g) \Big|_{t=0} = 0$ , получим

$$g_0 = \phi_0, \quad g_1 = \phi_1.$$

Therefore, the solution to problem (1), (10) is the function

$$w(x, y, t) = w_0(\phi_0) + w_1(\phi_1) \quad (12)$$

Let

$$\phi_0 = \xi_{\lambda, m, n}(x, y), \quad \phi_1 = 0, \quad (13)$$

Where

$$\begin{aligned} \xi_{1, m, n}(x, y) &= \sin a_m x \sin b_n y; & \xi_{2, m, n}(x, y) &= \cos a_m x \sin b_n y; \\ \xi_{3, m, n}(x, y) &= \sin a_m x \cos b_n y; & \xi_{4, m, n}(x, y) &= \cos a_m x \cos b_n y. \end{aligned} \quad (14)$$

Substituting (14) in (13) and taking into account (4), we get

$$\begin{aligned} w_0^{\lambda, m, n} &= \\ &= \xi_{\lambda, m, n} \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} (-1)^{i+j} Q_{i, j} a_m^{2i} a_n^{2j} \frac{t^{(i+j)}}{(i+j)!} = \\ &= \xi_{\lambda, m, n} \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} (-1)^{i+j} Q_{i, j} a_m^{2i} a_n^{2j} \frac{t^{(i+j)}}{(i+j)!} = \\ &= \xi_{\lambda, m, n} \sum_{k=0}^{\infty} (-1)^k (b_0 a_m^4 + b_1 a_m^2 b_n^2 + b_2 b_n^4)^k \frac{t^{2k}}{(2k)!} = \xi_{\lambda, m, n} \cos \sqrt{\delta} t, \end{aligned} \quad (15)$$

Where

$$\delta = b_0 a_m^4 + b_1 a_m^2 b_n^2 + b_2 b_n^4 \quad (16)$$

The coefficients property is used here  $Q_{i, j} = 0$  by  $i + j = 2k + 1$ , and also the ratio

$$\sum_{i=0}^{2k} Q_{i, 2k-i} a_m^{2i} b_n^{2(2k-i)} = (-1)^k \delta^k.$$

In the case of an isotropic plate, we obtain

$$w_0^{\lambda, m, n} = \xi_{\lambda, m, n} \cos[b(a_m^2 + b_n^2)t] \quad (17)$$

The function (15) satisfies equation (1) and the initial conditions (13).

If the initial conditions are given as

$$\phi_0 = 0, \quad \phi_1 = \xi_{\lambda, m, n}(x, y), \quad (18)$$

Then the solution to the Cauchy problem will have the form

$$w_1^{\lambda, m, n} = \xi_{\lambda, m, n} \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} (-1)^{i+j} Q_{i, j} a_m^{2i} a_n^{2j} \frac{t^{(i+j+1)}}{(i+j+1)!} = \xi_{\lambda, m, n} \frac{1}{\sqrt{\delta}} \sin \sqrt{\delta} t. \quad (19)$$

In the case of an isotropic plate, the solution (19) will take the form

$$w_1^{\lambda, m, n} = \xi_{\lambda, m, n} \frac{1}{b(a_m^2 + b_n^2)} \sin[b(a_m^2 + b_n^2)t] \quad (20)$$

The function (19) satisfies equation (1) and the initial conditions (18). We

Proceed to the solution of the inhomogeneous equation

$$L(w) \equiv \left( b_0 \frac{\partial^4}{\partial x^4} + b_1 \frac{\partial^4}{\partial x^2 \partial y^2} + b_2 \frac{\partial^4}{\partial y^4} + \frac{\partial^2}{\partial t^2} \right) w = f(x, y, t) \quad (21)$$

In accordance with the recurrent operator method [6, 7], the solution of equation (1) is

$$w_3(f) = \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} Q_{i,j} \frac{\partial^{2(i+j)}}{\partial x^{2i} \partial y^{2j}} \frac{\partial^{-(i+j+2)}}{\partial t^{-(i+j+2)}} (f). \quad (22)$$

$Q_{i,j}$  -it is taken by the formula (5),  $\frac{\partial^{-s}}{\partial t^{-s}} (f) = \int_0^t \dots \int_0^t f(x, y, t) dt^s$ .

The general solution of equation (1) is the sum of solutions (4) and (21). Assuming

$F(x, y, t) = \phi(x, y) \psi(t)$ , we represent (22)

$$\begin{aligned} w_3(f) &= -(Q_{0,0} f^{-2} + Q_{0,1} f y^{-3} + Q_{0,2} f y^{-4} + Q_{0,3} f y^{-5} + \dots \\ &\quad + Q_{1,0} f x^{-3} + Q_{1,1} f x^2 y^2 + Q_{1,2} f x^2 y^4 + \dots \\ &\quad + Q_{2,0} f x^4 + Q_{2,1} f x^4 y^2 + \dots \\ &\quad + Q_{3,0} f x^6 + \dots) = \\ &= \left[ Q_{0,0} \phi \psi^{-2} + \underbrace{(Q_{1,0} \partial_{x^2} + Q_{0,1} \partial_{y^2})}_{=0} (\phi)(\psi)^{-3} + \right. \\ &\quad \left. + (Q_{2,0} \partial_{x^4} + Q_{1,1} \partial_{x^2 y^2} + Q_{0,2} \partial_{y^4}) (\phi)(\psi)^{-4} + \right. \\ &\quad \left. \underbrace{(Q_{3,0} \partial_{x^6} + Q_{2,1} \partial_{x^4 y^2} + Q_{1,2} \partial_{x^2 y^4} + Q_{0,3} \partial_{y^6})}_{=0} (\phi)(\psi)^{-5} + \right. \\ &\quad \left. + (Q_{4,0} \partial_{x^8} + Q_{3,1} \partial_{x^6 y^2} + Q_{2,2} \partial_{x^4 y^4} + \right. \\ &\quad \left. + Q_{1,3} \partial_{x^2 y^6} + Q_{0,4} \partial_{y^8}) (\phi)(\psi)^{-6} + \dots \right] \end{aligned}$$

Adding expressions  $Q_{i,j}$  from (5), we get

$$w_3(f) = w_3(\phi(x, y) \psi(t)) = \sum_{k=0}^{\infty} (-1)^k \Delta_{xy}^{2k} (\phi) \int_0^t \dots \int_0^t \psi(t) dt^{2k+2}. \quad (23)$$

**Example.** We solve the problem of forced vibrations of a rectangular, orthotropic, hinged plate. The problem is reduced to solving equation (21) under the following boundary and initial conditions

$$w \Big|_{\substack{x=0,a \\ y=0,b}} = \frac{\partial^2 w}{\partial x^2} \Big|_{x=0,a} = \frac{\partial^2 w}{\partial y^2} \Big|_{y=0,b} = 0, \quad w \Big|_{t=0} = 0, \quad \frac{\partial}{\partial t} w \Big|_{t=0} = 0.$$

$$f = \sin \frac{\pi}{20} x \sin \frac{\pi}{20} \cos \omega t, \quad b_0 = 0,735 \cdot 10^{-5} \frac{cM^2}{\kappa^2}, \quad b_1 = 1,2436 \cdot 10^{-5} \frac{cM^2}{\kappa^2}, \quad b_2 = 0,508 \cdot 10^{-5} \frac{cM^2}{\kappa^2}, \quad \omega = 20c^{-1} \text{ (the material is fiberglass CAST-In) [3,4].}$$

Let's solve the test problem of mechanical vibrations for a rectangular ( $0 \leq x \leq a$ ,  $0 \leq y \leq b$ ) plates in the case of equation (1) with the right-hand side

$$f = \sin \frac{\pi x}{a} \sin \frac{\pi y}{b} \cos \omega t, \quad (24)$$

under the following conditions

$$w \Big|_{\substack{x=0,a \\ y=0,b}} = \frac{\partial^2 w}{\partial x^2} \Big|_{x=0,a} = \frac{\partial^2 w}{\partial y^2} \Big|_{y=0,b} = 0, w \Big|_{t=0} = 0, \frac{\partial w}{\partial t} \Big|_{t=0} = 0. \quad (25)$$

We assume the following initial data  $a=b=20$ . The rest of the data is taken from the previous example [8, 9]. Substituting (24) in (21), we obtain solutions to equation (1) in the form

$$w_3(f) = \sin \frac{\pi}{a} x \sin \frac{\pi}{b} y \sum_{k=0}^{\infty} - \left[ \left( b_0 \left( \frac{\pi}{a} \right)^4 + b_1 \left( \frac{\pi}{a} \right)^2 \left( \frac{\pi}{b} \right)^2 + b_2 \left( \frac{\pi}{b} \right)^4 \right)^k \left( \frac{1}{\omega^2} \right)^{k+1} \times \right. \\ \left. \times \left( \cos \omega t + \sum_{i=0}^k (-1)^{i+1} \frac{\omega^{2i} t^{2i}}{(2i)!} \right) \right] \quad (26)$$

Solutions (26) satisfy (1) and initial boundary conditions (25). According to the formula (26), graphs are plotted (Fig. 1) of the oscillations of the central point of the plate from the impact (24). Figure 2 shows graphs of changes in the shape of the oscillation over time ( $t=0.2$  s,  $0.4$  s,  $0.5$  s) in the cross section  $x=10$  cm.

### ABSTRACT

*This article reveals some aspects of the development of students' creative potential, which is one of the main factors in the quality of education. One of these goals is to create a comfortable learning environment, that is, the conditions under which the student feels his success, his intellectual competence, which makes the learning process itself productive. The joint activity of students in the process of learning, mastering the educational material means that everyone makes their own special individual contribution to this process, that there is an exchange of knowledge, ideas, and ways of activity.*

**KEYWORDS:** *Interactive learning, interactive activities, cooperative learning, basic concepts of first-order differential equations.*

### INTRODUCTION

*Interactive training* – this is learning, immersed in communication. However, "submerged" does not mean "substituted". Interactive learning preserves the ultimate goal and the main content of the educational process. It modifies the forms from broadcasting to dialogical, i.e., including the exchange of information based on mutual understanding and interaction.

Interactive learning has very specific and predictable goals. One of these goals is to create a comfortable learning environment, that is, the conditions under which the student feels his success, his intellectual competence, which makes the learning process itself productive. The essence of interactive learning is to organize the learning process in such a way that almost all

students are involved in the process of learning, they have the opportunity to understand and reflect on what they know and think.

Interactive learning simultaneously solves several tasks:

- develops communication skills, helps to establish emotional contacts between students;
- solves the information problem, since it provides students with the necessary information, without which it is impossible to implement joint activities;
- develops general learning skills (analysis, synthesis, goal setting), that is, provides the solution of learning tasks;
- provides an educational task, as it teaches you to work in a team, to listen to other people's opinions.
- creates relaxation of the participants of the educational process, relieves nervous stress, switches attention, changes the forms of activity.

The use of interactive teaching methods in the work gives

**to the student:**

- \* development of personal reflection;
- \* awareness of involvement in the overall work;
- \* formation of an active subject position in educational activities;
- \* develop communication skills;
- \* adoption of moral norms and rules of joint activity;
- \* increased cognitive activity

**group:**

- \* formation of a group as a group community;
- \* increase cognitive interest;
- \* development of skills of analysis and introspection in the process of group reflection;

**to the teacher:**

- \* Non-standard attitude to the organization of the educational process;
- \* Formation of motivational readiness for interpersonal interaction not only in educational, but also in other situations.

The joint activity of students in the process of learning, mastering the educational material means that everyone makes their own special individual contribution to this process, that there is an exchange of knowledge, ideas, and ways of activity. And this happens in an atmosphere of goodwill and mutual support, which allows not only gaining new knowledge, but also develops the cognitive activity itself, translates it to higher forms of cooperation and cooperation.

Very often, teachers use various teaching methods, such as direct learning, research, and modeling. Each of these methods has advantages and disadvantages. Research makes learning

active, modeling interactive. A new level of interactivity is inherent in cooperative learning [1-4].

Cooperative learning is a way of working in small groups, where students themselves are responsible for the educational process. The essence of this method: "Everyone achieves their learning goals only if the other members of the group achieve their own."

Co-education has many variations. One approach is "competing teams". First, the teacher explains the material, which the students then work with in groups to consolidate. Control is carried out by writing each control work. The current score is calculated by group and compared over time. The winner with the highest total of individual points is awarded. Another approach is "teams-tournament". The initial stage is exactly the same as in the first case. However, the test paper is replaced by a tournament, where team members compete against each other to earn the most points for their group. The third approach is a "picture-mosaic", when a whole canvas is made up of individual pieces.

Traditionally, in universities, seminars begin with listening to students' reports, discussing the presented and studied material, and then discussing educational issues with a further assessment of the quality of the material learned on the topic. For example, the topic of the course of mathematical analysis "First-order differential equations" is studied by the traditional method of teaching. First, as a rule, there is a survey on the material passed, then listening to reports, for example, problems that lead to the concept of "differential equation»; the Cauchy problem on the existence and uniqueness of the solution of a first-order differential equation; the geometric meaning of the equation and its solution.

Then the training questions on the topic are analyzed:

1. General definition of a differential equation.
2. First-order differential equation (ordinary).
3. What does it mean to solve a differential equation?

The difference between the general and particular solutions of the equation.

4. The main essence of the Cauchy problem of solving a differential equation.
5. Geometric interpretation of the differential equation itself and its solutions.
6. The first skills of composing a differential equation based on the data of a certain problem.

The result at the end is that the two-hour lesson turns into a two-hour survey of students with a subsequent assessment of knowledge.

An interactive practical lesson on the same topic, for example, using the "teams-tournament" technique, will allow students to better remember and assimilate the proposed educational material.

The text for such a lesson is prepared in advance and divided by the teacher into several semantic parts. In this case, the topic is divided into three parts: general concepts and definitions of the differential equation and its elements, general concepts, definitions of the theorem on the first-order differential equation and the composition of the differential equation of the first equation. Depending on the number of semantic parts, the number of students in a small group is

determined. The maximum variation can be up to 6 parts. Let's assume that the text is divided into 3 parts. Let's imagine the stages of conducting a class through a tournament.

1. First, the participants are divided into small groups of 4 people. The training group of 15 people includes 4 small groups. Each student of the small group was assigned an ordinal number (from one to four).

2. Students, having received their part of the text, work with it for 15 minutes. If necessary, the teacher comes to the rescue. The fourth group - "experts" from among students who evaluate the answers of their friends on a ten-point system. Two criteria are evaluated - the complete answer and the answer to the questions asked by the experts.

3. The teacher, at the end of the lesson, conducts a summary, based on a table that is provided to him by a group of "experts". The results of the lesson are summed up.

Currently, more than 50% of the time provided for in the curricula of training specialists at the university is devoted to independent work, as one of the main factors in the development of the creative potential of students. In these conditions, it is very important to monitor its progress, so that this work, first, is carried out in a timely manner, and secondly, it is effective, that is, it allows you to achieve your goals. There are several areas, each of which requires its own control system:

- ✓ Independent preparation of students for each practical lesson or laboratory work, during which the study of lecture material, educational literature recommended by the teacher is required.
- ✓ Control is carried out in the form of a current cross-section of students' knowledge, writing small (for 10-15 minutes) control papers or test tasks;

One of the weaknesses in the training of specialists is the inability of students to use the information obtained in lectures and practical classes to solve specific problems.

In order to improve the quality of knowledge and eliminate this shortcoming, it is necessary to develop a system of individual tasks that also allow you to exclude cheating when registering and submitting ratings.

The ability of students to improve themselves independently, to gain knowledge is important, because modern society and production need employees and managers who are able to think quickly and correctly solve specific problems that arise, conduct a dialogue with colleagues and partners, and make decisions independently. Therefore, it is necessary to use technologies related to modern requirements in the classroom.

This one of the interactive methods is "*project technology*". The essence and idea of it is to organize independent, creative, search activities of students.

The "technology of projects" is based on the idea of the orientation of the student's educational and cognitive activity on the result that is obtained when finding a solution to a particular practical or theoretical problem. The external result can be understood, applied, and seen in real practical activity.

The internal result – the experience of activity-becomes the property of the student, combining all the knowledge and skills, competencies and values.

The project method in the learning process allows us to develop educational skills, the student's communication potential, solve information problems, organize the interaction of all participants in the educational process, and activate the students' mental activity. Their creative activity is the creation or discovery of something previously unknown to this student.

The work on the research project is carried out under the guidance of a teacher, but his role is to organize and adjust the independent activities of students.

Project activities of students can give the best results in the development of the student's creative potential. Preparation for a serious student activity begins with the very first year of study.

We offer an example of a project work on the subject "Mathematical analysis". Project topic: "First-order differential equations, and ways to solve them".

***Project participants:*** students of the 2nd year of the Faculty of Mathematics.

***Project implementation timeline:*** 2 months.

***Result:*** defending projects, and then helping fellow students who have difficulties with this training material. Tasks for groups (each group has 4-5 people):

**Task for group 1.**

1. Collection of information on the topic "First-order differential equations (general concepts). Equations with separated and separable variables of the first order", methods and methods of their solution" (using materials from textbooks and textbooks on mathematical analysis, reference books, the Internet).
2. Selection of 25-30 equations on this topic; explanations with solutions.
3. Making a report on the work done: theory + practical tasks.
4. Project protection. (Presentation), ("paper" version).

**Task for group 2.**

1. Collection of information on the topic "Homogeneous equations, linear equations", "Equations reduced to homogeneous ones and methods for their solution". (Use of materials from textbooks and textbooks on mathematical analysis, reference books, and the Internet).
2. Selection of 25-30 equations on this topic (together with the solution).
3. Making a report on the work done: theory + practical tasks.
4. Project protection. (Presentation), ("paper" version).

**Task for group 3.**

1. Collection of information on the topic "Differential equations in full differentials". Methods and methods of their solutions. (Use of materials from textbooks and textbooks on mathematical analysis, reference books, and the Internet).
  2. Selection of 25-30 equations on this topic (together with the solution).
  3. Making a report on the work done: theory + practical tasks.
  4. Project protection. (Presentation), ("paper" version).
-

**Task for group 4.**

1. Collection of information on the topic "First-order differential equations not resolved with respect to the derivative". The Lagrange, Celera, and Riccati equations and their solutions. (use of materials from textbooks and textbooks on mathematical analysis, reference books, and the Internet).
2. Selection of 25-30 equations on this topic (together with the solution).
3. Making a report on the work done: theory + practical tasks.
4. Project protection. (Presentation), ("paper" version).

### ABSTRACT

*Methods of storage of seeds of harvested cotton seeds improving and improving the quality of stored cotton. Pay attention to the fact that it is stored indoors in order to maintain its fertility giving, as well as ensuring quality storage of seeds. This way the biggest drawback of based devices is the bottom of the camera Along with heavy mixtures of cotton also fall remains. To eliminate this, at the bottom of the camera in experiments the need to reduce the size of the pocket quality seeds as a result of its detection and elimination was found to be conservative. Such a situation in turn leads to deterioration in product quality. Increased humidity, extreme temperature drop or rise deterioration of seed quality, its forgetfulness, quantity, it also causes deterioration in fibre quality.*

**KEYWORDS:** *Product Quality, Seeds, Technology, Equipment, Fibre Quality, Temperature, Humidity, Processing, Climatic Conditions, Forgetfulness.*

### INTRODUCTION

Improving the efficiency of cotton harvest in cotton growing, from cotton increase the quantity and quality of cotton products depending on the quality of the seed and the seed being prepared. Improving the quality of seeds by the Uzpakhtasanoat Association in order to create new technology and equipment and clean them with cotton Great importance is attached to the introduction of plants.

## MATERIALS AND METHODS

Based on the above, we have hand-picked cotton to study the improvement of seed storage methods scientific research was conducted for this purpose. Cotton varieties grown in Uzbekistan are fast-ripening, high-yielding, The fibre yield is high, its fibre quality is good, seed oil and protein-rich in substances, resistant to adverse environmental conditions (soil salinity, low temperature, garmsel, drought, etc.) as well as disease and pest resistant, agrotechnical measures efficient use of row spacing adapted to mechanization, machine harvesting and other valuable farm characters and characteristics are required [1-3]. The quality of the seeds sown next year in cotton the timing of their collection in the field. Which is the harvest season level of organization, preparation for storage processes and planting to what extent the work is carried out in accordance with the requirements of the State Standard depending on the destination. Quality of cotton products in cotton mills many scientists, their own experiences as well as on further improvement has been making a huge contribution to the news. Develop these innovations there are enough opportunities by our state to introduce the issue being created. As a result, almost all of our country today cotton gins have been transferred to a cluster system and modernized again equipment is provided. This year our country in the regions of cotton 15 early ripening, 5 medium ripening, 8 promising it is planned to sow the seeds of varieties. This in turn is the sowing of seeds 55.0% of the planned total area, 30.0% medium-ripe, promising 6.5 per cent and new varieties 8.5 per cent means placed. Varieties are adaptable to environmental changes, including resistance to soil moisture deficiency, salinity and agrofon should contribute to the improvement. Distinguished by the quality of the fibre and high productivity The "Sultan" cotton variety is different in its adaptability to environmental changes. In the current year, this variety is higher than the varieties Republic of Karakalpakstan, Andijan, Samarkand, Surkhandarya, Tashkent and 20-50 per cent in the Syrdarya region. Cotton growers in Andijan, Namangan and Fergana regions produce 60-70% of cotton "Andijan-35", "Andijan-36", "Andijan-37", "Namangan-77", S-High-yielding varieties such as 8290, S-6524 are planned to be planted. Type IV fibre, which is distinguished by the quality of fibre in the cotton market Given that the demand for the S-6524 navigator is increasing, the current variety is grown in Jizzakh, Namangan, Sirdarya, Tashkent, Fergana planting in 15-35% of the cotton-growing areas of the regions intended. Jizzakh, Syrdarya and Navoi regions are also affected by 20-30 cotton fields of durable, fast-ripening variety "An-Boyovut-2" per cent, which is also abundant in the soil-climatic conditions of this region allows you to harvest [4-6]. Cotton selection, industry varieties and classes on the top is covered with a tarpaulin on special open areas stored in a special order in cages and covered warehouses. Seeds open areas for storing cotton 40 cm from the ground. Their high surface 25x14 m. or 22x11 m. will be. 150-400t for such open areas. Seed cotton can be stored up too. Overall dimensions of closed warehouses where seed cotton is stored 54x18x8 m. ; 54x24x8 m. their capacity is 600x750 t. and reinforced concrete should be assembled from pieces (blocks) or built of baked brick. Shelters from four-sided open sheds can also be used. Djaborov G. D., Baltaboev S.D. to the results of a research according to, with a change in the quality of the processed seed cotton the fibre residue of the seed also changes. To do this, it is cleaned of fibre the seeds flow over the vibrating net. Require a mesh hole The cleaned seeds fall to the level of. The fibre residue was 0.12-0.19% and seeds with a moisture content of 12% remain on the net for re-cleaning. It can be seen that well-dried seeds go into the sorting process has a negative effect. When storing seed cotton and seeds in cotton mills complex physiological-biochemical processes occur. In doing so, not only storage but also quality

improvement will be required. Khodjiev M.T., Tadjiev U.S., Mubarakov A.Ya. (1999) cotton processing plants and The cotton received from the farms in the settlements is different methods and conditions. Cotton in bunts, a variety of winter in the barns and warehouses under the covered shed a certain degree of moisture when stored in humid conditions attracts. In this case, the humid environment is exposed to cotton fibre and seeds (especially seeds) may be adversely affected. Such a situation in turn leads to deterioration in product quality. Increased humidity, extreme temperature drop or rise deterioration of seed quality, its forgetfulness, quantity, it also causes deterioration in fibre quality. Especially although the seeds need to be stored in closed warehouses, so second and third-generation due to lack of warehouses seed cotton and seeds are also stored in piles [5-7]. We know that Uzbekistan is not only in the world cotton industry weighted not only in quantity but also in fibre quality takes place. Climatic conditions in Uzbekistan are variable given that it has the property of collecting from the fields. The extracted cotton is stored in different conditions of autumn weather. This is due to the difference in the quality of cotton products received leads to Mannopov A., Boronov H. (2001) noted that the cotton ginning industry is the last stage in the Republican cotton complex is calculated. Therefore, improving the quality of work in the industry is mainly to organize his work with 5-2 modern tools depends on the equipment. After processing the prepared cotton and seeds dehydrated or a small amount of hair is left. They are such seeds that are shed in pots and stored at low pressure while exposed to a variety of natural conditions. The moisture content of cotton during storage and depends on it the effect of the temperature on the quality of the seed and fibre is one way or another important in terms of. If the temperature in the bath rises, a state of self-healing occurs, resulting in respiration of the seed accelerates, which is from the duration of the available energy reserve in the seed leads to pre-consumption. With the increase of machine harvesting in seed cotton the moisture and dirtiness of the cotton increases. Such a situation is clearing leading to increased drying and cleaning operations in factories. Iksanov MI, Egamberdiev A., Khalmanov B., for information first grade cotton with a moisture content of up to 11% and a moisture content of up to 13% The naturalness of fibre and seeds in the storage of low-grade cotton even if no measures are taken to preserve its properties. However, in practice, there are cases when the humidity is too high the upper bouts featured two cutaways, for easier access to the higher frets. In this case, some of the garam spontaneous heating of cotton occurs in places. Therefore 1-11 varieties with humidity up to 11%, low humidity up to 13 % opening tunnels and warm air during long-term storage of varietal cotton mentioned the expediency of removal. Mirahmedov S. M. et al (1989) of seed germination the humidity is of great practical and economic importance. In high humidity, the germination of existing seeds decreases and rots during storage. Seed production should not exceed 10% in Central Asia. Moisture, germination and other quality of seeds are divided into three classes depending on the indicators: first-class seed germination at least 95%, second grade-90%, the third class should be 85%. Fertility for planting was less than 85% mentioned that the seeds are considered invalid. Data obtained from observations showed that as the shelf life of the seed increases and as a result of heating, the protein in it also decreases to a certain extent observed, the amount of protein in the annual seeds averaged 2-3% decreased, in biennial seeds this figure is 5% found to have done. However, the total protease activity of the enzyme is slightly dependent on the shelf life of the seed activation was also detected. Stored for year seeds, germination and growth relative to 2-3-year-old seeds proves that it has a high energy index found Cleaning of heavy mixtures in cotton gins the devices are mounted on the horizontal side of the pneumatic transport is set to the side. In doing

so, lift the cotton in a vertical direction that is heavier than the speed of the air it can move allows the mixtures to separate. This way the biggest drawback of based devices is the bottom of the camera. Along with heavy mixtures of cotton also fall remains. To eliminate this, at the bottom of the camera in experiments the need to reduce the size of the pocket quality seeds as a result of its detection and elimination was found to be conservative. Fibre-separated seeds in ginning plants the products are collected in tanks and stored for 1-4 months. Save during the period, the temperature is basically the same. Seeds before firing and then 96 % with sulfuric acid depleted. Up to 30% of seeds to the required size in accordance with GOST requirements those who do not have them are sent to oil companies. Cotton removable fibre, lint and fibrous waste bales in sheds stacked on top of each other, if there are no special sheds, weddings the bottom is covered with wood, the top is covered with tarpaulin stored.

### CONCLUSION

According to the results of experiments, in the closed state, 3.7-4.1% of the stored cotton fiber is stored in the open state.

### ABSTRACT

*In this article, the authors have tried to determine the influence of tribes such as the Sarmatians, Yue-chji, Hun, Usun, who came from the Eurasian steppes in ancient times, by analyzing the burials in the Ustrushona tombs. It is also noted that the formation of the "Qovunchi" (Melon) culture and its ethnic basis was greatly influenced by the tribes that entered during this period.*

**KEYWORDS:** *Ustrushona, Sopollitepa, Gulbo, Sagonak, Lavender, Volga, Munchoktepa, Sarmatian Tribes, Yue-Chji, Kenkul, "Qovunchitepa", "Qovunchi" Culture, "Jetiasar" Culture.*

### INTRODUCTION

During the years of independence, large-scale archaeological research in the country has allowed collecting new information about the material and spiritual culture of the ancient population, its way of life, household items, traditional economy, etc. Of particular importance in these studies is the study of ancient burial structures and ceremonies in them.

According to the ideas of the ancients, breath, spirit, and shadow were related concepts that formed the basis of animism. Based on this notion, the idea of "living in the world" after the death of people is widespread among the herdsmen of Ustrushna. Therefore, many rituals were performed at the funeral, and "all the conveniences" were created in the tomb. Funeral rites become rituals formed over time, and they are mainly divided into rituals performed before, during, and after burial [Alyokshin, 1986. p.6]. This is reflected in the open burial mounds, the burial of household items, clothing, weapons, ornaments used in the life of the deceased, and the

placement of various foods in containers for his consumption in the world and their convenient placement in the cellar.

Accordingly, the funeral consists of several interrelated religious-spiritual processes. According to B.H. Matboboev, each of them organizes various ceremonies performed by his relatives to observe the deceased in the "other world". This process is long and involves the installation of a sign (monument) on the grave of a seriously ill patient, starting before his death, burying him after his death, and subsequent rituals "[Matboboev, 2006. P.156]. The most important of these is the ritual of burying (burying) a person after his death (digging a grave, bringing the deceased to the grave, burial, etc.). The funeral reflects the originality of the ideological views before the burial, the religious mythological system, the rites of burial and remembrance. Burial and burial beliefs include (J), burial and remembrance traditions (GD), and tombstone (E).

They, in turn, reflect the ideological scope of the funeral rites, the semantic (meaning) level, the stages of the process, the practical scope of the burial, the ideological scope of the funeral, and the practical manifestations of remembrance, uniting grave complexes and grave groups. Together, they form the tombstone (E1), which is an archaeological object [Olkhovsky, 1986. p.67].

From the above descriptions, it can be concluded that funerals contain the most ancient archaeological and ethnographic sources of mankind and it is difficult to bring them into a single system.

## **MATERIALS AND METHODS**

In all the graves in the Ustrushona cemetery, the deceased were buried in the grave individually or in pairs, sometimes in groups. The corpses were buried mostly lying down and folded. Funerals take different forms, and we want to begin the description with which side of the head of the deceased is placed. At the Gulbo cemetery in Ustrushna, it is common to place the heads of the dead to the north and south. On the right, in the north and south directions, in the Kulpisar and Karatash cemeteries, the head of the deceased is buried to the north, and in the Bekkeldi cemetery to the south.

Hence, in the burial traditions of the ancient inhabitants of Ustrushna, the burial of the dead was common in the south and north directions. South-facing burials of corpses found in the Ustrushan cemeteries have been reported in many other areas. In particular, Kuyimazor, Lavender, Oqjartepa of the II-I centuries BC [Obelchenko, 1956. P.119-220], Achamoyli near Tashkent, Usta Mullo and Langari Khojiyon studied in Isfara district, as well as in the III-I centuries BC in South Kazakhstan. The heads of the bodies were buried in the southern direction in the burial mounds around the roof, as well as in the Ural, Volga and Caucasus regions, which date back to BC. The structure of the tomb also seems to have played an important role in which direction the corpses were to be placed.

For example, in the tombs of the Oqjartepa cemetery in Sughd, the heads of the corpses were buried facing south, and in the tombs of Lhadli, facing east. O.V.Obelchenko notes that burials in the southern direction are more often observed in BC tombs [Obelchenko, 1992. p. 144].

M.I. Filanovich's custom of turning the head of the deceased to the south is "connected with the newly arrived peoples" [Filanovich, 2010. p. 85]. These ideas are also consistent with the periodicity of the material sources studied in the tombs. But there are other opinions on the

matter. According to B.H. Matboboev Munchoktepa, "it was not customary to place the dead in a strict direction at the funeral. The side of the head with the head of the deceased did not matter to the ancient population, because the burial structure itself is oriented, " he concluded. The material of the ancient period shows a very broad essence of the properties associated with the parties. For example, the warlike Turkic tribes in western China, the Rung-DI, and the DI in the north, according to Chinese sources, called themselves the Great DI, the Red DI, the White DI, and the Northern DI. Si Machyan, 1989. b. 28].

This means that the custom of the Turkic peoples to mark the sides with colour began 3,000 years ago with the DIs. To the east, those who lived on the east side of the sun were glorified and called "dust DI" (great, great DI). It seems that these Turkic peoples glorified the colour blue and called it "great" [Aytbaev, 2004. B. 25]. Because of the light in the south, those in the south are called "chi DI" (red DI) and those in the west are called "bay DI" (white DI). Only for some reason, the northerners were called "northern DI" instead of "black DI". Based on this information, we can say that in Ustrushna it meant a certain way to put the head of the deceased. Burial in the southern direction is also common in the burial customs of the Scythian and Sarmatian tribes. Scholars have found that this later became popular instead of burial in the northern direction [Grakov, 1947. p.143].

Hence, burial in the southern direction, observed in the tombs of Ustrushna, was more dependent on the newly arrived peoples. Although the southern direction was common in Central Asia in the III-I centuries BC, burial in the northern and eastern directions was also studied. According to archaeological data, the Yue-chji had a family grave or a cemetery belonging to a generation, and it was customary to bury the heads of the dead with skins facing north. The burial in the northern direction mentioned in Gulbo and the fact that the objects placed next to the body are very close to the Yue-chji culture further enhances our assumptions that they belong to the Yue-chji.

Our view is further enriched by the view that political power in Fergana was in the hands of the great Yue-chji in the second half of the first century BC [Anarboev, 2017. p. 66].

O.V. Obelchenko's research revealed that burials in the southern direction were more common in the burial mounds of the 1st and 1st centuries BC, but from the 1st century AD burials in this direction decreased [Obelchenko, 1992. p.144].

Analyzes show that south-facing burials are common in Central Asia in the 3rd-1st centuries BC, especially in tombs dating back to the 1st century BC. The burial of corpses in the eastern direction, as in Shirinsoy, is predominant. This situation is also observed in the tombs of Pskent, Kenkol, Borkorbaz, Khaniz, Kalandarkhana, which date back to the II-IV centuries AD [Obelchenko, 1962. p. 66].

Catacombs such as Shoshtepa, Yangi Yol, Qovunchitepa, Vrevskiy, Tuyaboguz, Achamoyli in the Tashkent oasis are buried in the east, north-east, south-east, north and south directions.

The heads of the dead were buried mainly in the northern and eastern directions in the graves and porches of the burial mounds in the Fergana Valley, such as Borkorbaz, Karabulak, Jangail, Gormiron, Isfara [Sorokin, 1954. p.134-141]. In general, burials in the northern and eastern directions are common in the "Melon" cemeteries in the neighbouring Tashkent oasis. Even in the I-VII centuries AD, the head of the corpses was buried in the northern and eastern directions.

Burial in the eastern direction was especially widespread among the Turks, and it also meant the worship of the sun (towards the rising of the sun). In our country, after the Arabs, only western burials have survived. Apparently, in the Ustrushona cemetery, before the Arab invasion, there was no single order in which direction the heads of the dead should be turned. It can be said that such cases were related to natural phenomena, seasons - the time of the deceased's death, the relief of the place (mountains), etc., rather than some religious ideas. In the Uchtepa cemetery in Ustrushna, the body was buried in a special coffin. The burial of the deceased in a coffin is considered local. This is because the tombs of the Sopollitepa monument of the Bronze Age in southern Uzbekistan contain the oldest wooden coffins in Central Asia [Askarov, 1977. p.40-41.].

In the Borkorbaz, Karabulak, Jangail, Gormiron, Isfara cemeteries of the first half of the 1st millennium AD in the Fergana Valley, corpses were laid individually, sometimes in pairs or groups, on wooden coffins (grob) and reed beds, with their backs to the body. Sorokin, 1954. p.134 -141].

Significantly, wooden coffins are found at the same time in the catacombs and terraced tombs of the first half of the first millennium AD in the Fergana Valley. The burial of the dead in such coffins is common in the burial ceremonies of the peoples of Central Asia. One of the catacomb tombs studied in the Kenkol Valley by A.N. Bernstam also mentions a wooden grob made of spruce. However, unlike the Uchtepa cemetery, this tomb is rich in burial objects. Along with the body of the corpse, there is a silk shirt, leather trousers and shoes (shoes), and next to it there are three-sided bow arrows made of ceramic jugs, iron and bone [Bernstam., Kenkolsky, 1940. p. 29].

In Shirinsay and Gulbo cemeteries, there is a special "bed" of pillows under the heads of some corpses. Such a "pillow" under the head of the body has been used since the Bronze Age [Matboboev, 2006. p.156].

The custom of putting a pillow under the head of the deceased is one of the signs of confidence that they will live in the "beyond" world. They tried to make the deceased as comfortable as possible in order to pass into this world. Hence, the convenient placement of the head of the deceased was also one of the conveniences made for the world beyond the deceased. The burial of the dead in Ustrushona cemeteries, individually or in pairs, on their backs, in an elongated or folded position, is no different from other parts of Central Asia. In the Sughd cemeteries, the bodies were buried more in the 1st group in the northern direction, in the 2nd group in the southern direction, and in the 3rd group mainly in the northern and eastern directions. There are cases of fire worship at the burial of corpses, traces of ingumation, the shape and patterns of pottery, the anthropological structure of the deceased [Pardaev., Toshboev, 2007, p. 54-58], as well as the structure of the tombs in the monuments "Melon-1" and the position of the body, laying a bed under them, such features as in the Ustrushona cemetery. Although it is common to bury corpses in all the cemeteries in Ustrushan, mainly by laying them on the ground, the corpses are buried in reeds or wooden beds (in Gulbo 2, 3 tombs) or in reed wrappers (baskets) (Gulbo 5 tombs). B.Kh. Matboboev, who studied the first medieval Munchoktepa cemeteries in the Fergana Valley, noted that "the dead were buried in three ways in the Sagans of Munchoktepa cemeteries: burial on the ground and on a special bed; burying the body in a basket; to bury in a coffin". Two comparisons emerge from this comparison, the first being the similarity of burial ceremonies in the Ettisuv, Fergana, and Ustrushna regions, and the second the fact that burial

customs in antiquity were somewhat polished even in the early Middle Ages. Reeds and underground sags, which were buried under the corpses at the time of burial, entered Northern Fergana under the influence of the Melon and Jetiasar cultures. Such sags are similar to the sags found and studied in Chach, Ustrushona, Aral Sea.

## CONCLUSION

Thus, in concluding on burial ceremonies, burials in the southern and northern directions observed in the tombs of Ustrushona were associated with ancient and early medieval migratory processes, and it was more associated with newly arrived peoples. The collected anthropological data also show that the last quarter of the 1st millennium BC and the beginning of our era were a period of intense tribal movement in Ustrushana.

 UZBEKISTAN

### **ABSTRACT**

*Women's rights have a special place in the human rights system, but in some countries women's rights are not fully realized, despite certain universally recognized guarantees. When it comes to women's rights today, it should be noted that in many countries it is a legally balanced category where men and women have equal conditions and opportunities to exercise their rights equally in political, social, cultural and other spheres, regardless of their gender. .*

**KEYWORDS:** *Law, Gender Equality, Convention, Declaration, Democracy, Equality, Legitimacy.*

### **INTRODUCTION**

Women are the successors of human life on earth. As long as they exist, life is lifelong. Human life has a history of many thousands of years, and it has traversed its own path of great progress and development, ascension. In this long and rich history, our women and girls have stood shoulder to shoulder with our men. As an example, we can mention the names of Tomaris, Nodirabegim, Zebiniso, Uvaysiy, Zebo Ganieva, Zulfiyakhanim and many other Uzbek women.

So, what is the attitude to women in our country today? Are their rights equal in all areas?

Unfortunately, today we cannot say that the equality of women and men is fully guaranteed. We can see in the example of the use of social networks that men and women are not equally active. Women and men are more or less equal, on the Internet: 78% of women and 80% of men use the Internet every day. However, older women and less educated women are lagging behind.

In addition, 25% of women aged 55-74 (compared to 21% of men) and 27% of women with low education (21% of men) did not have access to the Internet. Men are more likely to participate in professional networks, download programs, and search for online training materials.

In terms of gender equality indicators, the overall Gender Equality Index for the European Union in 2018 is 67.9 points, indicating the need for urgent development in all member states. Since 2017, scores have increased by only 0.5 points and since 2010 by 4.1 points. At this rate - 1 point every 2 years - it will take more than 60 years to achieve gender equality in the EU.

Today's global progress in the field of gender equality encourages us to look at the positives on this issue as well.

Today, gender equality in Norway is traditionally strong on issues such as the labor market and social state, family and care, health, violence, education and rural development. He is well represented in sciences such as history, literature, sociology, pedagogy, medicine, law, theology, and technology. Speaking of gender equality in India, women in India are thriving in all fields, including politics, business, medicine, sports and agriculture. History has shown that two female scientists from the Indian Space Research Organization conducted the country's Chandrayaan-2 monthly mission from the beginning to the end in 2019. Gender equality has taken another step after the Supreme Court of India increased the government's position towards women serving as army commanders in 2020.

Women were first enlisted in the armed forces in 1992 and have served in many positions, including fighter pilots, doctors, nurses, engineers, signalmen, and more. While the issue of women serving in combat roles has caused controversy around the world, Indian women continue to serve alongside men in the armed forces.

It is known from history that the Uzbek land has always been a country where women are cared for and respected. During the years of independence, a number of measures have been taken to protect the rights and legitimate interests of women, who are an equal part of our society. Article 46 of the Constitution, which is our main encyclopedia, states that "Men and women have equal rights."

As a proof of this, the Presidential Decree "On Amendments to the Decree of the President of the Republic of Uzbekistan dated June 10, 1999" On Support of Proposals for the Establishment of the State Prize named after Zulfiya "(March 29, 2018, No. PF-5389) was adopted. . According to the document, the Zulfiya State Prize is awarded twice a year to representatives of the Republic of Karakalpakstan, regions and the city of Tashkent on the eve of International Women's Day for talented people aged fourteen and not older than thirty. was given to the girls.

In addition, in order to further improve the legal framework for ensuring and protecting women's rights in Uzbekistan, in September 2019, the Law "On Guarantees of Equal Rights and Opportunities for Women and Men" and the Law "On Protection of Women from Oppression and Violence" were adopted. Laws were adopted. The basic principles of guaranteeing equal rights and opportunities for women and men are the rule of law, democracy, equality between women and men, non-discrimination on the basis of sex, openness and transparency.

Universal and universal recognition of women's rights, the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, the International Covenant on Economic, Social and Cultural Rights, the Convention on the Elimination of All Forms of Discrimination against Women, The Declaration on the Elimination of Violence against Women, the Convention on the Political Rights of Women, and the European Convention for the Protection of Human Rights and Fundamental Freedoms.

The UN Charter enshrines basic human rights, the dignity and worth of the individual, and the equality of men and women. Indeed, in our country, our women are working effectively in all areas. In this regard, the Chairman of the Senate of the OliyMajlis of the Republic of Uzbekistan, as well as the Chairman of the Cycling Federation of Uzbekistan - TanzilaKamolovnaNorbaeva, the Chairman of the Women's Committee of Uzbekistan - Elmira Basitkhanova, the Minister of Preschool Education - Agrippina Shin, the Deputy Prosecutor General - Svetlana Artikova The hard work of our women, such as Boymirzaevna, is commendable.

On December 5, 1998, at the solemn meeting dedicated to the 6th anniversary of the adoption of our Constitution, our first President I. A. In his speech, Karimov declared 1991 the Year of Women: "Human history testifies that for thousands of years the cultural and spiritual life of every society has been determined by their attitude towards women. We value this value more because we treat women with oriental respect. " Indeed, the upbringing, culture, modesty and modesty of the Oriental women, which have been embodied in our grandmothers and mothers since ancient times, are reflected in our modern Uzbek sisters and mothers.

A country where a wife is happy in the family, a society that grows and prospers so much.

At present, the women of Uzbekistan are considered as equal, creative, active members of society, and their actions to realize their full potential, abilities, dreams and goals are personally supported by the head of our state.

At the first plenary session of the Senate on January 20, 2020, President Sh. Mirziyoyev said he was looking for women for the post of district governor and would try out suitable candidates in practice: "Why? I want to say again and again that our women can be an example to all with a deeper understanding of the problems, dedication, a strong sense of responsibility and diligence, "said the head of state.

The high confidence of the head of our state in women is reflected in the selfless work and responsible activities of our sisters and mothers, who have been working as many district governors.

In addition, the head of state spoke with satisfaction that 48 deputies of the Legislative Chamber of the OliyMajlis of the Republic of Uzbekistan are women.

"I believe that the election of 48 women to this parliament will bring justice, cleanliness, and the most difficult, difficult, delicate issues in the lower, lower, rural, aul, neighborhood, and once again I congratulate our women."

May there be more women in the Uzbek land, where women are consciously aware of their rights and have a legal culture, where their rights are so highly respected and the protection of their rights has risen to the level of state policy.

### ABSTRACT

*This article examines the post-Covid state of patients who have undergone COVID-19 who have complications such as post-Covid fibrosis. The article gives recommendations to patients on the rehabilitation of the post-like state in order to fully restore health.*

**KEYWORDS:** *Rehabilitation, Complications*

### INTRODUCTION

Dangers of viral inflammation

They differ from bacterial pneumonia primarily in the prevalence and nature of inflammation. As a rule, these are bilateral poly-segmental pneumonia. The term “covid pneumonia” is even more suitable for the term “viral covid pneumonitis”. Such inflammation in the lungs proceeds differently - with the development of interstitial inflammation (that is, affecting the walls of the alveoli and the connective tissue of the lung. - Ed.) And thrombosis of small pulmonary vessels, the formation of such a complication as pneumo-fibrosis. And it requires longer treatment than bacterial pneumonia, an early start of rehabilitation measures, and their continuation even during

the period of aftercare and recovery.

Against the background of a viral infection, damage to the wall of the pulmonary alveoli, pulmonary interstitium, involved in a gas exchange of small vessels (which causes vasculitis, micro thrombosis). The nature of the inflammation is different than bacterial pneumonia - there the alveoli are filled with liquid or purulent secretion, but this is not the case here. It takes a certain amount of time to aggravate bacterial pneumonia, and with viral pneumonia, lung damage can be lightning-fast and lead in the future to severe fibrosis. The risk of developing fibrosis in the lungs is higher in patients with extensive lung lesions, in those who have undergone mechanical ventilation, in patients with concomitant pathology (diabetes mellitus, obesity, hypertension).

Fibrosis in the lungs can be accompanied by persistent coughing, fatigue and poor tolerance to normal physical activity.

The course of covid pneumonia is unpredictable, it is impossible to say in advance how the disease will develop in a particular person. Sometimes pneumonia with initially small lung damage is severe, with rapidly increasing symptoms and volume of damage to the lung tissue, up to life-threatening complications and death.

Scars can cause respiratory failure

The main target of coronavirus infection is the lungs, therefore, viral pneumonia, especially severe, with a large lesion, invasive ventilation of the lungs during treatment can result in fibrosis in the lungs. Fibrosis is a consequence of the inflammatory process when the lung tissue is replaced by a connective tissue scar. In common parlance, this is a scar on the lung. If it is small, then the lung function and gas exchange will not be affected. If fibrosis is extensive, bilateral, with damage to several segments or even lobes, then in the future this can lead to irreversible changes in pulmonary function, respiratory failure, up to disability.

After suffering Covid, patients complain of shortness of breath during normal physical activity, it does not go away for several weeks or even months (shortness of breath can still be a manifestation of a post-Covid asthenic syndrome). Also, fibrosis in the lungs can be accompanied by a constant unproductive cough, fatigue, and poor tolerance to normal physical activity. The most informative method for assessing the prevalence of fibrosis is computed tomography of the chest organs. In addition, doctors prescribe body plethysmography (study of the ratio of different lung volumes), spirometry (a method that allows you to estimate the volume of inhaled and exhaled air), since the vital capacity of the lungs with pneumofibrosis can be reduced.

There are no highly effective, universal drugs for the prevention of fibrosis; it is necessary to start non-drug prevention methods as soon as possible. First of all, it is therapeutic breathing exercises. There are many breathing techniques: remedial gymnastics according to Strelnikova, Buteyko, yoga breathing. You can use your own breathing simulators: blowing air through a tube into a glass of water. Do this exercise for 10 minutes three times a day.

It should be noted that the breathing exercise loved by many - inflating balloons - is prohibited in the acute period of the disease, since there is a risk of damage to the inflamed lung tissue, up to the development of pneumothorax. But during the aftercare period, chest massage, physiotherapy procedures (but taking into account contraindications) are very useful.

Physical activity should be dosed. During the aftercare period, walking, Nordic walking (where the upper shoulder girdle is involved, movements help to improve drainage function and blood flow in the lungs) are very useful. But heavy physical activity should definitely be avoided since the body needs to be given time to recover from a severe infection. It is also forbidden to breathe essential oils, which can settle in the lungs, disrupting blood supply and gas exchange in them. You can not breathe aggressive non-medicinal preparations, alcohol solutions, soda. And our people are very fond of self-medication. By the way, many of those who have had a hard time covid, subsequently quit smoking - due to pronounced respiratory discomfort and shortness of breath and even experienced smokers.

A third of the tests are false negative

Unfortunately, false-negative tests are not uncommon. Approximately every third patient with pneumonia we have with a false-negative PCR test for COVID-19, and there are patients who have been repeatedly tested. There may be several reasons: violation of the timing and technique of taking smears, the unpreparedness of the patient (certain conditions must be met). With the development of covid pneumonia, tests may well show a negative result, because the virus has already penetrated far into the lower respiratory tract and in the upper, where the smear is taken from, it may no longer be there.

About one in three pneumonia patients have a false negative PCR test for COVID-19.

Viral pneumonia is radiographically different from bacterial pneumonia. And from the picture, we can say with a high degree of confidence that this is covid pneumonia. It has certain radiological features, the so-called "ground glass" symptom, changes are bilateral, located subpleural, and affect several segments of the lungs. In addition, patients describe symptoms characteristic of coronavirus infection that cannot be confused with other viral diseases. All patients say: "This was the first time in my life." If a patient wants to make sure that he has suffered from coronavirus pneumonia, we recommend that he be tested for antibodies. And in 99 percent of patients, these antibodies are detected.

For the first 6-8 months after covid pneumonia, people are protected from re-infection, they develop antibodies and develop immunity. By the way, we also have another type of immunity - cellular, which also protects against viral infections. Against the background of weakened immunity after coronavirus, you can contract any other viral infection that has not disappeared from your life and spreads seasonally.

Based on a CT scan of the chest, doctors can say with a high degree of confidence that pneumonia is a coronavirus, even with a negative test for COVID-19.

It is extremely difficult to protect against infection, as well as to predict the course of coronavirus infection. I believe that the risk of developing complications from vaccination is lower than the risk of a severe course of coronavirus infection and its complications. And I meet with complications in my practice every day, and these are not only pneumonia but also myocarditis, pericarditis, cardiac arrhythmias, polyneuropathy, neuropathy of the facial nerve, venous thrombosis, and more.

Rehabilitation of patients

It is necessary to use therapeutic exercises, chest massage, physiotherapy procedures, if

necessary, drug therapy. These are not only patients after pneumonia, but also patients with the post-vein asthenic syndrome, mild post-vascular complications from the nervous, cardiovascular system.

If the patient is not suitable for the rehabilitation program. If there are decompensated chronic diseases of the lungs, heart, rhythm disturbances, any acute diseases until recovery. Already about 100 people are undergoing a rehabilitation course.

## CONCLUSION

To protect yourself from covid pneumonia and other lung infections, you need to:

- get vaccinated against influenza annually, get vaccinated against coronavirus infection, then get vaccinated against pneumococcal infection (pneumococcus - the most common causative agent of bacterial pneumonia);
- Stop smoking - the less aggressive effect on the respiratory tract, the better;
- Timely sanitize chronic foci of other infections;
- Play sports, if possible, lead an active lifestyle (athletes rarely get severe covid pneumonia, and they usually do not have fibrotic changes in the lungs);
- eat properly and fully, take preventive courses of vitamins and mineral complexes;
- humidify the air in the house;
- continue to wear masks, treat hands with antiseptic, avoid crowds of people.

### ABSTRACT

*ODR procedures involve the filing of electronic documents in which the parties can use encryption or electronic signatures to protect the integrity of documents and authenticate transactions. Typically, when parties turn to ODR for help, a service provider allows for the appointment of a neutral panel of judges or panelists. Parties generally prefer structured and clear procedures where the authorisation process is simple and well defined. Institutions such as WIPO, SIAC and ICC have positive track records in resolving online disputes through mediation or other alternative methods of dispute resolution.*

**KEYWORDS:** *ODR, Electronic Documents, WIPO, SIAC, ICC, UNCITRAL Model Law, New York Convention, WIPO Uniform Domain Name Dispute Resolution Policy, Electronic Consumer Dispute Resolution (ECODIR), Online Ombuds Office.*

### INTRODUCTION

The jurisdiction of online dispute resolution may involve the application of the conflict of laws rule to the server location or registration of the corresponding domain. If it is a company, then the place of registration is that of the company. It is ideal if the arbitration centre associated with the ODR platform uses its jurisdiction and the approval of the decision by the centre itself to ensure its execution. ODR can gain the most popularity and relevance within the framework of smart contracts. In this regard, it is necessary to adopt an international convention or amend the New York Convention as well as recognise national laws and the UNCITRAL Model Law, a rule

on the recognition and enforcement of ODR awards. Also, online arbitration needs to be described, the procedure is only online, and there are parties and arbitrators in it. In digital arbitration, everything is done by a computer and through artificial intelligence.

When filing a complaint, the applicant seeks compensation or another remedy, and the defendant, if he agrees to participate in the process, provides his detailed response. The process may or may not include an oral hearing via teleconference software or video conference rooms. Sometimes, automated software could be used to resolve a dispute without the need to appoint a third party.

Typically, the ODR service provider serves as the administrator and infrastructure provider rather than a judge who resolves disputes. ODR is known for its efficient and cost-effective dispute resolution that also reduces irritability between parties.

## RESULTS AND DISCUSSIONS

The origins of ODR can be traced back to 1996, when the Virtual Magistrate Project was created to offer an online arbitration system for resolving electronic defamation issues. For instance, the University of Massachusetts Online OmbudsOffice resolved a website dispute with the owner of a local newspaper associated with a copyright infringement through mediation.<sup>1</sup> Since 1999, many ODR service providers have actively addressed disputes in both the public and private spheres involving public and commercial entities.<sup>2</sup>

To provide another example, in India, ODR originated from alternative dispute resolution (ADR) processes in which family disputes were resolved by srenis (businessmen doing the same business) and parishads (a group of men with legal knowledge). In other jurisdictions, ODR was also based on ADR practices, adding technologies to the ADR process to make it more efficient and convenient for the parties. In India, the use of ADR techniques is explicitly encouraged in the Nyaya Panchayat, Lok Adalat, Arbitration and Conciliation Act 1996, based on the UNCITRAL Model Law on Arbitration, providing statutory arbitration among other initiatives. The Indian legal framework supports ODR, including Section 89 of the 1908 Civil Procedure Code, which promotes the use of alternative dispute resolution between parties. Likewise, Rule 1A of Bylaw X empowers the court to direct the litigants to select any ADR method to resolve disputes. In addition, the Information Technology Act 2000 legally recognises the use of electronic signatures and electronic records. Recently, in the State of Maharashtra v Dr Praful B. Desai,<sup>3</sup> the Indian Supreme Court ruled that video conferencing is an acceptable method of recording witness statements. In the case of Grid Corporation of Orissa Ltd v AES Corporation,<sup>4</sup> the Supreme Court ruled: 'When effective consultation can be achieved through electronic media and remote conferencing, there is no need for two people who need to act in consultation with each other to necessarily sit together in one place unless required by law or by the basic agreement between the parties'.<sup>5</sup>

Thus, the legal framework, as well as the precedents set by the Supreme Court of India, support the use of technology to resolve disputes and encourage the use of ODR practices.

Cost and time efficiency are typical characteristics of ODR, as opposed to litigation, which is a time-consuming and expensive method of resolving disputes. Brams, S.J. and Taylor, have clearly stated: 'The difficulty of using traditional dispute resolution methods in low-value cross-

border disputes has led to an interest in cheap cases, methods of resolving disputes between jurisdictions'.<sup>6</sup>

Jurisdictional issues have been studied in depth by western experts. In particular, Johnson examined the topic of borders on the Internet, countries in which the domain name is registered under the jurisdiction of the court.<sup>7</sup>

ODR offers plenty of flexibility, as it can be initiated at any point in a trial or even before a trial begins. The ODR may also be terminated if the parties mutually agree that it does not lead to a workable solution. The parties have the right to independently determine the methods and procedures for resolving disputes online in the event of disputes arising under a specific electronic contract. Even in the absence of a written contract declaring the ODR as a dispute resolution method, parties can use ODR methods to resolve their disputes when such disputes arise. In contrast to litigation, the parties are free to choose their governing contract law, dispute resolution procedure, ODR service provider and other related issues. The use of ODR also allows for the selection of a neutral third party from an experienced group of mediators and arbitrators, which increases impartiality and means that the parties can present their cases on their own without fear of their private disputes entering the public domain through legal precedents. Disputes and negotiations between the parties will always remain confidential. In B2C (Business to Consumer) transactions, ODR encourages customer loyalty, while in C2C (Consumer-to-consumer) transactions, it minimises dissatisfaction and the risk of fraudulent transactions between stakeholders.

Another definition of international jurisdiction is analysed by Fedotov. In his opinion, the country in which the Internet server is located depends on the criterion of jurisdiction. The author believes that every server that is materially located in a particular state and on the territory of that state is subject to its laws.<sup>8</sup>

The state establishes its jurisdiction over a person if there is a specific connection between his territory and that person. A connection to a region is particularly evident when the information is located on a specific server that allows Internet users to access it. Obviously, a state can, at any time, establish its jurisdiction over persons who store information on its territory, and it is inappropriate for a person operating on the Internet to ignore the legislation of the state in which the information is posted. However, this precedent does not mean that other states should abandon their jurisdictions in favor of the jurisdiction of the state in which the server is located.<sup>9</sup>

Referring to the jurisdiction of the country in which the server is located for a person who publishes a relevant item on the Internet is, without a doubt, convenient, as acknowledging the legislation of the 'host' country can resolve vexing issues. However, this also raises a serious concern; the opportunity for a person to create and use a document himself is especially convenient for keeping the level of protection of absolute right slow, and no special legislation on the Internet may decide the jurisdiction described. At the same time, it is important to remember that the domain name of the country in which the server is located may not be compatible with the country of registration, in which case a user that accesses the Internet from one domain name and switches to another computer thousands of miles away does not pose a problem for the domain name owner.<sup>10</sup>

A variety of dispute resolution methods may be involved in ODR, including negotiation, conciliation, mediation, arbitration and hybrid mechanisms such as final offer arbitration, Medola,

mini-trial, med-arb, and neutral evaluation. ODR can be adjudicated or out of court. An example of a litigation is arbitration in which the award by the arbitrator is binding on both parties. In contrast, in a non-adjudicated process, the main goal is to arrive at a settlement of a dispute between parties without ruling on its merits. Mediation by a neutral third party offers options for resolving disputes between the parties and active participation in the dispute resolution process.

In Canada, the Cyber Tribunal in Montreal has successfully resolved electronic disputes using ODR, while in the United States, the Online Ombuds Office has used electronic mediation. SquareTrade is a well-known ODR provider that resolves disputes between sellers and buyers who use online commercial services by adopting methods of negotiation and mediation. Financial and insurance disputes may be resolved in the USA through Cybersettle and Click'NSettle. Other ODR service providers include [www.mediate.com](http://www.mediate.com), [www.novaforum.com](http://www.novaforum.com), [www.icourthouse.com](http://www.icourthouse.com) and [www.tribunal.com](http://www.tribunal.com). Smartsettle uses negotiation software to resolve disputes between parties as well as give priority to various interests affected by disputes.

Deutscher Bundestag put forward his proposal to regulate the considered sphere of relations.<sup>11</sup> According to the author, non-contractual obligations on the Internet should be governed by the legislation of the country of permanent residence, the main place of business of the operator of the site or an individual or legal entity who has posted the results of intellectual activity on the Internet. However, the level of protection afforded under the relevant law cannot be lower than the level of protection afforded under the Berne Convention and the Agreement on Trade-Related Aspects of Intellectual Property Rights. Otherwise, the laws of the country containing the server hosting the illegally used intellectual property shall apply. The author proposes the use of the proximity principle as a criterion for correction.<sup>12</sup>

One of the most successful ODR initiatives is the WIPO Uniform Domain Name Dispute Resolution Policy (UDRP). The policy, adopted by ICANN on 26 August 1999, provides for an administrative procedure to resolve domain name disputes through accredited service providers that follow the UDRP along with their own additional rules. WIPO, the National Arbitration Forum and the Asian Domain Name Dispute Resolution Center are among the most highly accredited ODR service providers. In administrative proceedings, it is stipulated that disputes are subject to resolution. Within a certain time frame, procedures can be initiated before the trial continues. The decision of the administrative board can be appealed within 10 days. Disputes have been resolved through the UDRP on the transfer of domain names registered in bad faith by the respondent, which has no legitimate interest if the domain name is deceptively similar or identical to the complainant's trademark. At *Tata Sons Ltd. v Advanced Information Technology Association*,<sup>13</sup> WIPO ordered the transfer of the [Tata.org](http://Tata.org) domain name to the plaintiff *Tata Sons Ltd.*, as all three criteria of the UDRP policy were established in the case.<sup>14</sup>

Conflicting rules regarding 'law of location', 'law of structured place' and 'law of damaged place', which are usually used to define rights in private international law, have different meanings when applied to legal disputes arising on the Internet in accordance with the criterion 'server location'.<sup>15</sup> Server location is the location of the physical communications system (hardware and software), and the physical location of the server hosting the information (website) cannot be considered as a criterion for this type of dispute. The location of the equipment qualifies as the location of the server if the tools and software installed on it belong to a specific person and are used to perform activities that are critical to legal disputes that arise on the Internet.<sup>16</sup>

In online dispute resolution, many complex issues may arise – including commercial and legal ones – and their consequences follow. As a rule, when accessing the ODR process, mutual consent between the parties is required, whether through an explicit clause in the contract or by mutual agreement of the parties after a dispute that may arise. The service provider must be legally binding or enforceable. Most jurisdictions recognise and enforce the standard ODR clause on a B2B website; however, in the case of B2C contracts, especially in the European Union, consumers cannot be deprived of the additional rights available to them by the law of their place of residence through an agreement restricting the jurisdiction of the court to the country of the ODR service provider if it provides lower standards of protection that the consumer is entitled to in his country of residence.<sup>17</sup> Maintaining the confidentiality and secrecy of negotiations as well as of any subsequent transactions between the parties when resolving disputes is one of the most important tasks of online international arbitration. The Internet is still considered an unsafe medium for arbitration, as cybercriminals have several methods with which to intercept data and messages between parties, and any information passing through Internet networks can be illegally stored or used by cybercriminals. In light of this, increasingly sophisticated methods of security on the Internet are emerging, such as the use of digital signatures. Furthermore, technology can be used to combat any Internet security loopholes and strengthen the ODR process. Stanieri A. and Zeleznikow J.<sup>18</sup> also believed that technology is a fourth party in the ODR process and noted that ODR can be used not only to effectively resolve online disputes but to build trust in virtual spaces as well. The use of cookies often violates Internet users' privacy and increases security concerns. E-litigation employs multiple layers of security, including a sophisticated server, complex passwords and software that backs up the complete data of its servers and stores information provided by parties in a secure environment. Such technical infrastructures are required to address any concerns about confidentiality breaches in the ODR process. Many paralegal rights, such as money back guarantees, buyer protection clauses and authentication stamps, are becoming popular on e-commerce websites. This only serves to generate more trust in ODR practices and promote consumer confidence in e-commerce.

Another significant concern for most parties is that their disputes should be independent and decisions should be impartial. To this end, they tend to prefer institutional ODR providers, which are more structured and transparent, reducing the chances of bias affecting panelists' decision-making process.

In cyberspace, there are no uniform laws for ODR, which creates challenges regarding the application of substantive and procedural law to the resolution of electronic disputes. To decide on the jurisdiction that applies to online disputes, the effects test<sup>19</sup> and the Zippo sliding scale approach<sup>20</sup> can be used. In private international law, the place of performance of a contract is an important parameter for determining the substantive law or jurisdiction that will be relevant to the circumstances of the case. Consumer protection law provides stronger consumer protections in Europe and the enforcement of binding legal regulations in *lex situs*, some of the challenges stemming from the lack of uniform cyber laws. Could there ever be an International Court of Justice that resolves disputes of any nature by enacting homogeneous cyber laws regulating the ODR process and procedures? Here, I draw an analogy between ODR and the application of *lex mercatoria* to international trade. It will be beneficial, though homogeneous, to formulate law on ODR or the basic legal principles of ODR legislation and practice. Major international legislative texts, treaties, conventions and national initiatives can add certainty to ODR law and practices in

cyberspace. In fact, this mission is thought to be halfway complete, as several initiatives have been implemented to bring more clarity to ODR. These initiatives include the United Nations Convention on the Recognition and Enforcement of Foreign Arbitral Awards 1958, the Brussels Convention on Jurisdiction and the Enforcement of Judgments in Civil and Commercial Matters 1968 and the Rome Convention on the Law Applicable to Contractual Obligations 1980. In 1999, the Organisation for Economic Co-operation and Development (OECD) published its guidelines for consumer protection in the context of electronic commerce.<sup>21</sup> The guidelines stipulate that the consumer should have access to fair and cost-effective means of resolving disputes and explain the importance of information technology when using ADR systems.<sup>22</sup>

In the European Union, letter E of Article 17 of the Trade Directive<sup>23</sup> provides that, in the event of an electronic dispute, Member States are required to ensure that parties are not prevented from using ADR procedures, 'including appropriate electronic means', to resolve a dispute. The National Alternative Dispute Resolution Advisory Board developed standards for ADR in 2001 and established ODR guidelines in 2002.<sup>24</sup>

Thus, some legislative initiatives aimed at promoting ADR and the use of technology to provide rapid dispute resolution services already exist. This is an issue of introducing new ideas and solutions to promote and optimise ODR laws, including the legal principles proclaimed by international initiatives and fair adaptation, which will lead to the unification of ODR legislation and practices.

Some critics, such as Drake and Mober<sup>25</sup> and Wilson, Aleman and Leatham,<sup>26</sup> have expressed fears arising from a lack of personal interaction between the parties of the dispute. Physical presence, body language and tone of conversation are important when resolving a dispute. Along these lines, Goffman<sup>27</sup> developed 'face theory', which explains that the process of resolving a dispute and its success directly depend on the communication between the parties and any negative or positive statements made during communication.

Nevertheless, in most cases of ODR, the parties are not familiar with one another, and a face-to-face meeting between the parties may reduce the likelihood of a dispute resolution. In ODR, multiple technical methods, such as automated software, are used to resolve disputes between the parties, and the parties may not be required to participate in person or even in video conferencing hearings in which the parties can exchange negative comments. If the theory of faces can be correctly applied to ODR, hostility between the parties diminishes, as in many cases, automated online processes help to resolve disputes. Additionally, if any language or cultural barriers exist, it is common practice to use translation and interpretation services during ODR. In terms of enforcement, critics may be of the opinion that when ODR is not binding, it is useless. However, in my opinion, if the optional ODR is successful and results in a binding settlement agreement, it is enforceable in court. ODR also offers fair solutions, as it recognises the principles of fairness and natural justice in addition to statutory rules for resolving a dispute.

Over time, discussions about 'self-regulation versus government interference' in ODR have arisen. Self-regulation has been challenged by consumer groups due to a lack of credibility, leading to the role of government in the ODR process. Initially, the American Arbitration Association, ICC and Better Business Bureau laid out principles for ODR regulation and emphasised the use of the seal of confidence.

Companies such as Verisign and TRUSTe were then formed, and SquareTrade and BBB Online implemented the concept of trust marks as a self-regulatory initiative in ODR practice. At the government level, Electronic Consumer Dispute Resolution (ECODIR) and other ODR projects were implemented as measures of e-governance, as ODR proved to be an effective means of dispute resolution. Schultz<sup>28</sup> was of the opinion that the role of the state is more important than the self-regulatory approach. According to Schultz, 'symbolic capital' – that is, the social reputation of the ODR provider – lends credibility and authenticity to the ODR process that the government is able to provide. The government also provides financial assistance to ODR projects and assists in setting up the technical and administrative infrastructure needed to perform ODR. In addition, Schultz suggests that accreditation is imperative when providing ODR services, as well as acting as a certifier and clearinghouse, helping parties select a service provider, facilitating electronic filing of forms and overseeing the ODR process. He also advocated for an online appeal system of verifying decisions by ODR providers that will provide greater transparency and accountability in the ODR system. Likewise, Rule states: 'To a large extent, the government is the ideal place to resolve disputes because the government has a strong incentive to resolve disputes so that society can function normally. The government is also a good place to resolve disputes, as it is usually not interested in the outcome of most of the issues that are entrusted to it'.<sup>29</sup>

## CONCLUSION

After analysing these two approaches, we have come to believe that ODR growth can be realised to its fullest potential through public-private partnerships. The role of government will be to instill trust and credibility, and the private sector will contribute to cutting-edge technology. In public-private partnerships, ODR best practices can be successfully established and implemented, and greater awareness and participation in the ODR process can be realised. In the US, Australia, New Zealand, Singapore, Canada and the UK, special funding provided by the government may help to initiate ODR projects.

In the Netherlands, the e-commerce platform is a joint initiative of the business community and the Dutch Ministry of Economy, which developed a Code of Conduct for Electronic Commerce.<sup>30</sup>

In Singapore, e-ADR has been launched and is jointly administered and controlled by the lower courts of Singapore, the Ministry of Law, the Singapore Mediation Centre, the Singapore International Arbitration Court Centre, the Trade Development Council and the International Economic Development Council to resolve commercial disputes. Electronic courts in India also seek to promote ODR, judicial review and judicial ODR using online resources, and the CBI (Central Bureau of Investigation) is in the process of establishing electronic courts.<sup>31</sup>

An analysis of the issue of digital arbitration and its jurisdiction in electronic dispute resolution showed that digital arbitration can be considered on the basis of artificial intelligence and become an effective mechanism for resolving disputes arising primarily on the Internet and with regard to smart contracts. Additionally, a proposal on digital arbitration jurisdiction has been developed to introduce special conflict-of-law rules on the subordination of the relevant domain to the law of the place of registration. It was also concluded that the introduction of digital arbitration by existing arbitration centers and their subordination to their jurisdiction is an ideal

situation, and the formalization of decisions by the arbitration center will facilitate its implementation.

### ABSTRACT

*This can present a challenge to educators wishing to engage students in the classroom while still providing required content in order to enhance learning outcomes. In Teaching and learning communication skills, we have a lot to choose from the world of technology: TV, CD Rom, Computers, the Internet, Electronic Dictionary, Email, Blogs and Audio Cassettes, Power Point, Videos, DVD's or VCD's. The last two decades have witnessed a revolution due to onset of technology, and has changed the dynamics of educational institutes, and has also influenced the educational system and the way people interact and work in the society. This rapid rising and development of information technology has offered a better pattern to explore the new teaching model. Using multimedia to create a context to teach communication skill has its unique advantages. As a result technology plays a very important role in teaching communication skill.*

**KEYWORDS:** *Multimedia, Education, Media, Image, Graphics.*

### INTRODUCTION

It is probably one of the most exciting innovations in the information age. The rapid growth of multimedia technologies over the last decade has brought about fundamental changes to computing, entertainment, and education (Norhayati& Siew 2004). Multimedia technologies and applications are probably one of the most exciting innovations in the age of information evolution. They helped and got help from the Internet and other communication and computer inventions. Multimedia has the potential to create high quality learning environments, with the capability of creating a more realistic learning context through its different media. It also helps allowing a learner to take better control of the classroom especially when the class size is large.

Multimedia has the potential to create high quality learning environments. With the capability of creating a more realistic learning context through its different media and allowing a learner to take control, interactive multimedia can provide an effective learning environment to different kinds of learners (Margie & Liu, 1996).

### **The history of multimedia**

The term "multimedia" was coined by Bob Goldstein to promote the July 1966 opening of his "Light Works at L' Oursin" show at Southampton, Long Island. On August 10, 1966, Richard Albarino of Variety borrowed the terminology, reporting: "Brainchild of song scribe-comic Bob Goldstein, the 'Light works' is the latest multi-media music-cum-visuals to debut as discothèque fare". Two years later, in 1968, the term "multimedia" was re-appropriated to describe the work of a political consultant, David Sawyer, the husband of Iris Sawyer one of Goldstein's producers at L'Oursin.

This term is said to date back to 1965 and was used to describe a show by the Exploding Plastic Inevitable. The show included a performance that integrated music, cinema, special lighting, and human performance. In the 1993 first edition of McGraw-Hill's *Multimedia: Making It Work*, Tay Vaughan declared "Multimedia is any combination of text, graphic art, sound, animation, and video that is delivered by computer. When you allow the user – the viewer of the project – to control what and when these elements are delivered, it is interactive multimedia. When you provide a structure of linked elements through which the user can navigate, interactive multimedia becomes hypermedia."<sup>1</sup>

In common usage, the term multimedia refers to an electronically delivered combination of media including video, still images, audio, text in such a way that can be accessed interactively. Much of the content on the web today falls within this definition as understood by millions. Some computers which were marketed in the 1990s were called "multimedia" computers because they incorporated a CD-ROM drive, which allowed for the delivery of several hundred megabytes of video, picture, and audio data.

Accordingly, it is media and content that uses a combination of different content forms. The term can be used as a noun (a medium with multiple content forms) or as an adjective describing a medium as having multiple content forms. The term is used in contrast to media which use only rudimentary computer display such as text-only or traditional forms of printed or hand-produced material. Moreover it includes a combination of text, audio, still images, animation, video, or interactivity content forms.

Multimedia is usually recorded and played, displayed or accessed by content processing devices, such as computerized and electronic devices, but can also be part of a live performance. Multimedia as an adjective also describes media devices used to store and experience multimedia content.<sup>2</sup> Besides multiple types of media being integrated with one another, multimedia can also stand for interactive types of media such as video games, CD ROMs that teach a foreign language, or an information Kiosk at a subway terminal. Other terms that are sometimes used for multimedia include hypermedia and rich media.

Once the media elements have been digitized and stored in the PC, they can then be edited or modified in software packages. In these packages, the media elements are modified to include special effects and filters to further enhance its look and perspective. The group members who

were designated as graphic designers had the responsibility to edit images in image-editing packages. Many chose to use Adobe Photoshop for this purpose. Adobe Photoshop is a sophisticated image-editing tool that is popularly used to modify and edit digital images. Other media elements like animations were digitally created in animation software like Macromedia Flash and 3D packages like Kinetix 3D Studio Max. Authoring is the stage where all the media elements that have been created or modified and stored digitally in the PC are brought together into one final application and integrated into a cohesive presentation for the purpose of conveying a specific message to the audience. It is also at this stage that elements of interactivity and navigation are incorporated to involve the user in the application and to create a multi-sensory experience.

### **The role of multimedia in education**

The world in which we live is changing rapidly and the field of education is experiencing these changes in particular as it applies to Media Services. The old days of an educational institution having an isolated audio-visual department are long gone! The growth in use of multimedia within the education sector has accelerated in recent years, and looks set for continued expansion in the future.

The use of multimedia in education has been extensive, as it has been effective in increasing productivity and retention rates, where research has shown that people remember 20% of what they see, 40% of what they see and hear, but about 75% of what they see and hear and do simultaneously. This is especially significant in the CBT (Computer-Based Training) modules in corporations like Ernst & Young, and Union Pacific, where employees are trained in organizational procedures and in flight simulations in the aviation industry to train pilots. It is now permeating the educational system as a tool for effective teaching and learning. With multimedia, the communication of the information can be done in a more effective manner and it can be an effective instructional medium for delivering information. A multi-sensory experience can be created for the audience, which, in turn, elicits positive attitudes toward the application. Multimedia has also been shown to elicit the highest rate of information retention and result in shorter learning time. On the part of the creator, designing a multimedia application that is interactive and multi-sensory can be both a challenge and a thrill. Multimedia application design offers new insights into the learning process of the designer and forces him or her to represent information and knowledge in a new and innovative way.<sup>3</sup>

Multimedia, defined, is the combination of various digital media types such as text, images, sound and video, into an integrated multi-sensory interactive application or presentation to convey a message or information to an audience. In other words, multimedia means “an individual or a small group using a computer to interact with information that is represented in several media, by repeatedly selecting what to see and hear next”.

Multimedia is changing the way we communicate with each other. The way we send and receive messages is more effectively done and better comprehended. The inclusion of media elements reinforces the message and the delivery, which leads to a better learning rate. The power of multimedia lies in the fact that it is multi-sensory, stimulating the many senses of the audience. It is also interactive, enabling the end-users of the application to control the content and flow of information (Vaughan, 1998). This has introduced important changes in our educational system and impact the way we communicate information to the learners (Neo & Neo, 2000). The

evolution of multimedia has made it very possible for learners to become involved in their work. With multimedia technologies, they can create multimedia applications as part of their project requirements. This would make them active participants in their own learning process, instead of just being passive learners of the educational content.

Teachers primarily require access to learning resources, which can support concept development by learners in a variety of ways to meet individual learning needs. The development of multimedia technologies for learning offers new ways in which learning can take place in schools and at home. Enabling teachers to have access to multimedia learning resources, which support constructive concept development, allows the teacher to focus more on being a facilitator of learning while working with individual pupils. Extending the use of multimedia learning resources to the home represents an educational opportunity with the potential to improve pupil learning.

The elements used in multimedia have all existed before. Multimedia simply combines these elements into a powerful new tool, especially in the hands of teachers and pupils. Interactive multimedia weaves five basic types of media into the learning environment: text, video, sound, graphics and animation. Since the mode of learning is interactive and not linear, a pupil or teacher can choose what to investigate next. For example, one does not start on the first page of a linear document and read to the end. Interactive multimedia learning mode is more like constructing a spider's web, with one idea linked to another, allowing choices in the learner's path.

The multimedia technologies that have had the greatest impact in education are those that augment the existing curriculum, allowing both immediate enhancement and encouraging further curriculum development. For example, the WWW serves as a storehouse of information that individual learners can search for subject matter content that specifically fits their learning agendas. Multimedia applications for computers have been developed for single computing platforms such as the PC, Apple Mac and games machines.

It is very tempting to use the latest computer wizardry to represent information and develop computer enhanced learning materials. However, the instructional design of these systems should be based on a careful examination and analysis of the many factors, both human and technical, relating to visual learning. When is sound more meaningful than a picture? How much text is too much? Does the graphic overwhelm the screen? For a pupil, this allows them to test all of their skills gained in every subject area. Pupils must be able to select appropriate multimedia tools and apply them to the learning task within the learning environment in order for effective learning to take place.

In teaching English for Kids, multimedia is used to produce computer-based training courses (popularly called CBTs) and reference books like encyclopedia and almanacs. A CBT lets the user go through a series of presentations, text about a particular topic, and associated illustrations in various information formats. Edutainment is an informal term used to describe combining education with entertainment, especially multimedia entertainment.<sup>4</sup>

Learning theory in the past decade has expanded dramatically because of the introduction of multimedia. Several lines of research have evolved (e.g. Cognitive load, Multimedia learning, and the list goes on). The possibilities for learning and instruction are nearly endless.

The idea of media convergence is also becoming a major factor in education, particularly higher education. Defined as separate technologies such as voice (and telephony features), data (and productivity applications) and video that now share resources and interact with each other, synergistically creating new efficiencies, media convergence is rapidly changing the curriculum in universities all over the world. Likewise, it is changing the availability, or lack thereof, of jobs requiring this savvy technological skill.

English teaching today has gone into the vicious circle. Teachers need to consider how to perfect the teaching system to improve pupils' practical ability of English. Therefore an efficient way should be used to make the class vivid. Multimedia teaching will bring pupils into a class where they can interact with the teacher and the subject. Multimedia teaching is more intuitive than old ways; teachers can simulate situations in real life. More importantly, teachers will have more approaches to stimulating pupils' passion of learning

A *Multimedia Learning* environment involves a number of components or elements in order to enable learning to take place. Hardware and software are only part of the requirement. As mentioned earlier, multimedia learning integrates five types of media to provide flexibility in expressing the creativity of a pupil and in exchanging ideas

**Text.** Out of all of the elements, text has the most impact on the quality of the multimedia interaction. Generally, text provides the important information and acts as the keystone tying all of the other media elements together. It is well written text that makes a multimedia communication wonderful.

**Sound.** Sound is used to provide emphasis or highlight a transition from one page to another. Sound synchronized to screen display, enables teachers to present lots of information at once. This approach is used in a variety of ways, all based on visual display of a complex image paired with a spoken explanation. Sound which is used creatively becomes a stimulus to the imagination, or which is used inappropriately it becomes a hindrance or an annoyance. For instance, a script, some still images and a sound track, allow pupils to utilize their own power of imagination without being biased and influenced by the inappropriate use of video footage. A great advantage is that the sound file can be stopped and started very easily.

**Video.** The representation of information by using the visualization capabilities of video can be immediate and powerful. While this is not in doubt, it is the ability to choose how we view, and interact, with the content of digital video that provides new and exciting possibilities for the use of digital video in education. There are many instances where pupils who are studying particular processes, may find themselves faced with a scenario that seems highly complex when conveyed in purely text form, or by the use of diagrams and images. In such situations the representational qualities of video help in placing a theoretical concept into context.

Video can stimulate interest if it is relevant to the rest of the information on the page, and is not 'overdone'. Video can be used to give examples of phenomena or issues referred to in the text. For example, while pupils are reading notes about a particular issue, a video showing a short clip of the author/teacher emphasizing the key points can be inserted at a key moment; alternatively, the video clips can be used to tell readers what to do next. On the other hand, it is unlikely that video can completely replace the face-to-face lecture: rather, video needs to be used to supplement textual information.

One of the most compelling justifications for video may be its dramatic ability to elicit an emotional response from an individual. Such reaction can provide a strong motivational incentive to choose and persist in a task.

The use of video is appropriate to convey information about environments that can be either dangerous or too costly to consider, or recreate, in real life. For example: video images used to demonstrate particular chemical reactions without exposing pupils to highly volatile chemicals, or medical education, where real-life situations can be better understood via video.

**Animation.** Animation is used to show changes in state over time, or to present information slowly to pupils so they have time to assimilate it in smaller chunks. Animations that are combined with user input enable pupils to view different versions of change over time depending on different variables.

Animations are primarily used to demonstrate an idea or illustrate a concept. Video is usually taken from life, whereas animations are based on drawings. There are two types of animation: Cell based and Object based. Cell based animation consists of multiple drawings, each one a little different from the others. When shown in rapid sequence, for example, the operation of an engine's crankshaft, the drawings appear to move. Object based animation (also called slide or path animation) simply moves an object across a screen. The object itself does not change. Pupils can use object animation to illustrate a point – imagine a battle map of Gettysburg where troop movement is represented by sliding arrows.

**Graphics.** Graphics provide the most creative possibilities for a learning session. They can be photographs, drawings, graphs from a spreadsheet, pictures from CD-ROM, or something pulled from the Internet. With a scanner, hand-drawn work can be included. Standing commented that, “the capacity of recognition memory for pictures is almost limitless”. The reason for this is that images make use of a massive range of cortical skills: color, form, line, dimension, texture, visual rhythm, and especially imagination.

Employing multimedia tools into the learning environment is a rewarding, but complex and challenging task. All of the multimedia formats available: text, sound, video, animation and graphics, already exist in one form or another in most libraries. Pupils can explore an almost infinite variety of information. All these explorations can certainly lead to new discoveries, but unless consumption is followed by production, the story ends. Without a chance to use their new discoveries and demonstrate what they have learned, the knowledge gained soon becomes the knowledge forgotten.

The technology needed to support classroom teaching has increased in complexity. Until only a few years ago all that a lecture room needed were some seats for the pupils, and a blackboard and a lectern or table for the teacher. Then came the overhead projector, slide projector and the return of TV with video player. Now there is the computer, networks and related display tools. From having a next to zero maintenance cost, the teaching room is becoming not only costly to equip, but costly to run and maintain, including the escalating costs of security such as typical multimedia based educational environment. The main teaching spaces are equipped with a standard set of presentation equipment, and full details of what is, and is not, available in each room.

Many school reform models focus on a significant restructuring of the classroom. They propose a shift from a teacher-centered didactic model to a learner-centered constructivist model. While details of these constructivist models vary, they typically include an emphasis on cooperative learning and on the use of project-based learning. Most types of school reform models recognize that multimedia brings a new dimension to reading and writing, and the need for pupils to develop basic skills in information retrieval in multimedia environments.

Pupils respond to information differently. Thus, it is often to our advantage as teachers to use many different formats and modes to teach the subject matter of a lesson. This is why teachers normally use some combination of lecture, text and hands-on laboratory for conveying information. With the advent of the Internet and the multiple formats that can be communicated over the World Wide Web, we now have several new and exciting ways to present information. The Web allows the incorporation of animation, moving pictures, and sound into lessons, which extends our abilities to present materials that encourage pupil interaction with the subject matter. Pictures and animations help bring to life scientific principles, and multimedia allows pupils to take a more active role in learning: they can watch experiments in action, see microorganisms up close, and use a mouse or keyboard to navigate images, simulations and interactive material. One of the advantages of using multimedia is to convey information quickly and effectively to all pupils – and keep them interested in learning.<sup>5</sup>

School-purchased multimedia such as videos and CDs work well, but these can be limited by school budgets. Another drawback of these tools is that given the hectic schedule teachers are often forced to keep, it can be a significant strain on our time to review multimedia materials and seamlessly incorporate them into a lesson plans. Finally, juggling a VCR and TV for video, a CD-ROM player, computer, projector, and textbook can be technically, as well as financially, challenging. Ideally, what teachers needs is a singlesystem that blends text, images, simulations, video, audio and other multimedia material into a single, coherent environment that is available from school or home.

One of the goals of Visionlearning is to provide just such a resource. Visionlearning provides clearly written, concise online multimedia modules that focus on core scientific principles in biology, chemistry, earth sciences, and physics. Our modules make it possible for you to reach out to pupils and allow them to view engaging presentations repeatedly. Our modules provide core, text-based lessons written to conform to the National Science Education Standards. These modules also offer original photographs, scientific illustrations, Flash animations, educational videos, audio recordings, interactive quizzes, and ask-a-question areas through a series of external hyperlinks on the right and bottom menu bars.<sup>6</sup>

Photographs and scientific illustrations appear embedded within our learning modules. Photographs of scientists on the right menu of our modules link to biographies to provide historical context to the lesson. Within the text of the lessons, center-aligned, hyperlinked text loads interactive animations or short movies that help convey the core topic discussed in the lesson. For example, our Scientific Method module contains an interactive experiment in which pupils are virtually transported to Pisa, Italy where they can simultaneously drop different sized objects off of the Leaning Tower. For more examples of our interactive animations, visit our sample animations page. Many of our illustrations and animations are reproduced in an overheads area of the 'Resources' section (bottom menu) of our modules to provide teachers an easy way to show these materials to a class without having to search through a module.

Near the top of the right menu, all Vision learning modules contain an ‘Experiment’ section. This section contains links to educational videos and online interactive experiments that help augment the subject of the lesson. For example, our Cell module contains a link to a virtual tour of an animal cell. Our right-menu ‘Classics’ section contains links to journal articles, audio recordings and videos of scientists that have made key contributions to the field. In addition, interactive quizzes are contained in the bottom left ‘Resources’ section to provide pupils a way to self-assess their learning.

As a teacher, you can use Vision learning’s multimedia materials on and off the Internet. Using the Internet, you can project a computer screen to your class, slowly scrolling through text and clicking on graphics and animations within a lesson. Alternatively, you can work offline with an overhead projector. Our overhead pages (available in the bottom left Resources section) are formatted to be printed on transparencies for classroom use.

Multimedia presentations keep pupils alert and focused. It would benefit your pupils immensely if they could hear a researcher’s opinions, and read their original work. For example, Vision learning’s Atomic Theory I module “Atomic Theory: The Early Days,” has links to J.J. Thompson, a renowned physicist, speaking about his work in the early 1900s. In addition, we provide links to a biography of Thompson and a history of his work, and information about how Thompson went on to mentor other atomic scientists, including Ernest Rutherford.

## CONCLUSION

It is true that one of the ultimate goals of multimedia language teaching is to promote students’ motivation and learning interest, which can be a practical way to get them involved in the language learning. Context creation of ELT should be based on the openness and Accessibility of the teaching materials and information. Concerning the development of technology, we believe that in future, the use of multimedia English teaching will be further developed. The process of English communication learning will be more student-centered but less time-consuming. Therefore, it promises that the teaching quality will be improved and students’ applied English communication can be effectively cultivated, meaning that students’ communicative competence will be further developed. In conclusion, we believe that this process can fully improve students’ ideation and practical language skills, which is helpful and useful to ensure and fulfill an effective result of teaching and learning. Barring a few problem areas multimedia technology can be used effectively in classrooms of ELT with proper computer knowledge on the part of teachers, overcoming the finance problems in setting up the infrastructure and not allowing the teachers to become technophobes. Technology is advancing rapidly and is beginning to provide educators with a wealth of potential tools. The future of education is in finding those technologies that enable active learning experiences for students.

## **THE EFFECT OF COMBINED STRATEGY INSTRUCTION ON READING COMPREHENSION**

**Turdimatova Gulchiroy\***

\*Fourth year student of Uzbekistan State World Languages University,  
UZBEKISTAN

### **ABSTRACT**

*This study investigated the effectiveness of combined strategy instruction on reading comprehension, students' perceptions of combined strategy training in reading instruction, and teachers' perceptions about combined reading strategy instruction and their experiences during strategy instruction. Four upper-intermediate classes (two as control groups and two as experimental groups) participated in the study. The experimental group received four-week long combined strategy instruction while the control group followed the current reading syllabus without strategy instruction. During the four-week study, Chamot and O'Malley's (1994) strategy instruction model, Cognitive Academic Language Learning Approach (CALLA), was followed for the most part. Prior to and after the four-week study an International English Language Testing System (IELTS) reading test was given to the students to assess their reading comprehension. Retrospective think-aloud protocols were used after the post-reading test in order to gather evidence on the use of strategies during the post-test. Following the treatment, a questionnaire was administered to the experimental group students in order to explore their perceptions of the strategy instruction program. Finally, the instructors of the experimental classes were interviewed about their experiences during the treatment period. The data analysis showed that the experimental group showed significantly greater improvement on the reading test after the four-week study. Furthermore, the retrospective think-aloud protocols demonstrated that experimental group students employed a broad range of strategies during the post-reading test. The analysis of the questionnaire and interviews revealed that combined strategy instruction had a positive impact on both teachers and students.*

## INTRODUCTION

The era in which we are living has been described as the information age. An important feature of this age is the speed with which information is created, processed, stored or retrieved. This development has made reading an essential skill to acquire wherein readers need to employ strategies to assimilate information. Studies show that reading strategies, which have been defined as plans developed by a reader to assist in comprehending texts (Koda, 2005; Urquhart & Weir, 1998), have a positive influence on reading comprehension (Auerbach & Paxton, 1997; Urquhart & Weir, 1998). Therefore, while performing their reading tasks, students should learn to work strategically (Bimmel & Schooten, 2004; Janzen, 2002; Kern, 1989). A study by Block (1992) revealed that the difference between proficient and less proficient learners is that proficient readers make use of a larger variety of strategies and they can determine which strategy to use for different tasks. In order to develop strategic readers, the main goal of strategy instruction should be to employ a wide range of strategies in combination rather than instruction in a single strategy (Anderson, 1999; Bimmel, 2001). This study sets out to explore the effects of combined strategy instruction on students' reading comprehension. It will also examine the beliefs and perceptions of students and teachers about the use of reading strategies. The findings may be of benefit to Our University, School of Foreign Languages in terms of providing new insights for the syllabus.

Reading is a complex system of deriving meaning from a text, which involves skills like inferencing, guessing and prediction. Analysis of the reading process raises awareness of the demands of different texts and the need for strategy use to meet those demands. Three reading models, the bottom-up, top-down and interactive approaches, have been described to explain how reading occurs (Urquhart & Weir, 1998). According to Anderson (1999), the bottom-up process of reading is a piece-by-piece mental decoding of the information in the text. Readers start processing information from the smallest units (e.g., letters, words, sentences), decode them to sound, recognize words, and decode meaning (Carrell, 1998a; Grabe & Stoller, 2002). In contrast to the bottom-up model, in the top-down model the reader's main aim is to comprehend the overall meaning of the text. Readers start with the whole language, such as their background knowledge and their predictions, aiming for the overall comprehension of the text (Anderson, 1999; Grabe & Stoller, 2002). The interactive model was developed by theorists as a result of criticism against the bottom-up and top-down models. The interactive model provides a compound of bottom-up and top-down models (Carrell, 1998b). It emphasizes both what is on the written page and what a reader brings to it. Several studies have shown that proficient readers employ top-down and bottom-up processing simultaneously, whereas less proficient readers depend primarily on bottom-up processing (e.g., Auerbach & Paxton, 1997; Carrell, 1998b; Eskey, 1998). Schema theory is important in explaining how prior knowledge contributes in the acquisition of new knowledge. According to the theory, prior knowledge is stored in schema and later it is used to assist the reader to fill gaps in the new knowledge (Carrell, 1984). The crucial role of background knowledge on reading comprehension is highlighted by Anderson (1999) and reading problems related to the lack of schema were emphasized in Carrell's study (1987). Studies conducted with proficient and non-proficient readers revealed that proficient readers are reported to be making more use of their background knowledge and a higher frequency of reading strategies than non-proficient readers (e.g., Anderson, 1999; Janzen, 2002). According to Anderson (1991), reading strategies are conscious actions that learners take to improve their

language learning. Many reading researchers classify reading strategies into two main groups: cognitive and meta-cognitive. The results of a study conducted by Carrell, Pharis and Liberto (1989) show that metacognitive strategy instruction was effective in enhancing reading comprehension. Bimmel (2001) stated that reading comprehension instruction should aim at developing both cognitive and meta-cognitive competence. He further indicated that if students are given only separate reading strategy instruction, they will not be able to achieve reading comprehension successfully. Strategies are related to each other and therefore should be viewed as a process and not a singular isolated action (Anderson, 1999). A study conducted to find out whether poor and good readers make use of different reading strategies showed that good readers use a wider range of strategies and they determine the strategies according to their needs and interests. This suggests that students should have knowledge of a wide variety of reading strategies. Thus, they will be able to decide which strategy meets their learning styles and goals. Bimmel (2001) points out that not every strategy is equally useful and suitable for every student, so students should observe their reading processes and when an obstacle occurs they should be able to shift from one strategy to another while performing their reading tasks. Students must monitor their reading processes and choose reading strategies that are appropriate for them (Carrell et al., 1989; Casanave, 1988). In order to be able to shift from one strategy to another, students should be taught a wide set of strategies. Reading strategies can be taught explicitly by providing guidance on the use of the strategy (Chamot & O'Malley, 1994). The teacher names the strategy, and explains how it is used with a specific task. It would be beneficial to instill some rationale for the necessity of strategies in trying to comprehend a text. Bimmel (2001) emphasizes that strategy instruction should provide students with a wide repertoire of strategies and that students should be asked to use strategy combinations which they find to be useful for a particular activity.

Statement of the Problem Researchers continually attempt to understand the factors affecting success in reading comprehension. Studies conducted on reading comprehension have indicated that reading strategy instruction is an effective way of enhancing reading comprehension (e.g., Auerbach & Paxton, 1997; Bimmel, 2001; Bimmel & Schooten, 2004; Block, 1992; Goodman, 1998). Within the literature a variety of studies that examined strategy use can be found (Grabe & Stoller, 2002; Grellet, 1981; Koda, 2005). As no one strategy can fit the needs of students and as different types of texts require different strategies (Bernhardt, 1998; Eskey, 1998; Janzen, 2002; Masuhara, 2003), a combined set of reading strategies should be given to the students. Thus, students will develop the ability to decide which strategies are appropriate with different text types. Although evidence from empirical research for the effectiveness of reading strategies and combined strategy instruction in L1 exists, there is a lack of research conducted on the effectiveness of combined strategy instruction in the L2 setting (Grabe, 2004). Because the research on combined strategy instruction is limited in L2 settings, information is mainly obtained from the studies conducted on L1 reading. This study intends to investigate the effectiveness of combined reading strategies in the L2 setting. At our University, School of Foreign Languages, students are required to take reading courses in order to be prepared for the academic reading they will encounter in their future university courses. It is crucial for the students to develop reading strategies and techniques which will aid in learning, understanding and retaining concepts. However, in spite of their participation in reading courses, students still perform badly on reading comprehension activities and their results on reading comprehension tests are unsatisfactory.

The literature would suggest that there is a need to train the students to use reading strategies effectively in order to improve efficiency in reading courses. Reading strategies should be incorporated into the curriculum so that the students will be well equipped to deal with the language demands of their continuing academic study.

The purpose of this study will be to investigate the effectiveness of combined reading strategy instruction and then to explore our University, School of Foreign Languages teachers' and students' perceptions about reading strategies and strategy instruction.

### **Significance of the Study**

Although there has been much research conducted on combined strategy instruction, little research has focused on combined strategy instruction in an L2 setting (e.g., Carrell et al., 1989; Kern, 1989) and none of the research has explored the effects of combined strategy instruction in an EFL setting. The data obtained from this study will provide empirical evidence as to the effects of combined reading strategy instruction in an EFL setting. This study may also contribute to the literature by revealing tutors' and students' perceptions of how combined reading strategies are effective in promoting reading skills. Since the use of combined reading strategies in L2 is not only a local issue, it is hoped that the findings of this study will be of guidance to other educational institutions. This study may provide data for the reconsideration of the approach applied in reading courses at our University. It may provide additional insights on reading skills, and data that will lead to the reconsideration of the curriculum objectives related to reading courses. Moreover, it may assist the school in planning ways to incorporate combined reading strategies into the curriculum. This study also sets out to reveal teachers' perceptions about reading strategies, and determine to what extent they encourage reading strategies.

The results of the study may be valuable for my institution, as it may raise awareness for the teachers in understanding that they have a role in promoting learners' use of reading strategies.

### **Reading Strategies Research**

There is a general agreement that strategy training in reading strategies improves comprehension of readers. Silberstein (1994) emphasizes that in order to promote successful reading teachers should present reading strategies not only at high level English classes but also at beginning proficiency level classes. There are many studies in the literature that have concentrated on reading strategies and their effects on overall reading comprehension. Carrell et al. (1989), for example, examined the effects of meta-cognitive strategy instruction on reading comprehension. Intermediate level ESL students from varied native language backgrounds were the participants in the study. Participants were trained in either semantic mapping or the experience-text-relationship method. In semantic mapping training, students were asked to think of ideas related to the topic. This brainstorming made the students use their prior knowledge. As the students read the text, they altered their semantic maps accordingly. Thus, new information was integrated with prior knowledge. In the experience-text-relation method, the teacher first asked questions and guided the students to activate their background knowledge and make predictions about the text. While reading the text, students stopped at appropriate points to discuss the text and determine whether their predictions were confirmed.

A study by Palincsar & Brown (1984) also provided students with a set of strategies. They taught students four reading strategies: summarizing, questioning, clarifying and predicting. The study

reported that strategy training was effective in enhancing the reading ability of the students. However, this study was conducted with native speakers of English, not in an L2 setting. There has been a gap in the literature about the effects of combined reading strategy instruction in the EFL setting. Therefore, the current study will be a unique one in this respect. By providing EFL readers with a set of specific strategies this study examines the effectiveness of combined strategy instruction in fostering students' reading comprehension.

Finally, when the students finished reading, the teacher guided the students to relate ideas from the text to their own experiences.

Both groups showed enhanced reading comprehension, in comparison to a control group. In other words, the results of this study showed that metacognitive strategy instruction was effective in enhancing reading comprehension.

### **CONCLUSION**

In this research, the background of the study, statement of the problem, research questions, and significance of the problem have been discussed. The next chapter reviews the literature on reading, reading strategies, good reader strategy use, teaching reading strategies, strategic learners, and research on reading strategies. In the third chapter, the research methodology, including the participants, instruments, data collection and data analysis procedures, is presented. In the fourth chapter, data analysis procedures and findings are presented. The fifth chapter is the conclusion chapter which discusses the findings, pedagogical implications, limitations of the study, and suggestions for further research.

### ABSTRACT

*This paper presents a research carried out to x-ray the effects of using interactive multimedia on the English language pronunciation performance of pupils in the Nigerian primary School. The simple observation technique and a well-structured questionnaire were used coupled with class test to show whether the effect is negative or positive. Pupils from grade one to grade five were randomly selected and all the class teachers responded appropriately to the questionnaires administered to them. A well-structured formative test was also given to the pupils in order to ascertain the status of effect and the level of impact of interactive digital multimedia on English Language pronunciation performance of pupils. This paper illustrates that adopting the interactive multimedia technology in education makes it possible to achieve effective teaching and training in multiple domains which was not possible in the traditional text based environment.*

**KEYWORDS:** *Interactive Digital Multimedia, English Language Pronunciation, Performance.*

### INTRODUCTION

#### **Theoretical Basis of teaching pronunciation**

Pronunciation is important in English as communication purpose because, if we mispronounce a word, it will lead into misunderstanding. Pronunciation is how the way we pronounce the word. Unfortunately, some English learners think that basic vocabulary and grammar are enough for communicative with English native speaker, but they are wrong. We need to pronounce well so people can understand what we are talking about. Audio visual media is one of media that can be

used as the tool in learning and teaching process, but it is not enough to make the students interest in class, teacher need something special here. One of the way that teacher can use is game. There are so many kinds of games and teacher can combine it with audio visual media. This combination can create an interactive class. This article is about Teaching Pronunciation by Using Games and Audio Visual Media, to know how to used games and audio visual media then combine it in learning. It is important because by using games and audio visual media in fact are able to create fun and relax situation of the students in learning process, the students more able to answer teacher's questions and more active to give suggestion to the teacher. They will not refuse to read dialogue in front of the class, cheerful, pay attention to the learning, and active during the teaching and learning process.

### **Practical Aims of the Subject**

Pronunciation is important form of communication, wrong pronounce can make the mistake of words' meaning. Most of the students have difficulties in learning pronunciation, they feel bore and lazy to learn it. They also afraid of making mistake when they pronounced the words and they still passive in the classroom. It makes students achievement in learning English low.

At school, students are lack of pronunciation while Nurhayati (2008), states that the pronunciation means knowledge of knowing to produce word which is very essential in oral communication. When speakers mispronounce some words or phrases, people can be misunderstanding. To reduce it, the teacher must equip the learner with English certain degree accuracy and fluency in understanding, responding and in expressing himself in the language in speech in other the learners communicatively in using the language. In pronunciation, there are vowels and consonant.

### **Educational aims of the Subject**

In relation to the language teaching, there are some ways that can be used to motivate the students in learning English. English teacher can use some possible and successful media, strategies, approach, or methods for the classroom activities such as audio, audio visual, game, picture, etc. For the students, learning English as a foreign language is not easy.

One of the effective media in teaching pronunciation is by using audio media. Audio media has very significant roles to motivate the students to learn pronunciation. Those ways of teaching and learning will not make students bored. But it is not enough. Audio visual media is very kind of usual in daily class. In this article, teacher can combine it with something interesting, something fun. If we talk about something fun, it must be relate with "games". Games provide language teachers with many advantages when they are used in classroom. One of these advantages is that learners are motivated to learn the language when they are in a game. Mc Callum (1980:9) emphasizes this point by suggesting that "games automatically stimulate student interest, properly introduced game can be one of the highest motivating techniques." Avedon (1971; QuotedinDeesri, 2002:2) further argues that "games spurmotivation and students get very absorbed in the competitive aspects of the games; moreover, they try harder at games than in other courses". In other words, games stimulate students' interest in classroom activities and as a result, students become motivated and willing to learn. In this article, we will discuss about how to combine games and audio visual media. Pronunciation is the production of sound by using our speech organs for communication. According to Mahuda M. and Endang Sri. S (2011:1) says that "Pronunciation is the production of speech sound for communication". English

pronunciation has problem also, for example a native speaker of English most often have to grapple with the spelling system of the language as writer, words whose meaning and pronunciation are well-know have to be writer down, and it is this situation that native speakers become very conscious of the intricacies of the English spelling system. Only occasionally do we have attempted to write an unknown word. With non-native learners of English the predominant problem is usually how to pronounce an unknown word in a written text. According to Kenworthy Joanne, et.al (2002:97) says that “The English spelling system is rich in both regularities and irregularities which present problems to non-native learners (and to English-speaking children learning to write their language)”.

General observation suggests that it is those who start to learn English after their school years are most likely to have serious difficulties in acquiring intelligible pronunciation, with the degree of difficulty increasing markedly with age.

### **Pronouncing as a Process**

Historically, pronouncing skills have received less attention in language teaching than have the productive skills of speaking and writing. Die in part to a lack of knowledge about receptive skills, teachers often failed to devote explicit attention to devoting pronouncing abilities, assuming that comprehension would occur on its own. More recently, however, the profession has recognized that merely exposing learners to oral or written input is not sufficient and that explicit teaching of comprehension strategies is needed.

Pronouncing is an interactive process that goes on between the speaker and the speech, resulting in comprehension. The speech presents letters, words, sentences, and paragraphs that encode meaning. The speaker uses knowledge, skills, and strategies to determine what that meaning is.

Speaker knowledge, skills, and strategies include

- **Linguistic competence:** the ability to recognize the elements of the writing system; knowledge of vocabulary; knowledge of how words are structured into sentences
- **Discourse competence:** knowledge of discourse markers and how they connect parts of the speech to one another
- **Sociolinguistic competence:** knowledge about different types of speeches and their usual structure and content
- **Strategic competence:** the ability to use top-down strategies, as well as knowledge of the language (a bottom-up strategy)

The purpose(s) for pronouncing and the type of speech determine the specific knowledge, skills, and strategies that speakers need to apply to achieve comprehension. Pronouncing comprehension is thus much more than decoding. Pronouncing comprehension results when the speaker knows which skills and strategies are appropriate for the type of speech, and understands how to apply them to accomplish the pronouncing purpose.

### **Advantages and Disadvantages of interactive pronouncing methods**

#### **Teaching Pronunciation**

According to Kelly (2000:13), a lot of pronunciation teaching tends to be done in response to errors which students make in the classroom. It seems that the teaching is not planned before. He

adds that the fact that pronunciation tends to suffer from neglect may not be due to teachers lacking interest in the subject but rather to a feeling of doubt as to how to teach it. However, to make students able to speak fluently and their pronunciation achieve what the experts call as minimally intelligible, pronunciation instruction needs to be promoted to students. Moreover, in the standard of competence and basic competences of SMP students grade VII state that students need to master linguistic competences including pronunciation. It can be one of basic things that students need to master since pronunciation plays an important role in language teaching.

### **Games**

Games are student-focused activities requiring active involvement of learners. In Crookall's (1990) opinion, learner and teachers change their roles and relations through games and learners are encouraged to take active role in their learning process. As a result, games provide learners with a chance to direct their own learning. From an instructional view point, creating a meaningful context for language use is another advantage that games present. By using games, teachers can create contexts which enable unconscious learning because learners' attention is on the message, not on the language. Therefore, when they completely focus on a game as an activity, students acquire language in the same way that they acquire their mother tongue, that is, without being aware of it, Cross (2000:153).

Games bring real-life situations to the confinement of the classroom which provides learners with an opportunity to use the language. Celce-Murcia (1979:54) argues that "in games, language use takes precedence over language practice, and in this sense games help bring the classroom to the real world, no matter how contrived they may be. "To state this differently, by putting learners in real life situations, games make a connection with the real usage of language. There are many advantages of games such as the fact that they...

1. Focus students' attention on specific structures, grammatical patterns, and vocabulary items.
2. Can function as reinforcement, review and enrichment.
3. Involve equal participation from both slow and fast learners.
4. Can be adjusted to suit the individual age and language levels of the students.
5. Contribute to an atmosphere of healthy competition, providing an outlet for the creative use of natural language in a non-stressful situation.
6. Can be used in any language teaching situations and with all skill areas (reading, writing, speaking or listening).
7. Provide immediate feedback for the teacher.
8. Ensure maximum student participation for a minimum of teacher preparation.

### **Kinds of Games**

Teachers should be careful about choosing games if they want to make them advantageous. First of all, the teacher should decide on the purpose of a game. A game may seem appropriate and useful.

However, when its value is considered from the view point of foreign language teaching, it may have little or no purpose. Nedomová (2007:19) underlines the fact that we "should consider

whether the game-like activity is for children only to make the lesson more attractive and protect them from being bored or whether we tend to revise and practice some particular part of grammar, vocabulary, etc.” when they choose a game.

Considering the level of the game is equally important while choosing games. Teachers must decide whether the level of the game fits students’ language level because a game may become difficult when it is beyond the learners’ level or it may become boring when learners find it too easy to carry on. When a game’s value in grammar teaching is considered, teachers tend to use them for practice or to reinforce a specific grammatical aspect of language only if a game is suitable for learners’ level so that the grammatical knowledge can be used easily as they are playing the game.

Teachers should be well aware of their roles while using games in their classes. Since it is rather difficult to find a game that meets all the needs of the learners, careful preparation of the teacher is necessary. McCallum (1980:10) suggests that the teacher should organize the game before the instruction. The teacher may need some extra equipment or materials to play the game and most of the time these equipment and materials are not available in the classroom. Before explaining the rules to the class, the teacher should first understand how the game is played. Especially when working with children, the teacher should always be prepared to adapt the game to the given soft he class. After choosing the game, the teacher should explain its rules to the learners in a direct and non-complicated way. Especially for young learners, it may be necessary to use them other tongue because if these learners can not understand how to play the game, there is no educational purpose in playing it. Therefore, demonstrations may be beneficial because they can help young learners understand the rules clearly and easily. Moreover, the teacher is not recommended to interrupt a game to correct the mistakes of young learners. According to Celce-Murcia (1979:54), “interruptions should be as infrequent as possible so as not to detract from the student’s interest in the game. An alternative to immediate correction is to make note of errors and discuss them when the game is over”. In other words, as sudden interruptions may distract learners’ attention, it is better to wait until the game is over to discuss and correct the mistakes of the learners. In addition, appropriate class organization increases the success of a game. Many games require the class to be divided in to groups or pairs. This gives the teacher a chance to monitor the activity of the learners while they are playing the game. McCallum (1980:12) asserts that learners should be in the same team during the year because it both saves the teacher’s time and helps learners develop team spirit that promotes exchange of ideas among themselves. Pair work is also beneficial as it develops learners’ communication skills. In short, dividing class into pairs and groups enables learners to improve their language and communication skills while promoting competition among the teams or pairs. As such, the teacher may find more time to focus on students’ language development.

### **Media**

According YudhiMunadi (2013: 6) the word ‘media’ comes from Latin language namely “medius”, literally “middle”, “introductory” or “intermediate”. Because of the position in the center, it is also could be called as an introductory or conjunction, which is delivering or connecting something from one side to the other side. Thus, the purpose of the use media in learning process is to make learning process effective and efficient.

According to Wright (1976:1) many media and many styles of visual presentation are useful to the language learner. That is to say, all audio-visual materials have positive contributions to language learning as long as they are used at the right time, in the right place.

### **Audio Visual Media**

According to YudhiMunadi (2013: 56) audio-visual media is media that involves the senses of hearing and vision at the same time in one process. According to YudhiMunadi (2013: 113) the audio visual media can be divided into two types. The first type, equipped with sound and image equipment functions in a single unit, called pure audio visual media, such as movies, television and video. The second kind is not purely audio visual media that what we are familiar with slides, opaque, OHP and other visual equipment when given the sound elements of the recording tapes are used simultaneously in one time or the learning process.

In teaching English foreign language for primary students is not easy. The teachers should provide pleasant atmosphere to invite the motivation and interest of the students. The motivation and interest of students are very important in learning achievement. That is why we need motivational and interesting media in teaching English.

According to Hemei (1997:45). Students like it because video presentations are interesting, challenging, and stimulating to watch. Video shows them how people behave in the culture whose language they are learning by bringing into the classroom a wide range of communicative situations. Another important factor for teachers that makes it more interesting and enjoyable is that it helps to promote comprehension.

One of the first things that students should know in learning English is pronunciation. Knowing its pronunciation will also cover the knowing of its spelling, stressing and how to speak correctly and fluently in communication. Using audio visual will help students to learn English pronunciation easily and enjoying it. The students not only hear the sound but also see some interesting sights simultaneously. Teacher can use many kinds of audio visual to teach students in the class; such as MP3, Video Cassette, Cassette Recorder, Computer Program, Audio Book, or the teacher him/herself.

### **CONCLUSION**

Pronunciation instruction can be adjusted according to what level our learners belong to. One of the aims that students need to achieve is that they are able to develop the communication ability inform of spoken and written forms so that they can achieve functional level. Functional level means that students need to be able to overcome daily problems. The language that is used for that matter is not so complicated. It is considered to be simple. So, what teachers need to promote in pronunciation instruction is simple or basic activities for pronunciation.

In relation to the language teaching, there are some ways that can be used to motivate the students in learning Pronunciation. English teacher can use some possible and successful media, strategies, approach, or methods for the classroom activities such as audio, audio visual, game, picture, etc. For the students, learning English as a foreign language is not easy.

Using audio visual media has old and sometimes not work; now teacher can combine more than one way in teaching pronunciation. Add another activity. Ask the students watch the audio visual media such as a movie then make the games base on the movie will very affective. The class will

active, the students will happy and automatically the teaching and learning will achieve a good goal.

Using audio visual will help students to learn English pronunciation easily and enjoying it. The students not only hear the sound but also see some interesting sights simultaneously. Teacher can use many kinds of audio visual to teach students in the class; such as MP3, Video Cassette, Cassette Recorder, Computer Program, Audio Book, or the teacher him/herself.

## CONDITIONS FOR EFFECTIVE IMPLEMENTATION OF INNOVATIVE ACTIVITIES IN A PRESCHOOL EDUCATIONAL ORGANIZATION

**Muminov Shermuhammad Karimovich\***

\*Independent Researcher,  
Institute for retraining and advanced training of directors and,  
Specialists of Preschool Education organizations,  
Tashkent, UZBEKISTAN

### ABSTRACT

*The article addresses issues such as the effective conditions for the implementation of innovative activities in preschool education and their content. The ongoing seminars were devoted to identifying the optimal forms of interaction, developing the content of activities that would enrich the knowledge of parents on the issues of psychosocial development of the child. The effectiveness of the work, expressed in the intermediate results of monitoring, was coordinated by constant and purposeful psychological and pedagogical support of the participants of the innovation project. During the implementation of the innovation project, constant monitoring of the results of innovation activities was carried out. The effectiveness of the work, expressed in the intermediate results of monitoring, was coordinated by constant and purposeful psychological and pedagogical support of the participants of the innovation project.*

**KEYWORDS:** *Innovative Activity, Creative Process, Preschool Organization, Innovative Project, Educator, Parents.*

### INTRODUCTION

In pedagogy, the concept of "innovative activity" has a wide semantic range. This is a purposeful pedagogical activity based on comprehending one's own pedagogical experience by comparing and studying the educational process in order to achieve better results, obtain new knowledge, introduce new pedagogical practice; it is a creative process for planning and implementing pedagogical innovations aimed at improving the quality of education. This is a socio-pedagogical phenomenon that reflects the creative potential of a teacher-educator. Currently, innovative activity is one of the decisive factors in the development of a modern preschool education institution. Each teaching staff has the right to such activities. But in this case, he must take on

certain obligations for the preparation and organization of the innovation, since children become the object of the pedagogical initiative.

State of preschool educational organizations in Tashkent is working in an innovative project "Implementation of a model for the formation of effective parenthood as a condition of social well-being of pupils of preschool educational organizations. institutions ". The work on the innovative project is carried out in the "teacher-child-parent" triad. The implementation of an innovative project involves the gradual formation of all structural components of the parental position in the families of pupils: from a conscious through a responsible one to an effective parental position. According to the general opinion of experts, family education is unique and unique in its effect. It is interfamilial relations that mediate the social well-being of the child, since they are primary, long-lasting, related by kinship and affect the age sensitivity of children. At the same time, modern teachers and psychologists emphasize that a preschool institution is the first institution that enters into open interaction with the families of pupils. And the teacher often becomes a socially significant adult for the child. Based on the fact that the social well-being of a preschool child is directly interconnected with the characteristics of child-parent interaction, the goal of teachers was to establish close and trusting (partner) interaction with various categories of families of pupils. Large, young, single-parent families, as well as families in a socially dangerous situation have become participants in our innovative project. Building interaction with this category of families has a number of specific features due to the low quality and content of family education, the manifestation of alienation of parents and children, the family's unpreparedness for a healthy lifestyle, and a low level of pedagogical culture. At the same time, the use of the experience of a family with positive parent-child relationships contributes to the prevention and correction of social ill-being.

## **MATERIALS AND METHODS**

During the work on the innovative project, methodological, psychological and pedagogical support of all participants was carried out. Diagnostics of teachers at the preparatory stage revealed that among the project participants there is an innovative personality potential associated with the following main parameters: creative ability to generate and produce new ideas and ideas, and most importantly - to design and model them in practical forms; openness of the personality to a new one, different from one's own ideas, which is based on personality tolerance, flexibility and panoramic thinking; cultural and aesthetic development and education; willingness to improve their activities, the presence of internal means and methods that ensure this readiness; developed innovative consciousness (the value of innovative activities in comparison with traditional ones, innovative needs, motivation for innovative behavior).

By the teacher's readiness for innovative activity, it is customary to understand the formation of the personal ones necessary for this activity (great working capacity, the ability to withstand the action of strong stimuli, high emotional status, readiness to creativity) and special qualities (knowledge of new technologies, mastering new teaching methods, the ability to develop projects, the ability to analyze and identify the causes of shortcomings) [1, p. 17]. In the work on the project in a preschool institution, a special place was given to increasing the level of professional competence of teachers as one of the criteria for the effectiveness of project activities. An important direction in the implementation of project activities is working with teachers through constructive communication in the implementation of individual research activities. Collective discussion of the content side of pedagogical research allowed us to

determine a wide field for research activities, where attention is paid to organizational and managerial support, methodological support, psychological support, provision of social, pedagogical and legal assistance, the formation of partnerships, the preservation of family traditions, the activation of paternal and grandparent education.

## **RESULT AND DISCUSSION**

Methodological support for the professional growth of educators using the ideas of tutoring has also yielded positive results; all teachers have acquired the skills to work with e-mail, educators and specialists have created individual methodological piggy banks; members of the creative group are more involved with colleagues. The ongoing seminars were devoted to identifying the optimal forms of interaction, developing the content of activities that would enrich the knowledge of parents on the issues of psychosocial development of the child. At the round table meetings, teachers analyzed the results of monitoring innovative activities, shared their experience in interacting with parents, and creative ideas. At the meetings of the creative group, which we held once a quarter, the project participants discussed aspects related to individual research activities, determined the priority areas of pedagogical diagnostics and correction within the designated topics. Scientific and methodological support of teachers' activities is of particular importance in the work on an innovative project. Participation in various kinds of conferences, seminars, webinars, the possibility of online communication with scientific consultants, raises the efficiency of work to a new level.

During the implementation of the innovation project, constant monitoring of the results of innovation activities was carried out. The effectiveness of the work, expressed in the intermediate results of monitoring, was coordinated by constant and purposeful psychological and pedagogical support of the participants of the innovation project. This type of support in the "parent-teacher" dyad allowed us to vary pedagogical techniques to improve the psychological culture of parents, as one of the criteria for effective parenting, as well as outline further promising areas of methodological work with teachers based on the results obtained.

The effective solution of problems aimed at creating conditions for the successful socialization of pupils by increasing the psychological culture of parents in the process of partnership between the preschool institution and the family and the implementation of activities, the content of which contributes to the formation of effective parenting, is facilitated by the reference to the following criteria: social well-being of preschool children; manifestation of effective parenting; increasing the level of professional competence of teachers; increasing the social activity of participants in innovative activities; improving the quality of management of innovative processes in the institution of preschool education. In this aspect, promising is the innovative transformation of the educational process of a preschool institution through the optimization of all its subjects of interaction [2, p.194].

## **CONCLUSION**

Thus, the priority conditions for the effective implementation of innovative activities in a preschool institution are the validity and relevance of the project topic, taking into account the specifics of the educational process as a whole; the use of effective management mechanisms of coordination and leadership in the implementation of innovation; purposeful increase in the professional competence of educators by achieving the goals and objectives of the innovative project, taking into account individual interests and needs.

**PROFESSIONAL PERSONAL DEVELOPMENT IN THE EDUCATIONAL  
 SPACE**

**Jumanazarova Zuxra Kosimjonovna\***

\*Namangan Engineering-Technology,  
 Institutes, Namangan, UZBEKISTAN

**ABSTRACT**

*This article reveals the essence of issues such as professional development of the individual in the educational environment, approaches to personal development, abilities, special and general abilities, talents. Inclinations are natural prerequisites that are a condition for the development of abilities, not only in the sense that they give originality to the process of their development, but also in the sense that, within certain limits, they can determine the content side and influence the level of achievement.*

**KEYWORDS:** *Personality, Individuality, Learning Environment, Subject, Personality Development, Ability Professional Development, Individual, Temperament.*

**INTRODUCTION**

*In psychology, there are many definitions of personality. In relation to a person, the concepts of "individual", "personality", "subject of activity", "individuality" are used. Often these concepts replace each other. So, speaking about personality, researchers can emphasize the individual characteristics of a person or characterize his individuality.*

*Most Russian psychologists include in the concept of personality a complex of natural properties, the psychological ambiguity of which is determined by the system of social relations in which the person is included.*

*A.G. Kovalev identifies the following substructures in the structure of personality:*

- Temperament (structure of natural properties);*
- focus (system of needs, interests and ideals);*
- Abilities (a system of intellectual, volitional and emotional properties).*

---

## MATERIALS AND METHODS

*V.N.Myasishchev characterizes the unity of personality by orientation, level of development, personality structure and dynamics of neuropsychic reactivity (temperament). The personality structure is a more particular characteristic of the personality, which includes motivation, attitudes and personality tendencies. K.K. Platonov identifies the following levels in the personality structure:*

- *Socially determined characteristics (orientation, moral qualities);*
- *Biologically determined characteristics (temperament, inclinations, instincts, the simplest needs);*
- *experience (volume and quality of existing knowledge, skills, abilities and habits);*
- *Individual characteristics of various mental processes.*

*According to B.M.Teplov's definition, abilities are individual psychological characteristics that distinguish one person from another and are related to the success of an activity. When talking about abilities, keep in mind the following:*

1. These are the features that distinguish one person from another. B. M. Teplov considers the most important sign of abilities to be the individual uniqueness of productive activity, the originality and uniqueness of the techniques used in the activity.
2. Abilities serve the successful performance of the activity. Some researchers, for example N.A.Menchinskaya, believe that it is more logical to talk about learning as success in acquiring skills, knowledge, and skills.
3. Abilities are characterized by the possibility of transferring the developed skills and abilities to a new situation. In this case, the new task should be similar to the previously solved tasks not by the sequence of methods of action, but by the requirements for the same mental properties of a person.

## RESULT AND DISCUSSION

Abilities are based on inclinations. Inclinations are natural prerequisites that are a condition for the development of abilities, not only in the sense that they give originality to the process of their development, but also in the sense that, within certain limits, they can determine the content side and influence the level of achievement. The inclinations include not only anatomical, morphological and physiological properties brain, but also mental properties to the extent that they are directly and directly determined by heredity.

Ability is a dynamic concept. They are formed, developed and manifested in activity. General and special abilities.

Special abilities - the ability for certain types of activity (mathematical ability, musical ability, teaching, etc.).

General abilities are the ability to develop special abilities.

Giftedness is a qualitatively unique combination of abilities, on which the possibility of achieving more or less success in performing one or another activity depends.

The concept of ability is usually associated with mental activity. But there are no grounds for such a narrow interpretation of abilities, although traditionally it is the sphere of mental activity that has been studied and continues to be studied in connection with abilities.

High general mental development may not be accompanied by the manifestation in any special area of abilities or any kind of special giftedness. However, the manifestation and achievement of high special abilities, special giftedness is unthinkable without the presence of general abilities, general giftedness.

As reality shows, the priority of the student's creative development, highlighted at the level of state policy in the field of education, is still often far from real implementation.

However, the opinions of psychologists who conducted long-term experiments coincide: the properties of the human psyche, the basis of the intellect and the entire spiritual sphere arise and are formed mainly in preschool and primary school age, although the results of development are discovered later. Lack of creativity, as a rule, becomes an insurmountable obstacle in professional education, when it is required to solve non-standard problems, interpret materials from primary sources, etc.

In the psychology of professions, one of the acute problems is the interaction of multifaceted factors that determine the professional development of the individual. The main factors include the natural environment (geographic location of a person and climatic conditions), biological and social factors, one's own personality activity and a random confluence of circumstances and events. The interaction of these factors occurs against the background of age-related changes during most of a person's life.

To solve the problems of professional development of the individual, due to the need for professional self-determination and choice of a profession, professional education and advanced training, professional growth and career, professional adaptation and reaching the heights of professionalism, as well as many others, it is necessary to determine the leading semantic factors.

These include age-related changes in a person over time, development and education of the personality.

Professional development develops in time from the beginning of the formation of professional interests and inclinations until the end of active professional activity. Age-related changes in a person over a long period of life are an important basis for the professional development of an individual. The system of continuous vocational education is of great importance in ensuring and supporting professional development. General education is a leading factor in personal development and a prerequisite for successful professional development.

Thus, the movement of an individual in a developing professional space is determined by the following three factors:

- age-related changes that determine periods of personality development;
- the system of continuous education;
- leading professionally oriented activities.

**CONCLUSION**

The resultant interaction of these three factors is the professional formation of the personality - its movement in the professional and educational space and time of professional life. It covers the period of personality development from the beginning of the formation of professional interests and inclinations to the end of a professional biography.

## INTEGRATED APPROACH TO ORGANIZATION OF INDEPENDENT WORK OF STUDENTS

**Nurova Oliya Salomovna\***

\*Senior Lecturer of the Institute,  
Counter Engineering Economics,  
Karshi city, UZBEKISTAN

### ABSTRACT

*The article highlights the essence of the integrated approach to the organization of independent work of students, the fact that independent work is an important part of the educational process. It is possible to complete assignments by a small group of students. Before the project is completed, roles are assigned in the group and each student completes his part of the task. This form of performing independent work is preparation for work in a team.*

**KEYWORDS:** *Independent Work, Creative Initiative, New Forms Of Education, Creative Activity, Student, Teacher, Integrative Approach.*

### INTRODUCTION

*One of the leading requirements of the State Educational Standard is the development of students' independent work skills.*

*The implementation of this requirement dictates the need for students to manifest their creative initiative, foster their need for self-education, strive to increase the level of their theoretical training, as well as to improve the skills of self-education.*

### MATERIALS AND METHODS

*Independent work is one of the most important components of the educational process. Independent work is the planned work of students, carried out according to the assignment and with the methodological guidance of the teacher, but without his direct participation. The teacher only organizes the cognitive activity of students, while the student himself carries out cognition.*

*Independent work completes the tasks of all types of educational work. It contributes to:*

- *deepening and expanding knowledge;*
- *the formation of interest in cognitive activity;*
- *mastering the techniques of the cognition process;*
- *the development of cognitive abilities.*

*To increase interest in students' independent work, it is necessary to improve existing and find new forms of education.*

*As an experiment, we decided to use an integrated approach. Namely, students of the specialty Programming in computer systems should be offered tasks for independent work simultaneously in two disciplines - the discipline Effective behavior in the labor market and MDK.03.01 Software development technology.*

## **RESULT AND DISCUSSION**

*Independent work includes reproducing and creative processes in the student's activity. Depending on this, three levels of independent educational activity of students are distinguished:*

- 1) Reproductive (training) - independent training work is performed according to the model. The student's cognitive activity is manifested in recognition, comprehension, memorization. The purpose of this kind of work is to consolidate knowledge, develop skills;*
- 2) Reconstructive - in the course of such independent work, decisions are restructured, a plan, abstracts, annotated. Abstracts can be performed at this level;*
- 3) Creative, search - creative independent work requires an analysis of a problem situation, obtaining new information; the student must independently make a choice of means and methods of solution (project assignments, coursework and final qualification works)*

An integrated approach involves completing tasks related to the third level. This level involves the use of the project method, since it is always focused on the independent activity of students - individual, pair, group, which they perform for a certain period of time.

Tasks for independent project activities of students are developed jointly by teachers of two disciplines. For example, disciplines Effective behavior in the labor market and MDK.03.01 Software development technology. Independent work of students is organized according to the following plan:

1. Students receive assignments of different types. For example:
  - Create a presentation using Microsoft PowerPoint on the topic "Sign language".
  - Develop a version of the test using Microsoft Excel on the topic "Types of temperament".
  - To develop a program in the Delphi 7 environment "Correspondence of temperament and type of professional activity" (tasks of this type are the most preferable and often used - the topics are varied).
2. Based on the task received, the student develops an algorithm for solving the problem.
3. The task is performed according to the developed algorithm.
4. The last stage of work is the student's defense of the project (open defense is possible).

The process of completing such tasks takes place in the form of a business game:

- The teacher of the discipline Effective behavior in the labor market acts as a customer of the project and a consultant on psychological issues.
- Teacher MDK.03.01. Software Development Technologies - in the role of project development leader.
- The student is in the role of the performer.

It is possible to complete assignments by a small group of students. Before the project is completed, roles are assigned in the group and each student completes his part of the task. This form of performing independent work is preparation for work in a team. This is especially important for students of the specialty "Programming in computer systems". This form of organization of independent work simulates his subsequent professional activity.

An integrated approach to the organization of independent work has another big plus - the results of students' project activities can be used to conduct classes in the discipline Effective behavior in the labor market, as well as in extracurricular work by group curators.

The application of this approach is universal and can be applied in teaching any specialty - it all depends on the experience, qualifications and creative potential of the teacher. The technology of educational design makes it possible to form students' skills in effective behavior in the labor market, stimulates the development of key competencies of students, forms the ability for self-employment and obtaining additional (reserve) professional competencies.

## CONCLUSION

Correctly organized independent work of students is focused on the development of their personal and educational resources in order to enhance their adaptive potential and increase the chances of effective employment and the formation of a professional career.

## USE OF INNOVATIVE PEDAGOGICAL TECHNOLOGIES IN TEACHING ECONOMIC DISCIPLINES

**Kanglibekov Kuatbai\***

\*Applicant for the Institute of Pedagogical Innovation,  
 Retraining and Advanced Training of Leading and,  
 Pedagogical Personnel of Professional Education,  
 Tashkent, UZBEKISTAN

### ABSTRACT

*The article covers issues such as the teaching of economics in vocational education institutions, the content of the use of pedagogical technologies in their teaching. A cluster is a graphical form of organizing the presentation of information, when the main semantic units are highlighted, which are fixed in the form of a diagram with the designation of all connections between them. One of these methods is the "Fish Bone" method. This method is based on a schematic diagram in the form of a "fish skeleton", in the head of which the indicated problem is placed, the elements of the problem are written on the upper bones, the results of the study are recorded on the lower bones.*

**KEYWORDS:** *Market Economy, Economics, Pedagogical Technology, Case Technology, Small Group Work, Creativity, Fish-Bone Method.*

### INTRODUCTION

In modern economic conditions of management on the labor market, highly qualified specialists are more and more in demand who are able to carry out the tasks of their self-development and self-improvement, who are able to acquire the necessary knowledge and acquire the necessary competencies themselves. Society sets new tasks for professional education to train a modern specialist who will be not just a professional in a particular field, but a person, a citizen who has such socially necessary personal qualities as tolerance, professional responsibility, creativity of thinking, culture of health and a healthy lifestyle. life.

At the same time, a special role is assigned to innovative pedagogical technologies, since only an innovative approach to the process of teaching and upbringing will make it possible to form students' professional competencies of a future specialist.

---

## MATERIALS AND METHODS

In professional educational institutions (colleges, technical schools) of the Republic of Uzbekistan, for many years, he has been training specialists in economic profile, paying great attention to the quality of training students. The teaching staff of our college is constantly working on the implementation and use of innovative teaching technologies.

Currently, a variety of educational technologies are being implemented in secondary vocational education. The analysis showed that the modern and most demanded of our teachers are the following: technology for the development of critical thinking, game technologies, case technologies, problem-developing education, natural-reflective technology for the development and self-development of a person, information and communication technologies, and others.

The choice of certain teaching methods depends on many factors: on the didactic goals of the lesson, on the discipline being studied and the professional module, on the level of training of students and the professional competencies of teachers.

At the moment, we consider it quite relevant for ourselves to introduce and use the technology of critical thinking in the learning process.

### Result and discussion

One of these methods is the "Fish Bone" method. This method is based on a schematic diagram in the form of a "fish skeleton", in the head of which the indicated problem is placed, the elements of the problem are written on the upper bones, the results of the study are recorded on the lower bones. The ways of solving the posed problem, as a result of research, are written in the tail of the fish. The use of this method develops students' ability to analyze the text, highlight the main events, concepts, definitions and look for the reasons for their relationship, generalize and draw conclusions. The main goal of the method is to stimulate creative and develop critical thinking in students. We use the "Fish Bone" method in teaching the disciplines of Economics, Economic Analysis, Taxes and Taxation.

Another, no less interesting method of critical thinking used in the classroom is the "cluster method". A cluster is a graphical form of organizing the presentation of information, when the main semantic units are highlighted, which are fixed in the form of a diagram with the designation of all connections between them. The cluster can be designed as a model of a planet with satellites. In the center is the main economic concept, term, thought, on the sides are designated large semantic units, connected to the central concept by straight lines. And already around the "satellites" of the central planet there may be less significant semantic units that more fully reveal the topic and expand logical connections. Depending on the method of organizing the lesson, the cluster can be drawn up on the board, on a separate sheet or in a notebook for each student when completing an individual assignment. So, for example, with the help of a cluster in the lesson in the discipline "Fundamentals of accounting", students systematize and generalize their knowledge on the characteristics of the balance sheet, and in the discipline "Economic analysis" they form a scheme of factor analysis of economic indicators. The cluster method contributes to the systematization and generalization of educational material.

Experience shows that when solving economic problems, the most effective is the use of role-playing games. When carrying out a role-playing game, one or another production situation is imitated, real production conditions are taken into account, specific specific operations are

worked out, the corresponding work process is modeled [2, 35]. For example, when analyzing the balance sheet of an enterprise, it is possible to organize a role-playing game that simulates a meeting of the balance sheet commission of the enterprise. For this, a set of roles is created, which is distributed among the students of the group (chief accountant, deputy chief accountant, economist, director of an enterprise, etc.), the goal of the game is set, a specific task is given to analyze financial statements and identify reserves for effective financial management. The results of the analysis are then heard and discussed at a meeting of the balance sheet commission, where subsequently certain management decisions are made. Thus, role-playing games make it possible to activate the thinking of students, increase the independence of future specialists, and bring them as close as possible to the real conditions of production.

Quite an effective teaching method used in practical training is the solution and analysis of specific production situations [3,32]. At the same time, the group of students is divided into five or six microgroups. The composition of the group is determined independently by the students themselves, which creates comfortable conditions for their activities. In each microgroup, a leader is allocated who leads the work, distributes responsibilities between the group members. Each group is given a production situation, sources of information are selected to solve the assigned task, and time is given to complete the task.

For example, when completing a practical exercise on the topic "Assessment of the financial condition and business activity of an organization", each group is given the following assignments:

- to give an overall assessment of the financial condition of the enterprise according to the balance sheet data;
- to assess the solvency and liquidity of the company's assets;
- to assess the financial stability of the enterprise;
- to assess the business activity of the enterprise.

All these tasks are carried out by a group of students according to the data of the main forms of annual accounting statements and production and financial plans of various organizations. Based on the calculations performed, conclusions are drawn, reports are prepared, all results are discussed both within the group and with all participants in the lesson. Such activity of students allows them to stimulate the development of their self-esteem and self-control, and most fully to show their abilities and capabilities in the development of professional competencies. The activities of a teacher in such classes are reduced to the activities of a leader, assistant, controller and is aimed at encouraging and stimulating students' independent work.

The method of cases or the method of case studies (UCS) is used quite successfully in practical classes in the discipline "Management". The teacher, already at the stage of organizing the target space, acquaints students with the content of the case, identifies the problem, and forms micro-groups of students. Then, working in micro-groups, the students analyze the situation, deepening their understanding of the content of the case, develop solutions and present a report in the form of presentations. The case method combines search, problem and research teaching methods and allows students to master the general and professional competencies of their future specialty.

Teachers of economic disciplines practice integrated classes in their activities. An integrated lesson allows you to identify interdisciplinary connections between disciplines, MDC and deeper understand the importance of your future profession. For example, the disciplines of Economic Analysis and Information Technology in professional activities, professional modules in the specialty "Economics and Accounting" and Audit, and others are successfully integrated.

The use of active teaching methods involves the use of innovative teaching aids, namely, computer programs, presentations, electronic textbooks, manuals, workbooks. So, when performing practical calculations in the discipline "Economics of the organization" and "Economic analysis" students use the program "MicrosoftExcel", when solving problems in the discipline "Taxes and Taxation", "Audit" reference and legal system "Garant".

The optimal combination of active methods and innovative teaching aids allows students to form the professional competencies of the accounting profession.

Thus, the use of innovative pedagogical technologies contributes to:

- improving the quality of students' performance;
- an increase in motivation to study academic disciplines and professional modules; - the formation of professional competencies of a future specialist;
- Awareness of the importance of their future profession.

## **CONCLUSION**

I believe that the use of active teaching methods is aimed at the end result, namely, at improving the quality of training of specialists, at the students' awareness of the importance of their future profession, at the ability of graduates to make the most of their professional capabilities. As the results of reflection carried out in the framework of training sessions and research of the psychological service of colleges and technical school show, the goals have been achieved.

## NATIONAL FEATURE-CRITERION OF LABOR ORGANIZATION

N.Urinbaev\*

\*Associate Professor, Senior Lecturer,  
 Candidate of Philosophical Sciences,  
 Institute of Advanced Training under the Fergana Regional Department of Public Education,  
 UZBEKISTAN

### ABSTRACT

*This article discusses important issues related to the organization and management of labor. In the transition to market relations in Uzbekistan, great attention was paid to the national features of the organization of this labor. One of the important issues facing the requirement to take into account national specifics in the organization of labor in the process of transition to market relations is the priority development of trade and services. Unlike others, Uzbekistan is committed to investment, first of all, to the protection of the labor interests of our people, to establish cooperation with them on the basis of equal rights and mutual interests.*

**KEYWORDS:** *Market, Labor, Ethnopsychological, Lifestyle, Activity, Village, Population, Attitude, Socio-Economic Problems, Economy, Need, Degree, National Tradition, Method, Creativity, Property, Value.*

### INTRODUCTION

In the transition to market relations, it is important to take into account the characteristics of the ethnopsychological norm of labor organization, which is inherent in the national psyche. These features are characterized by the fact that the Uzbek nation has always been closer to the land at the level of social consciousness, the desire to have a private farm near his home is the basis of his lifestyle. It is this vital value that dominates all work-related skills. At a time when the natural demand for arable land among the local population is extremely high, the limited availability of arable land and its low quality composition pose serious socio-economic problems.

### MATERIALS AND METHODS

Only 10% of the total area of the country, which is more than 447.4 thousand square kilometers, is arable land. The number of people working on agricultural land is particularly high. Uzbekistan is the most densely populated region in Central Asia. 51.4 people per square kilometer of the territory of the Republic. However, this figure is several times lower in other republics.

This situation shows that we are absolutely overwhelmed by the demand and need of our able-bodied people living in rural areas. Also, due to the escalation of environmental problems, the level of land use is declining from year to year also sets the task of comprehensive study and application of national traditional methods in the organization of labor.

This state of the socio-economic situation is mainly explained by the lack of attention paid to this important issue in the way labor organization and management has been introduced in the recent past. While the republic views the national economy as a one-sided raw material base, it also has a technocratic approach to the organization and management of labor, and has not allowed the people to freely engage in the professions formed over the centuries. As a result, the creative and creative values of labor in the social consciousness have disappeared, and the process of alienation from labor has intensified year by year. People were forced to pursue their chosen professions secretly and semi-secretly.

The path chosen by the Republic of Uzbekistan in the transition to a market economy is based on national characteristics, "... in many respects, the processing of economic traditions and customs on a qualitatively new basis, to get rid of the old, unchanging path and to enlighten the economic thinking and psychology inherent in market relations among the population[1].

In the transition to market relations in Uzbekistan, great attention was paid to the national features of the organization of this labor. The family contract and lease method, which is based on different forms of ownership in land management, has developed as the most acceptable and most advanced method of labor organization.

This method of labor organization leads to the establishment of a new type of social relations based on ensuring the right of the farmer to own land, combining the economic freedom of each working person with his own success and personal responsibility for the welfare of his family.

## **RESULT AND DISCUSSION**

One of the important issues facing the requirement to take into account national specifics in the organization of labor in the process of transition to market relations is the priority development of trade and services. Market relations are not new for the Uzbek people, as for many Eastern nations. Our generation and ancestors have long been engaged in trade. Therefore, the history of our people has accumulated a great deal of experience in this area. Because market relations in our country have been developed since ancient times, in which "... patriarchal-feudal relations are explained by the fact that they are interrelated with the specific market relations that are emerging.

Despite the low level of maturity of market relations at that time, they left a deep mark. Even the harsh conditions of a planned-centralized economy have not been able to eradicate these traces". [1]

Another important factor that reflects national characteristics in the organization of labor is that "... the form of social cohesion is historically unique to the Uzbek people, which is closely linked to its traditional way of life." [2]. This factor is clearly reflected in the priority of family interests in our people, the commitment of the population to the community, the careful preservation of the shape of the neighborhood. In order to mobilize it, it is necessary to pay close attention to the priority of economic change, the abandonment of the administrative command system of distribution, the comprehensive consideration of the specific conditions and characteristics of the local people, traditions, customs and way of life.

The specific path of development produced should in practice prevent a sharp decline in production, provide social protection to the population in transition, and, most importantly, form a national traditional commodity production system. Rather than other independent CIS countries, Uzbekistan creates favorable conditions to support producers.

The population is divided by the ability to fill the consumer market with locally produced products. Commenting on this path of development, the first President of our country I.A.Karimov wrote: "We did not look for an easy way. In the early stages of the reform, we had to limit the consumer market somewhat. At the same time, we have spent money and resources on structural changes in the economy, building modern enterprises that produce products abroad, equipped with advanced technology, and fill the domestic market with our own goods. [2].

Based on the emerging socio-economic and natural conditions, the approach to the organization of labor, based on the annual characteristics, once again demonstrates its correctness in the conditions of cooperation with the investments that are being studied.

Unlike others, Uzbekistan is committed to investment, first of all, to the protection of the labor interests of our people, to establish cooperation with them on the basis of equal rights and mutual interests. That is why dozens and hundreds of manufacturing enterprises, such as the Asaka Automobile Plant, the Bukhara Oil Refinery, the Andijan and Fergana spinning and hosiery factories, are opening the way for the people of Uzbekistan to study world standards of labor organization.

One of the main ways to ensure the national characteristics of the organization of labor in the conditions of market relations is to open up the creative and labor potential of man through the radical reform of property relations, is to change the psychology of dependency that has been formed and to pave the way for the restoration in every worker of the sense of mastery which he has tried to lose in relation to his labor.

## CONCLUSION

Entrepreneurship and entrepreneurship, the ability to own property are in the blood of our people. Therefore, in the organization of labor, special attention is paid to the diversity of forms of ownership, the inviolability of private property and the formation of a class of owners who can be the economic and political basis of society.

Because only in this way, in the unique socio-natural conditions of the Republic, the irrational location and abundance of labor, the traditions and mentality of the population can be effectively directed to the activities of small and medium-sized businesses.

It is scientifically and practically based on the fact that in all spheres of the national economy of the republic, based on the roots and psyche of the people's historical labor traditions, small and medium business is considered as a dynamic, fast-paced leading development path that can fully meet modern requirements.

**ABSTRACT**

*According to the latest data of radiation diagnosis and sectional studies, it became known that the most common clinical manifestation of a new version of COVID-19 coronavirus infection is pneumonitis or intersticiopathy. The scheme of pathomorphological changes in the lungs seems to be as follows: interstitial inflammation → Interstitial fibrosis (NSIP) • Fibrin → Organization → Interstitial fibrosis (OIP) • Metaplasia of the alveolar epithelium (Fig1,2), [2, 4,4].*

Fig. 1 Interstitial inflammation: Elemental myxoid stroma in the interstition of interalveolar partitions. Coloring hematoxylin and eosin,  $\times 130$ .

Fig. 2 Intraalveolar expressed edema. Coloring hematoxylin and eosin,  $\times 25$ .

At the same time, traditional methods of anti-inflammatory and antibacterial therapy are often not effective, due to the pronounced edema and the impossibility of creating therapeutic concentrations of drugs in the lungs and the lymphatic system of affected mediastinal organs, which leads to a severe course of pathology accompanied by high death [1].

### Purpose of the study

The study of gentamicin pharmacokinetics with pretracheal lymphotropic antibiotic therapy and regional stimulation of the lungs' interstitial space's lymphatic drainage.

**KEYWORDS:** *Pretracheal Lymphatic Therapy, Covid-19, Pulmonary Complications*

## INTRODUCTION

### MATERIAL AND RESEARCH METHODS

Experimental studies consisted of three stages. The first stage consisted of a one-time administration with 50 gentamicin, in a dose of 30 mg/kg., One of the studied methods: lymphotropic is pretracheal, using lymphodases and intramuscularly as a stimulator - lidases and intramuscularly, with subsequent thoracotomy, undertaken to withdraw the chest organs. cavities, paratracheal lymph nodes, and puncture of femoral veins, for blood collection. The second stage was to dynamically determine the concentration of gentamicin in the blood and the elevated tissues. The third stage is 10 outlets, the radionuclide method of Kety, using albumin I-131, the rate of lymphatic lung drainage was studied, with a pretracheal administration of a not concentrated lidase solution.

### RESULTS AND ITS DISCUSSION

Analysis of the dynamics of gentamicin concentration during pretracheallymphotropic administration showed (Table 1), which the maximum concentration in the blood and tissues of respiratory organs is observed after 1 hour, as with intramuscular administration. In the serum, the concentration was 1 hour and  $40.9 \pm 0.49 \mu\text{g} / \text{ml}$ , and after 3 hours  $-25.9 \pm 0.49 \mu\text{g} / \text{ml}$ . After 5 hours, the concentration exceeded such with intramuscular administration of 7 times, constituting,  $2.9 \pm 0.1 \mu\text{g} / \text{ml}$ , ( $P < 0.001$ ). The area of concentration under curve  $-15.2 \text{ cm}^2$  in

the tissues of paratracheal lymph nodes, in all times of the study, the antibiotic concentration significantly exceeded that observed with intramuscular administration (Fig. 3). The maximum concentration of gentamicin in an hour was equal to  $90.5 \pm 12.4 \mu\text{g} / \text{mg}$ , ( $35.5 \pm 1.2 \mu\text{g} / \text{mg}$  - at V / m), after 3 hours -  $56.3 \pm 8,4 \text{ mg} / \text{mg}$  ., ( $26.8 \pm 0.2 \mu\text{g} / \text{mg}$ ), in the future, during the day, the concentration decreases evenly. After 24 hours, the subtherapeutic level was maintained -  $3.6 \pm 0.19 \mu\text{g} / \text{mg}$ , ( $1.4 \pm 0.12 \mu\text{g} / \text{mg}$ ), ( $p < 0.005$ ). The total area of concentration under the curve under the paratracheallymphotropic administration is  $41\text{cm}^2$ ., The area of concentration under the curve with intramuscular administration -  $28.7 \text{ cm}^2$

Fig.3. Dynamics of gentamicin concentration in paratracheal lymph nodes after single preaching lymphotropic and intramuscular administration.

In the tissues of the tracheal and bronchi, the maximum concentration of gentamicin after 1 hour is  $80.3 \pm 10.5 \mu\text{g} / \text{mg}$ , after 3 hours -  $72.4 \pm 9.3 \mu\text{g} / \text{mg}$ ., (Fig. 4). After 5 and 8 hours, high therapeutic concentrations are held, after 24 hours the antibiotic content is maintained at the subtherapeutic level and equal to  $4.9 \pm 0.3 \mu\text{g} / \text{mg}$ , ( $3.7 \pm 0.2 \mu\text{g} / \text{mg}$  at a per / m administration). The area of concentration under the curve is  $47.0 \text{ cm}^2$ ., (At a per / m administration -  $24 \text{ cm}^2$ ).

Fig.4 The dynamics of gentamicin concentration in trachea and bronchi after a single paratracheallymphotropic and intramuscular administration.

In the lungs, under pretracheallymphotropic administration, the content of gentamicin was 1 hour  $102.4 \pm 13.3 \mu\text{g} / \text{mg}$ , decreasing 3 hours to  $63.3 \pm 2.3 \mu\text{g} / \text{mg}$ ., (Fig.5). During the day, its concentration decreases smoothly, after 24 hours it was  $9.8 \pm 0.44 \mu\text{g} / \text{mg}$ . and exceeded as 2 times compared with intramuscular administration. The concentration area under the curve is  $50.9 \text{ cm}^2$ ., (At the I / M of the introduction -  $21 \text{ cm}^2$ ), ( $p < 0.005$ ). In the pleural tissue, the antibiotic content after 1 hour -  $38.6 \pm 3.2 \mu\text{g} / \text{mg}$  ( $23.9 \pm 0.49 \mu\text{g} / \text{mg}$  at V / m), after 3 hours -  $18.9 \pm 0.97 \mu\text{g} / \text{mg}$ ., ( $6.2 \pm 0.49 \mu\text{g} / \text{mg}$ ), and within the remaining duration of observing the concentration of gentamicin at both methods of administration amounted to approximately the same values.

Fig.5 Changing the concentration of gentamicin in the pulmonary tissue after one-time paratracheallymphotropic and intramuscular administration.

**TABLE 1 THE CONCENTRATION OF GENTAMICIN IN BLOOD SERUM (MG / ML) AND TISSUES (MG / MG) IN ONE-TIME INTRAMUSCULAR AND LYMPHOTROPIC PREACHING INTRODUCTION AT A DOSE OF 30 MG/KG**

Biological substrate		Time after administration (h)				
		1	3	5	8	24
Blood in	i/m	238,2±18,2	101,8±7,8	0,41±0,06	0,23±0,02	0,019±0,004
	l/t	40,9±0,49	25,6±0,49	2,9±0,1	0,43±0,1	0,036±0,002
Paratracheallymphnodes	i/m	35,5±1,2	26,8±0,2	7,4±0,2	5,1±0,49	1,4±0,12
	l/t	90,5±12,4*	56,3±8,4*	13,9±1,2	6,7±1,02	3,6±0,19*
Trachea bronchi	i/m	70,2±7,3	68,8±10,1	27,4±0,5	6,5±0,1	3,7±0,2
	l/t	80,3±10,5*	72,4±9,3	45,3±2,4*	14,6±0,7*	4,9±0,3
Lungs	i/m	93,3±3,2	41,8±2,3	33,5±0,6	12,8±1,2	5,2±0,46
	l/t	102,4±13,3	63,3±3,3*	48,9±0,5*	20,1±1,2*	9,8±0,44*
Pleura	i/m	23,9±0,49	6,2±0,49	1,8±0,19	1,7±0,22	0,48±0,05

	l/t	38,6±3,2*	18,9±0,9 *	1,5±0,12	1,4±0,1	0,58±0,05
--	-----	-----------	---------------	----------	---------	-----------

Note B-external-free, L-lymphotropic method: \* -duppottically different values at compared methods of administration (P <0.05).

The area of concentration under the curve is 13.2 cm<sup>2</sup>. The introduction of lidase into the preaching cellular space, as shown by our radionuclide studies, increase the lymphatic drainage of the interstitial space of the lungs by 120-180% (P< 00.5).

In the first clinical trials, on volunteers, the method of pretracheallymphotropic antibiotic therapy with regional lymph stimulation turned out to be very encouraging.

## CONCLUSIONS

Analysis of data of pharmacokinetics and radionuclide study of lymph flow showed that the method of lymphotropicpretracheal administration of antibiotics and regional lymph stimulation may have advantages over the traditional methods of administering drugs in the treatment of pneumonitis (intersticiopathy) at COVID-19, due to higher and prolonged content of the latter in tissues and The lymphatic system of the bronchopulmonary system is the place of the largest cluster and the spread of infection, as well as the stimulation of the lymphatic lung drainage.

**ABSTRACT**

*The teaching effectiveness of a faculty is assessed on various criteria such as professional competencies, student feedback, interpersonal relationships with students and peers, personality of the teacher and last but not least teaching capabilities. There are abundant studies on teaching effectiveness, organisational politics and employee engagement, however this research is the first of its kind to discuss about the relationship and its influence on teaching effectiveness. The researcher has collected the primary data source through structured questionnaire collected from 410 college teachers working in various private engineering colleges operating in Rayalaseema Region of Andhra Pradesh. Since the study is sought to understand the relationship and influence among the variables, the study adopts descriptive research design. The sample selected from the total population through convenience sampling method in selection of college teachers in collecting the primary data. The results revealed are as follows:*

- *The study findings reveal that college teachers have mediocre perception levels towards organizational politics and employee engagement.*
- *The study finds significant association organisational politics, employee engagement and its influence on teaching effectiveness.*

- *In addition the study finds negative association of organizational politics and Teaching Effectiveness.*
- *However the study fails to prove significant moderation effect of organizational politics on the relationship between employee engagement and teaching effectiveness.*

*Even though study fails to prove the moderation effect of organisational politics, it should be considered as critical variable in influencing teaching effectiveness. Consequently the study suggests management of private engineering colleges need to design appropriate policies and programmes to free the institutions from politics.*

**KEYWORDS:** *Employee Engagement, Organisational Politics, Teaching Effectiveness, Private Engineering Colleges.*

---

## 1. INTRODUCTION

Organisational politics is a quest of individual agendas and self-interest in an organization without regard to their effect on the organization's efforts to achieve its goals. Hence it is treated as a negative variable that affects environment, morale, culture and employee behavior. Private engineering colleges too cannot be exempted from Organizational politics, which can influence the overall teaching effectiveness. Hence the researchers in human resource domain are more interested in understanding the characteristics and momentous of organizational politics and its influence on performance of the institution. It is evident from the literature that organizational politics has among the various variables in negatively affecting the growth of the organization in many areas.

At the other end employee engagement is a noteworthy behavioral variable that has become essential and expected by the management. In order to enhance employee engagement the management has to think and implement those schemes pertaining to the welfare and growth of employees in the organization. However the organizational politics is one variable that has negative effects on the employee who is engaged in his work.

After the effects of prolonged recession and at the foot hills of growth of global economy, the colleges and universities are been questioned and facing greater scrutiny on their efficiency as well as concerns about teachers ability to educate a highly diverse population. The teachers in private engineering colleges in particular are been facing enquires and reports on their productivity, rigor and contributions to the economic development and intellectual vitality, at the outset coping with reduced public funding and assuming larger academic workloads. Consequently the teachers in private engineering colleges have reported professional isolation, higher levels of occupational stress and decreasing levels of job satisfaction and retention. The present levels of economic and demographic conditions, teachers are expected to contribute higher levels of accountability pertaining to their teaching and research efforts and also to cater the needs of higher diverse and globalised society. Consequently the study is assumed to be important in understanding the various employees and organizational factors that influence teaching effectiveness. Hence the present research is sought to understand the association between Organizational Politics, Employee Engagement and Teaching Effectiveness.

## 2. REVIEW OF LITERATURE

**Massimo Garbuio, Dan Lovallo, (2017)**, in their paper titled "Does organizational politics kill company growth?", has discussed about the organisational politics and its negative effects on organisation growth. The basic question behind the research is that whether the organizational politics is positively associated to organisation performance. It is observed from the literature though there are ample studies on the above research question, but are limited to the elaboration in the form of case studies, apart from a niche set of studies in international business.

Hence the above research is been aimed to investigate the above said question through a survey among managers and executives working around the world and across industries. The study was successful in determining the association between politics and the ability of a company to achieve the higher heights. The study was conducted among the 382 executives from across the world. It is evident from the study that alternative explanations of slow speed to growth are explained by power centralization and decision making layers and conflicts.

It is evident from the present study that covert action of executives in influencing the internal decision has direct negative effect on a firm's ability to reach higher growth rates. That is, not only is politics time-consuming but it may also have a detrimental impact on the selection of the best growth opportunities. Hence it can be understood that politics has negative influence on growth, it slows down the ability and creates hurdle in reaching higher growth rates of market. It is also evident from the study that the reasons for slow pace to market is not only because of too many decision making layers but also because of consultative processes in resource allocation decisions and conflicts.

**Zinta S. Byrne, Steven G. Manning , James W. Weston, Wayne A. Hochwarter, (2017)**, in their paper titled "All Roads Lead to Well-Being: Unexpected Relationships Between Organizational Politics Perceptions, Employee Engagement, and Worker Well-Being" has been initiated to investigate the perceptions of organizational politics and its negative influences on detrimental outcomes of the organization and employees. The recent past demand for literature on more balanced treatment, the present study is been extended to know how the positive and negative organizational politics perceptions are reasons for stressors and affecting the employee efforts through the effect on social environment. The study assumes that employees appraise of positive and negative politics is either a challenge or hindering stressors or they respond with engagement and disengagement as problem or emotion focused coping strategies. In particular employees perceiving negative politics as hindrance use both problem and emotion focused coping strategies such as (1) decreasing their engagement, (2) narrowing the focus of their engagement, or (3) disengaging. Consequently these strategies result in negative impacts on organization, but if the employees coping with negative politics leads to their positive well being.

Conversely the employees perceiving positive politics as a challenge stressors use problem focused coping strategies such as increasing their engagement to reap the perceived benefits of a positive political environment. However positive politics perceptions may be perceived as hindrance stressors in certain situations and therefore employees resort to adopt emotion focused coping wherein they use a disengagement strategy. In disengagement process they deal with negative effects of politics perceptions and resulting in positive well being. Thus the study conceptual framework suggest that any unexpected turn to the stress process of politics can lead strain provoking component of employee work environments.

**Erin M. Landells, Simon L. Albrecht, (2017)**, in their paper titled “Positive Politics, Negative Politics, and Engagement: Psychological Safety, Meaningfulness, and Availability as “Black Box Explanatory Mechanisms” has been initiated to investigate on the psychological mechanisms that can explain the influence of negative organizational politics on individual employees and organisational performance. Since majority of the literature is inclined towards understanding the negative outcomes such as stress, burnout and turnover intentions. Hence the present study is sought to describe more about the positive conceptualizations of organizational politics and investigate the potential associations between both positive and negative politics and employees engagement. The outcome of the present study is to propose a model exhibiting how psychological conditions such as safety, availability and meaningfulness explain the relationship between perceptions of positive and negative politics and employee engagement. Therefore it is concluded and suggested that practical interventions that support organizations developing a more positive organisational political climate.

**Aviv Kidron, Hedva Vinarski Peretz (2017)**, "Organizational political climate and employee engagement in political behavior in public sector organizations: a mixed methods study", The study is sought to know the association between organisational politics climate and individual engagement in political behavior. Further the moderating role of organisational commitment and trust in local government organizations. Mixed and explanatory methods design were adopted and data is collected from 217 managers and employees, in addition 16 interviews were conducted.

The findings of the study suggested that political climate is associated with political behavior, further associated with trust and affective commitment and negatively associated to political climate. The moderating role of trust between political climate and political behaviors is evident from the study results. In addition it is observed that the moderation effect of affective commitment moderated by political climate and political behavior in the case of women. It is also evident that men perceive more positive than women regarding the organizational politics.

**Usman Aslam, Farwa Muqadas, Muhammad Kashif Imran, Ubaid Ur Rahman, (2018)** in their paper titled "Investigating the antecedents of work disengagement in the workplace" has proposed that organizations are anxious in knowing the causes of work disengagement and effecting the desired level of performance. The predictors and levels of work disengagement differ among organizations and sectors, the reason could be the differences in organisational culture Galit Meisler, Eran Vigoda-Gadot, Amos Drory, (2017). Hence the aim of the present study is to determine the predictors of work disengagement. The study is conducted among 303 employees of the public sector organizations through self administered questionnaires and cluster sampling technique. Hayes's (2013) moderation model and regressions statistical techniques reveal that work disengagement is increasing because of manager's personal preferences, unfairness, over the rule practices, negative political influence, work overload, and a lack of accountability in the workplace. It is also evident that there is positive relation among organizational injustice, organizational politics, work overload, and work disengagement. In addition it is also observed that organizational injustice is a strongest antecedent of work disengagement. Bureaucratic culture of the public sector organizations has a strong strengthening effect on above-stated relationships. The mixed methods design for studying the contextual-organizational antecedent (perception of political climate) for politicking and individual

engagement in political behavior may serve to expand the theory of organizational politics Mohammed Y.A. Rawwas, Basharat Javed, Muhammad Naveed Iqbal, (2018).

### 3. Objectives

The following are the objectives of the study:

1. To investigate the demographic profile of faculties working in private engineering colleges in Andhra Pradesh
2. To determine the negative effects and moderations of organisational politics on relationship between employee engagement and teaching effectiveness.

### 4. Hypothesis Development

**H1:** *There is significant association between employee engagement and Teaching Effectiveness*

**H2:** *There is negative association of Organisational Politics on Teaching Effectiveness*

**H3:** *Organisational Politics negatively moderates the relationship between employee engagement and Teaching Effectiveness.*

### 5. Research Design

The aim of the present study is determine the perception levels of engineering colleges teachers and direction of relationship between Employee Engagement, Organizational Politics and Teaching Effectiveness. Consequently the study assumes employee engagement, organisational politics and teaching effectiveness as independent, moderating and dependent variables. The engineering college teachers are the respondents of the study. Hence the study is sought to describe the levels and relationships between the study variable, descriptive research design is adopted.

#### Sample Design and size:

Andhra Pradesh is a geographically dispersed state, classified with two regions –Rayalaseema and Coastal with 13 districts. Convenience sampling techniques is followed to select the respondents among the populations. Since the faculty members working in private engineering colleges working are geographically dispersed, it is difficult to get access, because of their availability during the visit to the colleges; hence the study adopts convenience sampling method.

Even though convenience sampling method is adopted at most care is taken in selecting the colleges and faculty members for collection of the primary data. The study in the first stage divides Andhra Pradesh into Rayalaseema region comprising of four districts and Coastal region comprising of nine districts, then among the two regions Rayalaseema Region is selected for the study. Rayalaseema region is selected since the density of private engineering colleges to area is high comparatively to Coastal region. In Rayalaseema region, i) Kadapa (21 colleges), ii) Chittoor (32 Colleges) iii) Kurnool (21 colleges) and iv) Anantapur (15 Colleges) have 89 private engineering colleges are selected as sample in first stage.

The researcher has visited the above engineering colleges as stated in the above towns randomly, before visiting the colleges the faculty members and principals of the respective

colleges are been requested for permission to conduct the survey. Hence the survey is conducted only in those colleges where the permission is granted.

The sample size of the study is calculated using [www.raosoft.com](http://www.raosoft.com) website. The inputs to be given for calculating sample size are i) Margin of error accepted ii) Confidence level iii) Population size and iv) Response distribution.

The study considered a Margin of error equal to standard of 5%, Confidence level 95%, Population size of 20,000 (Assumed value, since the exact number of faculty members is not known) engineering faculty members in Andhra Pradesh and Response distribution of 50%. Finally the calculated value of sample size is 377. Hence the study collected primary data from 400 engineering college faculty to the nearest value. The 400 sample is been distributed equally among the four districts of Rayalaseema Region, Hence from each district the study has collected the primary data from 100 engineering college faculty members. The details are as follows.

**TABLE 1: SAMPLE DISTRIBUTION**

SL.No	District	Sample Size
1	Kadapa	110
2	Chittor	100
3	Anantapur	100
4	Kurnool	100
<b>Total Sample Size</b>		<b>410</b>

### **Data Collection:**

The present study has collected the primary data by distributing structured questionnaire among engineering college faculty members working in Andhra Pradesh. Enough care has been taken so that the data collected is not biased. We have distributed questionnaires to each and every faculty and the opinions given by them are truly confidential.

### **Statistical Tools:**

Data is analyzed by using SPSS 16.0 version. Statistical tools like correlation and regression analysis were employed for this study.

### **6. Data Analysis**

The study states Organizational Politics negatively moderates the relationship between Employee Engagement and Teaching Effectiveness. The hypothesis is tested by conducting regression analysis, Teaching Effectiveness is considered as dependent variable, Organizational Politics as moderating variable and Employee Engagement as independent variable. Results are summarized in the following **Table 2**.

**TABLE 2: MODERATION EFFECT OF ORGANIZATIONAL POLITICS ON EMPLOYEE ENGAGEMENT AND TEACHING EFFECTIVENESS**

Regression Parameters	Employee Engagement(EE)	Organisational Politics(OP)	EE*OP	Model Summary
R <sup>2</sup>			.0017	.119
Df			406	406

<b>F</b>			.791	18.44
<b>P</b>			.374	.000**
<b>B</b>	.459	-.203	.0989	4.204 (Constant)
<b>T</b>	6.407	-2.947	.889	103.129
<b>P</b>	.000**	.003**	.374	.000**

\*\*Significance at  $P < 0.01$ .

\* Significance at  $P < 0.05$ .

**Model:** Employee Engagement (Predictor), Organisational politics (Moderating Variable) and Teaching Effectiveness (Dependent Variable).

The regression of Organizational Politics on teaching effectiveness is significant at  $\beta = -.203$ ,  $t(406) = -2.947$ ,  $p = .003$ . The regression of Employee Engagement on Teaching effectiveness is significant in presence of Organisational Politics at  $\beta = .459$ ,  $t(406) = 6.407$ ,  $p = .000$ . The total model summary is significant at  $R^2 = .119$ ,  $F(406) = 18.44$ ,  $p = .000$ . Interaction effect of Organisational Politics and Employee Engagement is insignificant at  $R^2 = .0017$ ,  $F(406) = .791$ ,  $p = .374$ ,  $\beta = .0989$ ,  $t(406) = .889$ ,  $p = .374$ .

**Chart 1: Interaction Effect of Employee Engagement and Organizational Politics**

It is observed from the above interaction plot chart 1, Teaching Effectiveness is low at High Organisational politics and Low Employee Engagement. Further, it is inferred that Teaching Effectiveness is high in the conditions of Low Organisational Politics and High Employee Engagement. However, study fails to prove statistically the moderation effect of Organizational

Politics on relationship between Employee Engagement and Teaching Effectiveness. Hence **H1 and H2 are accepted and H3 is rejected.**

## 7. DISCUSSION

The study find faculty has neutral opinions regarding organizational politics. Politics is a constraint for organisational development. In the context of private engineering college the study opines Organisational Politics being neutral as a positive setting. In the opinion of faculty and personal observation, Organisation rewards people working hard; favoritism is less in the organization. Conversely the faculty opine, they fear to speak due to retaliation of others; there are some influential group in organisation on which no one crosses.

The study finds relatively positive levels of Employee Engagement among faculty in engineering colleges. The faculty opines that they are fascinated being a member of their organisation; highly engaged in their job and they feel concern regarding the activities happening in their organization. Hence the study opines faculties are engaged in their job and organisational activities.

The study examines relationship between organisational politics, employee engagement and teaching effectiveness, finds that there is significant relationship. However the study fails to proves significant moderation effect of Organisational politics.

The study finding shows that Organisational Politics and Employee Engagement have significant variance in Teaching Effectiveness in isolation. Conversely interaction plot reveal unresponsive lines indicating Organisational Politics have insignificant moderation effect on Employee Engagement and Teaching Effectiveness. Additionally the statistical results reveal Organisational Politics have insignificant moderation effect. Hence the study opines Organisational Politics has no influence on the relationship between Employee Engagement and Teaching Effectiveness.

### INTRODUCTION

As mentioned above, 4-component noun phrases are the most difficult to translate into English. This is due to the fact that they are not available in paper dictionaries, and such a developing and new science as opt informatics constantly requires competent translation, especially complex terminology.

There is a special algorithm for translating terms, which greatly simplifies the task of the translator.

1. Since we consider the specifics of the translation of a multicomponent terminology, and, as mentioned above, it is almost impossible to find such a term in a paper dictionary in its full

version. In this case, the translator must refer to the terminology dictionaries in order to find the translation of each n-gram component separately. For example, consider such a four-component term as the total power of the directed rays. We divide it into two components: the total power and the directed rays. One of the most effective methods for testing a hypothesis is a search engine on the Internet. It is such because, when we search for a term in the search bar, we see the frequency of use of terms in the texts of various fields of knowledge and can choose the one that is used in our own field. After translating the first component in the terminology dictionary, we get the full capacity translation. The translation of the second component in our hypothesis will sound like directed beams. Combining both elements, we get the translation: full capacity of the directed beams. To make sure that the translated name group is correct, enter the resulting translation of the term in the search bar. Sometimes, search engines can display a complete translation of one or even two components, but, in this case, you need to be extremely careful in the texts of what nature this term or part of it occurs. In our case, we see that 37 variant of the wording of the translation of the term is not found in the search engines Google and Yandex.

2. In cases where the terminology dictionary and search engines they cannot cope with the task, a good assistant in the translation of scientific and technical terminology, and, in particular, multicomponent vocabulary, can be the Transdict program, which is a bilingual lexicographic knowledge base. The dictionary includes only a limited set of values in each zone: not everything that is in the language, but only what may be needed for automatic processing of highly specialized texts and makes this processing less complex. The main advantage is that Transdict includes the translation of nominal phrases related to the area of knowledge we are studying. Another advantage of the program is the introduction and preservation of multicomponent terms, which are then checked by specialists in this field.

3. Turning to the dictionary Transdict, select the search field where you need to enter the desired 4-gram. We get the translation: the total power of the associated rays in order to check the correctness and use in scientific works on opt informatics, it will be correct to use any of the search engines again. Again, we enter the resulting translation of the total power of the connected rays in the search bar. The Google search engine produces a huge number of results, but the very first ones already make it possible to understand that there really is one and it is used in materials related to opt informatics - the theory of the optical waveguide-Page 71-The result from Google and the Book. According to the first sentence, which shows the user where the desired term is used, it becomes clear that we are looking at a scientific work, which is indicated by the keywords in this sentence. Consider, an immediate consequence of this definition is that fibers with the same profile volumes carry the same total power of the bound rays when illuminated by a diffuse source.

The translation will sound something like this:

An immediate consequence of this definition is that fibers with equal profile volumes carry an identical total transmission beam power when illuminated by a diffuse source.

Thus, thanks to the compilation of a translation hypothesis, which in most cases can be trusted, but always to question and verify the correctness of a particular term, as well as the use of specialized automatic translation dictionaries related to narrow areas of knowledge-makes the task of translating a complex, multi-component term much easier.

During the translation process, a specialist may encounter such a problem as a search for an English equivalent for a Russian term, since in English it can be interpreted in different ways, that is, it may have more than one syntactic structure. For example, take two multicomponent terms, the shape of the refractive index profile and the function of the refractive index profile. We see that the structure of these terms in the Russian language is the same and, moreover, the three components of this 4-gram are absolutely identical. But despite this, when translating two given multicomponent elements, their syntactic structure will differ. The refractive index profile function can be translated as a complex attribute group refractive index profile function, while in 4-gram-refractive index profile form-the defining word in the translation will stand at the beginning-shape of the refractive index profile, which makes the term for the translator much simpler in structure. Accordingly, the choice of a translation of terms that are identical in structure in Russian directly depends on the word being defined.

Another difficulty that can be identified when translating scientific and technical multicomponent terms is the variety of translation options for the same nominal group. In such cases, the choice of the equivalent of the term when translated into English is influenced by three other components that belong to this nominal group. For example, the following terms as a "system of coupled mode equations", it can be translated in two ways. The first option will sound like system of equations of the coupled mode, while another valid translation option may be the multicomponent term system of coupled mode equations.

In order to check which version of the translation is correct, really used in real texts of a scientific nature, you should again turn to the search engine. When checking the first term, we will make sure that it is used very rarely in texts, while the second version of the translation is found on the Internet about 40 million times. Another example is the 4-gram "field of higher-order modes". We can translate this term in two ways: field of modes of the higher-order and field of the higher-order modes, and referring to the texts in which these translation variants occur, we are convinced that several equivalents can correspond to the Russian term in English, and the most frequent in use, as a rule, are terms in which three components form an attribute construction.

Special attention should be paid to the problem of translating terms in the field of opt informatics in grammatical constructions. In the body of the text were such multicomponent terms as "use of three-dimensional photonic quasicrystals", "production of three-dimensional photonic crystals", and "violation of total internal reflection" are found. In order to translate them correctly, you need to understand how the keywords are expressed in these terms. We see that all of them have a suffix-n, which most likely indicates that they belong to the verbal forms of the noun. Only they, in turn, are translated into English by a gerund, which combines the features of a noun and a verb and carries the meaning of a process. This form is not inherent in the Russian language.

As a result, we get the translation using the three-dimensional photonic quasicrystals, acquiring three-dimensional photonic crystals and breaking of the total internal reflection, which once again confirms the difference in grammatical forms of the two languages, which can cause problems when translating. The text body contains multicomponent terms that should be translated from Russian into English using attribute constructions. Examples of the most frequent terms constructed on an attribute basis are presented in Table 1.

**TABLE 1 – TRANSLATION OF RUSSIAN TERMS INTO ENGLISH, BY ATTRIBUTE GROUPS**

форма профиля показателя преломления	15	refractive index profile form
параболический показатель преломления профиль	14	parabolic refractive index profile
эффективность основной моды возбуждения	14	fundamental mode excitation efficiency

In our study, we considered four-component terms, since they are the main difficulties in translating from Russian into English. Russian translation is based on the difference in the syntactic structures of the two languages, the variety of equivalents in English that fall on one Russian term, as well as the appearance of new components in the English equivalent when translated from Russian.

Further, a translation hypothesis was developed, which makes it easier for the translator to solve the problem and increases the chances of finding a more accurate equivalent of the term in English. Each term was translated using this technique, as well as checked in Internet search engines in order to identify the use of a particular term in the texts of technical fields of knowledge. Dictionaries such as Transdict, Google, and Prompt were among the main helpers in translating terms.

### ABSTRACT

*The article presents the results of experimental studies of the phenomenon in a flat gas-discharge cell with a semiconductor electrode. The possibility of limiting the background, which is an obstacle to increasing the contrast of the output image, is shown.*

**KEYWORDS:** *Image Converter, Semiconductor Electrode, Ionization Chamber, Gas-Discharge Gap, Semi-Insulating Gallium Arsenide, Photodetector, Current-Voltage Characteristic, Photocurrent, Pulse Duration, Pulse Voltage.*

### INTRODUCTION

A semiconductor photographic system of the ionization type, in which one of the electrodes is a plate made of a high-resistance and photosensitive semiconductor, has found practical application in recent years. On its basis, so-called photoionization systems have been created, which are used for high-speed IR photography [1-2], silver-free photography, as IR image converters [3-4], as devices for visualizing electrical and structural defects in high-resistance semiconductors, as a source of uniform UV radiation over a large area, as a system where dissipative structures are formed in a gas plasma [5].

The semiconductor ionization system [6] operates in two modes: waiting and gating. In the standby mode, high-resistance semiconductors with  $p \geq 10^7$  ohm cm at direct current are mainly used. In the gating mode, relatively low-resistance photodetectors are also used in the pulse

mode. In the second case, the dark current and thus the background radiation on the output screen of the semiconductor ionization chamber is much larger.

The study of the dependences of the average current on various values (photocurrent, pulse duration, pulse voltage, gas pressure, etc.) in the system is of considerable interest not only for understanding the physical mechanism of phenomena, but also has applied significance.

Recent research suggests that a new approach to a flat gas-discharge cell with a semiconductor photosensitive electrode will lead to a new class of devices. In our next works, we will show that changing the configuration and location of the cell elements, as well as the use of new photodetectors, allows us to create a unique photographic system, or rather a modern type of night vision devices.

This paper presents the results of experimental studies of the phenomenon in a flat gas-discharge cell with a semiconductor electrode. As part of this work, the possibilities of limiting the background, which is an obstacle to increasing the contrast of the output image, and in general improving the characteristics of the system, are shown.

### SCHEMATIC DIAGRAM OF THE SYSTEM

The schematic diagram of a semiconductor ionization photographic system is shown in Fig.1. The photosensitive photodetector (2) is a semi-insulating gallium arsenide ( $\rho \cong 10^8 \text{ Ohm.cm}$ ), on one of the surfaces of which a translucent nickel contact (1) is filed. The inner surface of the plate is separated from the surface of the recording layer (4) by a gas gap (3). The recording layer (4) is located on a transparent conducting counter-electrode (5), made, for example, of a glass plate covered with a conducting film. When connected to the voltage system, a gas discharge breakdown occurs, characterized in that there is a distributed resistance of the semiconductor in the discharge cell, which contributes to the damping of current instabilities.

**Fig. 1. Schematic-ionization system .**

**1 – translucent electrode, 2-semiconductor photodetector,  
3-gas-discharge gap, 4-recording layer, 5-transparent counter electrode.**

The resistance of a semiconductor completely determines the value of the current density over the cross-sectional area, and when the semiconductor is illuminated, it can control the value and distribution of the current in the gas gap.[7]

For the measurements, the usual scheme of an ionization system with a semiconductor photodetector made of compensated gallium arsenide with a dark resistivity  $\rho = 108 \text{ om}\cdot\text{cm}$  was used. Providing output voltage pulses with a duration of 0.5 – 30 ms, up to 1.6 kV. The measurements were performed at two values of the gas discharge gap-40 microns and 100 microns-and an air pressure of 0.2 atm.

## RESULTS AND DISCUSSIONS

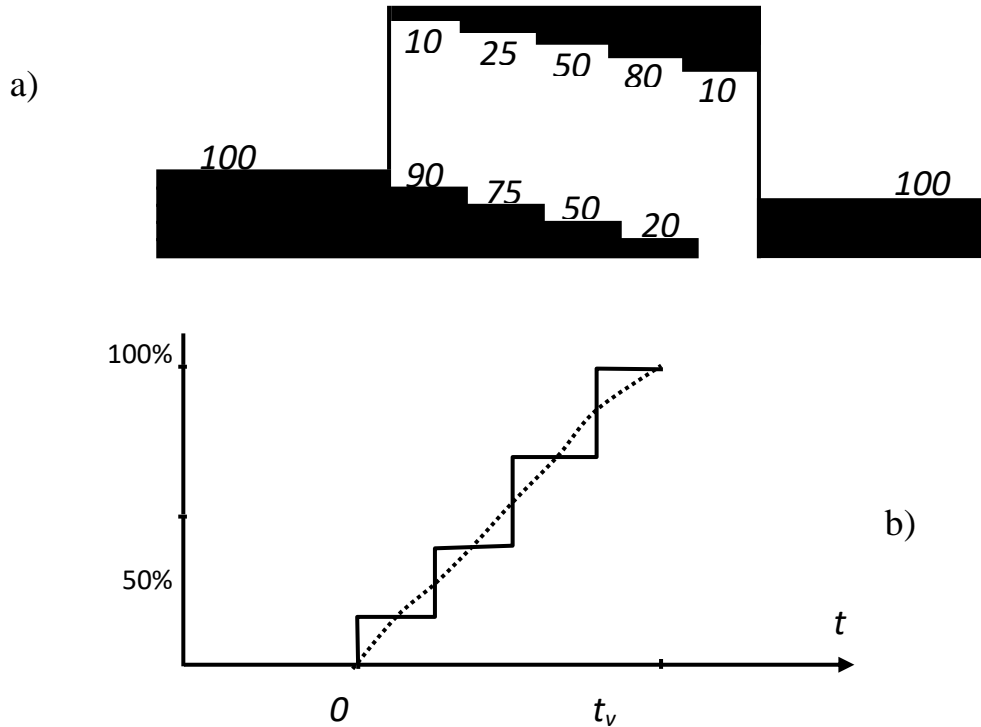

When a rectangular voltage pulse is applied to a cell consisting of a gas – discharge gap contacting, on the one hand, a semiconductor electrode and on the other, a counter electrode, a gas breakdown occurs. The appearance of current pulses – the presence of an easily recorded delay time  $\theta$  relative to the moment of switching on the voltage. Another feature of current pulses is the presence of a statistical spread of the breakdown delay value  $\chi$  relative to some of its values.

Figure 2 shows a diagram of oscillograms of successive current pulses, illustrating the nature of the manifestation of the statistical spread of the moment of ignition of the discharge. Oscillograms of successive current pulses were taken in a semiconductor ionization chamber, illustrating the nature of the manifestation of the statistical spread of the discharge ignition moment.

**Fig. 2. Diagram of the breakdown current  $j$  waveforms with voltage pulses  $V$  applied in series.**

Since the photographic effect on the recording medium is determined by the value of the average amount of electricity, we were interested not only in the values of the charge in each individual current pulse, but also in the average values of the charge and current over the period. Therefore, the first experimental task was to determine the average current averaged for each moment of time by the total number of pulses during exposure.

**Fig. 3. a). Schematically – the distribution of the optical density of blackening on the current pulse waveform. b). the time dependence of the average current obtained from the waveform (a).**

The method for obtaining the average current kinetics from densitometry of waveforms is schematically explained in Fig. 3, a, where the optical density on the waveform is conventionally represented by lines of different thickness, and the smooth curve in Fig. 3, b shows the resulting average current kinetics.

Thus, the total delay time is determined by two components: the delay time of the discharge gap capacitance through the illuminated semiconductor and the time of the statistical breakdown delay at a given voltage in the gap.

To determine the value of the stationary voltage, the stationary VAC was removed (Fig. 4), from which it follows that the value of the breakdown voltage is 500 V with a gap length of 100 microns. The value of the resistance under illumination varies from 50M to 790K.

**Fig. 4 Stationary VAC systems at different values of the semiconductor illumination. The light intensity is equal to (in rel. units.): 1 – 100%, 2 -72, 3 – 50, 4 – 25, 5 – 10, 6 – 0%.**

Figures 5a and b show the dependences of the average current in the pulse on the light intensity at different values of the voltage pulse duration. A characteristic feature of the curves is the "threshold" type of these dependencies, which is a consequence of the breakdown delay effect. With an increase in the duration of the voltage pulse, the threshold value of the illumination intensity decreases, below which the conduction current in the system, and therefore the discharge glow, is absent. Note also that starting from the threshold value, the current, as well as the past charge, sharply increase with increasing light intensity. Received "threshold values" the dependences of the average amount of electricity passed and the value of the average current with the adjustment of the threshold value are of considerable interest, being in principle a new method of background discrimination. Such a possibility of dynamic background discrimination is undoubtedly realized in independent gas-discharge cells with a distributed resistance of the semiconductor electrode in a semiconductor photographic system of the ionization type.

**Fig. 6. a). Lux-ampere characteristics of the system at different values of the voltage pulse duration with a gap thickness  $d = 40$  mm. b). The same is true for the gap thickness  $d = 100$  mkm.**

Studies of the dynamic background discrimination mode with photographic image registration at different values of the breakdown delay and different illumination of individual areas of the semiconductor photosensitive electrode area are carried out

## CONCLUSION

Thus, the shown breakdown delay in a gas-discharge cell with a semiconductor electrode during electrical and photovoltaic measurements generally confirms the possibility of implementing dynamic background restriction at a given level.

### **ABSTRACT**

*This system allows to control the flow of light by adding or subtracting light. Such actions can be performed via a remote control. This system is quite complex, but very convenient. With the help of this system, a special sensor that detects the level of light can be installed and it is possible to provide automatic lighting of lamps at the desired level. The article discusses the support of energy-saving systems in the technical regulation of public utilities, in particular, metrological regulation of ballast effect control.*

**KEYWORDS:** *Light Flux, Acoustic Noise, Acoustic Control System, General Control System, Optical Control System, Functional Circuit, Light Source.*

### **INTRODUCTION**

In today's world of energy, most of the electricity is used for lighting. Based on the facts on the topic, we can say that in most industries, agriculture, national economy, industry and utilities, energy conservation and energy conservation issues have become an urgent problem of modern lighting systems technologies. In 14 countries of the world there are state programs and fundamental projects on energy saving in green light systems, according to which practical and financial support is provided for the development of energy saving systems. [10]

EE consumption can be reduced due to a competent choice of lighting devices with the required light distribution, design, and optimal suspension height. Today, luminaires with fluorescent lamps (FL) are widely used for lighting public premises. When choosing lamps with FL, and other light sources, special attention must be paid to the optical efficiency, the higher it is, the better. [2]

The optical efficiency (CUA) of a luminaire largely depends on the reflector and diffuser used in the luminaire. Currently, for the production of diffusers for fluorescent lamps, polymethyl methacrylate, polycarbonate and light-stabilized polystyrene are used. During the operation of luminaires, the transmittance of diffusers decreases as a result of exposure to short-wavelength visible and ultraviolet radiation, which is present in the spectrum of lamps and in the spectrum of natural light.[5]

At the same time, the most effective now are fluorescent lamps of a new generation with a tube diameter of 16 mm (the so-called T5 lamps) for which only electronic high-frequency PRO (EPRO) are used. For example, an analogue of an FL in a T8 tube with a power of 36 W is an FL with a 16 mm bulb (T5) with a power of 28 W. The luminous fluxes of these lamps at an ambient temperature of 35 ° C, which corresponds to the actual temperature inside the lamp, are comparable. It is also worth noting the advantages of FL in the T5 tube: service life 24000 h; the decline in luminous flux by the end of the service life is no more than 10%; sharply reduced content of mercury in these lamps (from 30 to 3 mg); high color rendering index. The luminous efficiency of T5 fluorescent lamps is 105 lm/W. And the most promising at the moment are LEDs, the maximum achieved luminous efficiency is 303 lm/W. The luminous efficiency of serial samples at the moment is 140-150 lm/W. LEDs are gradually replacing other light sources, but price is a limiting factor for even more widespread adoption. [1]

A ballast is a lighting product, with the help of which the LS (light source) is powered from the electrical network, providing the necessary starting and operating modes of the LS. When choosing PRO, you need to understand that the LS parameters, including energy, depend on its quality. To facilitate the choice of PRO for FL from the point of view of energy efficiency, the Committee of the European Associations IMO and PRO (CELMA) proposed to classify PRO according to the energy efficiency index by EU directive 2000/55/EC. The EEI - Energy Efficiency Index - is applied to the PRO by the manufacturer (part of CELMA). For the consumer, this means that there are 7 classes depending on losses (table 1). The first 3 - A1 (most effective), A2 and A3 are EPRO, and the remaining 4 - B1, B2, C and D are electromagnetic PRO (EmPRO).

#### The efficiency of the ballast handling system

Lamp (code ILCOS)	Lamp power W		Ballast efficiency (Plamp/Pinput %)						
	EmPRO	EPRO	A1*	A2	A3	B1	B2	C	D
<b>FD 18-E-G13-26</b>	<b>18</b>	<b>16</b>	-	< 19	< 21	< 24	< 26	< 28	> 28
<b>FD 36-E-G13-26</b>	<b>36</b>	<b>32</b>	-	< 36	< 38	< 41	< 43	< 45	> 45
<b>FD 58-E-G13-26</b>	<b>58</b>	<b>50</b>	-	< 55	< 59	< 64	< 67	< 67	> 70

\* *dimmableEPRO* [9]

The above points give the efficiency of the main ballast system, which should be discussed with any supplier and a checklist has been formed.

For more information on how to ensure high efficiency of the energy saving system, a wide range of proposed resources for automated system management was analyzed.[8]

To assess the impact of the above recommendations on the technical and economic indicators of the educational institution, a comparison of the educational auditorium options was carried out. According to the current regulatory documents for classrooms, it is necessary to provide:

- illumination on the working surface 400Lx;
- illumination in the middle of the board  $E = 500Lx$ ;
- the combined indicator of discomfort UGR is not more than 21;
- the coefficient of pulsation of illumination is no more than 10%, for offices for working with computers no more than 5%.

Automatic control. Automatic lighting control can be done in two ways. The first is to install a lighting system on each console. The second way is full automation using special sensors. In this case, the lighting system is activated when a person enters the room, and turns off a few seconds after he leaves the room.[4]

Lighting brightness control. This system allows you to control the flow of light by adding or removing light. This can be done using the remote control.

Lighting control during daylight hours. This system is quite complex, but very convenient. In cloudy weather on summer days, natural light may not be enough to illuminate rooms. In this case, a special sensor can be installed that detects the level of illumination and provides automatic ignition of the lamps at the desired level.

Traffic lighting control. Such systems are one of the main factors in energy saving and are useful in everyday life and utilities.

The main feature of this lighting system is that it only burns in the dark and in the presence of acoustic noise. The functional diagrams of the device are shown in the following figures:

**Figure 1. Functional diagram of the acoustic control device**

The acoustic control system along the main pipes is designed to automatically control the movement of the flow inspection device (cleaning piston and defect detectors) along the pipe.

The data transmitted in this functional diagram is transmitted to the external control system via telemechanics (TM) or GSM channels. In this case, the processed acoustic signal of the piston movement is recorded in digital form in the internal memory of the acoustic control kits installed on the crane platforms and in the control room computer. [7]

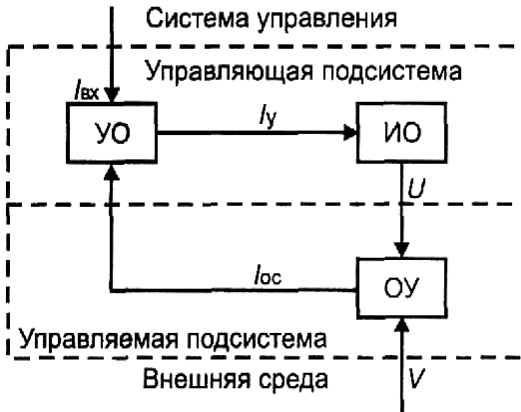

**Figure 2. Functional diagram of the optical control device.**

Optical inspection systems are usually designed to monitor 2D or 3D areas. Unlike conventional sensors, they have the ability to record and analyze detailed data over a fully observed area.

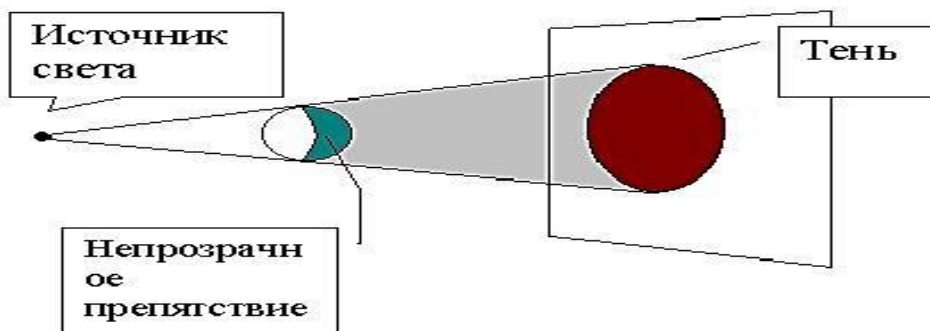

Optical surveillance systems provide a high level of security in a convenient sequence according to user requirements for various security processes and standard control functions.

**Figure 3. Control system for optical and acoustic devices.**

The principle of operation of the device is as follows: optical and acoustic changes affect the sensor, which generates signals at the outputs of optical and acoustic control systems. These signals are transmitted to the general control system and, in its turn, the general control system issues a signal that activates the light source.

**Figure 4. View of a light source on a schematic diagram.**

Conclusion. Most of the world's electricity is only used to drive binoculars. We can ensure the energy efficiency of buildings mainly by adopting and using factors to implement smart energy saving strategies. Without internal and external cooperation in the field of energy conservation, the technical regulation of many control strategies will not be successful, since energy savings cannot be achieved through their lighting conditions. Correctly designed and implemented energy efficient utility lighting systems do not violate working conditions. The following targets for progressive and industrial lighting systems are 1-3 W/m<sup>2</sup>/100 lx. In particular, saving energy is good. In this article, we've shown what energy efficient lighting can look like at a national or corporate level. [9]

**ABSTRACT**

*John Steinbeck is the prominent literary representative who greatly contributed to the development of American literature. His works reflect the psyche of the period to which they belong, the contradictions of society, different characters and destinies, changes, disagreements or imbalances between society and man. In the following article some literary peculiarities of the work “Cannery Row” by John Steinbeck are discussed. In the novel the author shows the fate and feelings of people belonging to different classes in the society, besides he expresses the problems of the time, too. The novelist created his works at a time when the spiritual, moral and social situation in the country was complicated.*

**KEYWORDS:** *John Steinbeck, Short Novel, Style, Language, Narration, Character, Setting, Society, Person, Relationship, Protagonist, Identity, Peculiarity, Writer.*

**I. INTRODUCTION**

Social factors play a key role in human development. It is undoubted that in maturity of the person the ideology in the family, society, and time is crucial and in order to increase a sense of identity education, upbringing, knowledge, and life experience greatly matter. The role of literary works in the acquisition of knowledge and in drawing the necessary conclusions in the various stages of life is invaluable. “Cannery Row” by John Steinbeck is the work that is of great value in this aspect. A. Ulugov states, “Good works are always created on the basis of writer’s emotions or the experiences that bother him” []. John Steinbeck wrote about the serious issues, life stories and people around them and expressed their views on the events in depth.

John Steinbeck’s best short novels include “Tortilla Flat”, “Of Mice and Men”, “The Pearl”, and “Cannery Row”. Though there is a similarity between the themes of “Tortilla Flat” and “Cannery

Row”, the latter reveals the images more deeply than “Tortilla Flat”, characters’ sufferings and feelings are described in detail and the relationship between character and society is vividly depicted. S. Baturin notes that small community represented in the work can embody impression about American society []. Although the work is based on the relationship between the protagonist Doc and Mack with his friends, the reader will have a full impression of the people living in the area where the canneries are located, their occupations, and their lifestyles.

## II. Main part

“Cannery Row” was written at the end of World War II and published in 1945.

For a nation who was exhausted with the war, the work was at first glance a social comedy and a light satire, while a closer look reveals the dominance of death and deep sorrow in society. The story takes place in Monterey, California, on what is now called “Cannery Row” in honor of the book. Each building and the unique world of the people living in it are depicted with Steinbeck’s pathos. Commenting on his work, the author described it as a ‘nostalgic’ work designed to lift the mood after the emotional turmoil of his career as a reporter in the war. [] In fact, the story is dedicated to a real street in the town where he lived for several years and a close friend Ed Ricketts (a prototype of the protagonist Doc, so readers recognized him as soon as the book was published). Although the author begins the work with *“The people, places and events in this book are, of course, fictitious and fabrications”*, several real people, places, and events in the book are embodied in the work. []

The story of Cannery Row illuminates Doc’s relationship with the people around him, in which various professions are described, who live in the street near the beach in Monterey. While getting acquainted closely with the life of such characters as the biologist Doc, a grocer Lee Chong, *“Mack and Hazel, a young man of great strength, Eddie who filled in as a bartender at La Ida, Hughie and Jones who occasionally collected frogs and cats for Western Biological, were currently living in those large rusty pipes in the lot next to Lee Chong’s. That is, they lived in the pipes when it was damp but in fine weather they lived in the shadow of the black cypress tree at the top of the lot. The limbs folded down and made a canopy under which a man could lie and look at the flow and vitality of Cannery Row”*. [] The protagonist of the story is Doc, a biologist, owner and manager of a Western Biological Laboratory, collects water animals from the shores of California and studies them. He is engaged in sending many living things he has collected to the Universities of the country, laboratories and museums. Throughout the story the author describes that Doc is ready to help the people around him. Therefore, Mack and his friends also want to cheer him up in order to thank in return. *“It is said that he has helped many a girl out of one trouble and into another, Doc has the hands of a brain surgeon, and a cool warm mind. Doc tips his hat to dogs as he drives by and the dogs look up and smile at him”*. [] The protagonist is a person who stretches out his hand of help to the people around him, able to make friendly compromises with everyone. Although his profession is a biologist, but people who know him are helped by him as a person aware of any field. But Doc is also a person with some lacks in his character, *“when passionate anger comes on him he can be very fierce.....He can kill anything for need but he could not even hurt a feeling for pleasure”*. [] The writer describes his protagonist as a person who, if he is angry, cannot behave, can bring anything to hurt if there is a need, but for fun he does not anything or anyone. Thanks to his spiritual support, the fate of many people changes to the positive side. The author points out that even a single person can

spread positive features as mutual respect, kindness, generosity and exaltation in society and change the social environment towards goodness.

### III. RESULTS AND DISCUSSIONS

All the characters in “Cannery Row” try to please Doc, with the hope to respond his goodness. The same goal unites all the people in the work. The fate of Frankie is poignant. Being dismissed from school for mental problem, the boy is alone in the street without any shelter. His mother gives up him as she thinks that he is a burden for her. Frankie finds warmth in relations with Doc and a 10-year-old boy steals a bronze statuette clock to please Doc in the party being organized by Mack and his friends. His mother, who has given up the responsibility of motherhood, blames Doc in this situation. With this episode the author describes human love, which is shown to a child who does not even have a relation in the society to anyone at all. It is clearly reflected that Doc is sincere and kind person to totally strange one. *“Frankie,” he said, “why did you take it?” Frankie looked a long time at him. “I love you,” he said*. [] The sentence “I love you” and a glance reflect real human features. The fate of this child, who has not yet reached adulthood, has not developed mentally, but is waiting for salvation in the face of cruelty of life, while having a living mother who cares for him, shakes each soul. In a society built on interests, the power that actually unites people, leading them to kindness is described in bright colors by the author through the episode about human kindness. The relationship of people living on the small street is opposed to the image of people who live in a big city.

In novel not only Doc’s characteristic features in uniting people around him, but also his inner world is reflected. Although those around him feel themselves indebted to, Doc feels very lonely. When he goes to the beach to collect marine animals, he spends his hours there. He listens to the soul of all characters and does not spare advice, support. But there is not any person who Doc can share his problems with. Because in this small team, both in terms of knowledge and in terms of life experience, only Doc has an advantage. However, he is not ventilated from this and therefore all people around him do not avoid from him. As he behaves the way that the others accept, it makes him become the person who unites together all people in Cannery Row. By describing Doc’s relation with the surrounding simple and sincere people, Steinbeck criticizes the people of his own time who are interested in wealth and do not help others at all.

One of the noticeable female characters is Dora. She also lives in Cannery Row, though her behavior is always under discussion in this small society, but she follows the rules strictly. As the owner of the Bear Flag restaurant she does not sell any alcohol drinks, or she controls the costs of the services and tries to do them affordable for the indigenous people of the street. Beside she always keeps under control not to use any vulgar words in the restaurant. She is treated well by mostly men in the street, because women hate her. But she helps to all people who are in difficult situation not paying attention whether this is a man or woman. During economic crisis in the country she made great charities, paid some peoples’ debts, brought up some children herself, supported the families where men could not provide the members. As a result of it she nearly went bankrupt. *“Dora who, madam and girl for fifty years, has through the exercise of special gifts of tact and honesty, charity and a certain realism, made herself respected by the intelligent, the learned, the kind”*. [] Dora is one of the complex characters in the novel. Steinbeck points out that each person living in the world has his or her own responsibilities. She is also the woman who is not only mother but also nurturer to the men of the street. She always helps the men who could not cope with their responsibilities spiritually and materially in their life.

#### IV. CONCLUSION

John Steinbeck described characters and their relations towards each other in Cannery Row. Doc is depicted as a person who unites Lee Chong, Mack and his friends, Dora and her girls, Frankie and others. The author reiterates that only personal features as kindness, generosity, sincerity can lead the members of any society towards goodness. In “Cannery Row” through the characters’ relationship the writer proves this truth.

## THE IMPORTANCE OF INTRODUCING INNOVATIVE EDUCATIONAL TECHNOLOGIES IN SOCIAL DEVELOPMENT OF SOCIETY

**Diloram Kambarova\***

\*Associate professor,  
 Candidate of pedagogical sciences,  
 Fergana State University,  
 UZBEKISTAN

### ABSTRACT

*The analysis of pedagogical research conducted in the country shows that the technologicalization of the educational process is closely linked with innovative ideas that reflect the status of pedagogical innovations. Improving the effectiveness of education and the introduction of innovative developments in the field of science will serve to increase the intellectual potential of consumer students and learners. This article scientifically examines the importance of the introduction of innovative educational technologies in the social development of society.*

**KEYWORDS:** *Civil Society, Pedagogy, Innovation, Educational Efficiency, Innovative Education, Information Technology, Pedagogical Skills.*

### INTRODUCTION

It is known that the formation of spiritual maturity in young people is one of the foundations of the formation of civil society. Today, the upbringing of a spiritually and physically harmoniously developed generation is an urgent task for us on a national scale. Consistent and decisive continuation of our work on the way to this noble goal is today at the center of our policy.

Educating young people in the spirit of patriotism and respect for our national values, protection from various ills and threats, increasing the effectiveness of propaganda work is one of the pressing problems of today.

In the process of reforming the development of a new society in Uzbekistan, it is important to study the theoretical and practical aspects and experiences of the creation of the foundations of civil society in different countries of the world at different levels and periods. Civil society is a

certain social system that guarantees every citizen of this country full freedom to build his economic and political life at his own discretion. Civil society is formed in harmony with the increase in self – awareness of people, their ability to feel a sense of responsibility in the object.

### **Main part**

Nowadays, in our society, everyone has the right to receive education in any field, regardless of his level of primary education. It is known that such concepts as innovation in pedagogy, innovative activity, innovative pedagogy, management of innovation processes in computer education appeared in the 60s of the XX century while the concept of "Educational Technology" was recognized in the United States and Western Europe. These concepts arise as a result of technologicalization of the education system, reform of the education system through the introduction of new innovative pedagogical technologies in the computer education system, increasing the effectiveness of education, ensuring socialization of the individual, trying to form student-friendly relations in the educational process.

“For thousands of years, the history of mankind has neglected young people as a separate social class, an equal member of society. Finally, with the emergence of buds and elements of civil society, the issue of the role of youth in society began to rise”[1, 312]. In line with the requirements of today’s rapidly evolving era, many pressing challenges have arisen due to the need for a new approach to achieving educational effectiveness. Therefore, the teacher must have professional skills, be able to use new modern educational technologies that meet modern requirements. While participating in the process of educating a harmoniously developed generation, a teacher should not only be an example to others with his spiritual and moral culture, but also be able to demonstrate his pedagogical skills, make a worthy contribution to the training of qualified personnel as a mature teacher. “Any pedagogically correct activity affects the mental and volitional development of an individual. This means that as a child grows up, his activities change in form and content”[2, 35].

### **DISCUSSION**

An educator is a highly qualified specialist, who has a deep knowledge of his subject, a good knowledge of general and student psychology, and a perfect knowledge of teaching methods. “The activity of a modern teacher should be evaluated not from the point of view of an ordinary methodologist who transmits knowledge, but from the point of view of a “Teacher technologist”. Technology is a pedagogical activity that incorporates the laws of teaching, educating and developing the individual and ensures the end result”[3, 290]. “All countries strive to innovate as much as possible in education... Innovation is a long-term investment for the future ...”[4, 26]. Thus, the reliance on pedagogical technologies and the pursuit of innovation in education, the use of various interactive methods aimed at the active participation of students, contribute to the effective implementation of educational goals.

New information and innovative technologies involve the use of new methods and approaches to increase and strengthen students' knowledge in the educational process. At the same time, in the context of the evolving process of informatization of society, issues aimed at preparing students for independent living, the formation of their talents, abilities, aspirations and interests play an important role.

Today's globalization process, along with the modernization of society, bypasses any society or state. Therefore, their positive and negative effects are seen in social life, especially in the case of young people who have the power to influence the country's future. Particularly the currents that are trying to influence our youth in various ways, the so-called "mass cultures" are aimed at provoking youth in such a way as national identity, patriotism. The ability to withstand such modern threats is a time-consuming use of national spiritual heritage and Islamic culture, which is a national idea and its basic principles in the implementation of the country's strategic goals and objectives.

The genesis of socio-cultural technologies in scientific management of society is the development of science, the rise of human thinking and scientific knowledge. The solution of existing problems in the society is related to innovative activities. The genesis of socio-cultural technologies is also closely linked to the development of "technology". The Decree of the President of the Republic of Uzbekistan dated September 8, 2017 "On approval of the concept of administrative reform in the Republic of Uzbekistan" was important.

Innovations are up-to-date, important, new approaches formed in a system. They are born on the basis of initiatives and innovations and are promising for the development of educational content. It also has a positive impact on the development of the education system as a whole. Innovation is the end result of a technology, form, and method in a particular field of activity or production, a new approach to solving a problem, or the application of a new technological process that is known to lead to greater success than ever before.

Improving the effectiveness of new innovative technologies in the educational process largely depends on the creative pursuit of teachers. Therefore, for the lesson to be interesting and effective, it is necessary to find new ways of pedagogical innovation, to select the most effective under in-depth analysis and apply it in practice. In fact, the term "advanced pedagogical experience" is used in two different senses to mean a teacher's high skill in a broad sense, i.e., a teaching practice that provides high pedagogical effectiveness. The concept of advanced innovative experience in a narrower, more rigorous sense combines elements of creative research, originality, in other words, innovation.

Today, there is a growing interest in the use of innovative technologies and interactive methods in the educational process. The use of such methods increases the effectiveness and efficiency of teaching, develops in students the ability to deepen the understanding of the content of the lesson.

Innovative methods of education allow students to use and activate the enormous educational power, to incorporate elements of competition into the learning process. Interactive teaching methods are among the innovations in education. According to Angelevsky, "all countries are trying to innovate education as much as possible". Today's news requires an organized, planned, public approach to them. News is a long-term investment for the future. In order to arouse interest in innovation, to cultivate a person who strives for innovation, education itself must be rich in innovations, in which the spirit and creativity of creativity prevail"[3, 26]. The tasks of new innovative pedagogical technologies include:

- development of new forms and methods of organizing the educational process in the acquisition of skills to work with modern teaching aids;

- conduct various tests from time to time on the organization of the educational process and the problems of research methodology;
- joint development and implementation of scientific and scientific-pedagogical methods with foreign educational institutions in the framework of international cooperation programs;
- implementation of the program of generalization of the accumulated foreign experience in training.

The organization of major changes and innovative processes in the educational institution will be aimed at achieving the main goal, in particular, should always be based on the implementation of a model of training educated and talented young people in line with socio-economic needs of society. The introduction of innovative approaches to the process of formation and development of pedagogical culture of students (updating educational programs) is also important.

### CONCLUSION

In general, the organization of innovative processes raises issues of research and application of modern pedagogical technologies, which are based on subject-subject, student and teacher relations. These relations are the basis for determining the general conditions of development, aimed at understanding the interests, abilities and qualities of the individual, and undoubtedly play an invaluable role in the development of society, especially in the development of pedagogical culture and environmental protection.

### ABSTRACT

*The article discusses the joint teaching of a technical discipline and English as an option for conducting an interdisciplinary binary lecture. The stages of preparation and implementation of this model of the classroom lesson are considered, as well as the positive and negative aspects of conducting a lesson by two teachers simultaneously. An opinion is expressed on the obligatory presence of the lesson plan, in which all possible bifurcation moments of the lecture are spelled out. It is concluded that an interdisciplinary binary lecture is a modern interactive teaching method that allows you to activate the audience's attention, increases the percentage of assimilation, reveals the potential of teachers, increases the professional competence of teachers, and motivates students to further study.*

**KEYWORDS:** *Lecture, Binary Lecture, Interdisciplinary Binary Lecture, Psychological Compatibility, Interactive Lecture, Bifurcation Moments Of The Lecture, Pedagogical Scenario.*

## INTRODUCTION

In Uzbekistan, on the background of a radical reform of higher education, the number of talented students studying in prestigious foreign educational, scientific and other institutions is increasing every year. Since April 1, 2021, the number of young people sent to study for Master's and Doctoral degrees at prestigious foreign universities through the 'El-Yurt Umidi' Foundation, which was created in accordance with the Decree of the President of Uzbekistan dated September 25, 2018 [1], has increased by 5 times. To obtain fundamental knowledge of the world science, undergraduates and doctoral students must not only know the basics of their specialty and be fluent in general English, their vocabulary must include the terms of the specialty being studied. Uzbekistan is located in the post-Soviet space, and all training is conducted either in Russian or in Uzbek. The volume of the school and university curriculum of the English language is sometimes not enough, and requires additional improvement of the technical vocabulary for a student who decides to continue his studies abroad. Therefore, it would be advisable to combine the study of the specialty with the study of the English language directly at the lecture in the disciplines of the studied specialty. One of the methods for studying specialized, for example, technical English vocabulary, is an interdisciplinary binary lecture. This teaching methodology will allow all students of technical universities to use the world technical literature in its original source, written in English.

## LITERATURE REVIEW

The very idea of inter disciplinary teaching is not new; great teachers of the past, such as Ya.A. Komensky, K.D. Ushinsky, N.K. Krupskaya, A.A. Smirnov, G.K. Selevko, Yu.A. Samarin were interested and considered this issue in their works. The teachings of Ivan Pavlov, the great Russian physiologist introduced the psychological foundations of interdisciplinary relations. He wrote that our mental activity is a chain of irritations and associations. L.S. Vygotsky argued that any new stage of generalization arises only on the basis of the previous ones [2, p.59-73]. The naturalness of the use of interdisciplinary lectures is based on the principles of thinking ability of a student, as well as of any person, and should be structured according to the laws of both physiology and psychology. A binary lecture is a lecture delivered by two teachers at the same time and at the same place. The main goal of a binary lecture, as well as an interdisciplinary one, is the active involvement of students into the thinking process. There are several varieties of this type of classroom activity, depending on the type of specialist duo. It can be a mentor-lecturer and an intern-teacher leading practice, or there can be two highly qualified professors, but having different points of view on the topic of the lecture. The union of lecture presenters may consist of a lecturer and a student, who prepared presentation on the given topic, or there may be two teachers of related disciplines, or one of the specialists is invited from the factory, who is a highly qualified practitioner. In this article, it is proposed to combine the study of the specialty with the study of "technical" English vocabulary, and accordingly the lecturer of the technical discipline and the teacher of the English language act as the leading binary lecturers.

**Methodology for preparing and delivering an interdisciplinary binary lecture.** When preparing and conducting an interdisciplinary binary lecture, numerous difficulties arise, therefore, at the present stage teachers practice only one or two lectures per semester. It is most advisable to choose an overview as introductory, overview as final lecture or, at the discretion of the lecturer in the specialty, the most important lecture of the discipline, in the content of which there is a maximum number of new terms and a high degree of complexity. Already at this stage,

the first difficulty arises, since when choosing the "central" topic of the subject, the English teacher needs to master not only the terms, but also the general technical meaning of the selected material.

At the second stage of preparation, for an effective classroom lesson, it is necessary to select two teachers who are intellectually and psychologically compatible, since an interdisciplinary binary lecture is a mini performance in which students receive not only knowledge, but also acquire the skill of communication culture and dialogue. At the same time, the manner of material presentation among teachers can be completely different. For example, one of the teachers is used to explaining emotionally, using gestures and facial expressions, and the other, gains attention by quietly and calmly conducting the lesson. Mixing styles will add intrigue, which will attract the maximum number of listeners to the process of mastering new material. Transferring a lecture from a passive to an active level is one of the main methodological tasks of the proposed method. Another goal of a binary lecture is the inevitable exchange of experience between teachers.

At the third stage of preparation, a lesson plan for the lecture is developed: the volume of scientific material is determined, which is immediately divided into blocks, according to content and time [4]. It is preferable to conduct the first lessons with a written script, but with the acquisition of experience, you can get by with a verbal agreement. When giving a lecture, simultaneous translation into English is not done so as not to waste almost half of the classroom time. To check the technical material acquisition, after each block, the English teacher, using one of the question and answer methods, for example, the "funnel" method, in English, asks questions from the most general to more specific, using new terms [5, 6]. Each question that will be asked, as well as possible answers, are written in the script. If errors arise in the understanding of terminology, then the correction continues in English, and if the student does not have an understanding of the lecture material meaning, then there is an extended explanation of the technical meaning of the topic in Russian.

Let's take an example, the lecture on the discipline "Theory of mechanisms and machines" is being conducted and after the block of material on "geometrical dimensions of gearing", provided at the lecture in the Russian language, the teacher asks in English: "Which of the listed parameters is the main one through which all the rest can be calculated?". The student replies in English that this is a "engagement module", but he did not understand why it can be assigned and calculated. In this case, the explanation continues in Russian. If the respondent in the answer used not "engagement module", but "engagement unit", then the incorrect use of the term is clarified in English. And only after that clarifying the main lecture can go on with the next block of new topic material, but meanwhile giving way to the English teacher, who can check understanding of the previous block once again.

Initially, it is assumed that a binary lecture is a constant improvisation in the behavior of the presenters. Yes, teachers' speeches should be natural and unconstrained, but before the start of the lesson, they must have a behavioral scenario, especially the bifurcation moments of the lecture [7]. Putting it differently, we can say, that every improvisation must be carefully prepared. An experienced teacher will always keep in mind several possible variants of the present material explanation, and he or she can use two or three of them at the same lecture.

The behavior patterns of students are quite predictable, and there are many pedagogical and psychological techniques of interaction with the students at the lecture. Now any kind of lecture is interactive as the teacher will never leave the classroom without arranging feedback of the students in any form: oral or written, questions and answers, completing some statements by the students, etc.

### **Main results and conclusions**

An interdisciplinary binary lecture is a special lecture in which two teachers of different disciplines participate. The purpose of the interdisciplinary binary lecture is to activate the thinking process of students. On the one hand, when perceiving a binary lecture, difficulties arise, since the focus of attention is bifurcated, on the other hand, it is the differences in behavior styles that increase concentration of attention and give a large percentage of residual knowledge. In such classes, the ability to adequately reflect on non-standard situations increases, the creativity of both students and teachers develops, reveals new forms of professional communication, creates conditions for the implementation of the creative potential of teachers, in other words, increases all aspects of professional competencies of teachers.

An interdisciplinary binary lecture is definitely an up-to-date and interactive method for preparing bachelors for further training in prestigious foreign educational and scientific institutions. This is an effective way of non-traditional organization of the educational process. "Lecture for two" is an impulse for the personal and professional growth of lecturers for whom classical teaching methods are not enough.

**ABSTRACT**

*Today, more and more attention is paid to the creation of green areas in cities, and in our hot and dry climate, the importance of trees and shrubs, especially conifers and evergreens, is very high. In recent years, the number of ornamental coniferous trees and evergreen shrubs has increased in the city's greening system. Beautification of cities and villages in Uzbekistan in a modern style is an important state measure aimed at dramatically improving the living standards of the population.*

**KEYWORDS:** *Ecology, Vegetation, Landscape Design, Ornamental Plants, Nature, Ecological Culture.*

**INTRODUCTION**

In the early stages of human development, ecology plays an important role among people of this period. Ecology is a science much more ancient than the various drawings left by ancient people in caves and rocks. Every person who lived at that time knew about the state of the environment in order to avoid hunger, cold and heat, collect seeds and fruits of plants, catch animals and expose themselves to danger. They knew how to avoid and hide from enemies, natural disasters. Studying the power of nature, its laws and the influence of environmental factors on adaptation to these laws, people have been collecting information for years and centuries. Ancient Greek scientists such as Hippocrates and Aristotle described the ecological nature of approximately 500 plant species and 454 animal species. For example, in his scientific works, Aristotle described the life and distribution of more than 500 species of animals, birds and fish, as well as their migration from one place to another. Galen and Theophrastus also written valuable information

about the life of different animals and their adaptation to nature.

### **Main part**

Today, it is advisable to solve the issues of environmental education and training when developing measures to prevent various environmental conflicts arising in the environment:

- 1) deeply teach everyone the laws of development of society and nature, teach the relationship between them, educate a person who can think in a modern way; take into account the ecological state of various natural areas in the direction of the productive forces of socio-economic development;
- 2) developing of environmental plans for the future and training of environmental specialists who will implement these plans;
- 3) continuous communication of each person, society and various groups and categories within society with the environment in which they live, aimed at preserving nature and its resources, as well as training qualified personnel in this area;
- 4) the importance of the beauty of the place where they live, valleys, groves, hills, mountains and streams, their importance for human life and health in the development of their social, cultural, religious views and traditions. Explain to the younger generation in order to instill in them a love of nature;
- 5) explain to the population the causes of various environmental conflicts, conduct environmental education and training among them, teach to develop and implement measures, methods to overcome environmental conflicts;
- 6) the fulfillment of the above tasks of educational work by educators of kindergartens, schools, higher and secondary specialized educational institutions in the course of various games, films, natural and social sciences in response to natural disasters and environmental conditions in their places of live.

### **DISCUSSION**

It is known that one of the main components of landscape design is ornamental shrubs. Trees and shrubs are not only a source of raw materials and various products, but also one of the main factors that improve the environment. The vital activity of the plant world affects the climate, i.e. it absorbs and neutralizes CO<sub>2</sub> and other harmful gases and smoke in the air, reduces the amount of dust in the city air, phytoncides emitted by trees kill pathogenic bacteria.

One of the main directions of development of ornamental horticulture in Uzbekistan is to increase the number of species of trees and shrubs that are biologically resistant to urban conditions for landscaping. Evergreen and flowering shrubs are also one of the most important components of landscape design.

Landscape endemic and introduced plants are the beauty of alleys, parks and gardens, which are widely used as green adornments of architectural structures in cities, districts and villages.

Today it is necessary to reduce the impact of man-made factors in cities, improve the environment, protect human health, create new urban landscapes with unique architectural beauty, and introduce new trees and shrubs adapted to the climate of the region.

Chestnut, oak, tulip tree, black pine, Crimean pine, bird cherry, dzhuka, magnolia plants introduced on city streets, as well as chestnuts, oak, Crimean pine, meta grown in the climatic conditions of Uzbekistan in order to study the bioecological properties of aboriginal plants, such like sequoia, linden, virgin spruce.

During the observations, the tree branches were observed, which make up the bulk of the experimental areas. At the beginning of the year, phenological observations were carried out at the experimental sites, the results obtained were recorded in the established table of phenological observations.

A comparative analysis of the growth of branches according to the method of F.N. Rusanov (1970) was carried out at different ages in the ontogeny of species of the genus *Picea*.

The association of trees with low winter and high summer temperatures was determined twice a year during the tree inventory in the autumn and spring months.

The relation of spruce to light was studied on trees of different ages. The level of illumination was determined by natural and artificial dimming (umbrellas, gauze). The effect of light on the growth and development of trees was determined by the order and number of branches, the annual growth rate of branches, the size of the upper and side branches, as well as the number of leaves in branches aged 5-7 years.

In 2014-2015, with the introduced forms of chestnut, oak, tulip plants, the growth and development of local plants, adaptability to the environment, morphological, biological, ecological characteristics of plants were monitored.

According to the observation results, it can be noted that in September-October 2014, the ecological mortality of chestnut plants imported from abroad increased by 15%, which is associated with a decrease in temperature in winter and spring 2015 by 20% in oak. 5% in 2014, 15% in 2015, 18% in tulips in 2014 and 20-25% in 2015.

It was found that local chestnuts 10% in 2014, 15% in 2015, 3% and oaks lost 5% in 2014 and 2015.

In addition, the growth and development of local and introduced shrubs, such as black and red barberry, David's budley, Japanese beech, Magonia, Chubushnik, Pyrrakanta Smarodina, Elderberry, Tobulga, Sirena, Kalina, Veige, imported in the course of our research, showed resistance to external factors, climatization of plants were observed in the indicated order.

Revealed the need to examine the root and root collar of the plant to determine the symptoms of root cancer. With sharp changes in temperature day and night, cracks were found on the surface of some leaves.

In view of the above, the cause of the disease can be attributed to a change in the water regime and temperature. As a result, the plant suffers from metabolic disorders, first of all, spots that do not contain chlorophyll, which leads to yellowing and darkening of the leaf surface, slowing down the growth of the stem. In order for the seedlings to germinate well, first of all, it is necessary to take into account the soil and climatic conditions, and also after each watering the seedlings should be thinned and loosened. An excess of water and a solution of mineral fertilizers used to preserve the greenery of these lawns will fill the first hole or well when preparing ornamental trees for planting, slightly moistening the root system of the seedlings,

affecting the circulation of root air, reducing metabolism and, ultimately, leading to yellowing of the leaves slowing down the growth of annual plant stems.

Because this is due to the fact that in some of the surveyed areas the soil in the pits under the seedlings turned out to be in a sticky clay state, despite the fact that the lawn was watered for several days. It should be noted here that ornamental trees brought in for the alley require special care for their full development. When they are fully developed, they need to be brought to the lawn.

In the fall and winter, when the seedlings were transplanted from one place to another, the trees were found to dry out in early spring due to shallow planting of trees and successive floods and, in some cases, sudden cooling of the air. Therefore, when planting on seedlings, if the root collar is covered with 5-10 cm of excess soil, the above situation is not observed. This is due to the fact that one of the main reasons that some chestnut, oak and pine seedlings of the same species grow and dry out is that the wrong agrotechnical measures were taken when they were planted.

### CONCLUSION

It is necessary to pay attention to suitable for planting in cities, which has a valuable scenic view, strong and durable, like conifers, such as pine, spruce, biota, metasequoia, spruce, linden, artificial chestnut, scarlet, coniferous oak, suitable for planting in cities, strong and durable and with a valuable scenic look, Norway maple, tulip tree, magnolia, catalpa, linden, sophora, small-leaved linden, ornamental shrubs, magnolia, common lilac, Indian lilac, fortification, yucca, viburnum, buldanezh, rosemary.

### ABSTRACT

*How to learn English using hypnosis and NLP methods in just 2 months from this article you will not learn. But we will tell you what features of the psyche can be used for more effective and faster learning of the English language. These techniques will not harm your mental health, but can also make it much easier to learn and remember new information.*

**KEYWORDS:** *Psychological Phenomenon, Psychological Effect, Learn In A New Way, Memory, Perception*

---

### INTRODUCTION

In the 21<sup>ST</sup> of century methods of learning language has been changing dramatically. Not only linguists and philologists develop methods but psychologists also do different investigations in this field. And researches show these effects are showing its efficiency. Psychological effects and tricks to help you learn English:

#### ***1. The effect of the "yellow marker" or the effect of isolation***

This psychological phenomenon lies in the fact that we perfectly remember an object that stands out against the background of other identical objects. For example, when you walk down the street, dozens of people pass by. In the evening, you hardly remember passers-by in office suits or ordinary outfits, but you will not forget a strange girl in an acid-colored dress and with a mohawk on her head for at least a couple of days.

By the way, this method is actively used by the media to manipulate our consciousness. So, some insignificant events are sometimes inflated to unprecedented proportions with the help of interesting reports, impressive photographs, etc. Usually this is done to divert our attention from some more important topic that they want to "hush up".

How to use: Suppose you have a word that you cannot remember, such as comb (comb). Try to "incorporate" this word into a selection of contrasting words: write yourself a list of 9 words on "food" (or any other non-beauty topic), and the last one is comb. Now learn these ten words the way you are used to. You will see that the "contrasting" word comb was the first to be remembered and firmly entrenched in memory. This way you can learn all the words that you often come across, but cannot remember.

In addition, you can use this effect in other ways, the main goal of which is to make the learning process memorable, clearly standing out against the background of the techniques that you have used before. Try:

Underline or highlight the phrases you want to learn. The simplest but very effective technique. And some linguists advise writing with a colored pen or typing in bright colors new vocabulary or words that you cannot remember the spelling. The brain will gladly perceive the brightly highlighted information.

Speak or hum the words you are learning loudly. This method is recommended by many linguists. Remember, as a rule, when studying words, we say them to ourselves or quietly pronounce them. If you try to learn in a new way, your memory will learn the material faster.

Study in an unfamiliar place. Psychologists recommend using this method when preparing for the exam. So, the material will be assimilated better if you study it in an unfamiliar environment for yourself, even if it will be a different room in your apartment. Better yet, go to study English in nature: according to studies, observing nature increases attention, memory, concentration by almost 20%. So, get off your monitor and head to the nearest park to learn English.

Draw what you are learning. This method is especially suitable for beginners who need to master basic vocabulary. Draw the word you are learning, for example, next to umbrella, draw an umbrella, next to door, a door.

## ***2. Audience effect***

This psychological effect works differently for all people. For example, some people calmly work in a separate office, where no one is watching them, where there is no "audience". Others, on the contrary, are activated when they are in the same room with colleagues and the boss, that is, in fact, they work in full view of the audience.

How to use: First, determine if you are motivated by the presence of people around you or, on the contrary, you are ashamed of them. Based on this, you can choose the most productive way to learn English. So, if you love the spirit of competition and are not afraid to sometimes make mistakes in public, go to study English in a group course. If the presence of outside observers confuses you, learn the language with a personal teacher or on your own.

## ***3. The charisma effect or the Dr. Fox effect***

This is a very interesting phenomenon that is often used by salespeople, sales managers, marketers and other people who want to sell you something. The effect is that the charisma of the person who tells you something is much more important than WHAT he tells you. That is, a charming salesperson can easily sell you a "hello from the 90s" style carpet, even if you came to the store for sausage.

How to use: Carefully weed out all the information that comes to you about learning English. For several years now we have been observing a tendency for skilled speakers to confidently sell dubious products to those wishing to learn English: a super method of learning 999 words in 30 minutes, an English course "for the weak-minded", etc. These people speak so interestingly that they just want to buy another "super-tablet for problems with English" and solve all the problems in one fell swoop. At this moment, we need to remember about the Dr. Fox effect and think about whether it is worth believing the beautiful speeches. Remember the Russian proverb "All that glitters is not gold."

#### ***4. Authorship effect or generation effect***

This psychological feature is best manifested in adults and consists in the fact that a person best remembers the material that he himself invented. For example, if you write an essay, you will remember it better than the read text of someone else's authorship. And all because in the process of creating an essay, your brain was actively working and information was stored in your memory.

How to use: This effect can be used when learning new words or grammar structures. For example, you need to learn 7 new words. Make up a story with them, and you will remember them well. Studied they would rather construct - compose 10 examples of your own using this construct. In both cases, it is desirable that both the story and the examples concern you, give up abstract phrases.

#### ***5. Effect of unfinished action or Zeigarnik effect***

This phenomenon lies in the fact that we are better at remembering unfinished actions than completed ones. That is, if you did not complete something and were distracted, after a while you will perfectly remember what you were doing. If you have completed the task and only then switched to the next task, after a while the memory will erase the memories of the first task. That is why at school and university all our knowledge disappeared immediately after the exam.

How to use: In order for the information not to be forgotten, it is necessary that it remains relevant to you. That is, you cannot stop learning English, even if you have reached the desired level of knowledge. For example, keep watching movies and TV shows to get modern vocabulary from there, read books in English so as not to forget how to build English sentences correctly, etc.

#### ***6. Law of interest***

We think it is difficult to argue with this law: indeed, we easily remember what is interesting to us. For example, we can easily forget to buy bread, but we can tell the content of our favorite TV show, even if we are woken up in the middle of the night.

How to use: Only you can make English interesting. To do this, choose such methods of studying it that are pleasant to you. For example, you can learn English from movies and TV shows, songs and games.

#### ***7. The law of the beginning and the end or the law of retroactive and proactive inhibition***

According to this law, when studying any material, it is best to remember the first and last blocks of information. The fact is that each subsequent block of information worsens the perception of

the previous block, and at the same time, each previous block worsens the perception of the next one. For example, if you are reading some text in which some bright unusual events do not occur, then it is best for you to remember its beginning and end.

The Stirlitz method is based on these laws. This is the name of the manipulation technique when you state the most important information at the very beginning and end of a conversation. For example, if you ask the waiter to recommend you some dishes, then in most cases, stop at the first and last. Be careful: some restaurateurs are well aware of this law and force waiters to name stale dishes first and last in order to quickly sell them to guests.

How to use: First, you can separate blocks of information so that they don't follow one after the other. For example, learn 10 new words in the morning, as soon as you wake up, the first information that arrives in the brain will be well remembered. It is also effective to study something before bedtime: the last block of information received on that day will be stored in memory.

Secondly, you can structure your independent English lesson so that the most important exercises occur at the beginning and end.

### ***8. The paradox of choice***

You've probably all heard about this psychological phenomenon: the wider the assortment, the more difficult it is to make a choice. For example, you came to a cafe and decided to order a dessert. You open the menu hoping to quickly find your favorite cheesecake and ... you see 29 types of this delicacy. A simple and time-tested "Napoleon" modestly sheltered nearby. Psychologists say that in most cases you will choose "Napoleon" and do not want to understand the many varieties of cheesecakes.

How to use: A similar situation of choice constantly arises for an English learner: first, you must choose a way of learning the language. As soon as we have coped with this, we face another choice. If you decide to study with a tutor, you must choose courses or a personal tutor. If you study on your own, you need to choose resources for learning, and there are hundreds of them on the Internet. To make it easier for you to choose, we have written an article "How to learn English on your own and for free", in which we have selected for you the best learning sites and resources from the whole variety of the Internet.

Now take a break from reading for a few minutes and watch a great TED video on the paradox of choice.

### **9. The effect of the choice made or the distortion of the perception of the choice made**

So, you have already made a choice, and now it is important not to fall into an interesting trap. We always zealously defend what we have chosen ourselves: shoes with uncomfortable heels (you don't understand anything, they are so cute!), A disgusting place of work (what do you mean, I have a stable income!), Etc. It's so difficult for us to refuse from old habits, things and beliefs that we spoil our own lives.

How to use: We cling to our beliefs about learning English as tightly as we cling to beautiful but uncomfortable 15-centimeter heels. Therefore, we suggest that you do not use this psychological effect, but fight it. If you still have a three-column vocabulary and memorize grammar rules, read

our article “13 Essential School English Learning Principles You Need to Forget” to get rid of outdated academic stereotypes.

### ***10. The principle of "first is right" or the principle of priority***

Our psyche is designed in such a way that we most of all trust the information we received first. Even if after that we find more reliable and useful information, our brain will refuse to accept it. The fact is that it is almost impossible to immediately assess the reliability of the first information received, so we accept it as correct. And then it is very difficult to question your attitudes and change them.

How to use: Be careful with your choice of knowledge sources and instructor. So, an unqualified teacher or a low-quality textbook may incorrectly give you knowledge, and this information will firmly sit in your head, and retraining is always more difficult than learning.

For example, our teachers often encounter students who pronounce clothes like / kləʊðəz / instead of / kləʊðz /. It is very difficult to retrain them, because at school they were taught the wrong pronunciation, which was deposited in their memory.

### ***11. The method of associations or mnemonics***

You've probably heard of this method of learning new words. Mnemonics (or mnemonics) are used by world champions from memory - people who memorize information in fantastically large volumes. This method consists in the fact that when learning a new word, you select an association for it, which helps to remember the information.

How to use: Mnemonics work in different ways. First, you can try to associate English words with Russians: owl / aol / (owl) - an owl flies around the aul.

Secondly, you can try visual associations: learn the word ring (ring) and imagine Frodo with the Ring of Omnipotence.

Third, you can try the method of the Roman room or the Cicero chain, which was used by Julius Caesar. This trick seems a little strange, but the world champion in memory Andy Bell uses it, so check it out, maybe it will work for you. Take 10 words or phrases that you need to learn, walk around your room and mentally “put” each word or phrase on a subject. Then walk around the room and try to remember where each word “lies”. Then close your eyes and imagine the room in your mind, try again to remember all the words, they should be well fixed in your memory.

### ***12. Effect of mechanical actions***

Movement is not only life, but also a good memory. Mechanical actions activate the brain, and we begin to memorize information more actively. So, many schoolchildren, when studying poetry, walk around the room, while pronouncing the lines in time with the steps. Blood circulation improves, the brain is better supplied with oxygen, therefore, the memorization process is faster.

How to use: Try walking around the room or doing some simple exercise as you learn new words or grammar. So, you will improve not only your knowledge, but also your physical fitness.

This psychological trick may have a small side effect. Some people can remember learned information only if they follow the same steps as when learning it.

### ***13. Method of "written in pen"***

At school and university, we were forced to write hundreds of pens. The idea of the teachers was not to enrich stationery stores, but to get mechanical and visual memory to be included in the work at the same time.

How to use: It is not necessary to write everything in a row, so you will only overload your brain and start to dislike us for such advice :-) Write down only what you cannot remember: difficult words, examples of sentences with difficult grammar, etc.

### ***14. The principle of visibility***

For the most part, people are visuals, so it is much easier for us to perceive visual diagrams and tables than solid text. For example, if you need to find a building, it will be much easier to do this by looking at the map than by reading the description of the road from your house to the desired point.

How to use: It is not for nothing that we always advise using textbooks by English-speaking authors instead of Uzbek manuals, in which grammar is explained in a difficult way and undersigns several pages. While authentic textbooks usually use short explanations, diagrams, tables to highlight the grammatical topic. Despite the lack of explanations in Uzbek, such a manual is easier to understand than a textbook in your native language. So, if you want to learn from clear materials try to learn from English Grammar Textbooks.

### ***15. The principle of repetition***

Repetition is not only an important principle for learning something new, but also a very cunning psychological technique that is widely used to manipulate our consciousness. Thus, repeated repetition of information makes a person unconsciously memorize it and find application for it. Gradually, this information seems to us no longer received from the outside, but our own conviction. That is why, although we do not like advertising, we still buy yoghurts with live bacteria and toothpaste with a 3D whitening effect.

How to use: Be sure to repeat what you've learned. Only geniuses with a unique memory can memorize material at first glance, while ordinary people need to repeat information several times so that it will be deposited in memory for a long time.

### ***16. The principle of "memory is not rubber"***

Experimentally, scientists managed to find out that our memory perfectly assimilates 7 +/- 2 units of information in one approach. That is why, despite the popularity of the "Learn 999 New Words a Day" methodology, we see very few examples of people who actually did it. This is because short-term memory is not infinite.

How to use: Learn no more than 5-9 new words a day, then they will be memorized normally and you will have time to repeat them. Pursue the quality of memorization, not quantity.

So, in conclusion we can say that there are different psychological effects that help us to learn foreign language. Thinking way of every person differs that's why one tip helps to some people, others not. Every person should choose the appropriate one. It seems learning English in near future will be more simply as every sphere is developing rapidly including psychology. Researchers have been trying to investigate the way of thinking human being and the functioning

of brain in order to facilitate more efficient ways of learning foreign languages. Interesting features of human psychology can help us learn English effectively and much faster improving knowledge and being able to acquire new ones.

**ABSTRACT**

*After evaluating the microbial landscape of the cultured microorganisms, they analyzed and evaluated the results of Scientific work on taxonomic traits and their changes, ie the manifestation of atypical traits that are not specific to the species. We found it necessary to differentiate each generation and species separately in order to facilitate the evaluation of the results obtained, to characterize the taxonomic characteristics of the grown pathogens, and to strengthen the identification results.*

**KEYWORDS:** *Escherichia coli. microorganisms., pathogen strains*

**INTRODUCTION**

The description of the microorganisms was given in sequence according to their growth rate.

Escherichia coli. Escherichia coli has been identified as a genus of Escherichia coli. They grew in their own universal (meat-peptone agar) and differential-diagnostic nutrient media. All studied strains of this gram-negative bacterium did not differ from each other in morphological and tinctorial properties. When observed under a microscope (7x90 = 630), the field of view

appeared to be medium-sized, short, rod-shaped (100%), irregularly spaced (100%), and stained red (100%) with control dye (aqueous fuchsin) when stained on Gram[1,4,6,8,9].

As for the cultural feature, the colonies grown in the Endo environment were bulging, the edges smooth, the surface smooth, C-shaped, mostly fuzzy (100%), metallic radiant, reddish, and sometimes dark pink. All strain colonies were of solid consistency (100%).

### Result and methods

Study of the biochemical properties of E.coli strains isolated from the urine sample of women of childbearing age showed that it utilizes glucose, lactose, maltose, arabinose, mannitol, sodium citrate, does not break down sorbitol, inositol, sodium Malone, does not produce hydrogen sulfide, urease, arginine dehydrola (Table 1).

According to the results of the analysis, practically half of the pathogen strains isolated from women diagnosed with UTI did not break down the enzyme sucrose. All studied strains (except 19 strains of E.coli) did not have hemolytic activity.

Strains that did not fully represent all taxonomic traits were assessed as atypical strains, however, their scarcity and the fact that there was only a change in 1-2 taxonomic traits allowed us to describe this pathogen as Escherichia coli[5,9].

Proteus srr. We did not find it necessary to identify the species because they are not pathogenetically different from each other. All strains of this microorganism were similar to other enterobacteria in morphological (100%), tinctorial (100%), and cultural (100%) properties. In this respect, similar characteristics were observed in other members of the family he represented.

**TABLE 1 INDICATORS OF BIOCHEMICAL PROPERTIES OF E.COLI STRAIN ISOLATED FROM URINE SAMPLE (FROM N = 12)**

Characteristics of strains	Acute UTI	Chronic UTI
Fermentation of carbohydrates		
Glucose utilization	+	+
Lactose fermentation	+	+
Mannitol fermentation	+	+
Sucrose fermentation	+	+(58,3%)
Inositol fermentation	-	-
Sorbitol fermentation	-	-
Arabinose fermentation	+	+
Maltose fermentation	+	+
Citrate Na Fermentation	-	-
Malonate Na	-	-
Fermentation		
Lysin decarboxylase	+	+
Ornithine decarboxylase	+(50,0%)	+(75,0%)
Arginine dehydrolase	-	-
Phenylalanine deaminase	-	-
Urease	-	-

B-galactosidase	–	–
Hydrogen formation	–	–
Hemolytic activity	+ (66,7%)	+ (41,7%)

Note: the percentage is given the number of strains with these characteristics; in the percentage not specified (+) the result was 100.0%.

According to Shukevich, the main differentiating features are "creeping growth" (100%), lactose fermentation (100%), sorbitol degradation ( $83.3 \pm 15.2\%$ ), lysine decarboxylase activity ( $83.3 \pm 15.2\%$ ), indole we can cite positive results of additional bacteriological tests such as formation (100%), malonate activity ( $83.3 \pm 15.2\%$ ). Bacteriological studies did not reveal pathogenic factors (0%). Apparently, the percentage of atypical strains is low, so there was no doubt that they belonged to the Proteus family.

Klebsiella SRP. In terms of morphological, tinctorial, cultural, and enzymatic properties (100%) showed taxonomic traits specific to this generation, as with other gram-negative bacteria analyzed, no atypical strains, i.e. no generational taxonomic traits were observed, no pathogenic factors were identified (0%).

Thus, strains of uropathogenic enterobacteria (Escherichia coli, Proteus SRP, Klebsiella SRP) collected from the urine of sick women were typical strains of all genera and species-specific to all studied taxonomic traits. detected.

Pseudomonas aeruginosa. This microorganism, which belongs to the genus Pseudomonas, along with other non-fermentable gram-negative bacteria (NFGNBs) has good growth properties in all nutrient media, so we did not choose a separate nutrient medium and grew it in Endo medium. we have described.

Colonies suspected of being the causative agent were replanted on 2% glycerin-containing oblique frozen agar. On its surface, Pseudomonas aeruginosa grew abundantly and densely, forming oily green pigmented (pyocyanin) colonies and distinguished by its distinctive 'blooming purple' odor.

For differentiation from other gram-negative microorganisms, especially enterobacteria, Pseudomonas aeruginosa was evaluated for the following characteristics:

- good growth (100%) in normal nutrient media (meat-peptone agar);
- mobility (100%);
- formation of green pigment (piocyanin) (100%);
- solubility of gelatin at 22°C (100%);
- Positive result of the Hugh Leifson test ( $90.9 \pm 8.7\%$ );
- Occurrence of the phenomenon of "rainbow lysis" ( $90.9 \pm 8.7\%$ ).

The phenomenon of "rainbow lysis" (formation of a mucous membrane of different colors on the surface of a colony of microorganisms) was recommended as an additional test in the identification of Pseudomonas aeruginosa in the bacteriological diagnosis of UTI. Since the atypicality of the strains was associated only with additional tests - the Hugh-Leifson positive

test and the “rainbow lysis” phenomenon, we relied on key taxonomic features in identification[1].

*Staphylococcus aureus*. When the described stimulus was stained on Gram, it was observed in the field of view that it was stained with the primary dye in 100% of cases. Under a microscope (7x90 = 630) it was observed that they were ball-shaped and arranged in a “grape bunch” shape (100%).

The following taxonomic characteristics of cultured strains were identified: bulging, dull, larger than 5 mm in diameter, large, C-shaped colonies (100%) grew on the surface of the nutrient medium; the presence of the causative colony in the golden pigment (100%); Growth in a nutrient medium containing 10% NaCl ( $83.3 \pm 15.2\%$ ); the colonies were found to be of solid consistency (100%).

Based on the above morphological, tinctorial, and cultural characteristics, the strains described were identified as belonging to the *Staphylococcus* genus.

The results of the identification of strains of the genus *Staphylococcus* by type are given below:

- coagulase activity of strains (coagulase-positive strains) was detected ( $83.3 \pm 15.2\%$ );
- Growing in nutritious juice ( $83.3 \pm 15.2\%$ );
- fermented mannitol in the Giss series under anaerobic conditions (100%);
- showed sensitivity to novobiocin ( $83.3 \pm 15.2\%$ );
- One of the signs of pathogenicity of the strain is the activity of lecithovetilase or the breakdown of lecithin, which forms the appearance of a "rainbow circle" around the colony ( $83.3 \pm 15.2\%$ );
- breaks down glucose (100%), lactose (100%), mannose (100%), sucrose ( $83.3 \pm 15.2\%$ ) (enzymatic activity).

The results show that basically all strains exhibited taxonomic traits specific to the genus *Staphylococcus aureus*. In some cases, i.e., in reactions, less than 100%, strains that showed atypical reactions that differed from typical strains specific to the *Staphylococcus aureus* species were also identified. However, the percentage of these cultures was low, and these strains differed from typical strains by only 1–2 characters. With this in mind, strains with an atypical reaction were also recognized as belonging to the genus *Staphylococcus aureus*[2,3,9].

*Staphylococcus epidermidis*. Morphologically, it is difficult to distinguish this microorganism from *Staphylococcus aureus* in terms of tinctorial properties, so it was not difficult to identify the generation by these taxonomic traits, in all strains (100%) these features were fully manifested.

The percentage of typical and atypical strains relative to *Staphylococcus acc* did not differ significantly.

The Main differential taxonomic features that distinguish *Staphylococcus epidermidis* from *Staphylococcus aureus* are the absence of golden pigment formation, the absence of coagulase activity (coagulase-negative), and the absence of hemolytic activity of pathogenicity.

Thus, *Staphylococcus epidermidis* was close to *Staphylococcus aureus* in morphological, tinctorial, cultural, enzymatic properties, differentiated by some cultural properties (absence of

golden pigment), lack of coagulase activity and a low percentage of pathogenic factors and closeness to healthy women.

*Staphylococcus saprophyticus*. In the identification of these strains, differences in their typical properties were not observed in practice. While it was acknowledged that staphylococcal traits were observed during microbiological identification, there was no difficulty in bacteriological identification.

*Enterococcus faecalis*. These identified enterococci were differentiated using tests used in the following microbiological diagnosis: gram-positive, chain-like in the visual field; grass-esculin agar formed C-shaped, dark-colored colonies, grown in a nutrient medium with 6.5% NaCl, on obliquely hardened meat-peptone agar (this test was used to differentiate from streptococci); fermented lactose, glucose, and mannitol to acid but without gas[1,9].

*Candida* spp. The overgrown strains were spherical and oval in shape, they did not break down lactose, they broke down sucrose to acid. The main differential signs - no ascospores, formed pseudomycelium, verticillas, chlamydo spores, without breaking down lactose, breaking down glucose, maltose, and sucrose, sprouting from the tip.

*Bacteroides* spp. Identification of this anaerobic microorganism was based on gram-negative, rod-like, inactive, sequential location in the visual field, growth under strict anaerobic conditions, C-shaped, pale, small colonies on blood agar, no hemolysis, hydrogen sulfide, glucose, lactose, sucrose breakdown.

The pathogenic properties of strains grown as large uropathogenic pathogens were characterized by the percentage of detection of pathogenic factors.

A total of 35 strains of acute UTI pathogens and 25 strains of chronic UTI pathogens were studied as pathogenic factors.

Strains with plasma coagulase, lecithinase, hyaluronidase activity accounted for a large percentage.

It is noteworthy that the hemolytic property was detected in low percentages only in *E.coli* (n = 19).

No significant differences were found between gram-negative bacteria and gram-positive cocci in the detection of pathogenic factors, and no similar convincing differences in this parameter were observed between acute and chronic UTI.

Thus, there were no significant differences in the identification of the main taxonomic features between strains that are considered uropathogenic pathogens and strains of microorganisms belonging to the same species derived from other biotopes. The variability of biological properties was also low, which did not prevent the identification of pathogens by generation and type.

## CONCLUSION

No practically convincing differences were found in the biochemical and pathogenic properties of the strains in the acute and chronic forms of UTI. This suggests that the main taxonomic features of uropathogenic strains that cause UTI in women of childbearing age are that there are

no changes to the extent that can be included in the diagnostic algorithm of microbiological studies on the characteristics of their variability.

This situation showed that the results obtained differed significantly from the results of Scientific studies published by the other researchers mentioned above.

### ABSTRACT

*This article is devoted to the study of the audio-lingual method of teaching English. The author indicates the relevance and practical significance of the research topic. The content of the concept of "teaching method" in the system of teaching English is considered. It is concluded that the audio-lingual method should be the basis for the formation of a methodology (strategy development) of teaching English, and not be an autonomous teaching method. The history, essence, key principles and criteria for the effective use of the audio-lingual method of teaching English have been studied. As a conclusion, the main advantages of the method are indicated, in the case of its application as an integral part of the methodology of teaching English, and the disadvantages that may appear in the case of its autonomous or remote use.*

**KEYWORDS:** *Audio-Lingual, Methodology, Teaching English, Advantages, Disadvantages, Foreign Language.*

### INTRODUCTION

The audio-lingual teaching method is one of the most popular methods for learning foreign languages. Most often it is used by those who intend to independently learn a particular foreign language. Although in the educational environment, it has its own popularity.

To understand what an audio-lingual language learning method is, we refer to a dictionary entry. The dictionary of methodological terms says that the audio-lingual teaching method is a method of teaching a foreign language, which provides for the use of the auditory channel of perception in the course of classes and repeated listening and reproduction following the speaker of strictly

selected structures, sample sentences, which leads to their automation (Vogt W. Paul., Johnson R. Burke, 2015).

The audio-lingual method is the product of three historical circumstances. It drew on the work of American linguist such as Leonard Bloomfield (Bloomfield Leonard, 1984). It was based on repeating simple patterns in a foreign language. In short, the linguist, not knowing the language, was trained to perceive its basic structure from an informant/native speaker and, together with the students, "gradually learned to speak this language and also to understand most of its basic grammar. The primary task of American linguists in the early decades of the twentieth century was to document all the indigenous languages spoken in the United States. However, due to a shortage of trained native speaker teachers who could provide theoretical descriptions of native languages, linguists had to rely on observation. For the same reason, a strong emphasis on speaking has been developed.

At the same time, behavioral psychologists such as B.F. Skinner, formed the belief that all behavior (including language) is learned through repetition and positive or negative reinforcement (Skinner, 1957).

The third factor is the outbreak of World War II, which made it necessary to deploy large numbers of American troops around the world. Therefore, it was necessary to give these soldiers at least basic verbal communication skills. Unsurprisingly, the new method relied on the prevailing scientific methods of the day, observation and repetition, which were also excellent for mass learning. Due to the influence of the military, early versions of the audio language became known as the "military method." At that time, the US government felt it was imperative to create a special language training program to provide language personnel for the war. Therefore, the government has instructed American universities to develop a foreign language program for military personnel ([https://en.wikipedia.org/wiki/Audio-lingual\\_method](https://en.wikipedia.org/wiki/Audio-lingual_method)).

Thus, in 1942, the Army Specialized Training Program (ASTP) was established. The method used was known as the "informant method" as it used native speakers, informant and linguist. The informant served as a source of language for imitation, and the linguist controlled the learning process. The intensive system adopted by the military has produced excellent results (Rivers, 1981).

## LITERATURE REVIEW

This method is one of the least studied in the system of scientific knowledge and is taken as a subject of analysis only in conjunction with other methods of teaching English. In addition, its use in the educational process "armed us with an understanding of the importance of speech patterns and training on them" (Markova, 2015). Developed in the 40s of the last century, the audio-lingual method was the basis for the practice of teaching English.

The evolution of English language teaching has a relatively short history when viewed in the context of its formation as an independent scientific discipline. At the same time, in essence, the history of language teaching is the history of teaching methods, whose supporters and opponents were either in a state of constant struggle and opposition (this is especially characteristic of the period the birth and development of direct and grammatical-translation methods at the end of the 19th and the beginning of the XX century). Today, the concept of "method" is also present in the name of the discipline - methodology, which gives grounds to talk about classifying teaching

methods among the main categories of methodology, and the choice of a method that meets the goals and objectives of training provides the most rational and effective way of mastering the language.

It should be noted that in modern linguo-didactics there is no unified approach to the interpretation of the concept of "teaching method". This, of course, makes it difficult to understand in what sense the term is used in the pedagogical process. On the one hand, the teaching method is a direction in teaching that determines the teaching concept (strategy) chosen by the teacher. On the other hand, in a broader sense, the teaching method can be understood as the way of teaching any aspect of the language (vocabulary, phonetics, grammatical structure, etc.), through which the practical aspect of the teacher's work in the specific conditions of language teaching is determined.

M.V. Lyakhovitskii wrote that the method gives an idea of the general concept of teaching, since it is based on "the dominant idea of solving the main methodological problems" (Lyakhovitskii, 1981). E.I. Passov defined the teaching method as "a system of interdependent methodological principles, united by a single strategic idea and aimed at mastering any type of speech activity" (Passov, 2009). In this case, the authors consider a broader approach to the definition of the term in question.

Thus, a specific feature of the method as a methodological concept is the leading idea, which determines the ways and means of achieving the set educational goal.

At the same time, to overcome the existing in the understanding of the term dualism, you can use the level approach, which was first spread thanks to the publications of D. Richards and G. Rogers. According to their approach, we can talk about three levels of using the concept of "teaching method": the level of approach to teaching, the level of development and the practical level. So, the first (theoretical) - defines the method as a direction in teaching, which determines the concept of teaching and language acquisition; the second - determines the tactical side of language teaching and implies the choice of the method and method of teaching in the context of the concept of the method, i.e. directions; the third one determines the ways of applying the method chosen for the work in the form of the teacher's labor technology, which in turn form a model of language teaching.

Based on the three-level approach presented by the English methodologists, the hierarchy of key categories of the methodology within the framework of using the concept of "teaching method" can be represented in the following way: the first level (from the standpoint of the approach to teaching) implies the use of direct, conscious and combined methods; the second (from the standpoint of development) - direct, conscious, combined and intensive methods; third (from the point of view of application) we mean the choice of teaching methods, the totality of which forms the content of the teaching strategy, corresponding to the teaching method chosen by the teacher (Shchukin, 2013).

## **DISCUSSION**

The audio-lingual method is based on two main theories: Structuralism: language is a system of structurally related elements such as phonological units, grammatical units and lexical units to convey meaning. So, to study the target language means to master the elements of the target language system.

Behavioral psychology claims that people are accustomed to learning many forms of behavior, including language, through learning or conditioning.

The five slogans that were established for the educational process and used by teachers who adopted this method were as follows:

1. Language is speech, not writing. The audio-lingual method mostly focused on speaking skills before written form (pronunciation, intonation, and colloquial forms).
2. Language is a set of habits. The audio-lingual method is based on habit formation. Language is learned in childhood in the same way that children acquire other social habits through imitation and memorization. Students learn the language automatically using conversational material.
3. Learn a language, not a language. This slogan is a reaction against the basic principle of the grammar translation method (the allotted time for communication in the target language without grammar analysis).
4. A language is what its native speakers' say, not what someone thinks they should speak. Teachers do not have to impose grammar scores according to certain criteria, but in order to learn, students must speak the language spoken by native speakers.
5. Languages are different. In this case, the concept of universal grammar was rejected. Thus, each language is analyzed according to its own characteristics without any relation to another language (Al-Mutawa N, Kailani T, 1998).

Methods and actions used by the audio-lingual method. The audio-lingual method is different from the grammatical translation method and the direct method. He emphasizes mimicry as a basic technique. This is achieved through memorization of dialogues and imitation repetition. The practice of using drills and templates includes the following:

1. Repetition: When a student repeats a statement as soon as he hears it, without looking at the printed material.
2. Kink: when one word in a sentence appears in a different form when repeated.
3. Substitution: when one word is replaced by another word.
4. Repeat Utterance: The student paraphrases the utterance and refers to someone else as instructed.
5. Completion.
6. Transpose: changing the word order is necessary when adding a word.
7. Extension. When a word is added, it occupies a specific position in the sequence.
8. Abbreviation: One word designates a phrase or sentence.
9. Transformation: The sentence is transformed by becoming negative or interrogative or through a change in time, mood, voice, aspect or modality.
10. Integration: Two separate statements are combined into one.

11. Remark: the student makes an appropriate answer to the given pattern. (politely, answer a question, agree, disagree, express surprise, etc.)
12. Recovery: This is one of the most common patterns found in English as foreign textbooks.
13. Using minimum pairs.

How is the audio-lingual method so different from traditional ways of learning a language?

The first and main distinguishing feature of the audio-lingual method is the assignment of oral speech to a primary role in learning. The ability to understand foreign speech at a normal pace is developed, as well as on such material that the student himself cannot reproduce - "I understand everything, but I cannot say."

The second feature is the colossal load on the student's memory and the method of analogy. The student must memorize (memorize) the basic set of sentences that are most often used in colloquial speech. By analogy with these sentences, the student will build other sentences for oral reproduction or listening.

It is also recommended to memorize entire dialogues and communication situations. At the initial stage of training, the student's vocabulary practically does not develop. A small set of words is used, which allows you to work out the basic grammatical structures through speech and repetition-pronunciation.

The third feature of the audio-lingual method is the sheer amount of practice. Only 15% of the lesson time is devoted to explaining grammatical, lexical, phonetic foundations. The rest of the time is devoted to practical exercises. However, such classes can quickly bore the student, with their monotony and monotony of approach. Therefore, it is recommended to immediately assess the student's actions - did it right - praise, wrong - correct.

The fourth feature is the dictionary. The audio-lingual method divides words into categories of different levels of difficulty with their own subgroups in each. The easiest ones include prepositions, adverbs, conjunctions, interrogative particles, articles. The most difficult - words for objects, words for actions, words for quality, that is, nouns, adjectives and verbs. Learning vocabulary is based on the principle from simple to complex.

However, at the initial stage of learning, words from a complex category are used, but they are selected in such a way that in form and meaning they correspond as much as possible to the equivalents of the native language.

The role of the teacher in the audio-lingual method is like an orchestra leader. "He guides and guides students in their language learning style. He is also responsible for providing students with good role models. Whereas the role of the student is seen as an imitator of what is said in front of him by the teacher or record. They follow their teacher's directions and respond as quickly as possible (Freeman, 2000).

*Advantages and disadvantages of the audio-lingual method.*

Advantages:

1. Availability. Indeed, this method of language learning is extremely accessible. There are app stores which help to find language learning programs based on the audio-lingual method. The

most popular are DUOLinguo and Memrise. Some of them are paid, some are not. But even paid apps turn out to be much cheaper than a lesson with a teacher.

2. Ease of use. Everything here is just straight up to disgrace. Set of words, pictures, cards and cubes-blocks are listened repeatedly which are related to each other to get a phrase by clicking on them or dragging them.

3. Stability and consistency of the teaching method. Training always takes place according to the same scenario. Set of words is seen, acting and pictures are voiced for them, and usually no more than 2-3 words are given per lesson. Then these words are practiced by choosing the translation, writing, speaking, constantly listening and repeating aloud. Each card is read out, so that other people can hear one word or expression many, many times. Further complication occurs. New words are added and phrases are expanded. They become more detailed and complex. For example, the phrase "A cat drinks milk", then after a couple of lessons this phrase turns into "A little cat drinks milk on the roof."

4. Comfort and duration of the lesson. There is no need to talk about convenience. Practice is required when it is convenient. The urge to repeat English pronouns overwhelmed at midnight. Controlling the duration of the lesson should be done by the student. It can be 5 minutes a day or 2 hours. It all depends only on students' desire and time possibilities.

Other advantages:

1. This was the first theory-based method.
2. It made language learning accessible to large groups of ordinary learners.
3. It was the first method to focus on the development of the syntax of a language, while other methods focused on morphology and vocabulary.
4. Developing simple methods and using a language lab.

Disadvantages:

1. Availability. One should not be surprised that good on the one hand is just as bad on the other. What cost invaluable for us is usually not appreciated by us. Therefore, very often after purchasing a particular program, after a couple of weeks, when the enthusiasm ends, we simply forget about it.

2. Stability. If at first the substitution of words, their pronunciation and listening seems to be the best that it can be, then after a while we begin to miss the variety. Where an experienced teacher would have suggested reading a magazine article that is interesting or discussing the taste preferences, students continue to "roll their "snowball"". And this is what often begins to tire and reduce motivation to the point of its complete absence.

3. Limitedness. The audio-lingual method does have its limits.

- A limited set of words and phrases that are comfortable to memorize through the auditory canal.
- The use of one type of memory for learning a foreign language, which may entail the impossibility of using the written language of the target language.
- Absence of a partner for practicing dialogical speech - the most common type of speech.

• Experience. The audio-lingual method is excellent for those who have experience in learning a foreign language, a very deep and consistent experience. What does it mean? Students will start asking “why,” for example, in the sentence “She eats cake every day” the verb eat has a –s ending, but the sentence “I eat cake every day” does not. It is simply impossible to get an answer to this question without understanding the presence of temporal structures of the language, grammatical and lexical forms of a word. Therefore, students will have to look for answers to the questions themselves, working through tons of different grammatical information. While, studying with a living person, they can always ask questions that interest them.

Thus, the audio-lingual method is a good addition when teaching English or another foreign language with a teacher, either individually or in a group.

Other disadvantages:

1. No creativity. Students repeat and remember what they do not understand.
2. The methods used by this method become "tedious and tedious, causing fatigue."
3. Make advanced learners bored.
4. There are many students in the class.

In the 1960s, many linguists criticized audio-lingual method, arguing that the theoretical basis of this approach was weak, and it turned out that students could not use the skills learned in the classroom in real communication. In 1966, Chomsky criticized behaviorist theory, which was the mainstay of audio-lingual method. He argued that this theory cannot serve as a model for how people learn languages. Chomsky presented an alternative theory of language learning (Chomsky, 1966).

He explained that languages are not acquired through repetition and imitation, but “are generated by the basic competencies of the learner”. With the advent of Chomsky's theory of transformational grammar, audio-linguism lost its popularity. (Richards and Rogers, 1987).

## CONCLUSION

In general, we can say that the audio-lingual method will be a significant addition to the general methodology of teaching English. Among the advantages of this method, one can note a clear formulation of learning goals, defining ways to achieve these goals through various exercises, mastering grammar through models and speech patterns, consistent inclusion of country-specific information in classes, widespread use of technical means and the development of special exercise. However, if it is used autonomously, a certain range of disadvantages will affect, for example, the monotony of speech exercises, the predominance of mechanical teaching methods, meaningless memorization of structures, which can lead to a misunderstanding of the purpose of the lessons by students, as well as the lack of interconnection in teaching the main types of communicative activity. In addition, the audio-lingual method can be effectively implemented exclusively in the system of full-time educational process, in audiovisual systems included in distance learning platforms, replacing a teacher - a native speaker with a computer significantly reduces the communicative efficiency of learning any foreign language, in particular, English.

### ABSTRACT

*Teaching vocabulary in the English as a foreign language (EFL) context is challenging. Incidental vocabulary learning is limited due to a lack of second language (L2) input, and most words are learned through classroom instruction. Overall, research has shown marginal L2 vocabulary growth in many EFL situations. Such research indicates a need for a more effective and efficient approach to teaching vocabulary in the EFL context. This chapter discusses how to optimize vocabulary learning in the EFL context. It touches on the following questions: Which words should be taught? How should vocabulary be taught? How many words do EFL learners need to know? What should a vocabulary-learning program include? How can vocabulary learning be fostered given limited classroom time? Which activities might be useful in indirect vocabulary learning?*

**KEYWORDS:** *Vocabulary Size, Vocabulary Learning, Extensive Reading, Extensive Viewing, Vocabulary-Learning Program.*

### INTRODUCTION

Hornby defines vocabulary as the total number of words in a language: “vocabulary is a list of words with their meanings”<sup>1</sup>. While Ur states as follows:

“Vocabulary can be defined, roughly, as the words we teach in the foreign language. However, a new item of vocabulary may be more than just a single word: for example, post office, and mother-in-law, which are made up of two or three words but express a single idea. A Useful convention is to cover all such cases by talking about vocabulary “items” rather than “words”<sup>2</sup>

In addition, Burns defines vocabulary as the stock of words which is used by a person, class or profession<sup>3</sup>. According to Zimmerman in Coady and Huckin vocabulary is central to language

and of critical importance to the typical language learning<sup>4</sup>. Furthermore, Diamond and Gutlohn in [www.readingrockets.org/article](http://www.readingrockets.org/article) state that vocabulary is the knowledge of words and word meanings<sup>5</sup>. From the definitions above, it can be concluded that vocabulary is the total number of words which are needed to communicate ideas and express the speakers means. That is the reason why it is important to learn vocabulary.

### **Kinds of Vocabulary**

Some experts divide two types of vocabulary: active and passive vocabulary. Harmer distinguishes between these two kinds of vocabulary<sup>6</sup>. The first kind of vocabulary refers to the one that the students have been taught or learnt and which they are expected to be able to use. Meanwhile, the second term refers to the words which the students will recognize when they meet them, but which they will probably not be able to pronounce. Haycraft, quoted by Hatch and Brown, divides two kinds of vocabulary, namely receptive vocabulary and productive vocabulary<sup>7</sup>.

#### **a. Receptive Vocabulary**

Receptive vocabulary is words that the learners recognize and understand when they are used in the context, but which they cannot produce. It is vocabulary that the learners recognize when they see or meet in reading text but do not use it in speaking and writing.

#### **b. Productive Vocabulary**

Productive vocabulary is the words which the learners understand, can pronounce correctly and use constructively in speaking and writing. It involves what is needed for receptive vocabulary plus the ability to speak or write at the appropriate time. Therefore, productive vocabulary can be addressed as an active process, because the learners can produce the words to express their thoughts to others.

### **Vocabulary Mastery**

In order to understand the language, vocabulary is crucial to be mastered by the learner. Vocabulary mastery is needed to express our ideas and to be able to understand other people's saying.

According to Webster mastery refers to (1) a. the authority of a master: dominion, b. the upper hand in a contest or competition; superiority, ascendancy and (2) a. possession or display or great skill or technique, b. skill or knowledge that makes one master of a subject comment<sup>8</sup>. While Hornby defines mastery as complete knowledge or complete skill. From that definition, mastery means complete knowledge or great skill that makes someone master in a certain subject<sup>9</sup>.

The specificity of any individual's vocabulary knowledge depends on the person and his motivation, desires, and need for the words<sup>10</sup>. Vocabulary mastery refers to the great skill in processing words of a language. It is an individual achievement and possession<sup>11</sup>. For that reason, the biggest responsibility in increasing the knowledge is in the individual himself. The success in widening the vocabulary mastery requires their own motivation and interest on the words of a language.

From the definition above, we can conclude that vocabulary mastery is an individual's great skill in using words of a language which is acquired based on their own interest, need and motivation.

Vocabulary mastery plays an important role in the four language skill and it has to be considered that vocabulary mastery is one of the needed components of language.

### **Teaching Vocabulary To Children**

One of the factors bringing to the unsuccessful teaching of English could be the students lack of vocabulary. Vocabulary is one of the vital elements in constructing meaningful communication. Without knowing the words needed to convey their ideas and feeling the learners can't speak and write well. A student who masters a good structure seems to lose its function whenever it is not supported by the abundance of words. In other words, it can be said that no matter how well students learn grammar and sounds of words, without words to express wide range of meanings, communication will become meaningless. In teaching vocabulary, the significant point is the selection of words the teachers want to teach. In teaching children, it is quite easy to teach concrete words and then become more abstract. The frequency also must be considered by the teacher. The teacher can decide which words to teach on the basis of frequency, how often the words are used by the speaker of the language. The teacher should teach the words that young learners are familiar with. How often words are taught depend on the themes and topics. A lot of books provide vocabulary according to the themes. For example, when there is a theme "Animals", then we can find words like names of animals, where they live, what they eat, etcetera.

Vocabulary mastery in elementary school especially at the third grade students still in the level of receptive use. They able to identify the words when they meet them but they are not able to produce or use the words speaking or writing. ado (1979: 121-126) gives some steps in vocabulary learning, namely: (1) listening the words, (2) pronouncing the words, (3) understanding the meaning, (4) making illustration in the form of sentence, (5) doing practice in expressing the meaning, (6) pronouncing the words in loud voice, (7) spelling the words. Based on this theory, the third grade students are able to master vocabulary in listening the words, pronouncing the words and spelling the words. Another expert, Ur (1998: 60-63) states the learners need to be taught the form of the words, then grammar, collocations, meaning and word formation. In the form of words, pronunciation and spelling should be mentioned. Ur states "The learner has to know what word sound is like (its pronunciation) and what it looks like (its spelling)." The grammar of a new item needs to be taught but it depends on what level the learners are. For example young learner in earlier age will find it difficult and confuse to be taught past forms when teaching verbs. Ur adds that the meaning of a word is primarily what it refers to in the real world, its denotation. It is important to inform learners about the meaning of the word as well as their form and grammar. Learners find this sometimes very difficult and discouraging because some words do not have just one meaning. Context helps them to find the right meaning. In word formation, using prefixes and suffixes, using hyphenated words etcetera, is too difficult for young learners.

It can be summarized that knowing the word and understanding its meaning go hand in hand. It is also easier to remember concrete words like a chair or a dog than abstract words. Young learners often put words together with what they can see, hear or with what they can touch. But as said above they also need to know other aspects of the words they learn. The third grade students able to master vocabularies in the form of listening the words, pronouncing the words and understanding the meaning of the words.

## **The Techniques in Teaching Vocabulary**

To get the best result on language learning, it is important to choose good and appropriate technique in teaching vocabulary. Here are some techniques of teaching vocabulary as stated by Brewster, Ellis, and Girard (1992: 90-91):

### **a. Using Objects**

Objects can be used to show meanings when the vocabulary consist of concrete nouns. Introducing a new word by showing the real object often helps pupils to memorize the word through visualization. Objects in the classroom can be used or things brought to the classroom.

### **b. Drawing**

Objects can either be drawn on the blackboard or drawn on flash cards. The latter can be used again and again in different contexts if they are made with cards and covered in plastic.

### **c. Using Illustrations and Pictures**

There are plenty of vocabularies that can be introduced by using illustrations or pictures. The teacher can use learning materials provided by school. They can also make their own visual aids, or using pictures from magazines. Visual support helps pupils understand the meaning and helps to make the world more memorable.

### **d. Contrast**

Some words are easily explained to student by contrasting it with its opposite, like the word *good* contrasted with *bad*. But some words are not. It is almost impossible to contrast the words whose opposite is the gradable one. When the word *white* contrasted with *black*, there is an “in between” word *grey*.

### **e. Enumeration**

We can use this to present meaning. We can say clothes and explain this by enumerating or listing various items.

### **f. Mime, Expressions and Gestures**

Many words can be introduced through mime, expressions, and gestures. For example, adjectives: sad, happy; mime: taking a hat off your head to teach hat and so on.

### **g. Using Opposites**

This technique allows pupils to associate words with a concept they already understand in their mother tongue and often pupils will learn two words instead of one. For example, long/short, big/little, straight/curly, town/country, ill/well, and so on. Meanings can also be conveyed using simple line drawings.

### **h. Guessing from Context**

This technique encourages pupils to take risks and guess the meanings of words they don't know as much as possible. This will help them build up their self-confidence so that they can work out the meanings of words when they are on their own. There are many clues pupils can use to establish meanings for themselves, such as illustrations, similarity of spelling or sound in the mother tongue, and general knowledge.

**i. Eliciting**

This technique is more motivating and memorable by simply giving pupils a list of words to learn.

**j. Translation**

There are always some words that need to be translated and this technique can save a lot of time. Other techniques of introducing new vocabulary are suggested by Gairns and Redman (1986: 76) as follows:

**a. Visuals****1) Visuals**

Visual techniques can be in the form of flashcards, photograph, blackboard drawings, wall charts, and realia. All of these techniques are extensively used for conveying meaning concrete nouns like animals or fruits, and certain areas of vocabulary such as professions, places and description of people and activities.

**2) Mime and Gesture**

These are often used to supplement other ways of conveying meaning. When teaching an item such as *to chew*, a teacher might build situation to illustrate it, make use of the blackboard and gesture to reinforce the concept.

**b. Verbal Techniques****1) Use of Illustrative Situations (Oral or Written)**

This could be the most helpful ways when the items become more abstract. The teacher often uses more than one situation or context to check that learners have grasped the concept.

**2) Use of Synonymy and Definition**

Teacher often use synonymy with low level students, where inevitably they have to compromise and restrict the length and complexity of their explanation.

**3) Contrasts and Opposites**

A new item like *big* is easily illustrated by contrasting it with *small* which is already known by the students. In this case, the teacher must have known exactly which vocabulary has been mastered by the students and which has not.

**4) Scales**

After the students have learnt two contrasted or related gradable items, this can be a useful way of revising and feeding in the new items.

**5) Examples of the Type**

To illustrate the meaning of subordinates, such as *flower*, *vegetables*, and *foods*, it is a common procedure to exemplify them e.g. rose, jasmine, and orchid are all *flower*. But the technique cannot be applied in delivering the words that belong to more than one ordinate.

**c. Translation**

---

This technique can be a very effective way to convey the meaning because it is not time consuming that might otherwise be spent on a complicated and largely unsuccessful explanation in English, and it can be a very quick way to dispose of low frequency items that may worry the students but do not warrant significant attention. The teacher give the meaning directly, so the students did not need to get involve in the process in finding the meaning.

Schmitt and McCarthy (1997: 11) propose strategies to learn vocabulary as follows: (1) guessing from context, (2) using word parts and mnemonic techniques to remember words, and (3) using vocabulary cards to remember foreign language-first language word pairs. It is supported by Decarrico in Murcia (2001: 290) who also propose three strategies to learn vocabularies. The first is guessing meaning from context; she says that a context is rich enough to adequate clues to guess word's meaning. The second is mnemonic devices: she proposes keyword technique. When seeing or hearing the target word, the learner is reminded of the keyword. The third is vocabulary notebooks; she suggests a memory aid in independent learning by setting up vocabulary notebooks. Based on the techniques used for presenting new vocabulary, the experts suggest lots more of techniques that are claimed to be helpful for students to learn vocabulary in an easier way. What the researcher sees as the better way to teach vocabulary is by learning in rich contexts.

## CONCLUSION

The research has made some findings. It had been found that before the action the students' vocabulary mastery was low. As identified from the result of pre-observation and pre-test. The pre-research showed that the teacher did not use appropriate method in presenting the materials. She taught the students by translating the vocabulary. This method did not give an opportunity for the students to show their ability and potential. There was also no media used in teaching and learning process. It made the students easily get bored and pay poor attention to the lesson.

From the research, teaching vocabulary using contextual teaching and learning can improve the students' vocabulary mastery and change the students' behavior. The improvement after CTL is applied in the teaching and learning process could be seen in the increasing students' participation in learning English.

Those improvements are as follows:

1. The improvement of students' participation in attending the lesson. The students participate well in following all the procedures of the teaching learning process. They love to take part in every single activity held in teaching and learning process. They are able to make a discussion with their group. They are also good in pair and individual activity. The better participation from the students is also indicated by their willingness in asking and answering questions.
2. The improvement of learning situation. The students learn in an enjoyable situation. They find that contextual teaching and learning is not boring. They could collaborate well with other students. Contextual teaching and learning is not always held by sitting in the chair and listening teachers' explanation for a long time, but the students have wider space to learn and this method creates a non-threatening situation which automatically made them consider that English is not a difficult subject.
3. The improvement of the students' spelling. Since the poorest component of vocabulary in the result of the first post test is spelling, the researcher and the teacher gave more spelling activities.

As the result, the students could practice to write the English word and had courage to speak up in English.

4. The improvement of students' score. One of the indicators that the action is successful is the improvement of the students' mean-score.

Before using CTL, the students tend to be passive. When the teacher asked some questions, nobody wanted to answer the questions. But after CTL was applied in the class, almost all of the students raised their hands as a sign for willing to answer the questions. The students were interested and motivated in learning English. Since CTL was done in group work activity, there was no problem of shy students. The students did not feel reluctant to ask to their own friends. They worked together as a team and there was also no domination of some students. The students were more enthusiastic and active in joining the lesson. Besides, their achievement also improved, as shown by the mean score of post-test an increase of the students' achievement from pre-test. Based on the research finding above, the researcher conclude that teaching vocabulary using CTL can improve the students' vocabulary.

## **INTRODUCTION**

During the years of independence, the education system and upbringing of a harmoniously developed generation in the country have risen to the level of the main priorities of state policy.

Preschool education is the primary part of lifelong learning. It ensures that the child develops into a healthy and developed person, stimulates the desire to learn and prepares for systematic learning.

The purpose of pre-school education is to prepare children for school, to form a child as a healthy, developed, independent person, to reveal their abilities, to cultivate a passion for learning, systematic education.

### **MATERIALS AND METHODS**

Further improvement of the integrated system of continuing education as an important part of the system of pre-school education, expansion of the network of preschool educational institutions and strengthening their material and technical base, providing them with qualified teaching staff. Our main goal is to radically increase their school readiness.

On December 16, 2019, the President signed the Law ZRU-595 "On Preschool Education and Upbringing." The law clearly defines the main directions of state policy in the field of preschool education and upbringing, as well as state guarantees for preschool education and upbringing [2].

In particular, the state guarantees the right of every child to undergo one year of compulsory one-year preparation for general secondary education in state pre-school educational institutions one year prior to enrollment in general secondary education.

Article 5 of the law sets out the main directions of state policy in the field of preschool education and upbringing.

They include: ensuring the right of every child to pre-school education and upbringing;  
creating conditions to ensure full coverage of children in preschool education and upbringing;  
to provide comprehensive assistance to the family in the development of the child, pre-school education and upbringing;  
creation of conditions for quality pre-school education and upbringing of children, including children with special educational needs;  
creation and development of alternative forms of education and upbringing;  
state support for the development of preschool education and upbringing;  
introduction and development of public-private partnership mechanisms aimed at expanding the network of preschool educational institutions;  
introduction of modern innovative and information and communication technologies for the comprehensive development of preschool children;  
development of international cooperation.

The system of pre-school education includes:

- preschool education organizations;
  - alternative forms of education;
  - Research institutions and educational organizations operating in the field of preschool education and upbringing;
- public administration bodies in the field of preschool education and upbringing, as well as organizations under their jurisdiction.

By law, a preschool organization can be a government or non-government organization.

---

Preschool education organizations are organized in the following types:

- General type of preschool education;
- Multidisciplinary specialized preschool education organization;
- Preschool education organization with inclusive groups;
- Joint type preschool education organization.

## **RESULT AND DISCUSSION**

The implementation of the state educational program of preschool education and upbringing will be ensured in the general development groups of the general type preschool education organization.

The implementation of the state educational program of preschool education and upbringing for children with physical or mental disabilities in the development of a multidisciplinary specialized preschool education organization will be ensured.

A preschool with inclusive groups provides equal opportunities for children to receive education and upbringing by adapting them to a healthy environment, taking into account their individual learning needs and individual capabilities.

The state educational program of pre-school education and upbringing aimed at organizing the joint study and upbringing of children with physical or mental disabilities and children with developmental disabilities in separate groups, as well as in inclusive groups in a single type of preschool education organization.

The groups are divided into age-appropriate categories of early development (1 to 3 years), small (3 to 4 years), medium (4 to 5 years), large (5 to 6 years) and pre-school (6 to 7 years). Completion of groups and transfer of children from one group to another is done every year until the beginning of the school year. According to the agreement with the Ministry of Preschool Education, it is allowed to organize groups with the maximum amount of their filling. The procedure for filling groups in non-governmental preschool educational institutions shall be established by their founder, taking into account the sanitary and hygienic requirements for the maintenance of preschool educational institutions, their structure and organization of their work regime.

The law sets out the rights and responsibilities of the participants in the educational process: children, their legal representatives and teachers. Social protection of preschool children is guaranteed, the order of organization of their nutrition and health protection, the order of weekly workload and remuneration of teachers are established. The governing bodies of public kindergartens: the powers of the pedagogical council, the supervisory board and the heads have been regulated.

From the point of view of recipients of educational services, it is important to ensure the quality of the educational process. The following public administration programs are used for this purpose:

- State accreditation of preschool education organizations is carried out in 5 years, the activities of private organizations are licensed. In both cases, the procedure is established by the Cabinet of

Ministers, and the State Inspectorate for Quality Control in Education under the Cabinet of Ministers is the competent authority;

- The state standard, which is mandatory for all preschool educational institutions, is adopted and revised at least once every 5 years, the state educational programs are approved;

- The professional standard of the teacher is approved by the Cabinet of Ministers, the professional standard of the teacher sets inseparable requirements to the personal qualities of the teacher from his knowledge, skills and abilities. Teachers are certified at least once in 5 years. Persons with incapacity or limited legal capacity, diseases or physical disabilities that impede the implementation of pedagogical activities, as well as persons previously convicted for intentional crimes may not engage in pedagogical activities in preschool education institutions.

The Address of the President of the Republic of Uzbekistan ShavkatMirziyoyev to the OliyMajlis on December 29, 2020 stated that the coverage of young children with preschool education has doubled in four years to 60%, and the number of kindergartens has tripled to more than 14,000 [2].

In his speech, the President noted that from the moment a child is born, it is at the pre-school age that mental activity increases, moral, aesthetic and physical qualities are formed. Therefore, our strategic goal for the development of preschool education in the coming years is to create the necessary conditions for the full coverage of every child of kindergarten age in this area of education.

At the same time, a number of tasks have been set for the preschool education system. In particular, by the end of 2021, the coverage of preschool education should reach 65%, and by the end of 2023 - 75%. An additional 2,000 non-governmental kindergartens will be established with a budget subsidy of 600 billion soums, and the share of the private sector will increase to 25 percent. Also, in 2021, 560,000 6-year-old children or 82% of them will be covered by the free school preparation system.

Alternative forms of pre-school education will be further expanded in remote villages. At the same time, in cooperation with UNICEF and the World Bank, a model of home pre-school education for children with disabilities will be launched.

## CONCLUSION

Therefore, today we must pay special attention to the preschool education system, dramatically increase the coverage of preschool education, create a healthy, active, harmonious, socially adapted child's personality, as well as conditions for future successful learning activities and quality preparation of children for primary education. required. We also need to ensure the coherence of primary education curricula, the use of modern forms of teaching, new pedagogical and information technologies in the preschool education system. These issues are among the most pressing and urgent tasks of today.

Nukus, UZBEKISTAN

### ABSTRACT

*The article examines the problems and errors of interpretation and translation of texts that students face when teaching foreign languages. Translation theory not only formulates the goals and objectives of translation, but also suggests ways to resolve the translation problems listed in this article. The importance of establishing correspondences and discrepancies in two languages - lexical, grammatical and stylistic - is emphasized.*

**KEYWORDS:** *Translation Studies, Translation Theory, James Holmes, Translation, Transformation, Homophones, Non-Equivalent Vocabulary.*

### INTRODUCTION

Despite the fact that translation theory as a science emerged only in the 20th century, many of its problems were recognized and considered many centuries ago. This is evidenced by the statements of translators, poets and writers, who often acted as translators themselves, as well as the reviews of political figures preserved by history. For several centuries, everyone who was directly involved in translation turned to the practical problems of their work, giving them theoretical understanding.

Initially, translation studies were based mainly on the practice of translating the Bible, philosophical and natural science works, and literary works. Translation helps people overcome language and cultural barriers. In our time, the importance of translation activity has increased, and the requirements for its quality have increased. The accuracy and quality of translation is constantly being improved. To date, translators have come to create a text that is fully consistent with the original in another language.

### Materials and Methods

For more than 50 years, translation has existed as an academic discipline, and its achievements are used to teach a foreign language using a communicative approach. In 1972 in Copenhagen, at

the III International Congress of Applied Linguistics, James Holmes announced the need to change focus and study translation within the framework of an integrated approach. Holmes identified three main obstacles to the further development of this theoretical discipline:

- scientists and researchers are "scattered" in different fields of science, and they do not have common channels of communication;
- "Trivial question" - no name for this area of study;
- there is no consensus on the scope and structure of the discipline.

Also J. Holmes proposed a scheme for his integrating concept. The scientist identified two main areas of research: "pure" and "applied" translation studies. The first was subdivided into theoretical and descriptive, which should be focused on: 1) the synchronous or diachronic study of the translation product, 2) the psychological study of the translation process, and 3) the sociological study of the functions of translation.

The applied branch consisted of translation didactics, translator aids, translation criticism and translation policy, which determined the place and role of translation and translator in society. The resources of a professional translator are knowledge of languages and cultures, specific translation skills, as well as their own personal characteristics and cognitive abilities. Cognitive elements and processes during translation are subject to multiplication, since an additional cognitive element appears between the speaker and the observer - the translator. The translator has to analyze and model the cognitive scheme of the author of the original text and recreate it in the translated text, thereby involving the cognitive levels of all three participants in intercultural communication in interaction.

So, when using transformation in translation, that is, paraphrasing, the translator should not only not simplify the meaning of the translation, which is functionally assigned only to the speaker, but also take into account the linguo-ethnic barrier that is present in the everyday life of any people. We are talking about a different perception of the world around us, the manner of communication, national traditions and habits, attitudes towards elders, work, holidays, their social responsibilities, etc.

Interpretation can be simultaneous and consecutive. Consecutive is performed in the pauses between the phrases of the speaker. Simultaneous translation by ear is the pinnacle of translation art. The translating language preserves the style and vocabulary of the speech. There must be a strict differentiation of the language by genre style. The translator in no way shows his attitude to the text he is translating, the ceremony taking place and the persons present.

Written translation differs from oral translation in that the text can be repeatedly altered and the desired translation option can be selected. The subtleties laid down by the author in the content are analyzed and transferred to the system of the translating language.

Translation methods are divided into automated and manual. Today there are a large number of programs - "translators" and sites that offer online text translation services. Students try to apply these programs to translate texts. However, this method of translation cannot often be called successful.

**Main Part**

An electronic translator may well make a translation of a specific word. But it is impossible to enter all cases of correct translation into dictionaries, and first of all this concerns technical terms. The inability to convey the associative array and the inadequacy of the analysis of the context of phrases is one of the main and practically unavoidable shortcomings of the "electronic translator". He gives out a literal translation, since he is not able to determine the figurative meanings of words or choose an appropriate translation option from several that are suitable on formal grounds. As a result, errors occur that distort the meaning of the text.

Translation is a complex process consisting of several, closely related and transitioning stages:

1. Preparatory stage. It is necessary to read the entire text or at least a part of it to yourself in order to get an idea of what is being said, to understand the main idea, the general meaning of the message.

2. Draft translation. Having understood the general content of this passage, you need to make its semantic analysis. After that, the text is marked up, difficult terms, grammatical constructions, lexical expressions, as well as Anglo-American measures (for conversion to metric) are identified.

It is recommended to write out all the core terms, as they appear in the text, on a separate sheet along with their Russian equivalents and use them throughout the translation process. Then you should proceed to work on individual sentences, dividing each into elements and links, realizing the connections between individual words and groups of words. After the connections between words are established, it is necessary to determine the corresponding meanings of unfamiliar words in the dictionary, but not in the order they appear in the text, but depending on the functions they perform in the sentence. You need to start with the disclosure of the meanings of the main members of the sentence - the subject and predicate. The title should be translated after the entire text has been translated. A draft translation can be done both in writing and orally.

3. Working translation. After the draft translation is completed, the sentences (paragraphs) of the text of your own translation are checked against the original so that each phrase of the translation corresponds to the original text, the uniformity of the terminology used, and the logic of presentation. The text of the translation is freed from expressions and phrases unusual for the Russian language, stylistic and semantic corrections are introduced into it. A working translation is a full-fledged, stylistically competent translation that correctly conveys the content of the original, in which some terminological and stylistic inaccuracies are allowed.

4. Final translation. This is the last stage of translation - literary processing and scientific editing. Without looking into the original, relying on the correctly revealed meaning with all its shades, it is necessary to convey all of its content into literary Russian. At the same time, if necessary, you can change the order of words, turn complex sentences into simple ones, and vice versa, develop simple ones into complex ones. Such a translation is complete, stylistically competent, it correctly conveys the content of the original and accurately uses special terminology.

It should be noted that when expressions are encountered that cause difficulties in translation, it is not always a matter of poor vocabulary or poor grammar knowledge. The ability to translate correctly is a whole science. English and Russian languages differ in their structure and system

of images, so the correct translation from English is often not an easy task. There are some major translation difficulties to consider.

The first of them is the polysemy of words. Many constructions of the Russian language turn out to be cumbersome in comparison with English phrases. It so happens that in the Russian language there is no meaning at all for any word. This may affect the nature of the translated sentence from English.

The verb to get is one of the most polysemantic verbs in the English language. For example, in the sentence We got the dress to our mother, the verb is used to mean "buy". And in the example: She got us tea - translated as "brought". Here are some more examples:

I'll get the translation by tomorrow. - I'll finish the translation by tomorrow.

I want to get the sofa to the sitting-room. - I want to move the sofa to the living room.

The next trap in translation is phrasal verbs. It is important to know that prepositions or postpositions that occur in stable verb combinations absolutely change the original meaning of the verb:

to call - call, call, call to call for - required

to call up - call

to call - enter (visit)

The example shows that the same verb with different prepositions acquires new meanings, which may be completely unrelated to the root word. Words that can be different parts of speech are also a problem in translation. So, a word can be an adjective, a noun, or a verb. And since there are no endings in English, the nature of such words can be determined based on their place in the sentence (syntax)

The main reason for translation errors is the translation of individual words or phrases; violation of the logical connection between parts; inability to distract from specific forms of words and inability to use context to understand their meaning. This needs to be learned. It should also be borne in mind that old words sometimes acquire qualitatively new meanings, and individual words outside the context do not have a definite meaning and therefore cannot be translated. It is not words that are translated, but what they express.

## CONCLUSION

In conclusion, it should be noted that for the translator, it is not so much knowledge of the vocabulary that is important, but knowledge of the peculiarities of its functioning in various situations. Therefore, it is important to develop in oneself the skills of analytical and critical work on the text of the translation, in every possible way to develop a sense of language and style, without which a qualified translation from any language is generally impossible.

### ABSTRACT

*This article discusses the introduction of interactive technologies and distance learning in the educational process, as well as the creation of a wide range of watercolors, watercolors, technologies, the use of which can be used to achieve effective results in fine arts classes. 'he said. Hierarchical technologies are reflected in students' visual abilities, contribute to the formation of introspection, thinking skills.*

**KEYWORDS:** *Fine Art, Watercolor, Watercolor, Coloring, Color Gamut, Paper, Canvas, Primer, Baguette.*

### INTRODUCTION

Man always lives in harmony with art. If we look closely, we are surrounded by the beauties of various artists, natural landscapes and magnificent buildings. There are so many types of art. They are music, cinema, theater, choreography, fine arts and more. Art that usually depicts an object in pictorial images, shapes, spatial latitudes, or planes (on a paper surface, a wall surface, etc.) is called fine art. As long as the artist depicts a real being in his works, he will never copy it mechanically. Otherwise, the works of art he creates will be no different from the pictures created by the photographer. The task of the artist is higher. As he describes the events and happenings in life, he puts forward any idea that excites him through the image, seeks to reveal the essence of the events and happenings in social life, expresses his attitude to them, makes judgments. For example, when an artist paints a picture of a person, he is never limited to just trying to imitate it. Through this working image, the artist first of all tries to convey his thoughts and feelings to the audience. The spectator sees the image of the noble, courageous people

depicted in the picture, is proud of him, imitates him, takes an example from him. Just as the beauty of music and song cannot be described in words, so the artist's work cannot be described in words.

### MAIN PART

When looking at works of fine art, it is also important to be able to accurately show how the psychological experiences of each image are resolved, and their relationship to the environment. Therefore, both the color scheme used by the artist and the composition of the event, the artist's workmanship, the nature of each selected shape, the overall color gamut - the color, the nature of the surface (for example, the smoothness or roughness of the surface) It is necessary to try to find an answer to why they were taken. Only then can one understand the true nature of works of fine art and learn to analyze them correctly.

As each artist shapes his or her work, he or she is inspired to discover new horizons. Expressing works of fine art in painting makes the work more vivid. Paintings are made using different colors. Schools and high schools teach more watercolor painting

**FIGURE 1**

**Water color**

**Water color**

Watercolor technology is then taught in colleges and universities (Figure 1).

### RESULTS

Requirements for painting work:

The following requirements apply to a colored still life:

- The image is placed correctly on the paper surface;
- The correct proportions of the described objects are obtained;
- The line image is found correctly;
- The hunger-saturation ratios of the items, as in nature, are correctly expressed using colors;
- The sharpness of the ratio of shadow and light in the image is accurately expressed;
- The ratio of shade and light colors of the colors in the image is reflected in accordance with the intensity of light;
- Correct local color saturation of objects in still life;
- The choice of color direction corresponding to the material of each item in the still life;

- The size of each item;
- The color perspective is a free expression of the distance between the objects placed in nature;
- Effective use of watercolor technology;
- The brightest and darkest of the colors involved in the still life;
- General integrity is found;
- Skillful depiction of shadows in bright, reflective, semi-shadow, blur and falling shadows in color media;
- Different description of items with full and empty interior;
- The correct placement of all objects in the plane of the object;
- Ensuring the general symmetrical construction of circular objects.

Watercolor painting opens up a wide range of possibilities for the artist. It takes a lot of skill and attention to work with watercolors. Because the colors go from light to dark. It will be difficult to correct the mistake and correct the mistake. The colors are stacked on top of each other in a watery state (Figure 2).

**FIGURE 2**

**Stage 1**

**Step 2**

**Stage 3**

**Step 4**

The colors dry out and move from one stage to the next Color matching. The work is completed by expressing the falling shadows, paying attention to the collisions, the proportions, and the shadows.

Watercolor painting is partially easier and more versatile than watercolor. First, make a frame of the right size for the picture. Then draw a size that fits the frame. We also need to make sure that the canvas (a special fabric for watercolors) is not too tight and flat. The finished surface is then primed. We can draw the picture we want to draw on it in pencil on the plane of the picture. Unlike watercolors, this painting should be done from hunger to hunger, not from hunger to hunger. We pay attention to the compatibility of dark colors with each other, their perspective (reduction or opening of colors as they move away). In the final stages of the work, we finish the work by putting the brightest colors (Figure 3). When working with watercolors, you can also correct any incorrect color.

**FIGURE 3**

**Stage 1****Step 2****Stage 3****Step 4**

When the picture is completely painted and the work is completed, a suitable baguette will be placed on the picture. The baguette (outer frame of the work) is also selected depending on the overall color of the work - color, size (Figure 4).

**FIGURE 4****CONCLUSION**

When everything and an event are described, it is impossible to portray it as it really is. This has always been emphasized by many art theorists, artists, and practitioners. Nevertheless, if we can use all our knowledge and show the way to the next generation, their interest in art will increase and they will be able to contribute to the development of our independent Uzbekistan. mature professionals who will be trained.

## YOUTH MENTALITY: SCIENTIFIC AND TECHNICAL KNOWLEDGE AND OBJECTIVE LAWS OF SPIRITUAL DEVELOPMENT

**Rajabboev Jurabek\***

\*Student,  
 Department of National Idea,  
 Fundamentals of Spirituality and Legal Education,  
 Urgench State University, Urgench, UZBEKISTAN  
 E-mail id: sv997710@gmail.com

### ABSTRACT

*In this article discussed the spiritual changes that have changed the mentality of today's youth of the socio-cultural space in the era of globalization. The main characteristics and basic parameters of modern globalization are analyzed. It also analyzes the emergence of social ties, solidarity and originality in uniting the world in all areas and on an interethnic scale. It has been concluded that all of these processes affect the change in the mentality of today's youth.*

**KEYWORDS:** *Innovation, Creation, Creativity, Superior, Modern Education, Cognitive, Processes, Harmonious View, Globalist Worldview, Expanded Youth Mentality, Youth Value Orientations, Youth Consciousness.*

### INTRODUCTION

Although we clearly see today that there can be no social development without scientific and technical discoveries, no work on spirituality mentions the importance of scientific and technical knowledge, the methodology of their study does not reveal. Scientific and technical knowledge is also a reflection of the objective laws and requirements of spiritual development. Actually, there is no place in our spiritual heritage to solve this problem, but the present time requires scientific and technical research; the effective use of the achievements of the scientific and technological revolution in all spheres of social life has become a necessity. Undoubtedly, such qualities as social justice, ideal society, perfect man, high spirituality, humanity, patriotism, faith, good behavior, community, unity, humility, generosity, peace-loving, diligence, family-oriented, which are glorified in the spiritual heritage of our people, are immortal. It is our duty to assimilate and inculcate it in the hearts of the younger generation. However, it is also true that

the objective laws of social development, the requirements of innovative development expect from us scientific and technical knowledge, discoveries. At the same time, it should be noted that historicalism and traditionalism prevail in spiritual-moral imperatives, which can sometimes lead to stagnation, conservatism. This historianism helps to ensure stability and unity in society, in interpersonal relations, strengthens the ties between the individual and society, it makes intergenerational diachronic ties into important values. However, they can also be an obstacle to innovative changes.

So we need to focus on deciding on a certain consensus, conformity, between traditionalism and modernization. Where historicism prevails, any innovation remains a dry desire. Therefore, it is necessary to pay due attention to young people who are active subjects of innovation, to form in them not only the ability to master innovations and creative activity, but also the ability to live with moral imperatives embedded in the spirituality of our people. Reconciling these two hypocritical, contradictory sides, no matter how complex and difficult the task is an objective requirement of our national development.

### **MATERIALS AND METHODS**

Spiritual and moral imperatives are, in essence, the values created by our ancestors, inherited from them, the mentality, way of life and cultural life of our people and nation. Their connection with different interests and hobbies has formed the categories of "I" and "We" in the spiritual and moral life. "Rituals, traditions, and customs that have been formed and developed in a society over the centuries are also a manifestation of the moral relationship that exists between the individual and society. Based on these, the relationship between the individual "I" and the collective "We" is harmonized [1].

Many literatures emphasize the predominance of "We" in the spiritual and moral imperatives of the East. The fact that this communism has risen to the level of tradition is not a negative, conservative case, of course. But in the development of society, the category of "I" or "We" has never been absolutely dominant, it was impossible to live without harmonizing them. It is natural that there is a contradiction between these categories. Because "the development of the relationship between the individual and society is not just about commonalities; There will also be contradictions in this relationship;

The basis of these contradictions is the disproportion in the understanding and formation of the relationship between the individual and society. A individual is a special person. And society is the unity of such individuals formed on the basis of certain goals. Conflicts occur as a result of society not understanding the individual, the individual not understanding society. Take the life of Maria Curie Skladovskaya, a two-time Nobel laureate, for even major social tragedies, such as the contradictions that arise as a result of personal selfishness or, conversely, the complete shadowing of personal interests. Having a unique scientific ability, the genius creator is so devoted to her interests and researches that she do not even think that a woman should have at least three or four dresses. Her "I" is Polonia, in search of radius. She wants to be alone all the time in this quest. Only her partnership with her husband, Pierre Curie (who is also a Nobel laureate), gives her peace of mind and satisfaction in life. It can be called creative (positive) selfishness, but still selfishness [2].

Many great artists are obsessed with one or another flaw, arrogance, as if glorifying their "I"[3]. That is why the Italian psychiatrist Lombroso notes the encounter of conceit, even

madness, in great creators [4]. Discovering something new, giving in to creativity is something that can lead to indifference. But this creative psychological state is unique to some individuals, and the whole society cannot live in such a state. In innovative mentality, there is a surge of creativity, but this is also typical of true inventors. The pain and joy of creating something activates the "I", sometimes making it a rival to those around him. That's why the great creators are introvert; don't like the circles, the crowds and the hassles. We find these qualities in Beruni, Ibn Sina, and mystics. The "I" is not limited to Western artists; we observe it in the qualities of almost all great personalities. However, the traditions of the East have always embodied the "I", and it is rare to go beyond the "We", even in the most talented people. In our opinion, this is the reason why scientific and technical mentality in the East is not sufficiently developed. This can be seen in the following reasonable thoughts of E. Yusupov: "Social moral duty and responsibility sometimes contradicts a individual's personal interests.

Man sometimes seeks to circumvent traditions, customs, which are part of social moral duty and responsibility. The tendency to deviate from certain traditions in the context of social problems is more common in young people who are influenced by emotions and passions. They sometimes tend to adapt them rather than adapt to a particular social, moral environment. In the field of love, there are times when parents try to achieve their goals without taking into account public opinion, and emotions sometimes lead a person astray. Some people go so far as to commit suicide when they cannot find a way to resolve the conflict between public opinion and personal interests" [5]

According to the scientist, the spiritual life of young people should be in line with public opinion, a reflection of the requirements of "We". Giving personal interests to the public is seen as a sign of spiritual maturity. Eastern traditionalism does not allow the individual to go beyond its own limits; it keeps it within the bounds of spiritual-moral imperatives. Is it good or bad? If there is a positive case, what are the positive aspects, and if there is a negative event, what are these aspects? What do these aspects have to do with the topic, innovative mentality? On the first question, academician E. Yusupov states the following: "Morality is the result of the fact that each person feels responsible and accountable to others.

Based on this, it can be concluded that moral maturity is the understanding, reliance and development of spiritual values that have been formed over the centuries in the course of one's life and activity. The key issue is not only what moral heritage each nation has, but also to what extent new generations adhere to and develop it. For this reason, it has always been a sign of morality that every person should follow the rules of behavior, manners, treatment and attitudes that exist in society. Deviation or disregard for traditions and values in this regard is considered immoral. Immorality is a violation of the balance between "I" and "We"[6].

## RESULTS AND DISCUSSION

It turns out that the values that have been formed over the centuries determine a person's behavior that following them is moral, that violating them is considered immoral. The centuries-old balance between 'I' and 'We' is transformed into a firm moral imperative that cannot be broken.

From a spiritual and moral point of view, this idea is remarkable, but there is a danger of translating it into all human behavior, including creative activity, innovative research. If we remember that almost all human activity in the East has been measured according to spiritual-

moral imperatives, we find that the above danger is not unfounded. At the same time, there is a positive side of this idea, the spiritual-moral imperative. The scientific and technological revolution in the West rejected the traditions formed over the centuries; saw the intellectual power of man, his scientific potential as the only factor that ensures social development. As a result, Western civilization has made great strides, rescuing man from muteness in the natural environment, making his life prosperous, his mind free and his possibilities wide, colorful and enjoyable.

But wealth, money, and prosperity, which the West worships as its core values, have become, according to E. Fromm, "universal arguments that will overthrow the world, change and destroy all natural things and human qualities"[7]. The scientific and technological revolution and that it gave birth the life ideals, lifestyle and way of thinking to play an important role in this. It is widely acknowledged that the scientific and technological revolution has caused global environmental, demographic and spiritual crises, and that it has brought humanity to the brink of destruction. These tragic consequences of the addiction to the development of scientific and technical mentality should not be transferred to innovative development. This can be prevented, first of all, by our spiritual and moral traditions, oriental traditionalism. This is where the conditionality of the dialectical relationship between spiritual and moral imperatives and innovative mentality is manifested. This is the answer to the first and second question above.

## CONCLUSION

Eastern traditionalism is based on the principles of "seven measures, one cut" and "thanks for everything." It is a priority to rely on traditions, to measure behavior in accordance with the norms and views decided in the social environment, to support only the initiative that conforms to these norms and views. The novelty seems to be atheism, even a violation of existing routines, traditions. Innovative mentality cannot be limited to such norms and views; it is characterized by constant restless research, creation of something, striving to improve existence. Continuous improvement is its element and demand.

### ABSTRACT

*In the following paper the notion of normative inflation and its signs have been analyzed by the authors. The pace and efficiency of law making in the Republic of Uzbekistan have been discussed with the exact statistics found out with the aid of National Database of Legislation of the Republic of Uzbekistan (lex.uz) of Uzbekistan. The results of social survey, which was conducted among the professors-teachers staff and students of Tashkent State University of Law, have been revealed with a reasoned conclusion. In the conclusion the authors came into the point that the balance of adoption of normative legal acts and efficiency of law enforcement should be followed by the subjects of primarily and secondary law making.*

**KEYWORDS:** *Law Making, Pace Of Law Making, Normative Legal Acts, Legislation, Parliament, Statistics Of Law Making, Law Enforcement.*

### INTRODUCTION

Competent state bodies and officials adopt normative legal acts that are the product of law making process in the interests of the development of society and citizens. Because of these normative legal acts, the relevant sector is regulated and development prospects are determined.

Normative legal acts adopted today are growing intensively. They are widely accepted, but studies have shown that one of the main causes of failure in public administration today is normative inflation. Normative inflation is an inadequate increase in the number of legal acts, which leads to negative consequences for the development of legal relations and it negatively

effects on the quality of legislation, as well as the incorrect implementation of acts, especially by competent authorities. The study offers solutions to address this situation, the most important of which is to review the existing normative legal acts, simplify legislation, improve the quality of the law making process, especially compliance with legal requirements.

In order to broaden the research, it is essential to focus on the following questions, which shall be answered thoroughly in the discussion part.

- How useful is the acceleration of the law making process for the life of society?
- Are the people benefiting from this process?
- How fast are the legislative processes in Uzbekistan and what is the reason for its pace?
- Does the pace of legislation in Uzbekistan correspond to the legal consciousness and development of society?

Without going back to the long history, it is expedient to analyze the ongoing reforms in the legislative sphere of “New Uzbekistan”, to assess the volume of normative legal acts and their practical (effective or ineffective) impact.

## **METHODOLOGY**

The object of this study is to research the theoretical and practical problems of inflation in law making of the Republic of Uzbekistan. The main goal of the study is to develop definitions regarding the research as well as decide whether inflation in legislation is negative or positive event.

In order to achieve these goals, the authors have applied methods of scientific research, such as statistical analysis, chronological, sociological, analysis, synthesis, and comparative. In addition, to analyze public opinion on normative inflation in the country the authors carried out online questionnaire among professors and students of Tashkent State University of Law (TSUL), Uzbekistan.

## **LITERATURE REVIEW**

A lot of scientists and lawyers studied national law making process in term of improvement the activity. In particular, Sh.Khayitov [1] researched the legal experiment in law making process. A.Sodikov [2] analyzed the role of information in rule making process. The condition and problems of scientific theoretical and methodological bases of adoption of normative legal acts in Uzbekistan are analyzed in the scientific works of Sh.Saydullaev [3]. Use of modern technology in law making process and public control has been researched by Sh.Yakubov [4].

If we focus on the Russian scientists, they also discussed the law making process in various aspects. In detail, the monitoring of rule making process was conducted with practical statistics by Y.Arzasov [5]. In addition, several aspects touching our topic have discussed in the scientific world by other Russian scientists such as normative legal acts of executive branch of Russian federation by T.Kucherova [6], comparison of two law making centuries’ practice by M.I Baytin [7], law making techniques by E.Usmanova [8], differences of law making from law making by E.Yarmanova [9], problems of modern law making by A.Krasavin [10].

Additionally, foreign scholars who studied law making process in terms of different aspects such as scrutiny in law making by Lanny W. Martin, Georg Vanberg [11], quantitative analysis of German Legislature by Jasmin Riedl [12], Italian law making by means of sequence analysis by

Enrico Borghetto [13], the quantitative assessment of the timing of European legislation by Laszlo Kovats [14].

Although a broad range of lawyers, scientists and scholars, who studied law making process, focused on general problems of law making, the following paper is the first complex research covering the quantitative and qualitative assessment of Uzbek normative legal acts.

## DISCUSSION

In the scientific literature, legislative inflation is defined as “continuous intensification of lawmaking activities, which includes two interrelated areas: firstly, a steady increase in regulatory arrays (that is, the adoption of new legal norms, normative legal acts) and, secondly, permanent novelization, that is, regular amendments to the current legislation” [15].

In principle, both journalists and politicians base their statements regarding the pace of legislation on (subjective) judgements. Science, for its part, analyzed the pace either qualitatively or employed variables to measure the speed of legislation that cannot inform about single processes pace. What is lacking is an appropriate objective measure for the pace of law making that works if one takes single processes as the unit of analysis. That is unfortunate, since said debates on legislative acceleration and deceleration are generally heated [16].

Some scholars suggest that one of the way to minimize inflation in law making by codification. However, there are already acting Uzbek 21 codes [17]. In addition, 5 codes such as the Code on Non-governmental non-profit organizations, Environmental Code, Healthcare Code, Entrepreneurial Code, Information Codes were suggested to adopt by the President of the Republic of Uzbekistan [18]. If we look at German experience in codification, there are 5 codes in total such as Civil Code (Bürgerliches Gesetzbuch), Commercial Code (Handelsgesetzbuch), Criminal Code (Strafgesetzbuch), Code of Criminal Procedure (Strafprozessordnung), Code of Civil Procedure (Zivilprozessordnung) [19]. Some countries develop overviews regarding the volume of law making process take an example of Austria, the Austrian Parliament provides a detailed overview on its legislative processes, but more detailed research is necessary to check if all events are listed [20].

The national database of the legislation of the Republic of Uzbekistan was studied based on personal legal research in determining the inflation rate of normative legal acts. To come into conclusion about whether there is inflation in law making of Uzbekistan; indeed, we should compare the statistics of two years (2014 and 2020). In 2020, 2015 normative legal acts were adopted, of which 60 are laws, and 1955 are bylaws. If we look at the statistics for 2014, a total of 588 normative legal acts were adopted, of which 16 are laws and 572 are bylaws. From these facts, we can see that the volume of normative legal acts increased 3,4 times in 2020 compared by 2014 [21].

If we focus on the experience of the Russian Federation over the past six years (from 2011 to 2017), the State Duma of the Russian Federation adopted an average of 462 laws per year [22].

According to paragraph 1 of the Decree No. 6075 of the President of the Republic of Uzbekistan “On measures to improve the business environment in the country through the introduction of a system of revision of obsolete legislation”, adopted on September 27, 2020, about 2.5 thousand old normative legal acts were identified [23].

As a statistic, we will consider how many normative legal acts were adopted from January 1, 2020 to December 31, 2020. A total of 2015 normative legal acts have been adopted, and their classification can be seen in **Table No. 1** below.

**TABLE NO. 1 [24]**

The subject of law making	Resolution	Decree	Order	Other normative legal acts
<b>Oliy Majlis (Parliament)</b>	–	–	–	60 laws
<b>The legislative chamber of Oliy Majlis</b>	449	–	–	–
<b>The Council of the legislative chamber of Oliy Majlis</b>	68	–	–	–
<b>The President of Uzbekistan</b>	303	125	20	–
<b>Cabinet of Ministers</b>	615	–	34	–
<b>Ministries</b>	57	–	–	109 orders
<b>State Committees</b>	58	–	–	–
<b>Other governmental agencies</b>	10	–	–	12 orders

In order to draw conclusions by comparing the above figures, we calculate the number of normative legal acts adopted from January 1, 2014 to December 31, 2014. A total of 2015 normative legal acts have been adopted, and their classification can be seen in **Table No. 2** below.

**Table No. 2 [25]**

The subject of law making	Resolution	Decree	Order	Other normative legal acts
<b>Oliy Majlis (Parliament)</b>	–	–	–	16 laws
<b>The legislative chamber of Oliy Majlis</b>	50	–	–	–
<b>The Council of the legislative chamber of Oliy Majlis</b>	21	–	–	–
<b>The President of Uzbekistan</b>	23	27	2	–
<b>Cabinet of Ministers</b>	165	–	34	–
<b>Ministries</b>	78	–	–	60 orders
<b>State Committees</b>	64	–	–	–
<b>Other governmental agencies</b>	16	–	–	44 orders

If we compare the two tables above, there is a significant difference in the number of acts adopted in 2014 and 2020. It should be noted that in 2020, more normative legal acts were adopted than in 2014.

We can also observe that in recent years the number of laws and decisions adopted by the Parliament and the President and other regulations has increased. For example, in 2014, the Legislative Chamber of the Oliy Majlis adopted 50 resolutions, the President 23 resolutions, 27 decrees, 2 decrees, and in 2020 the Legislative Chamber of the Oliy Majlis 449 resolutions, and the President 303 resolutions, 125 decrees, 20 orders were adopted. As can be seen, we can see that law making has increased significantly in these two subjects.

In addition, the level of adoption by the Cabinet of Ministers in 2020 increased by 3,4 times compared to 2014. The secondary law making activity of state committees and ministries, agencies has not changed dramatically. In short, in 2020, more normative legal acts were adopted than in 2014.

If we look at the last five years, a lot of normative legal acts have been adopted. We all know how these processes affect the lives of citizens. It is becoming a habit for people today to hear every day about a new law, decision and similar norms. The important task now is to ensure the implementation of the adopted laws.

If we look at law making in China, the whole process is guided by a principle that asserts that broad legislation is always better than detailed legislation [26].

First of all, in the hierarchy of each acts, it is advisable to do it from top to bottom, not from bottom to top. As all developing countries enter the stage of development, lawmaking accelerates so much that you can't count them. Today, you can directly observe this situation in our country. We will consider the confirmation of our opinion on the basis of the table shown below.

Also we conducted social research with the aid of survey. 108 people took part in the survey. The questions were answered by the respondents as follows.

1. Do you know the concept of normative inflation?

Yes – 58.3 %

No – 33.3 %

I do not know – 8.3 %

2. What do you think about normative inflation?

Good. – 19.4 %

Satisfactory. – 57.4 %

Bad. – 23.1%

3. Do you think normative inflation is necessary for the development of society?

I do not think so. – 31.5%

Definitely needed. – 24.1%

I never thought about it. – 44.4%

4. Do you think that normative inflation has been observed in Uzbekistan in recent years?

Yes, it has been increasing lately. – 38.9%

No, I did not observe it. – 26.9%

I do not know. – 34.3% [27]

It is possible to conclude that not only students but also scholars of the Tashkent State University of Law have sufficient knowledge and understanding about normative inflation and its effect on the society.

How useful is the acceleration of the law making process for the life of the society? Are the people benefiting from this process?

Logically, the speedy adoption of normative legal acts does not mean that these problems will be solved at once. In fact, the laws that are passed must be of high quality and weighty sufficient to last a long time and maintain their position.

As can be seen, more than two thousand normative legal acts were adopted in a year. At this point, let's talk a bit about speed in legislation. The rapid development of laws leads to a slowdown in the adoption of democratic laws. That is, rapid adoption affects everyone differently, because one legislative process can be slow for one and faster for another. speeding up legislation and slowing it down is a contentious debate. continuous and regular lawmaking and changing the former does not lead to the resolution of problems. As mentioned above, it affects everyone differently. The main issue here is that there must be an objective measure, for instance it depends on the law being enacted in a working and regular, long-term.

At this point, let us discuss two concepts, namely the speed of law making and the operative law making, and distinguish them a little. Moreover, when taking a closer look at the scientific debate, we find that analyses often focus on the number of bills passed, or the simple duration of their law making procedure, as a measure of legislative pace [28].

These two concepts are directly related to each other, but there are also differences. That is, the adoption of new laws on a large scale, every day or at a certain time, but in large numbers. Rapid adoption, on the other hand, can be said to be very short-lived, for example, relative to the speed that the president or MPs will adopt as the election approaches.

In the process of legal creation, new legal rules are developed and approved. At the same time, first of all, the defined tasks of the state activity are reflected in the law. Consequently, the law making is carried out by the state, regardless of the function, type, forms of exercise and organization of state power. Therefore, the rule of law is a process that involves the identification and assessment of the legal needs of society and the state, the formation and adoption of legal documents in the prescribed manner by the competent authorities.

This definition emphasizes the following important aspects: understanding, study and analysis of the situation or process that requires legal regulation, identification of the body (subject) authorized to adopt this or that legal act, selection of the form of the act to be adopted, preparation, adoption or amendment of the act. [29]

According to the Decree No. 5505 of the President of the Republic of Uzbekistan “On approval of the concept of improving the rule making activity”, adopted on August 8, 2018, by using the

model of “Smart regulation” the normative legal acts of governmental agencies should be decreased. [30]

It is also important to strengthen parliamentary control over the secondary law making activities, based on foreign experience. It is known that it is not possible to regulate all relations in the law; some issues related to its application may be regulated by secondary legislation. In these cases, it is necessary to introduce a new form of parliamentary control in the form of a study of the bylaw in terms of assessing the content of the by-law, its compliance with the goals and objectives of the law, the full implementation of the reference norm.

Today, there is a great deal of disagreement about the conflict that arises between expert scholars and members of the public between those who accelerate law making and those who advocate discussion. We can come across a lot of this in the media, on social media.

Today, the legislative process in Uzbekistan is accelerating, and we can see their speed in all areas. If you read the scientific works and articles of foreign scientists and professors, they have gone into detail about why these processes is accelerating, negative, and positive consequences.

In cases where the legislative process is accelerating, in most cases, we can observe this situation in developing countries. This is natural because states are adopting new laws to regulate all areas and to end or eliminate stagnant processes.

Of course, this process is based on the development of the state and society. But there are also downsides to this, people are dissatisfied with the fact that they do not understand the laws being passed and their implementation is not fully implemented. The general problem is that the speed of legislation in Uzbekistan does not correspond to the legal consciousness and development of society.

The purpose of passing laws is to find and solve major problems. There are a lot of normative legal acts being adopted today, the main purpose of which should be to regulate the problems that have arisen, are coming and may come. In many cases, the adopted laws do not serve to solve the problems in our society, because it is a matter of ensuring their adequate implementation. Analyzes show that we need to look at the number of bills being passed or the duration of their legislative procedures and as a means of measuring the speed of legislation.

The second question addresses another research field of Political Sciences: How does the legislative term effect legislative performance?

This is where research on the “political legislation cycle” sets in. In short, “political legislation cycle” means that the election period creates patterns of legislative action. Following the presumptions of political economy, political actors compete for constituency and align their actions accordingly [31].

## **CONCLUSION**

This, along with instability in the legislature, not only leads to a decline in the quality of the law, as in the current legislative environment, but also strengthens confidence in its power to ensure justice, promote and protect individual rights. Excessive production of laws leads to serious distortions in the application of laws, sometimes even making it impossible to apply, thus leading to an imbalance between rules and their application.

Firstly, legislative inflation leads to a significant decrease in legal certainty, which is an essential element of the rule of law. Legal certainty implies that legal provisions are readily available and predictable, as well as clear and precise.

Secondly, in conditions of legislative inflation, the addressees of legal norms are forced to assimilate the rapidly increasing volume of legal information, while adapting to its constant change. Eventually, the level of legal mind and consciousness of citizens will decrease dramatically.

Thirdly, legislative inflation can be viewed as a significant factor in erroneous lawmaking.

Fourthly, this may lead to inefficient mechanism of monitoring the execution. It is another matter that such a high pace of work will most likely lead to a weakening of control over the law enforcement process. The lack of appropriate control, in turn, turns into a haphazard “correction” of previously made law making mistakes, as a result of which previously made mistakes are not eliminated, but new ones multiply.

Fifthly, legislative inflation forms a negative image of the legislator among the population, as well as a negative attitude towards law in general.

Sixthly, due to normative inflation direct effect of laws may possibly underestimated and by law, acts will be major source of legal regulation.

Seventhly, the government should stipulate main responsible body, which regulates the state of law making inflation possibly it could be Ministry of Justice or the Constitutional Court of Uzbekistan.

### ABSTRACT

*The article describes the study of the germination of Salsola orientalis S.G.Gmel seeds in the conditions of culture. The literature highlights laboratory germination - this is the percentage of the number of normally germinated seeds. Germination is the main indicator of the quality of the seeds, it is used to determine the yield of seeds, as well as their biological and economic significance. This plant is found in all deserts and semi-deserts of Central Asia. Along with it grow such forage plants as black saxaul, white saxaul, wormwood, salsola arbuscula, ephemera and ephemeroïds.*

**KEYWORDS:** *Laboratory Germination, Germination Of Seeds, Ground Germination, Phenological Observations, Growth And Development, Cotyledons, Hypocotyl, Real Leaves, Aboveground Part, Seed Viability, Branching, Growth, Seedlings, Seed Sowing Time.*

### INTRODUCTION

Salsola orientalis S.G.Gmel (local name – keyreuk) belongs to the family of Chenopodiaceae. Salsola orientalis (keyreuk) is a semi-shrub plant with a height of 35-55 cm. Strong branching begins at the base and forms a bush with a dense branching in the lower part. The stem and leaves are strongly pubescent. This plant is found in all deserts and semi-deserts of Central Asia. Together with them grow such forage plants as black saxaul, white saxaul, wormwood, salsola arbuscula, ephemera and ephemeroïds.

In Uzbekistan, keyreuk is widely spread in all regions and in the Republic of Karakalpakstan (figure 1).

**Figure 1. General view of *Salsola orientalis* (keyreuk)**

On the Ustyurt plateau, keyreuk grows on gypsum-saline soils and is considered the main component of various plant layers.

Keyreuk is eaten by animals in all seasons and is a good fattening feed for sheep. The eaten part of the plants is annual shoots with leaves, flowers and fruits, and often the lower parts of the bushes are woodier. Therefore, it is difficult to find plants in grazed areas that are not damaged by animals, so *Salsola orientalis* is quite suitable for hay harvesting [2].

According to M. M. Sovetkin [5], the eaten mass of *Salsola orientalis* leaves, young twigs, and fruits contains 17.4% ash, 9.7% protein, 23.7% fiber, and no alkaloids.

Keyreuk grows in various soil conditions, having a wide adaptability to a variety of edaphic and hydrological factors [3].

In the conditions of the Karakalpak part of Kyzylkum, the biology of *Salsola orientalis* in culture is almost not studied. Therefore, this is our task to identify the dynamics of growth and development of the vegetative organs of *Salsola orientalis*.

The first experiments on the study of the biology of keyreuk were conducted in 2014 at the experimental site at the department of Biology of the Karakalpak State University named after Berdakh.

It is a semi-shrubby plant, prone mainly to overgrowth on saline and gypsum soils. In 2014, it was planted in the ground with gray-brown soil on which lichens grow, using two plowing methods (using moisture-accumulating furrows and strips) [4].

## MATERIALS AND METHODS

In the field, germination varies according to seeding rates. With an increase in the seeding rate, their germination rate in the field also increases. When determining laboratory germination, all conditions are created. As for the field, the possibilities for seed growth are quite different, for example, the water regime and lighting are different from the laboratory conditions. Thus, field germination directly depends on the weather conditions in the spring, the characteristics of soil fertility, agro technical methods, physical and mechanical properties of the soil.

The formation and viability of seeds depends on several factors, in particular, on meteorological conditions.

The first experiments on the biology of *Salsola orientalis* were conducted in 2014 at the experimental site at the Department of Biology of the Karakalpak State University named after Berdakh.

In our experiments, *Salsola orientalis* S.Gmel already had a generative phase in the first year and produces full-fledged fruits. The height of the plants by the end of the growing season reaches up to 43 cm. In the conditions of the culture in the Karakalpak part of Kyzylkum, *Salsola orientalis* S.Gmel passes the entire life cycle and gives seed reproduction.

## RESULTS AND DISCUSSION

At the end of March 2014, there was a general germination of plants in the area with moisture-accumulating furrows. There were 360 plants per 100 square meters. In the first decade of April, the length of the leaves was 0.6-0.8 cm, and the width 0.3 cm. In mid-April, two true cylindrical leaves appear, the surface of which is covered with hairs. They are stored for 18-22 days, after which the remaining leaves begin to appear. In early May, the main shoot appears, and by the end of the month, the side shoots appear. By the end of June, the lower leaves turn yellow and dry up in early July.

By the end of the year, the height of plants in the area with moisture-accumulating grooves is 6.5-26.9 cm, and in the areas plowed by the method of dividing the field into strips 7.3-14.5 cm. The growing season of two-year-old keyreuk plants begins at the end of March and the first buds appear. In April, branches are formed, the best time of development begins in May and lasts until mid-June. The height of plants in fields plowed by the strip was 9.2-18.6 cm, and in areas with moisture-accumulating furrows 14.2-36.3 cm, the length of annual branches 3.2-22.3 cm [1].

The height of an adult keyreuk is 64.3-69.45 cm. In the third year, due to the drought, the height of the keyreuk did not reach the previous year's size, but there were many branches. In 1985, the height of the plant reached 30.0-49.0 cm.

**Seed germination.** The quality of the material plays an important role in increasing the feed base. The quality of the seed material includes its freshness, germination and varieties.

Laboratory germination is the percentage of the number of normally germinated seeds. Germination is the main indicator of the quality of the seed material, it is used to determine the yield of seeds, as well as their biological and economic significance.

For the experiment, plant seeds were collected from special sites.

Laboratory germination of seeds in the conditions of the Chartak hills of the Fergana region in dry years was 10% (2017) and 61.2% in 2018, and meteorological conditions had a strong impact on seed germination in the soil (table 1). According to our experiments, laboratory germination was determined at room temperature (16-18 °C) using Petri dishes, filter paper is placed in a clean Petri dish and moistened with 2-3 drops of water, then counting 100 seeds are laid out in threefold repetition. Daily observation is carried out, the seeds sprouted on the 5th day, the laboratory germination rate was 50.1%.

**TABLE 1 GERMINATION OF KEYREUK SEEDS**

	<b>% in the lab</b>	<b>% in the field</b>
2017	10	5,0
2018	61,2	29,5
2019	23,0	9,5
On average	27,7	14,5

The germination of keyreuk seeds decreases after 5 months of storage, the seeds have good germination within a month after harvesting.

**TABLE 2 GERMINATION OF KEYREUK SEEDS DEPENDING ON THE PERIOD OF STORAGE**

Storage period (month)	Germination %	
	Of seeds of 2017	Of seeds of 2018
1	10,2	61,2
2	23,0	27,0
3	19,0	23,0
4	30,0	33,0
5	15,0	18,0

As can be seen from table 2, the germination rate of seeds stored for one month decreases to 61.2%, and after 5 months to 18.0%, so it is advisable to use freshly harvested seeds when sowing. The field germination of the keyreuk was determined on a special area in the Berdakh farm, Amudarya district. To do this, in the fall, the field is plowed to a depth of 25-30 cm, and then the field is prepared for sowing, after it is loose and leveled with a rake and harrow.

On November 9 2017, the seeds were sown on an area of 5 to 15 m<sup>2</sup>, these seeds were sprouted on our experimental area. To determine the optimal time of sowing, the seeds were planted in 2 terms (table 3).

**TABLE 3 GERMINATION OF KEYREUK SEEDS IN THE CONDITIONS OF A VARIETY OF BERDAKH FARMS IN THE AMUDARYA REGION (2018)**

	Germination of seeds
--	----------------------

Sowing date	The number of sprouts on an area of 1m <sup>2</sup>	The number of planted seeds
9.XI.2018	30	30
2.III.2019	7	7

As can be seen from table 3, the seeds planted in November gave good germination. In contrast to this, the seeds planted in the spring sprang up poorly, because the seeds have to go through a dormant period during the long wintertime.

Consequently, it will be advisable to plant the keyreuk in October and November. In the conditions of the Fergana region, the degree of germination of the keyreuk plant is much higher than in our conditions.

In the field, germination varies according to seeding rates. With an increase in the seeding rate, their germination rate in the field also increases. The reason for the low level of germination in the field compared to the indicators of laboratory germination is a sharp change in the conditions for seed growth. When determining laboratory germination, all conditions are considered. In contrast to this, in the field, the possibilities for seed growth are quite different, for example, the water regime and lighting are different from the laboratory conditions. In the field, after the seeds germinate, sprouts should appear on the ground surface. For this reason, unlike in the laboratory, field germination is very difficult to predict. As a result, field germination directly depends on the weather conditions in the spring, the characteristics of soil fertility, agro technical methods, physical and mechanical properties of the soil.

### ABSTRACT

*This article discusses ways to develop students' thinking skills in primary school, ways to explain how to solve initial problems, and effective methods. The first problem on the picture is created by the teacher. He teaches children to look at the pictures, to distinguish the given numbers and the life actions that led to the change of quantitative relations.*

**KEYWORDS:** *Problem, Simple Problem, Complex Problem, Arithmetic Operations, Staged, Visual, Ability, Method.*

---

### INTRODUCTION

Various issues play an important role in the development of thinking skills of primary school students in mathematics. We will discuss some of these types below.

Staged issues. Great attention is paid to staged issues. These issues reflect the actions of children, often directly observed. Instead of answering the question here, these given numbers can be seen on a visual basis. First graders often do not know how to solve a problem because they do not understand the meaning of the words that describe this or that action (spent, shared, donated, etc.). Therefore, in school, in the preparatory group, special attention should be paid to the meaning of the words that express this or that action. To this end, it is necessary to take into account what practical actions should be taken at the heart of the matter. In this case, it is expedient to compare the issues of finding the sum and the remainder, which implies the

opposite action: coming and going, coming and going, moving, buying and selling, bringing and taking, flying.

Demonstration issues. First, the children are told about the content of the topic, and are shown pictures depicting the given numbers. The first problem on the picture is created by the teacher. He teaches children to look at the pictures, to distinguish the given numbers and the life actions that led to the change of quantitative relations. For example, the picture shows a boy holding 5 balloons, he gives 1 balloon to a girl. Looking at the picture, the teacher: What is depicted here? What is the child holding? How many balls does it have?

What is he doing? What do we know? Create the condition of the matter. What can I ask about? he asks. By changing the numbers, the teacher encourages the children to create a problem based on a picture of any content that they use to teach them to think and tell stories about finding sums and residues of different content on the same topic.

## II. MATERIALS AND METHODS

Mathematical problems are divided into simple and complex problems. Problems that can be solved in one operation are called simple problems. Problems that are composed of several simple problems and therefore can be solved using two or more operations are called complex problems.

For example: there were 6 birds on a tree branch. 2 of them flew away? There are 2 inverse problems to this problem.

- 1) There were several birds on a tree branch. After 2 birds flew away, 4 birds remained on the tree branch. How many birds are left on the tree branch?
- 2) There were 6 birds perched on a tree branch, and after a few birds flew away, 2 birds remained. How many birds flew?

A simple problem is distinguished from a simple problem.

Issue 1. There are 8 apples in one box, which is 5 more than the second box.

How many apples are in the second box?

Solution:  $8 - 5 = 3$  (apples)

Answer: There are 3 apples in the second box.

Issue 2. Vali drew 6 rabbits. Vali's drawings are 2 more than Zokir's drawings. How many rabbits did Zokir draw?

Solution:  $6 - 2 = 4$ .

Answer: Zokir drew 4 rabbits.

Summation and remainder problems from simple problems.

Problem 3. Ahmad drew 3 dolls and two balls. How many toys did Ahmad draw?

Solution:  $3 + 2 = 5$ .

Answer: Ahmad drew 5 toy pictures.

Issue 4. Zokir took 7 apples from an apple tree and had 3 of them. How many apples are left in Zokir?

Solution:  $7 - 3 = 4$  (apples).

Answer: There are 4 apples left in Zakir.

Problem 5 There were 4 red pencils on the table and 4 blue pencils were added to it. How many pencils were on the table:

Solution:  $4 + 4 = 8$

Answer: There were 8 pencils on the table.

Another type of simple problem is how many units increase or decrease a number.

1. Ahmad has 6 pens and Salim has 2 more. How many pens does Salim have?

Solution:  $6 + 2 = 8$  (pens)

Answer: Salim has 8 pencils.

2. Salim drew 4 red cars and Ahmad drew 3 green cars. How many cars did the two draw?

Solution:  $4 + 3 = 7$  pieces.

Answer: Both drew 7 car pictures.

2. Vali drew 5 carrot pictures and Nadir drew 3 carrot pictures. How many carrots did the two draw?

Solution:  $5 + 3 = 8$  pieces.

Answer: Both drew 8 carrot pictures.

### III. CONCLUSION

The terms of simple problems should be clear to children, and residual finding problems are part of such a set of questions. By solving simple problems, one of the basic concepts of an elementary course in mathematics is the concept of arithmetic operations, and a number of other concepts. Once they have mastered the ability to solve simple problems, they learn to solve complex problems. Because complex problems consist of several simple problems.

Masala. There were 2 green and 3 red apples on the plate. After eating 2 red apples. How many apples are left on the plate?

Solution:  $3 + 2 = 5$  (pieces)

$5 - 2 = 3$  apples.

Answer: There are 3 apples left on the plate.

2. Karim has 3 pens and Sabir has 6 more. How many pens does the patient have? Karimda - 3 Patience -? -More than 6.

Solution: 3  
(pencil)

$+ 6 = 9$

Answer: Patience has 6 pencils.

3. Elyor cut 7 watermelons from the melon. Nadir cut 3 watermelons from the melon. How many watermelons did the two cut?

Solution:  $7 + 3 = 10$  (watermelon).

Answer: Both cut 10 watermelons.

## ABDUNAZAR POYONOV VERSION EPIC OF THE ALPOMISH

**Jumagulova Dilafuz Xushmurotqizi\***

\*2nd Year Student,  
 Language and Literature named after Alisher Navoi,  
 Tashkent State University of Uzbek UZBEKISTAN  
 Email id: dilafuzjumagulova@gmail.com

### ABSTRACT

*Folklore is a reflection of the worldview, knowledge, spirituality and glorious past of all nations. Among them, the epic genre in particular stands out for its complexity and perfection, its unique features. This article compares the variants of the epic "Alpomish", a masterpiece of the history of the Uzbek people, with the version written by AbdunazarBakhshiPoyonov, and highlights their similarities and differences.*

**KEYWORDS:** "Alpomish", Kungrad, Shahimardonpir, Childless Motif, Alp.

### INTRODUCTION

Samples of folklore, including epics, have been recorded and studied since the first half of the twentieth century. As a first step, G'ozim Olim Yunusov's services in this area are considered effective. He was one of the first to write the epic "Alpomish", the heroic epic of the Uzbek people, from his son FozilYo'ldosh, and made it known to scholars with some abbreviations. Later, Hodi Zarif, Mansur Afzalov, Muzayyana Alaviya, To'ra Mirzayev and a number of other folklorists from different regions of our people, FozilYo'ldoshog'li, ErgashJumanbulbulo'g'li, IslomShoir, MardonaqulAvliyoqulo'g'li, Samples of epics from poets such as Umir were written and studied scientifically. As a result, more than forty versions of the epic "Alpomish" became known to scientists, and the second, in written form, began to live. Recording of epics continued during the years of independence. One of them is recorded by f.f.d. JabborEshonqulov from AbdunazarPoyonov, a representative of the South Uzbek School of Epic.

### MATERIALS AND METHODS

Today, when we study the variants of the epic, the version of FozilYo'ldoshog'li, a representative of the Bulungur School of Epic, as the most perfect and classic version has been noted and republished by scholars. However, it should be noted that each of the variants of the

epic has its own characteristics, artistic value and great scientific significance. In particular, the version of AbdunazarPoyonov is noteworthy for the fact that it is still alive today, and at the same time recorded, published and won wide public recognition.

Along with most folk epics, the epic "Alpomish" consists of an introductory, main and concluding parts. The beginning will feature the birth of the protagonists, an epic depiction of space and time, as well as knots to untie as events unfold. In the main part, it is the process of removing those nodes, the obstacles in the way. In the end, the knots are untied and the heroes achieve their goals. All versions of the epic "Alpomish" are based on this plot. Only in expression, in the objects of the image, they differ from each other.

"Evaluate the beginning, not the end," says the Kazakh poet Abay. As we think about the epic Alpomish, we want to make a comparative study of how its beginnings unfold. In this regard, we analyzed the most popular versions of the epic FozilYo'ldosho'g'li and AbdunazarPoyonov, a representative of the School of Epic of South Uzbekistan.

The beginning of the epic genre begins, first of all, with the homeland of the heroes and their description. This is reflected in the version of FozilYo'ldosh: "In the past, sixteen tribes were called Dobonbiy in Kungrad. Dobonbi gave birth to a son, Alpinbi. Alpinbi had two more sons: the eldest was named Boybori and the youngest was named Boysari. Boybori and Boysari - both grew up. Boysari was rich and Boybori was rich, and they both had no children"<sup>1</sup>. No words in the story, especially in the beginning, are used for surfing. The very beginning introduces the listener to the epic reality of the epic.

The word "former" is used in reference to a past event. Bakhshi uses this word to indicate that the events of the epic took place in the past. JabborEshonqulov, a doctor of philology, "The past tense" as "the transformation of chaos into space." "... This is a pure, artistic history of any nation, free of numbers." The use of the word "sixteen seeds" is further proof of the historical truth.

## RESULT AND DISCUSSION

The Uzbek people have long been engaged in agriculture and animal husbandry, spread over a large area. According to some sources, this nation is 92, and according to some sources, it is 96 tribes. The bells mentioned in the epic are 16 tribes, which have a worthy place in the history of the statehood of the Uzbek people. The names of the trees in the poem are not only numerous, but also express the traditions of the people in governing the country, the cream of their knowledge. The people consider him to be a perfect man in every way. The epic says that people like Dobonbiy and Alpinbiy ruled the state. It is important to note that each name in the story is used to express a specific meaning. The name Dobonbi is used at the beginning of the epic and seems to be forgotten later. But Dobonbi is an important figure for the bell tribe. The word dobanbi is used in the dictionary to mean "a great work that leads to success."<sup>2</sup> The word "biy" is also a modified form of the word "bek" and refers to a person's social status. The word biy is also added to nouns in Khorezm dialect. Dobonbi is also mentioned in the bell tribe as a bek who did great things at the beginning of the statehood.

The second name is Alpinbi. The word alpine is used in the dictionary to mean "a hero of supernatural strength and courage."<sup>3</sup> The epic also mentions that the bright bow, which was the first of the fourteen batmans, was left by Alpinbi. The birth of an alpine, like an alpine, did not

happen by itself. It was because of Dobonbi's hard work and wisdom.

Boysari and Boybori are the sons of Alpinbi. The very word "rich" in their name indicates their ancestry. The birth of Alpomish, the protagonist of the epic, also indicates that he was not of ordinary people, but of Alpine descent.

It is no coincidence that Alpomish was originally called Hakimbek and later became known as Alp. The word "judge" means "wise." The fact that being an alpine requires not only strength but also wisdom is evident in the events of the epic.

The beginning of the epic is described in more detail in the version of AbdunazarPoyonov, a representative of the Sherabad School of Poetry. In this epic, which begins, "In the past, on the side of the bell," the bell is used as a place name, not a seed. The location of this area is also known. It is said that "from Alatag to Narmon, from Kokcha to Berman", that is, in a beautiful place between two mountains. The number of seeds in the Kuriroiroa tribe is sixty-six. The fact that Alpomish is mentioned in the poem as a representative of nineteen generations is found in the works of the South Uzbek School of Epic. AbdunazarPoyonov's version lists seven generations of heroes. These are: Doltanbiy, Arkonbiy, Orkanbiy, Dobonbiy, Alpinbiy, Boybori, Alpomish, Yodgor<sup>4</sup>.

All versions of the epic "Alpomish" contain the infertility and birth motives of Boybori and Boysari, and are analyzed differently in different versions. In FozilYo'ldosh, for example, the influence of Islam is noticeable. The two brothers' lack of respect at the wedding and their humiliation by the rich are highlighted by their childless motives. Two brothers are waiting for help from ShahimardonPir, who wants children. "From here, the window of ShahimardonPir comes for three days, and everyone goes to bed: the state demands the state, the child demands the child, the hereafter demands the faith, and the person who spends forty days returns to his destination. If we go, if we give our necessities, if we go to the window of ShahimardonPir, if we also want a child<sup>5</sup>.

The role of the Pirs in the life of Alpomish, the protagonist who was associated with the Pirs from birth, can be seen from the very beginning of the saga. In our opinion, the owner of the ravza, Shahimardon, who wanted two brothers and children, was one of the forty chiltons. According to religious beliefs, Chilton is one of 40 legendary spirits with supernatural powers. In the wisdom of Ahmad Yassaviy, it is said that the Chiltons are forty bodies, that is, forty people. These forty have the power of sainthood and act on God's command to solve the world's problems. The dead will be replaced by the living.<sup>6</sup> Doctor of Philology, Professor ShomirzaTurdimov calls chiltonseran and considers erans to be the cause of the alpine system embedded in the whole epic plot of Alpomish. The scholar notes that in the epic, the patron saint portrays one of his partners as a companion to the hero<sup>7</sup>. The naming of children at birth, the leaving of five claws on Hakimbek's shoulders, the removal of Boychibor's smiles, and so on, all testify to the constant support of the hero Alpomish by ShahimardonPir, one of the chiltons (patron erans).

In AbdunazarPoyonov's version, the motive of infertility is described as popular and convincing. Boybori and Boysari are not told that someone is childless, but after the captain's party at the wedding, people point to their brothers and whisper to each other: "... people push each other, whispering, pointing to Boybori and Boysari, "The centurion told the truth, what is there at a wedding without a man's lamp, fruit, children, sons and daughters? The wedding is at the

wedding, the sarpo, the wedding is back. How will the brothers return to Boybori and Boysari? If they don't have children, if they don't get married, the wedding they brought will be a doomsday debt for Togonbi, how will he repay it? The throne, the happiness, the possessions will be gone in a day. Who will reach the bottom of this world? ”- he whispers<sup>8</sup>.

The brothers' grief for the child was not only after this wedding, but was already there, and at the wedding it was even more: The young men lined up, their hearts were broken, and the old man, who was sitting, understood the gestures of the people, and his heart was broken, and his hopes were shattered.<sup>9</sup>

## CONCLUSION

AbdunazarPoyonov's version, like FozilYo'ldosh's version, is motivated by devotion to ShahimardonPir and asking for a child. But in contrast, there is a hunting motive associated with totemistic views. As a result of Boysari's failure to shoot the mother deer and her six cubs in the hunt, the mother deer pleads: “This man has climbed the mountains, he has a dream, he has mercy on my child, O Lord who created him, give him his intention, have mercy on him. Be kind, fill in the gaps”<sup>10</sup>. That is why the prayer is given to the brothers and sisters: “You did the right thing, God gave it to us. If you have mercy on the mother deer, may God have mercy on us, too.”The brothers slept that night, walking in the mountains. In the night, the grandfather of the saint appeared in a dream and said: May your children multiply and grow, amin.”<sup>11</sup>

It is known that in 1999 the 1000th anniversary of Alpomish was widely celebrated in our country. The story may have been written earlier. If we consider that the places related to ShahimardonPir in the epic originated after Islam, the aspects related to hunting can be understood as pre-Islamic views.

The childlessness of the parents before the birth of the Alpine hero is in fact symbolic, and it is about the birth of a new generation, the Alps, who will strengthen the kingdom and reunite the scattered people.

Among the variants of the epic "Alpomish", the version of AbdunazarPoyonov differs from other variants, including the version of FozilYo'ldosh, with the details of the plot and the details of the events, with new interpretations. The size of this option also proves our point. AbdunazarPoyonov's manuscript is more than 600 pages long. In this version, the poetic verses are 14,230 verses. In addition to hearing from his teachers, Bakhshi also read and studied epics. In the version of AbdunazarPoyonov, the individual skill of the bakhshi, his unique interpretation of a number of motives demonstrates his creativity and mastery.

**ABSTRACT**

*In this paper the dropout trend in Government Girls Primary Schools in District Mardan was analyzed through a descriptive research study. This study has investigated the class wise trend of dropout in Government Girls Primary Schools in District Mardan, analyzed the reasons of the dropout trend and determined a strategy for minimizing the dropout trend. The research was conducted by using systems analysis as theoretical framework of this study. Population for the study consisted of all the 10324 dropouts. A stratified random sample of 300 dropouts was drawn out of total population. Survey and questionnaires were used as tools for collecting data. Data regarding enrolment, dropouts and dropout rate was collected through survey. The researcher*

*administered a self assessment Questionnaire on sampled dropouts to gather their perceptions regarding the dropout phenomenon in Government Girls Primary Schools in District Mardan. The study found the highest dropout rate(15.98%) in Kachhi which gradually falls down in class 2. But in class 3 it jumps to(8.64%) and then it keeps on increasing up to class 5. The perceptual analysis of the responses of the Questionnaires revealed that the factors were divided into three main categories i.e. the institutional problems and procedures: including; frequent failure in classes, unpleasant teaching learning processes, high level of difficulty of courses, harsh behavior of teachers and insecurity in schools; Home based factors: including; high poverty level of the parents, frequent migration of their families, and community factors such as Lack of immediate returns of schooling. The study recommended: Teachers' training focused on enhancing teachers' competency to retain students in schools; introducing academic monitoring system; adopting strategies for reducing absenteeism of students; Mass mobilization of parents towards schooling of their kids; provision of stipends; special schooling arrangements for migrating families and introduction of individualized teaching strategies for slow learners.*

## **INTRODUCTION**

One of the major problem of primary education is that a considerable number of students dropout without completing their schooling. In Pakistan the participation rate in primary education is 50% to 60% and the dropout rate is estimated at 48 %.( Pakistan academy of educational planning and management, 1985). This phenomenon results in educational wastage. Dropping-out is undesirable because it indicates wastage of resources allocated to education sector and it also indicates the poor internal efficiency of that particular educational institution. Ajayi and Ayodele (2002) are of the view that the primary education is a key to success. So the researcher launched study to find out the causes of dropout.

## **LITERATURE REVIEW**

Wastage is a burning issue of the system of education. Wastage has been defined by salami as degree to which the human and material resources developed and made available are grossly under utilized or neglected. To Wijk T.V.(1983, p.432) pointed out that dropping-out is complete but also partial withdrawal, interruption as well as cessation. More often the students leave school due to their personal problems rather than academic, over which the institution has little control. Inadequacies of the education system to retain pupils until the completion of the educational levels is one out of the five major components of wastage in education system. (Brumer and Paul, 1971) According to Hewyood J.A. (1971, p. 190) "students wastage" provides two indications; the inefficiency of an education process and the individual's reaction to the process. Ayodele (2000) determined relatively higher wastage rates in lower classes of primary schools. However, these wastage rates decreases in upper classes. The study of Reis, New and MC Guire, (1997) has found that in a number of cases, the severity of learning disability decreases as adolescents mature into adults. Reiff et al : Sitloington and Frauh (1990) found that the severe learning disability has influenced the dropout phenomenon.

Rumberger (1987) has found that a number of factors strongly correlate with dropping out. Some of these factors remain constant, such as socioeconomic and racial minority status. Other factors are amendable to interventions, e.g. absenteeism, course failure and peer influences. Factors that push students out are repeating grades, low academic achievement and insufficient teachers care.

### OBJECTIVES OF THE STUDY

Objectives of the study were to:

1. Investigate the class wise trend of dropout rate in Government Girls Primary Schools in District Mardan in the academic year 2005-06.
2. Analyse the reasons of the dropout trend in Government Girls Primary Schools in District Mardan.
3. Determine a strategy for minimizing the dropout trend.

### METHOD

It was a descriptive study. Systems analysis was used as the theory basis of this study, using the adaptation of Coombs-Zwaenepoel Systems Model as a framework. Data was collected through survey and questionnaires. The school records were surveyed to find out enrollment & wastage situation. The researcher administered a self assessment questionnaire on sampled dropouts to gather their perceptions regarding the causes of their dropping out. For demographic profile, percentages, mean and standard deviation were used. Population for the study consisted of all the 10324 dropouts. A stratified random sample of 300 dropouts was drawn out of total population. A separate interview protocols was designed to verify and supplement the data gathered from dropout and to identify what students bring to school, how they studied, and their reasons for dropout.

### PRESENTATION AND ANALYSIS OF DATA

**TABLE 1 ENROLLMENT & WASTAGE SITUATION IN THE ACADEMIC YEAR 2005-06**

	Kachhi	Pakki	Class 2	Class 3	Class 4	Class 5
Enrollment	25038	19886	15734	13824	10094	9637
Dropouts	4001	1561	1222	1194	1096	1250
Dropout rate(%)	15.98	7.85	7.77	8.64	10.86	12.97

**Result:** Table 1 shows the highest dropout rate (15.98%) in Kachhi which gradually falls up to class 2. But in class 3 it jumps to (8.64%) and then it keeps on increasing up to class

Figure No.1 shows decreasing trend in enrolments from Kachhi up to class 5.

Figure No.2 shows the number of dropouts.

Figure No.3 shows dropout rates in percentages.

**TABLE2 PERCEPTIONS OF DROP OUTS REGARDING THE CAUSES OF THEIR DROPPING OUT**

S.No.	Statement	Yes	TSE	No	Mean	S D
1	High poverty level was the cause of your dropout.	212 (70.7%)	27 (9%)	61 (20.3%)	1.4967	.81170
2	Lack of transport facilities was the cause of your dropout.	55 (18.3%)	34 (11.3%)	211 (70.3%)	2.52	.78634
3	Frequent migration of your family in	177	20	103	1.7533	.93563

	search of a livelihood resulted in your dropout.	(59.0%)	(6.7%)	(34.3%)		
4	You need to assist your mother in house hold activities.	101 (33.7%)	15 (5.0%)	184 (61.3%)	2.2767	.93615
5	Frequent absenteeism of teachers caused you me to leave schooling.	119 (39.7%)	66 (22.0%)	115 (38.3%)	1.9867	.88455
6	Lack of parental interest in your schooling was the cause of your dropout	115 (38.3%)	88 (29.0%)	97 (32.7%)	1.9433	.84211
7	Lack of immediate returns of schooling was the reason of your drop out.	164 (54.7%)	57 (19.0%)	79 (26.3%)	1.7167	.85567
8	Frequent failure in classes compelled you to dropout.	211 (70.3%)	43 (14.3%)	46 (15.3%)	1.4500	.74567
9	Courses were quite difficult.	198 (66.0%)	27 (9.0%)	75 (25.0%)	1.5900	.86278
10	Teaching learning process was quite unpleasant.	201 (67.0%)	42 (14.0%)	57 (19.0%)	1.5200	.79480
11	Teachers' harsh behavior in classes compelled you to leave schooling.	178 (59.3%)	34 (11.3%)	88 (29.3%)	1.7000	.89405
12	Remote school was the reason of your drop out.	101 (33.7%)	9 (33.7%)	190 (63.3%)	2.2967	.94071
13	You left school due to your illness.	166 (55.3%)	61 (20.33%)	73 (24.3%)	1.6900	.83840
14	Tight school discipline was the reason of your dropout.	98 (32.7%)	68 (22.67%)	134 (44.7%)	2.1200	.87262
15	Poor building and material facilities in the school were the reason of your drop out.	118 (39.3%)	72 (24%)	110 (36.7%)	1.9733	.87283
16	You feel insecure in school.	158 (52.7%)	37 (12.33%)	105 (35.0%)	1.8233	.92102

Table 2 shows the The highest ranked statements were No.1“High poverty level was the cause of your dropout.” with a mean (1.4967) and standard deviation (.81170) and No.8 “Frequent failure in classes compelled you to dropout.” with a mean (1.4500) and standard deviation (.74567). While the lowest ranked statement was No.2 was “Lack of transport facilities was the cause of your dropout” with a mean (2.52) and standard deviation (.78634).

**Results:** the highest dropout rate(15.98%) in Kachhi and it gradually falls from Kachhi to class 2.but class 3 it jumps to(8.64%) then it keeps on increasing from class 3 to class 5.

70.7% respondents perceived that high poverty level of the parents compels students to leave schooling, with a mean, (1.4967) and standard deviation (.81170).

70.3% respondents perceived that frequent failure in classes compelled them to dropout, with a mean, (1.4500) and standard deviation (.74567).

67.0% respondents perceived that they left school because the teaching learning process was quite unpleasant, with a mean, (1.5200) and standard deviation ( .79480).

67.0% respondents perceived that they left school because the teaching learning process was quite unpleasant, with a mean, (1.5200) and standard deviation ( .79480).

66.0% respondents perceived that courses were quite difficult, with a mean, (1.5900) and standard deviation (.86278).

59.3% respondents perceived that teachers' harsh behavior in classes compelled them to leave schooling, with a mean, (1.7000) and standard deviation (.89405).

59.0% respondents perceived that frequent migration of their families in search of a livelihood resulted in their ultimate dropout. 11 on of dropout with a mean, (1.7533) and standard deviation (.93563).

55.3% respondents perceived that they left school due to their illness. 7 I left school due to my illness was found at rank 2 as a reason of dropout with a mean, (1.6900) and standard deviation(.83840).

54.7% respondents perceived that Lack of immediate returns of schooling was the reason of your drop out. The study found at rank 1that the Lack of immediate returns of schooling motivated students to dropout with a mean. (1.7167) and standard deviation (.84211).

52.7% respondents perceived that they feel insecure in school, with a mean, (1.8233) and standard deviation (.92102).

Table 1 shows the highest dropout rate(15.98%) in Kachhi and it gradually falls from Kachhi to class 2.but class 3 it jumps to(8.64%) then it keeps on increasing from class 3 to class 5.

## FINDINGS/RESULTS

### Findings

The study determined that the highest dropout rate(15.98%) in Kachhi and it gradually falls from Kachhi to class 2.However in class 3 it jumps to(8.64%) and then it keeps on increasing from class 3 to class 5.

70.7% respondents perceived that high poverty level of the parents compels students to leave schooling, with a mean, (1.4967) and standard deviation (.81170).

70.3% respondents perceived that frequent failure in classes compelled them to dropout, with a mean, (1.4500) and standard deviation (.74567).

67.0% respondents perceived that they left school because the teaching learning process was quite unpleasant, with a mean, ( 1.5200) and standard deviation( .79480).

66.0% respondents perceived that courses were quite difficult, with a mean, (1.5900) and standard deviation(.86278).

59.3% respondents perceived that teachers' harsh behavior in classes compelled them to leave schooling, with a mean, (1.7000) and standard deviation(.89405).

59.0% respondents perceived that frequent migration of their families in search of a livelihood resulted in their ultimate dropout. 11 out of dropout with a mean, (1.7533) and standard deviation(.93563).

55.3% respondents perceived that they left school due to their illness. 7 I left school due to my illness was found at rank 2 as a reason of dropout with a mean, (1.6900) and standard deviation(.83840).

54.7% respondents perceived that Lack of immediate returns of schooling was the reason of your drop out. 1. The study found at rank 1 that the Lack of immediate returns of schooling motivated students to dropout with a mean. (1.7167) and standard deviation(.84211).

52.7% respondents perceived that they feel insecure in school, with a mean, (1.8233) and standard deviation(.92102).

## CONCLUSIONS

- i. The study revealed an increasing dropout trend in Government Girls Primary Schools in District Mardan.
- ii. It was found that the high poverty level of the family causes the student to dropout.
- iii. The study revealed that frequent failure in classes compelled them to dropout.
- iv. The teaching learning process was found quite unpleasant in this study.
- v. The study showed that the courses were quite difficult.
- vi. It was found that the teachers' harsh behavior in classes compelled them to leave schooling.
- vii. The study showed that the frequent migration of families in search of a livelihood resulted in students' ultimate dropout.
- viii. The study found that students left school due to their illness.
- ix. The study revealed that Lack of immediate returns of schooling was the reason of their drop out.
- x. It was found that students feel insecurity in school.

## Recommendations;

The researcher recommends the following measures for dropout rates may be reduced

- i. Teachers' training may be focused to enhance teacher's competency to retain students in schools.
- ii. Academic monitoring system may be introduced for adequate supervision of teaching learning process.
- iii. Strategies may be adopted to reduce frequent absenteeism of students from school.
- iv. Mass mobilization campaigns may be launched for motivating parents for the schooling of their offspring.
- v. Stipends may be given to the poor students for the purchase of stationary and school uniform.
- vi. Special schooling arrangements may be made for the children of migrating families.

vii. Individualized teaching strategies may be introduced for slow learners.

viii. Pleasant school systems may be introduced with attractive delivery methods.

## ABOUT THE FEATURES OF ECONOMIC RELATIONS BETWEEN BUKHARA KHANATE AND INDIA

**A. A. Erkuziev\* ; R. Mahkamov\*\***

### ABSTRACT

*On the arrival of Anthony Jenkinson in Bukhara, the Bukhara Khanate had established active trade and economic relations with India. In his memories, Jenkinson wrote that there was an annual gathering of traders in Bukhara, which was visited by the traders from India with large caravans.*

**KEYWORDS:** *Economic Relation, Bukhara Khanate, India, Caravan.*

### INTRODUCTION

Admitting that Bukhara was one of the world's trade centers, the English traveler gave information about the foreign traders in the city, particularly, about the importance of trade by the Indian traders. Jenkinson pointed out that these traders were poorly dressed, and despite the fact that they had brought very little goods, these goods stayed unsold for 2-3 years.

However, a number of sources deny this information. According to them, Jenkinson deliberately discriminated against the activities of foreign, especially, Indian traders and the sale of Indian goods in Bukhara. The English traveler, who was well aware of the lack of demand for woolen fabrics woven in British manufactories in Central Asian markets, did not like the fact that the trade in Bukhara Khanate, in general, in Central Asian markets seemed to be important to another foreign country.

According to Jenkinson, Indian traders brought to Bukhara thin white fabrics used for turbans, as well as various white fabrics used for clothing and headwear. And they took silk cloths, unbleached hides, slaves and horses from Bukhara.

Jenkinson noted that Indian traders underestimated red and other mohair fabrics, and even though the traders from India and its distant lands, even from Bengal and the Ganges Valley were offered to exchange karasea for their goods, they did not want such mohair.

It is difficult to say that Jenkinson's information about the Bukhara trade was completely true. Because he could not sell woolen fabrics woven in British manufactories in Central Asia, so he deliberately tried to downplay the activities and role of Indian traders in Bukhara. Apparently he might have wanted to distract the traders who might be competitors in the trade from this trade.

Based on Jenkinson's data, it can be said that stable trade relations were established between the Bukhara Khanate and India. One of the main commodities in this trade was indigo (the Nile dye). There is also evidence that trade and diplomatic relations between the two countries revived in the XVI century. In particular, during the reign of Abdullakhan II, diplomatic relations were established between the Bukhara Khanate and Russia. In 1589, the ambassador Muhammad Ali from Bukhara brought gifts to the Russian Tsar Fyodor Ivanovich on behalf of Abdullakhan II, and the gifts included 40 pounds of the Nile dye.

This information indicates that at that time Bukhara served as a market for transit goods in trade between the Bukhara Khanate and India. N. I. Kostomarov and M. V. Fekhner, wrote in their works that Indian goods were import to Russia via Bukhara.

India was actively involved in international trade during the Baburids dynasty. However, India was gradually losing the opportunity to trade by sea with Western countries. V. V. Barthold writes, "The Portuguese began to occupy the most important coastal lands as early as the beginning of the XVI century in order to maintain profitable trade with India."

Such changes in India, in general, in the life of the Eastern states were associated with great geographical discoveries. In the early of XVI th century, the Portuguese occupied the port cities of India such as Diu, Daman, Gao, and took the control of the maritime trade of India. The fact that most of the country's maritime trade was passed into the hands of Europeans caused a great damage to the local traders. The Indian traders who were deprived of maritime trade began to turn their attention to Afghanistan and Central Asia.

Anthony Jenkinson said about the activities of Indian traders in the markets of Bukhara, "The Indians (to Bukhara) do not bring gold, silver, precious stones or spices. I tried to figure out the reason for this and found out that these goods were traded by the ocean. Because all the areas where these goods were produced (in India) were controlled by the Portuguese."

Jenkinson's opinion that the Indians did not bring gold, silver, precious stones, or spices to Bukhara is far from the truth. Because spices were one of the main exports from India to Bukhara.

In Russia in the XVII century gradually began to collect information on trade relations between Bukhara and India. For example, in 1671, Mullah Farrukh, the ambassador of Bukhara to Moscow, in meeting with Artamon Sergeevich Matveev, the head of the embassy in Russia, noted about the establishment of the constant trade relations between Bukhara and India and informed that precious stones, pearls and various floral fabrics were brought to Bukhara from India.

According to M. V. Fekhner, Rheum was brought to Bukhara from India.

The data about Bukhara-India relations given in Russian sources can also be found in the works of Western European authors. One of the foreign authors, the French traveler François Berne (1625-1688), lived in India for 12 years. According to him, there was a great demand for wet fruits in India. Wet fruits: melons, apples, pears, grapes were transported from Samarkand, Bukhara and Iran to Delhi and sold at high prices throughout the winter. In India, dried fruits, such as almonds, pistachios, hazelnuts, plums, apricots, raisins and other dried fruits were sold throughout the year.

According to F. Berne, because of the high demand for Central Asian horses in India, twenty-five thousand horses were brought to India every year from Central Asia, particularly, from the Bukhara Khanate. According to I. M. Reisner, the majority of the goods imported to India in the XVII century were horses imported from Central Asia and Arabia.

Afghan nomads, commonly known as "povinda", also took an active part in trade relations between the Bukhara khanate and India. In particular, the trade caravans coming from India to Central Asia, particularly, to the Bukhara Khanate, were guarded by the members of the Afghan povinda tribe. Povinda included the tribes such as lokhani, nasiri, haroti, miyahel, dutani, niyazi and they had more than 35,000 camels. Povinda members brought the goods belonging to the traders to Central Asia by their camels.

In the XV-XVIII centuries, the members of the povinda, who lived on caravan routes, took an active part as an intermediary in the India-Iran-Central Asia (Bukhara Khanate) trade. The data about the Afghan traders acting as intermediaries in trade between Bukhara and India can be found even in the sources of the XIX century. For example, in the article entitled "Afghanistan" it was noted as "They (members of the povinda) traded by their horses and camels between India, Khorasan and Bukhara. They joined an armed caravan to prevent looting on the road. They traveled to Bukhara and India twice a year. In March, they would return to their families and then to the Gilzai Mountains to prepare caravans for Kabul, Bukhara, Kandahar and Herat".

Thus, based on the above evidence, it can be said that in the XVI-XVIII centuries, trade and economic relations between the Bukhara Khanate and India continued despite all obstacles.

**ABSTRACT**

*The article highlights the experience of observing more than 500 patients with vertebral pain syndrome. The data of MRI and MSCT of patients with hernias of the lumbar spine were analyzed. The obtained data were compiled with the results of the survey of the observed patients on the questionnaires of pain and the questionnaire of Oswestri. Based on the results of the observation of patients, a conclusion was made about the absence of a clinically significant relationship between the size of the disc herniation and the size of the light bulb.*

**KEYWORDS:** *Herniated Disc Of The Lumbosacral Spine, Severity Of Pain Syndrome, Size Of The Lumbar, Correlation Of The Size Of The Hernia With Pain Syndrome*

## INTRODUCTION

The prevalence of vertebral back pain (VBP) is quite high. Often in the work of a neurologist, up to 85% of visits are associated with this disease. Also, back pain (in the lumbar region) is often the most common cause of disability and medical seeking [1,2,3,16].

According to the definition of the North American Society for the Study of Diseases of the Spine (NASS) [4,5] a herniated disc with symptoms of radiculopathy (discogenic radiculopathy) is a displacement of the components of the intervertebral disc outside the normal boundaries, manifested by pain and / or sensory disorders in the corresponding dermatomes, weakness in the corresponding myotomes (indicator muscles). According to foreign literature, in particular, epidemiological studies within one month on average, 20-30% of the population suffer from back pain on average [1,6,12,13]. Over the course of a year, 40-50% of adults over 22 years of age experience an episode of back pain, and 60 to 80% of people experience it during their lifetime, with a recent trend towards an increase in the prevalence of back pain among the younger population and disease progression over time.. The prevalence of chronic back pain reaches 20% [13,14,15].

According to the accepted diagnostic triad [9,10,17], the most common cause of back pain is musculoskeletal (nonspecific) sources, the second most common cause is discogenic lumbar radiculopathy. When lumbalgischeskom syndrome discogenic etiology with radiculopathy are used as surgical and various conservative therapies. Research data on their comparative effectiveness are contradictory [18,19,20,21,22].

At the same time, despite the high prevalence of pathology and the associated huge economic and labor-hour losses, the optimal algorithm for choosing tactics between conservative and surgical methods of treatment has not been determined [1, 12, 13]. Doctors of polyclinics and related specialties often focus on the size of the hernia when consulting patients with pain syndromes, forgetting about the possibility of a natural reduction in the size of a disc herniation, but with the preservation of the pain syndrome. However, the statistics that have emerged with the development of imaging technologies and screening research methodology force us to reconsider the emphasis.

Intervertebral hernia until relatively recently was considered almost the main cause of all dorsalgia (see "Back pain and other terms"). In some cases, a hernia is detected in people who did not even know about its existence, and vice versa: a lot of severe pain syndromes localized in the back area have nothing to do with an intervertebral hernia.

Of great scientific and practical interest is the identification of the relationship between MRI and MSCT, signs of degeneration and clinical manifestations of pathology of the lumbar spine.

**The main purpose** of the study was to identify the relationship between the size of the disc herniation and the severity of pain in patients with disc herniation of the lumbosacral spine, detected by imaging methods of examination.

## MATERIAL AND METHOD

The study was carried out on the basis of the department of the Central Multidisciplinary Polyclinic (CMPP) of the Fergana City Medical Association. By the method of continuous sampling, from March 2018 to March 2020, a group of 547 patients was formed (279 women [51%] and 268 men [49%], aged 18 to 69 years ( $38.8 \pm 11.8$  years)) The group did not include patients with mental illness (3), metastases in the spine (1), acute infectious disease (2), rheumatoid arthritis (3), acute trauma (4), instability of the spinal motion segments of the lumbar spine caused by spondylolysis and spondylolisthesis (16).

**TABLE 1. GENERAL CHARACTERISTICS OF THE GROUP OF PATIENTS WHO PARTICIPATED IN THE STUDY**

Indicators		Number	%
Education	Bachelor	187	34
	High school	360	56
Job	Employed	282	51
	Unemployed	265	49
Unemployed	Pensioner	81	15
	Housewives	132	24
	Students	43	8
Stage of the disease	Acute	128	23
	Exacerbations	257	47
	Chronic without exacerbation	162	30
Nosology	Nonspecific pain in the lower back	122	23
	Discogenic radiculopathy	425	77

All patients underwent MRI or MSCT examination of the lumbar spine to clarify the presence and size of the hernia.

Depending on the size of the hernia revealed during examination (MRI and / or MSCT) of the disease, the patients will be divided into 4 groups - the first group - with a disc herniation of 9 mm or more, the second - with dimensions from 6 mm to 8 mm, the third - with sizes from 2 mm to 5 mm, the fourth - with sizes up to 2 mm or without pathology when visualizing the lumbar spine.

**TABLE 2. DISTRIBUTION OF PATIENTS DEPENDING ON THE SIZE OF HERNIATED DISC**

Hernia size in mm	2018	2019	2020	Total	%
9 mm or more (extra large)	35	59	48	142	26
6 mm to 8 mm (large)	46	55	45	146	27
2 mm to 5 mm (medium)	52	44	41	137	25
up to 2 mm or without pathology (small)	48	35	39	122	22
<b>TOTAL</b>	<b>181</b>	<b>193</b>	<b>173</b>	<b>547</b>	

To compare the presence and severity of pain in patients with disc herniation, a questionnaire was conducted using 3 pain questionnaires;

- VAS and NAS - Visual and numerical analogue scale of pain (determination of the intensity of pain, estimated from 0 to 10 points, where 0 is no pain, and 10 is the maximum pain that a person can imagine)
- CPOT (Critical-Care Pain Observation Tool), from 0 to 8 points
- Oswestry questionnaire (index of disability due to pain in the lower back) from 0 to 50 points.

### Results

In the period from March 2018 to March 2020, 547 patients with herniated intervertebral discs of the lumbosacral spine were observed. Based on visualization diagnostic methods (MRI and MSCT), as well as as a result of questionnaires on pain questionnaires, data on the size of disc herniation and the severity of pain in patients were analyzed and compared.

According to the questionnaire VAS and NAS in the group of patients with disc herniation more than 9 mm (very large), the average result was 6.4 points, in the group from 6 mm to 8 mm (large) - 7.2 points, in the group from 2 mm to 5 mm (average) - 6.3 points, and in the group up to 2 mm or without pathology (small) - 4.8 points. According to the CPOT questionnaire, in the group of patients with disc herniation more than 9 mm (very large), the average result was 4.9 points, in the group from 6 mm to 8 mm (large) - 5.6 points, in the group from 2 mm to 5 mm (average) - 4.6 points, and in the group up to 2 mm or without pathology (small) - 3.8 points. According to the Oswestry questionnaire, in the group of patients with disc herniation more than 9 mm (very large), the average result was 43 points, in the group from 6 mm to 8 mm (large) - 35 points, in the group from 2 mm to 5 mm (average) - 36 points points, and in the group up to 2 mm or without pathology (small) - 42 points.

**TABLE 3. RESULTS OF THE QUESTIONNAIRE SURVEY ON PAIN QUESTIONNAIRES**

Hernia size in mm	Average score in the group						
	VAS/ NAS	% of max pain	CPOT	% of max pain	OSWE STRY	% of max pain	Total pain score in%
9 mm or more (very large)	6,4	64	4,9	61	43	86	<b>70,3</b>
6 mm to 8 mm (large)	7,2	72	5,6	70	35	70	<b>70,7</b>
2 mm to 5 mm (medium)	6,3	63	4,6	57	36	72	<b>64,0</b>
up to 2 mm or without pathology (small)	4,8	48	3,8	52	42	84	<b>61,3</b>

As you know, pain syndrome is considered to be directly proportional to the size of the disc herniation. However, the analysis of our data showed that in patients who deal with pain in the lower back, pain syndrome does not directly depend on the size of the disc herniation. Patients can have equally pronounced pain sensations, both with a large hernia (9 mm or more), and with a smaller hernia or in the absence of one. Pain intensity ratios and an index of disability due to lower back pain are practically at the same level, regardless of the size of the hernia. (Fig 1.)

The results are summarized in table. 3. When comparing the results of treatment in all four groups of patients, there were no clinically significant differences in the values of the intensity of pain syndrome and the index of disability due to pain in the lower back in the observed group of patients, which confirms the correctness of our assumption that there is no direct the relationship between the severity of the pain syndrome and the size of the intervertebral hernia of the lumbar spine.

## DISCUSSION

The current state of the problem of conservative treatment is such that there are many methods that do not have an evidence base.

The first and most controversial question in the treatment of herniated intervertebral discs is what treatment tactics to choose for the patient, whether an operation is needed or it is possible to “cure a herniated disc” with conservative methods. The aim of this work was not to analyze all the existing variants of neurological deficit in a herniated disc. The logical position of a practicing neurologist, who daily faces the question of choosing a treatment tactic, based on the presence of radicular pain syndrome and confirmation of compression of this root according to MRI data, to emphasize that pain syndrome often does not depend on the size of the hernia, that patients, regardless of the size of the hernial protrusion, experience comparable painful sensations. And from this it follows that many conservative methods allow you to completely

eliminate radicular pain syndrome, and in this case, the meaning of the operation is lost. That is why the choice of tactics for treating a large hernia cannot be based only on the results of MRI and the presence of complaints of back pain.

The second debatable issue is the choice of the method of conservative treatment in each particular case and its criteria. The use of only one technique, in our opinion, is not constructive. Different methods have their own niche. ” This is due to the technical limitations of the institution, contraindications for carrying out certain manipulations and methods (allergies, concomitant pathologies, etc.), on the one hand, and serious economic costs, on the other. Among other things, it should be noted that an important issue is the doctor's experience in carrying out one or another manipulation. The so-called “learning curve” indicates that when mastering techniques, there is always a fairly significant percentage of complications and unsuccessful outcomes.

The third debatable issue is the complications of surgical treatment. The most pronounced neurological complication that we encountered during the study was transient monoradicular paresis in the leg (21 cases). The most probable cause of this complication is mechanical “pressing” of the outgoing spinal nerve by the endoscopic port. Given the transient nature of the disorders, the anatomical integrity of the root was not compromised, and the symptoms were caused by a transient disturbance of blood circulation in the spinal nerve.

Of the surgical complications of the operation, it is necessary note the two most significant - recurrent disc herniation and damage to the dura mater. Only recurrence of a herniated disc, causing symptoms, is an indication for reoperation, in other cases conservative therapy is continued. In 13 cases, during portal discectomy, damage to the dura mater occurred, which did not lead to any symptoms.

## CONCLUSION

Based on the analysis of the results of intervertebral disc hernias and their size revealed by MRI and MSCT, as well as the use of various pain questionnaires, it was concluded that there was no clinically significant relationship between the size of the disc herniation and the severity of pain symptoms. The data obtained allow us to conclude that the choice of surgical tactics and treatment methods for patients with hernia sizes of more than 8-9 mm should not be based solely on the results of MRI and the presence of pain syndrome and take into account that the intensity of pain in the lower back does not directly depend on the size herniated disc.

## THE USAGE OF ICT IN THE CLASSROOMS OF PRIMARY SCHOOL

**N.U. Abraimova\***

\*Foreign Languages Department,  
Jizzakh State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*Traditionally, it is believed that a child receives literacy in primary school, where he is taught to write, read and count. This is undoubtedly the case. But modern society needs new ways of activity, which requires a person to develop a whole range of skills and abilities - finding the necessary information, processing it, providing it to other people, modeling new objects and processes, self-planning and building their actions. Along with teaching reading, writing and numeracy skills, starting from the first grade, it is important to teach children how to use digital technology as a working tool in their studies and everyday life.*

**KEYWORDS:** *Multimedia Products, Interactive Technologies, Educational Effects, Information And Communication Technologies, Modern Technologies, The Teacher And Pupils.*

### INTRODUCTION

Modern man is surrounded by so much information that he is not able to process and use for the development of society without the help of new information technologies. Every year more and more information technologies, computer breaks into our life. Proceeding from the fact that “information and communication technologies are a set of methods, devices and production processes used by society to collect, store, process and disseminate information”, the main thing in the teacher's practice is to understand the role of ICT application in educational activities. The success of the reform of Uzbek education largely depends on the human factor: the teacher and his professionalism. It is the level of qualifications of the teaching staff, their readiness to use modern technologies in professional activities that will be the main ones in the complex process of bringing education to the level of the needs of modern society. Information technologies provide a unique opportunity for development not only for the pupils, but also for the teacher. The development and expansion of the information space of children and adolescents, encourages the teacher to study together with pupils, mastering new previously unexplored

spaces. Let me emphasize that the simple use of computer technology in the classroom does not automatically entail an increase in the level of the teacher's professional skill and an increase in the quality of education. The firstly, the determining role is played by the personality of the teacher and his motivation. Therefore, in schools it is necessary to create such working conditions in which the teacher would like to apply the knowledge, he has in the field of ICT use and replenish it. At the same time, the introduction of modern technologies in pedagogical activity should not be just a necessity, but be a conscious process in the continuous education and self-education of a teacher in this area. The directions of modernization of education should be determined not so much by the presence of computer equipment and software in the school, as by the readiness of primary school teachers to change in accordance with the needs and problems of society. According to the website of statistics, 18% of teachers in grades 1-4 have a negative attitude to the usage of computer technologies in the classroom, do not show interest in computers, avoid training in computer literacy courses, preferring to resort to the help of their "advanced colleagues". The teaching experience of this group of teachers is over 20 years. More than half of primary school teachers (54%) have a positive attitude towards computers, show interest in new ICTs, usage them in their practice, including both young teachers (work experience up to 5 years) and experienced teachers. About a third of primary school teachers (28%) have a positive attitude towards IT, are interested in it, but do not use it in their lessons. This group also included teachers with different experience. And among primary school teachers who own computer technologies, 18% do not use them in class, 27% use them, but rarely, 36% use them 2-3 times a week, and 19% constantly, practically in every lesson. Table 1 shows data about why importance and using of ICT is decreasing.

**TABLE 1. THE USAGE OF ICT BY PRIMARY SCHOOL TEACHERS**

1	Electronic processing of documents
2	Use of off-the-shelf multimedia products
3	Using Internet resources to prepare for lessons or for self-education
4	Using e-mail for correspondence, communication with colleagues
5	The use of computer technology outside school hours
6	The use of computer technology in work with parents
7	Using your own multimedia products
8	Professional forums, work in network professional associations
9	Using the Internet to participate in distance competitions, olympiads, conferences of various levels
10	Distance education

From this table, it can be seen that teachers are more focused on the consumption of the finished product, the usage of a computer for reasons of convenience. They practically do not see its importance for self-education, professional communication, distance exchange of experience and distance learning. Now everyone understands that a computer cannot replace a living teacher. But it will help to facilitate his work, to interest children, to provide a more visual, completely new perception of the material. Therefore, topic of article was chosen for self-education "Using ICT in the classroom in primary school as a means of improving the quality of learning". It was trained in courses, studied literature on this topic and began to use ICT in the lessons. The usage of ICT in the educational process allows:

- To enhance educational effects;
- To improve the quality of assimilation of the material;
- To build individual educational trajectories of students;
- To imply a differentiated approach to students with different levels of readiness to learn;
- to organize at the same time children with different abilities and capabilities.

One of the most successful forms of preparation and presentation of educational material for lessons in primary school is the creation of multimedia presentations [1].

Moreover, the presentation allows the teacher to independently compose the educational material based on the characteristics of a particular class, topic, subject, which allows you to build a lesson in such a way as to achieve the maximum educational effect. The usage of interactive technologies is becoming commonplace in education. Interactive equipment such as interactive whiteboards create sustainable motivation for learners to acquire knowledge and help creatively solve learning problems, thereby developing the imaginative thinking of learners. With the help of an interactive whiteboard, you can demonstrate presentations, create models, actively involve students in the process of mastering the material, improve the pace and flow of the lesson[2]. The electronic board helps children to overcome fear and embarrassment at the blackboard, to easily involve them in the educational process. The class does not remain indifferent. Due to the great clarity, the use of an interactive whiteboard allows you to draw the attention of children to the learning process, increases motivation. Everything that is on the computer is demonstrated on the interactive whiteboard. It allows you to move objects and labels, add comments to texts, pictures and diagrams, highlight key areas and add colors. The teacher had the opportunity to model his lesson together with the students in the brainstorming mode, demonstrate the educational material, make written comments over the image on the screen, write down the students' ideas and thus create a general summary with the educational material together with the students. At the same time, what is written on the interactive whiteboard can be transmitted to pupils, saved on magnetic media, printed, and sent by e-mail.

Also, in the classroom, it is possible to access the Internet, where pupils can independently obtain new information. While working on interactive whiteboards, the concentration of pupils' attention is improved, the learning material is absorbed faster, and as a result, the academic performance of each of the pupils is increased, which qualitatively increases the level of modern education. Using an interactive whiteboard, the teacher can not only show and comment on paintings and graphics, but also create their own drawing.

Despite all the difficulties that the teacher is able to solve, new technologies open up more opportunities for the teacher to be creative. The little experience already available has shown that working with ID improves the perception of the material by pupils, especially in primary grades. Pupils find that working with ID is much more fun than working with a whiteboard or printed handout. They recognize that an interactive approach helps them take an active part in the lesson.

The main problem a teacher faces when preparing lessons is finding materials. Commercially available multimedia discs can be used as sources for demonstrations. Among the multimedia discs, firstly it should be noted is the "Cyril and Methodius Children's Encyclopedia" disc. It's an exciting journey into the world of knowledge. Lively interesting presentation, bright colorful

design, ease of use - all this make an indispensable assistant in understanding the world with little “why”. The encyclopedia contains a lot of useful information about the world around, about existing and disappeared civilizations, great eras and distant worlds, outstanding figures of the past and present, about unusual natural phenomena, animals and plants. A variety of illustrated information in a playful way will help to awaken a thirst for discovery in a child, explain and acquaint one with serious encyclopedic knowledge, and help to master school subjects. “Children's Encyclopedia of Cyril and Methodius” is more than 10,000 amazing facts and phenomena, the richest treasury of knowledge about everything.

The Internet is a new information phenomenon, before which we - teachers - found ourselves like a fabulous hero at a crossroads: there are many roads, a wide choice, and we have not had time to understand what it is and why we need it [3]. The global computer network for the educational process is a powerful tool that should organically fit into the subjects of educational areas.

Working with the Internet develops confidence, allows you to feel part of the big real world, spurs curiosity, increases communication skills, creates an element of competition, allows you to diversify the activities in the lesson. Often pictures from the Internet become the only source for children to see a portrait of the writer, photographs, Uzbek and other national folk costumes, masterpieces of Uzbek and other nations' art. It becomes a vivid visual aid and a source of inspiration in the lessons of fine art, the world around, literary reading and art work.

### **PERFORMANCE OF EXPERIENCE**

The effectiveness of this experience includes:

- Growth of positive motivation in the classroom using ICT;
- Increasing the level of use of clarity in the lesson;
- Increasing the productivity of the educational process;
- Qualitative change in the relationship between the participants in the educational process;
- Increasing in the quality of knowledge.

### ABSTRACT

*This article discusses the role of the social environment in personality formation. The author analyzed the social environment separately from the factors influencing the individual in the process of self-awareness. According to the definition widespread in psychology, a role is a program that meets the expected behavior of a person in the structure of a particular social group; it is a given, non-free way of his participation in the life of society.*

**KEYWORDS:** *Personality, Identification, Society, Social Groups, Sociology*

### INTRODUCTION

The formation of personality occurs in the process of assimilation by people of the experience and value orientations of a given society, which is called socialization. A person learns to fulfill special social roles, i.e. learns to behave in accordance with the role of a child, student, employee, spouse, parent, etc.

The social personality develops in the communication of people, starting with the primary forms of communication between the mother and the child. The child is constantly involved in some form of social practice; and if there is no special organization for it, then the child's upbringing effect is exerted by its traditional forms, the result of which may be in conflict with the goals of upbringing. The formation of a person as a person requires from society a constant and consciously organized improvement of the system of social education, overcoming stagnant, traditional, spontaneously formed forms.

Personality is a system of socially significant qualities of an individual, a measure of his mastery of social values and his ability to realize these values.

As a person, a person is characterized by the level of development of his consciousness, the correlation of his consciousness with social consciousness, which, in turn, is determined by the level of development of a given society.

An essential aspect of the personality is its relation to society, to individuals, to oneself and to one's social and labor duties.

A human being becomes a human only thanks to social heredity - thanks to the assimilation of the experience of previous generations, enshrined in knowledge, traditions, objects of material and spiritual culture, in the system of social relations.

But the formation of a person as a person occurs only in specific social conditions. The requirements of society determine both the models of people's behavior and the criteria for assessing their behavior.

As the starting point for understanding the nature of personality, one can take the statement of A. N. Leont'ev. Describing the subject of personality psychology, he wrote: "Personality is an individual; this is a special quality that is acquired by an individual in society, in the totality of relations that are social in nature, in which the individual is involved.

Personality is a systemic and therefore "supersensible" quality, although the bearer of this quality is a completely sensible, bodily individual with all his and acquired properties".

The essence of the personality is manifested in the study of the position, the position of a person in his relationship with other people, is revealed in his life goals and the motives behind them, in methods of behavior and means of action in relation to his general goals and objectives. The concept of personality is closely related to the concept of position and related concepts of social role and social status.

According to the definition widespread in psychology, a role is a program that meets the expected behavior of a person in the structure of a particular social group; it is a given, non-free way of his participation in the life of society. Status determines the behavior of a person included in the system of established social relations, where the place and mode of action, the type of normative behavior, are given for him. In the status system, there are always norms that govern our relations, our actions.

The concepts of status and role are related to the definition of personality. It is no coincidence that in everyday consciousness, a person's personality is identified with his social position, social status; a person is judged by his social actions, by his social role.

The place of a person in social life can be assigned, prescribed to him by chance, birth, circumstances. A person's place in life can be chosen, found, conquered by him, by his own will and free, conscious choice. In this case, they talk about the subject's choice of a position in life, about his personal self-determination. Position is the most integral characteristic of a person as a person. Personality is a person who freely, independently and responsibly determines his place in life, in society, in culture. Therefore, the personality is an entirely socio-cultural formation. You can also find such a definition: personality is a subject, freely defined, developed its position in the space of culture and time of history.

The social environment is, first of all, people united in various groups with which each individual has a specific relationship, in a complex and varied communication system. The social

---

environment surrounding the person is active, affects a person, exerts pressure, regulates, subordinates to social control, carries away, “infects with the corresponding“ models” of behavior, encourages, and often compels, a certain direction of social behavior.

A person draws a complex of scientific knowledge, rich life experience, motives of his actions from a direct source, which is the social environment. In the foreground are those opportunities that objectively exist in society that allow an individual to express himself as a person. The content of this impact lies in the fact that the realization of the rights, freedoms and duties of an individual should take place on the basis of a combination of the interests of the whole society as a whole and of each individual individually. This is possible only in a society where the free development of everyone is a condition for the free development of all. In addition to the state-social environment, social in the broadest sense of the word, one should also highlight the microenvironment, which includes relations that arise in a small social group, in a work collective, of which a person is a member, a set of interpersonal relations.

It cannot be assumed that, under the influence of the social environment in the broad sense of the word, representatives are unified, that they all become completely identical. Each personality has its own specific features that distinguish it.

A specifically human form of interactions and relationships is created by interconnections between people. Another person has a very peculiar effect on the individual. On the basis of a number of experimental studies, it is known that the presence of another person in a situation has a specific effect on the behavior of an individual. In social psychology, the effects of “coexistence”, “cooperation”, “social reinforcement”, “co-activity”, etc. have been noted. They cannot be explained in one way, only by the peculiarities of the subject-object relationship. Personal interactions are of a much more complex nature. Some of their features can be identified by analyzing social expectations.

Human activity involves the use of complex mental mechanisms. In the theory of the installation, some of their aspects have been studied experimentally. The analysis of experimental data showed that when “constructing behavior” by means of the setting mechanism, not only the needs of the individual and the corresponding situation are taken into account, but also those possible transformations that are expected with high probability. This feature of attitudinal activity was investigated from the physiological point of view by I.M. Feigenberg, and was designated by him as the ability of the brain to make probabilistic prediction.

Setting forecasting as a primitive form of expectation is one of the manifestations of the specificity of a person's attitude to reality (its reflection). Such expectations can act completely unconsciously. Moreover, as experimental studies show, the maturation of the abilities of objectification and awareness is not enough for the formation of social expectations. Their formation begins only at a transitional age, and only at the last stage of human socialization do they become determinants of behavior. It should also be noted that their formation requires the participation of consciousness and objectification, however, once formed, they can function at an unconscious level.

Although a person is born with many biological inclinations, the formation of his personal properties is determined by social interactions and patterns. As the classics of Marxism point out, the essence of man is created by the totality of social relations. Human needs, his conscious and unconscious relationship to reality, personal relationships should be considered as phenomena

---

that are the result of differentiation and concretization of an integral system of socio-cultural values. When studying the patterns of formation and action of social orientations of people, the principle of “differentiation - concretization of primary wholes” was used as a methodological principle, as opposed to the principle of “integration - linking of elements”, which is characteristic of associationist and behaviorist theories.
